The Florida Marine Research Institute (FMRI) is a bureau of the Florida Department of Environmental Protection (FDEP). The FDEP's mission is to "protect, conserve, and manage Florida's environment and natural resources." The FMRI conducts applied research pertinent to managing marine-fishery resources and marine species of special concern in Florida.

Programs at the FMRI focus on resource-management topics such as managing gamefish and shellfish populations, restoring depleted fish stocks and the habitats that support them, protecting coral reefs, preventing and mitigating oil-spill damage, protecting endangered and threatened species, and managing coastal-resource information.

The FMRI publishes three series: *Memoirs of the Hourglass Cruises*, *Florida Marine Research Publications*, and *FMRI Technical Reports*. *FMRI Technical Reports* contain information relevant to immediate resource-management needs.

Rationale and Scope of Checklists

David K. Camp, William G. Lyons, and Thomas H. Perkins

The Florida Department of Environmental Protection is preparing to use biological criteria to assess human impacts on the ambient water quality of Florida's estuaries and nearshore coastal zone. The use of biocriteria in environmental regulation and management is based on the principle that species composition and biotic abundance can serve as indicators of the environmental quality of a community and that these biological factors can be assessed to detect deviations in community condition and to evaluate trends in environmental health (Karr and Chu, 1997). To be able to perform such assessments, however, ecologists must have access to resources that will allow them to make accurate and consistent identifications of the biological components of the community. Accuracy and consistency of identification are integral parts of biological quality assurance in regulatory ecology, an enterprise whose results must be both scientifically valid and defensible. The more accurate and consistent the identifications of the biological components of the marine community are, the more likely it is that trends can be detected. If early warning signs of environmental impairment in Florida's marine communities are to be recognized, identifications must be accurate at the species level.

Identifying the fauna of Florida's estuarine and coastal marine communities is a challenging task. Florida is located in the transition area between two marine zoogeographic zones, the tropical zone to the south and the temperate zone to the north, and multitudes of species related to each of these zones contribute to the state's fauna, which also contains a significant endemic component. As a consequence, more species of marine organisms may be found in Florida waters than in those of any other of the continental United States.

Most of Florida's benthic marine macroinverte-

bbrate species belong to four principal groups: mollusks, polychaetous annelids, malacostracan crustaceans, and echinoderms (Table 1). Species of these groups are prominent in epibenthic and infaunal samples taken in shallow waters, and they generally contribute the greatest numbers of species and individuals found in these types of samples. Depending on the habitat and the type of gear used, it is not unusual for single samples of Florida marine benthos to contain from 30 to more than 100 species belonging to these four groups. Because of this great diversity, identifying organisms to the species level can be difficult and time-consuming.

Common impediments to the identification process include scattered or incomplete information on a fauna, out-of-date literature, and occurrences of "new" (undescribed) or extralimital species. Even with the recent decline of taxonomy as a research discipline, newly described marine invertebrate species are being added to the list of Florida's fauna every year, and specimens of other still-undescribed species are present in many museum collections, including the Florida Marine Research Institute's Marine Specimen Collection at St. Petersburg. Moreover, the classification of the major marine invertebrate groups is dynamic, changing as the understanding of phylogenetic relationships increases, so even quite familiar names may change from time to time. All of these factors pose problems of accuracy and consistency for those charged with conducting long-term, community-level comparisons of fauna within and between programs and with maintaining Florida's marine biodiversity.

The production, distribution, and periodic up-dating of authoritative identification guides would do much to improve the accuracy and consistency of identifications (Carney, 1996). By making these guides available to those engaged in faunal assessments in many

separate investigations, we can help to ensure that the same animal will be consistently identified by the same name and that the name selected will be based upon the most accurate information. Problems posed by reclassifications or by the appearances of "new" (undescribed, recently described, or extralimital) species can be mitigated by periodic and timely updates of the guides.

A first step in producing identification guides is to prepare authoritative, up-to-date checklists of all species of the major marine benthic macroinvertebrate groups known from shallow Florida waters. Such checklists will serve two purposes—they will provide ecologists with up-to-date names for most of Florida's benthic macroinvertebrates, and they will provide a basis from which to plan the scope and production of illustrated guides to the marine fauna of Florida. The purpose of this paper is to initiate that first step. An electronic network (perhaps via an Internet website) should also be established to allow easy access to the checklists and to inform Florida ecologists of nomenclatural changes to the checklists and of associated identification literature.

