| ENVCONDPCODE | Environmental Condition Code | The values represent history and degrees of ecological catastrophe involved in habitat changes. Types of catastrophic changes include thermal, chemical, and physical; the changes may be natural or anthropogenic. The coded values are: 1: pristine, stable conditions, relatively unchanged in a drastic manner since historic times; 2: drastic environmental change has occurred within historic times but at least three years prior to current measurement, and the system has not yet fully rebounded from injury; and 3: drastic environmental change has occurred recently (within the past three years) or the catastrophe has been so serious that the environment has not begun to rebound. |

| IZAAKWALTONSQ SINDEX | Izaak Walton WQ Index | The Izaak Walton League of America administers a Save Our Streams Program that uses the Stream Water Quality Index. The index values are weighted calculations based on sensitive and tolerant macroinvertebrates at the site. Generally, Values >22=Excellent; 17-22=Good; 11-16=Fair; <11=Poor; however, local modifications of these ratings may exist. Activity Comments may contain the rating scale, also.
