### **ABSTRACT**

A clear and concise checklist of the diatom species for the five Egyptian Mediterranean Lakes (Mariut, western section; Edku, Burullus, Manzala, Deltaic section and Bardawil, North Sinai) has yet been documented over 40 years of cited bibliography (also with their synonyms names). A total of 390 diatom species belong to 67 genera and 38 families have been recorded. The most recorded diatom genera were *Nitzchia* (Family: Bacillariaceae) and *Navicula* (Family: Naviculaceae). This diatom list has aided in identifying the original species, accepted names, synonyms and their habitat.

**Keywords:** *Diatom; Egypt; Mediterranean; lakes; checklist.*

## 1. INTRODUCTION

The five Egyptian Mediterranean Lakes (Mariut, western section; Edku, Burullus, Manzala, Deltaic section and Bardawil, North Sinai) were the most productive Lakes in Egypt (Fig. 1). In the meantime, the lakes were subjected to a gradual shrinkage during the past few decades, due to land reclamation and transformation of significant parts of the lakes to fish farms, particularly along the southern regions. In addition, large parts of the lakes are overgrown with aquatic vegetation which reduces the open water to nearly half of its total area, speeding up the process of land transformation [1].

Lake Manzala is the largest lake ( $1200 \text{ km}^2$ ), while Lake Mariut ( $63 \text{ km}^2$ ) is the smallest. Lake Bardawil is the most hypersaline water, while the other lakes are brackish water. Lake Mariut is the only lake that has no natural connection with the Mediterranean Sea [2].

Diatoms contribute to a substantial portion of primary production in the oceans and many lakes. It was abundant in every habitat where water is found (oceans, lakes, streams, mosses, soils, and even the bark of trees). These algae form a part of aquatic food web base in marine and freshwater habitats. Assemblages of diatom species are often specific to particular habitats and can be used to characterize those habitats [3,4].

The species names as it appears on the original publication, the accepted names, the common

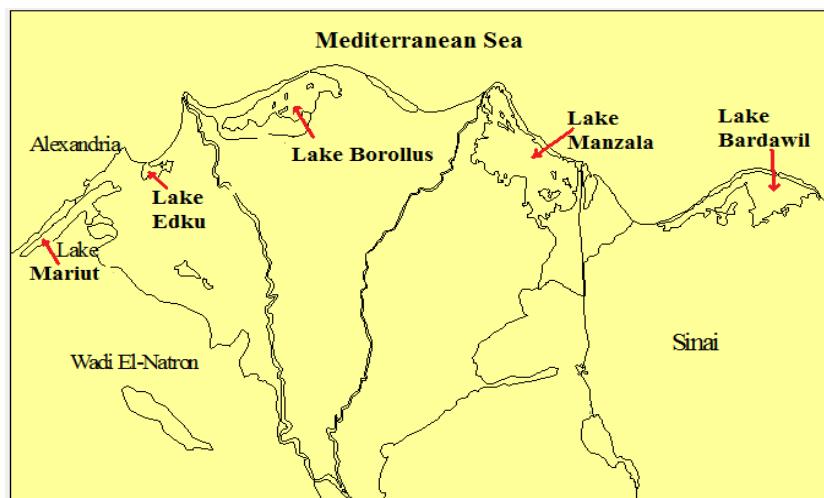

synonyms and species habitat verified through two taxonomic data bases [5,6] has been documented. Use of invalid names or synonyms can cause erroneous or confusing reports of species of micro-biota.

Based on these, this review will list both the present and past data available for examining the composition of diatom species in the Egyptian Northern Mediterranean Lakes, providing for new information about the changes occurring in species composition with environmental change.

## 2. IDENTIFICATION OF DIATOM SPECIES

Data collected from scientific journals were checked for diatom species and covered publications dated 40 years (1974 – 2014). The available data include diatom species from each lake collected according the previous literatures [1,7-33]. The most recorded species were checked for valid names according to World Register of Marine Species (WoRMS) and few species were checked according to algaebase ([www.algaebase.com](http://www.algaebase.com)).

The checklist of diatom species in the five northern lakes of Egypt was represented in Table (1). The following check list include 390 species belong to 67 genera and 38 families (Table 2). Results indicated that the diatoms in the northern lakes are highly diverse, commensurate with the wide range of habitats found in their ecosystems. The most recorded diatom genera are *Nitzschia* and *Navicula* belonging to two families (Bacillariaceae and Naviculaceae, respectively).