The checklists of mollusks, polychaetous annelids, malacostracan crustaceans, and echinoderms that follow list all species of these groups known to occur in Florida's estuarine and coastal marine waters offshore to depths of approximately 37 meters (20 fathoms or 120 feet). The 37-m depth was selected as a deep-water boundary because this depth has been shown to be an approximate point of transition between the faunas of shallow coastal zones and those of intermediate and deeper shelf zones, at least off western Florida (Lyons, 1980; Lyons and Camp, 1983). Although such points of transition can differ between animal groups and, certainly, among locations in a region as large and environmentally diverse as Florida, we have found that many of the species that demonstrate fidelity to particular depth zones off western Florida maintain that fidelity in other areas of the state. As a caveat to that generalization, it is important to recognize the phenomenon of latitudinal submergence—species that inhabit very shallow waters in the Florida Keys and along southeastern Florida may be found only in deeper waters farther north. However, the converse is seldom true—benthic macroinvertebrate species that customarily inhabit Florida's intermediate and deeper shelf communities are rarely found in inshore waters of Florida (although a few occur in lesser depths off New England).

The checklists should not be considered a complete listing of all species that live in Florida waters, because undescribed species in museum collections are usually not included, and many species currently

known only from nearby states and countries (*e.g.*, Bahama Islands, Cuba) could also occur in Florida waters. These lists are works in progress, and they should be updated regularly. Compilation of this version ended in November 1997.

Individual accounts of methods and acknowledgments related to the creation of each list are presented below, and the list for each group is accompanied by a separate compilation of pertinent literature. The references cited in those compilations include all literature sources consulted during the preparation of that list, as well as some other references useful in classifying and identifying organisms of that group. Many other references have also been included to guide the user to pertinent information on the communities in which the organisms live and the forces that may impact those organisms and their communities; however, the lists of references do not include all papers that have treated Florida's benthic invertebrates. The sound management of Florida's marine resources will depend not only upon the consistent and accurate identification of organisms but also upon an understanding and appreciation of the composition and dynamics of the communities in which these organisms live.

Acknowledgments

We thank the following people, who contributed their time and effort to improving the quality of this checklist. Staff of the library at Florida Marine Research Institute (FMRI) (Jan Boyett, Bob Brock, Felice Drouin, and James Thomas) acquired and provided copies of many of the publications we consulted. James F. Quinn, Jr., Llyn French, and Judy Leiby, of the FMRI Publications Production Office, edited our copy, assembled our several word-processing files into the finished document, and assisted in improving this work. Funding was provided by Florida Department of Environmental Protection, Division of Water Facilities, Bureau of Water Resources Protection from FY 1997 U.S. Environmental Protection Agency 604(b) grant monies administered by Mary Paulic. We are grateful to the department for giving us the opportunity to assemble these lists and associated references. Finally, we are especially grateful to Paul Humann, marine life author and photographer, for allowing several of his excellent photographs to grace the cover of this document.

Checklist of Shallow-Water Marine Mollusca of Florida

William G. Lyons

Methods

The initial draft of this list was based, in part, on information in *American Seashells, second edition* (Abbott, 1974) and on lists of mollusks prepared by the Council of Systematic Malacologists and the American Malacological Union for the American Fisheries Society (Turgeon *et al.*, 1988; Turgeon *et al.*, 1998). The Florida list was created by selecting from those larger lists the estuarine and marine species known from eastern North America and then by reducing that set of names, first by deleting the names of species not known from Florida and then by deleting the names of several hundred species known only from intermediate and deep-water regions of the continental shelf off Florida. Many other published and unpublished sources on occurrences of mollusks in Florida within the shallow-water limits set for this list were then examined to confirm that the names remaining were appropriate for listing. Regional information sources were consulted for the Jacksonville area (H. G. Lee, unpublished manuscript); the Indian River Lagoon (Mikkelsen *et al.*, 1995); the continental shelf off central and northeastern Florida (FMRI SEAMAP project, in prep.); the *Oculina* reefs off eastern Florida (Reed and Mikkelsen, 1987); shallow coastal waters off Hutchinson Island (Lyons, 1989); Peanut Island at Lake Worth Inlet (Lee, 1997b); Biscayne Bay and nearby environs (Voss and Voss, 1955; McNulty, 1961; McNulty *et al.*, 1962; O'Gower and Wacasey, 1967; H. B. Moore *et al.*, 1968; and numerous papers by Ev. Marcus, Er. Marcus, D. R. Moore, and others); the Florida Keys National Marine Sanctuary (Lyons and Quinn, 1995); Florida Bay (Tabb and Manning, 1961; Turney and Perkins, 1972; FMRI Florida Bay benthic faunal mapping project, in prep.); southwestern Florida (Perry and Schwengel, 1955); Charlotte Harbor (Estevez, 1986); Tampa Bay and Boca Ciega Bay (Hall and Saloman, 1975; many other papers in unpublished database compiled at FMRI by WGL); Crystal River region (Lyons *et al.*, 1971); Cedar Key region (Dall, 1884; Lee, 1997a); Florida Middle Ground (Hopkins *et al.*, 1977; Turgeon and Lyons, 1978; unpublished species list by Turgeon and Lyons); Apalachee Bay region (Menzel, 1971); St. Andrew Bay (Saloman *et al.*, 1982), Pensacola Bay region (Cooley, 1978; Frey and Dörjes, 1988); shallow coastal waters off western and southeastern Florida (Godcharles and Jaap, 1971); and the continental shelf off western Florida (D. R. Moore, 1977;

Bishof, 1980; Lyons, 1980; mollusks of Project Hourglass, FMRI unpublished). Additional records were consulted in a multitude of other papers.

The names on this list are presented in a phylogenetic arrangement of phylum, class, subclass, order, and family, with genera and species arranged alphabetically within families. The sequence of listing follows that of Turgeon *et al.* (1998) and is an accurate representation of the prevalent classification theory at this time. The format of the list differs from that of the larger lists (*e.g.*, Turgeon *et al.*, 1998) by including a category for subclass and also by providing authorities (original authors and dates) for higher taxa (phylum, class, subclass, order, family, and genus). Like the names themselves, the authorities for higher taxa were extracted from many sources, among the more prominent of which are Abbott (1974), H. E. Vokes (1980), Ponder and Warén (1988), Vaught (1989), Millard (1996), and Coan and Scott (1997). However, it was also necessary to consult many other works to obtain authorities for some of the names.

Three species included here are not listed by Turgeon *et al.* (1998) because a criterion for listing in the latter work requires prior publication of the information elsewhere, and there seem to be no published records of the following species in North America: 1) *Solariorbis semipuncta* D. R. Moore, 1965: fresh-dead shells and fragments among coralline sand in pockets atop reef structures, depth about 23-24 m, Florida Middle Ground, northeastern Gulf of Mexico, D. D. Turgeon and W G. Lyons, unpublished data; 2) *Careliopsis bartschi* (Aguayo and Rehder, 1936): Florida Bay, W. G. Lyons, unpublished data; 3) *Bornella calcarata* Mørch, 1863: shallow to intermediate shelf waters off northeastern Florida, SEAMAP benthic community study; also taken commonly there by a commercial shell dredger during the 1970s. Another species, *Erycina floridana* Vanatta, 1904, described from Florida, was overlooked in other recent compilations of taxa (*e.g.*, Abbott, 1974; Turgeon *et al.*, 1988, 1998).

Undescribed species are not included on this list. Seemingly unnamed species belonging to the families Triphoridae, Eulimidae, Buccinidae, Nassariidae, Columbellidae, Turridae, Conidae (subfamily Mangeliinae), and Pyramidellidae from shallow waters of Florida are known to various workers. However, few if any of these species have been figured or diagnosed in publications, so nothing would be served by listing

unreferenced names (e.g., *Nassarius* sp. A). On an encouraging note, several of these species are the subjects of ongoing studies, so names for some of them may be available soon.

Copies of the draft list were sent to three reviewers (see acknowledgments), each of whom provided comments that improved the final document.