**Fig. 1. Map showing the five Northern Lakes of Egypt (after Galal 2005)**

**Table 1. Names appear in the cited literature (in bold); accepted names, synonyms and habitats of diatom species recorded in the Egyptian Mediterranean Lakes over 40 years**

*Nitzschia* was represented by 46 species (25 fresh water, 10 marine, 10 marine - fresh and one marine and brackish. *Navicula* was represented by 51 species (16 fresh water, 8

marine - fresh, 6 marine, 3 marine - brackish, 4 terrestrial - fresh, 3 brackish, 3 brackish - fresh, 3

marine - brackish - fresh, 1 terrestrial, 1 brackish, fresh - terrestrial and 3 with unknown habitat (Table 1).

From the listed data in Table (3), Lake Manzala attained the highest number of fresh water

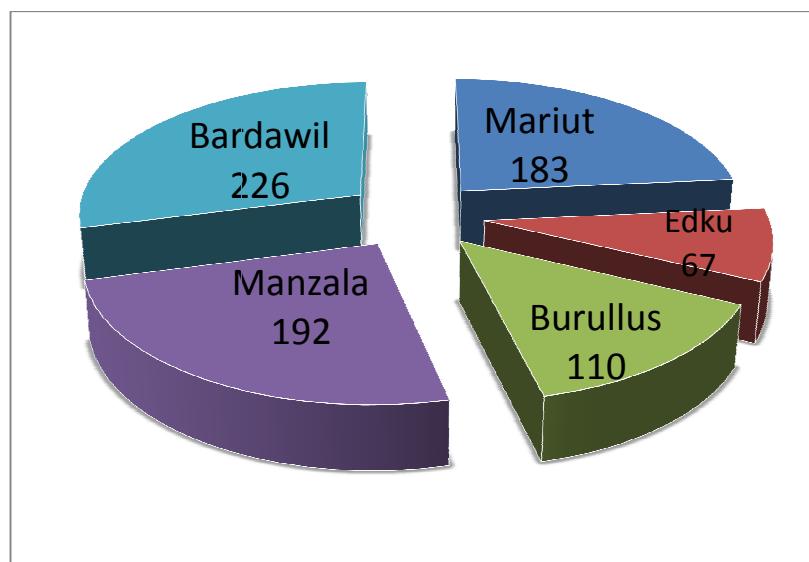

species (104 species). On the other hand some others are known to be introduced from the marine – fresh habitat. The highest recorded marine form was recorded in lake Bardawil (61 species).

As shown in Table (3) and Fig. 2, Lake Bardawil have the higher species number (226 species),

most of them are marine forms; followed by lake Manzala (193 species). Lake Mariut was represented by 183 species, while Lake Burullus was represented by 110 species. The lowest diatom number was occurred in Lake Edku (67 species).

**Table 3. Habitat of different diatom species recorded in the five Egyptian Mediterranean Lakes**

Habitat	Lake				
	Mariut (Ma)	Edku (Ed)	Burullus (Br)	Manzala (Mn)	Bardawil (Ba)
Marine and fresh (MF)	37	15	22	37	42
Fresh (F)	95	32	59	104	80
Fresh and terrestrial (FT)	2	0	3	7	2
Marine (M)	16	8	10	17	61
Marine, brakish and fresh (MBF)	9	4	6	8	8
Marine, fresh and terrestrial (MFT)	2	0	0	2	1
Marine and brakish (MB)	3	2	1	0	3
Brakish (B)	6	2	1	2	5
Brakish and fresh (BF)	6	2	6	6	10
Brakish, fresh and terrestrial (BFT)	0	0	0	1	0
Terrestrial (T)	1	1	1	1	1
Unknown habitat (U)	6	1	1	7	12
<b>Total number of species</b>	<b>183</b>	<b>67</b>	<b>110</b>	<b>192</b>	<b>226</b>

### 3. CONCLUSION

This checklist of diatom species represents the start of documenting species currently observed in the Egyptian wetland water. This publication has presented both past and present data for the composition of diatom species in the studied lakes.

This has also provided valuable baseline data and a greater understanding of the potential for introduction of new organisms from foreign locations that may exist in the lakes. From the survey of the literature on diatom assemblages of the northern lakes, there is a large variation among the researches in the species composition and density depending on the surveyed stations, water depth, sampling season and water quality.

This list has also aided in identifying the original species, accepted names, synonyms and habitat. Also, it seems inevitable that some marine organisms moved trans-oceanically into other habitats. Neglecting this information may lead to a misleading interpretation of invasion corridors, the types of communities susceptible or resistant to invasions, and invasion success rates.

Although we have included the majority of papers that list species from the Egyptian Mediterranean Lakes, we acknowledge that this may not be representative of all the data available. As more research is being conducted more species may be detected.