References

The accompanying compendium of references presents citations for nearly 1,100 books, journal articles, dissertations, theses, contract reports, and popular articles containing information on the classification, identification, distribution, life history, and ecology of the shallow-water mollusks of Florida. The list is by no means complete. For example, the classic works in which many of Florida's most well-known mollusks were described (e.g., the works of Linnaeus, Gmelin, Lamarck, Say, and others) have been omitted, although an attempt has been made to include early faunal surveys that documented and described Florida species (e.g., Conrad, 1846; Calkins, 1878; Dall, 1884). Many popular guides to the identification of Florida mollusks have been listed, but some are included principally for their historical value (e.g., Aldrich and Snyder, 1936; Morris, 1947), and some of the less useful paperback guides to seashells have been omitted. Likewise, most of the popular guides to worldwide seashells have been omitted, even though some of them include information on Florida shells. Many papers concerned only with the mollusks of Florida's deeper-water shelf and slope have also been omitted.

Papers describing the births, romances, diets, interspecific associates, competitive struggles, deaths, and similar facets of the natural history of Florida mollusks have been included on the assumption that such information can lead to a better understanding of the organisms by those who would study or manage them. On the other hand, reports of the ordinary data of fisheries (effort, landings, and economics) have been excluded, as such information is generally available elsewhere. Also excluded are papers on the more complex aspects of molluscan biology, such as anatomy, embryology, and biochemistry. Thus, a paper on prey preferences of a predatory gastropod would be included, but a paper describing the cell structure of that predator's stomach wall would not.

One very useful source of information on Florida's molluscan fauna is S. D. Kaicher's *Card Catalogue of World-Wide Shells*, a series of 60 card packs published individually between 1973 and 1992. Each pack consists of approximately 108 3 × 5 cards dedicated to a single family (or occasionally two related families) of marine

gastropods, and each card presents the name, range, diagnostic comments, and illustrations for a different species of that family. Nearly all of the packs contain cards treating species of the Florida fauna, but such information is readily available elsewhere for some families (e.g., Strombidae), so those packs are not cited here. In other cases, however, the information in the card packs is superior in accuracy and quality of illustration to any other information on those species, and an effort has been made to list the most pertinent of those packs. Examples of packs especially useful as identification aids for Florida species include those on Olividae (especially *Olivella*), Nassariidae, and Turridae.

A few articles from shell club newsletters have been included as examples of this information resource. Such articles can provide a wealth of information on local faunas, and in many instances they constitute the only record of local occurrence for a given species. Many useful and informative articles have been published in *Shell-O-Gram*, the newsletter of the Jacksonville Shell Club, in *Seafari*, the now-defunct newsletter of the Palm Beach County Shell Club, and in similar publications. Some of those newsletter articles have been later cited in scientific reports, but this is not peer-reviewed literature, and such articles should be used with caution. On the other hand, some of the shell collectors who write these articles are more knowledgeable identifiers of local fauna than are some of the biologists who identified mollusks for some of the environmental surveys cited in the present compendium. In fact, there seems to be an increasing tendency towards the publication of incorrect molluscan identifications in the peer-reviewed scientific literature, especially in papers reporting general faunal assessments, and some of those papers listed here contain remarkable errors. The best rule is to accept that information which seems reasonable and seek verification for that which does not, regardless of the source.

Acknowledgments

Dr. Paula M. Mikkelsen, Department of Invertebrates, American Museum of Natural History, New York, and Dr. James F. Quinn, Jr., Florida Department of Environmental Protection, Florida Marine Research Institute, St. Petersburg, each reviewed the entire draft list, and Dr. Kerry B. Clark, Department of Biological Sciences, Florida Institute of Technology, Melbourne, reviewed sections on aplacophorans and heterobranch and opisthobranch gastropods. Each of the reviewers has extensive experience working with the marine molluscan fauna of Florida, and each contributed valuable comments that improved the list. This effort also

benefited from information provided by many others who contributed to or reviewed manuscript drafts of the American Fisheries Society list (Turgeon *et al.*, 1998). Pelagic Mollusks

Many mollusks that live in the pelagic realm, either free-swimming or on the alga *Sargassum*, wash up conspicuously on Florida's shores. Most of these species are evidenced in the nearshore environment principally by their shells and/or dead or dying animals (e.g., the gastropods *Janthina*, *Recluzia*, *Fiona*, and *Glaucus* and the cephalopod *Spirula*) and egg cases ("paper nautilus": cephalopods, genus *Argonauta*), but some (e.g., the gastropods *Litiopa* and *Scyllaea*) may drop off *Sargassum* near shore and live for brief periods among the shallow-water benthos. All of these species are included in the general list. That list also includes *Cresolis acicula*, a pteropod snail with a glassy, needle-like shell that can become entangled in swimwear, causing a type of "swimmer's itch." The species sometimes occurs in

great densities in coastal waters, and windrows of its shells are occasionally found along Florida beaches. Consult Lalli and Gilmer (1989) for a comprehensive summary of these and the following species of pelagic snails.

The gastropods listed hereafter lead exclusively pelagic lives in the open ocean. Many of the species occur throughout the Atlantic Ocean, and some have world-wide distributions. Although they occur in waters that may intrude into coastal environments in areas such as southeastern and northwestern Florida, representatives of these species are virtually never collected except deliberately by those sampling plankton and nekton. Pelagic cephalopods, principally squids, are also encountered occasionally in Florida coastal waters, but most of these occurrences are accidental, and the many such deep-water species that may be involved are not listed here.

Checklist of Shallow-Water Marine Polychaetous Annelida of Florida

Thomas H. Perkins

Methods

This checklist of Florida shallow-water polychaetes, which current research is showing to be a weakly supported monophyletic group (Rouse and Fauchald, 1997), was derived from a variety of sources. These sources include 1) the extensive systematic literature on Florida polychaetes, which begins primarily with the publication on Florida annelids, in German, of Ehlers (1887), and which has not been systematically synthesized to allow for rapid identification; 2) the published results of ecological surveys; 3) data from specimen collections; 4) unpublished data and specimens examined from recently completed estuarine environmental-assessment programs (EMAP) conducted in Florida by the U.S. Environmental Protection Agency and the National Oceanic and Atmospheric Administration (NOAA) Coastal Oceans Program; and 5) other published and unpublished information from surveys conducted by the State of Florida and by qualified consultants for the state, the federal government, and private organizations. As a result, reliable polychaete identification data are available from almost all areas of the state.

The primary specimen repository from which species names were extracted for inclusion on this list is the Marine Specimen Collection housed at the Florida Marine Research Institute, St. Petersburg. Data from the Harbor Branch Oceanographic Museum, Fort Pierce, Florida, were also used. Other specimens from Florida, some of which have been examined but data for which were not generally used in compiling the list, are housed at the Florida Department of Environmental Protection's central laboratory, Tallahassee, and district offices; in the Texas A&M Oceanographic Collection, College Station, Texas; at Gulf Coast Research Laboratory, Ocean Springs, Mississippi; at Barry Vittor & Associates, Inc., Mobile, Alabama; in collections of the National Museum of Natural History, Washington, D.C.; and in collections of other national and international museums.

Citations for most of the literature listed as helpful in identifying Florida polychaetes (see References) were extracted from the Ward and Fauchald bibliography (Ward and Fauchald, 1997) available on the internet. Additional, more recent citations and local references not included in that bibliography are also

listed among the polychaete references, resulting in about 500 literature citations that are pertinent to the identification of Florida polychaetes.

Criteria used to determine which species names to include in the list were various combinations of the following: 1) location in estuarine and near-coastal waters of the state in depths of about 37 m or less; 2) a moderately skeptical determination by me of the reliability of an identification, continued availability of vouchers that will allow specimens to be reliably identified, or both; and 3) for published "lettered" or unnamed species, the availability of a description and voucher specimens that, with locality data, will allow species to subsequently be identified or described. A few taxa listed as "Genus name" cf. "species name," based on specimens in the FMRI Marine Specimen Collection that possibly are that species and may not deserve the "cf." designation have been included on the list.

Considering the state of knowledge of Florida polychaetes, this list is a work in progress. There is no doubt that there are names on the list that will prove to be incorrect, and some species may be listed under two or more names. There are specimens available of many undescribed species in Florida waters that are not listed, just as there are species that remain undiscovered.

The classification of the Polychaeta is currently unstable, especially at categories higher than family. The system in which the species are reported here is based on the classical system of Pettibone (1982). Another commonly used but different system, that of Fauchald (1977a), was used by the authors of the *Taxonomic Guide to the Polychaetes of the Northern Gulf of Mexico* (Uebelacker and Johnson, 1984). A new, well-documented classification system for family groups and higher categories has been proposed (Rouse and Fauchald, 1997). Rouse and Fauchald state that it is unlikely that any new classification will have any longevity, but their system should provide the basis for a stable and phylogenetically correct classification in the future.

Acknowledgments

Many biologists have provided specimens over the years. In particular, I thank Robert Ernest, Ecological

Associates (formerly Applied Biology, Inc.), Jensen Beach, Florida; Harvey Rudolph, Palm Beach County Government, formerly Florida Department of Environmental Protection (FDEP); Steve Kent, Florida Department of Environmental Protection, Orlando; David Karlen, Environmental Protection Commission of Hillsborough County; Vicki Whiting, FDEP central laboratory, Tallahassee; Jerry McLellan, Gulf Coast Research Laboratory; Dr. Gary Gaston and Carol Cleveland, University of Mississippi; and Dr. Marianne Whitehurst and Tim Thibault, BarryVittor & Assoc., Inc. Bob Ernest also provided data on specimen identifications from many studies conducted by Applied Biology, Inc. Harvey Rudolph provided data on specimens he and others identified from Biscayne Bay. Jerry McLellan and Sarah LeCroy, Gulf Coast Research Laboratory, provided data for their specimens collected at Perdido Key, Florida, during studies for the National Park Service; David Karlen provided data for specimens from Tampa Bay collected for the Tampa Bay National Estuary Program. Tom Dix, Florida Marine Research Institute (FMRI), provided data for polychaetes identified

from FMRI studies in Florida Bay. Marianne Whitehurst and Tim Thibault provided data from studies conducted by BarryVittor & Assoc., Inc., for NOAA in Biscayne Bay and Florida Bay and provided updates to the nomenclature of species reported in the *Taxonomic Guide to the Polychaetes of the Northern Gulf of Mexico* (Uebelacker and Johnson, 1984). Gary Gaston and Carol Cleveland also provided information from their studies for NOAA in Florida Bay and Biscayne Bay and from their Florida-West Indian Province EMAP studies for the U.S. Environmental Protection Agency (EPA) laboratory at Gulf Breeze, Florida. Dr. John Macauley, EPA, Gulf Breeze, Florida, and Linda Harwell, Johnson Controls, Inc., Gulf Breeze, Florida, the EPA data consultant, provided detailed data for specimens collected in the Florida area of the Louisianan Province estuarine EMAP program. Dr. Kristian Fauchald, National Museum of Natural History, Washington, D.C., Tim Thibault, Marianne Whitehurst, Gary Gaston, and Carol Cleveland reviewed draft copies of the species list and corrected several of my mistakes. All are gratefully acknowledged.

Checklist of Shallow-Water Marine Malacostracan Crustacea of Florida

David K. Camp

Methods

The list of benthic malacostracan Crustacea includes most of the described species known from Florida's estuaries and nearshore coastal zone to depths of approximately 37 meters, with exceptions noted below. Most of the list was compiled from previously published compendia, with taxonomic updates and additions taken from many widely scattered papers cited in the References section. Several species were added from lists of museum holdings, including those of the Florida Marine Research Institute Marine Specimen Collection.

The list of Stomatopoda was taken principally from Manning (1969), Camp (1971), Manning and Camp (1981), and Camp and Manning (1982, 1986). Farrell (1979) produced an identification guide to Florida's Mysidacea, and Stuck *et al.* (1979) published a key to mysidacean species of the northern Gulf of Mexico.

The list of Amphipoda was begun several years ago by the late Douglas H. Farrell, who gave his list to me. A few amphipods originally on the list have not appeared in publications about Florida's fauna, but were included by Dr. Farrell based on his observations of specimens from Florida. Dr. Farrell's list was augmented with species from computer records of the catalogued holdings of the National Museum of Natural History, Smithsonian Institution; from lists of catalogued holdings of the Harbor Branch Oceanographic Institution Museum; from a list of species identified from shallow-water sites off Florida by Richard Heard and Sara LeCroy; and from published works cited below. Recently published compendia of Amphipoda include works of McCain (1968), Bousfield (1973), Myers (1981), Barnard and Barnard (1983), Barnard and Karanman (1991), Ortiz (1991), Thomas (1993), LeCroy (1995), Nelson (1995), and Lowry and Stoddart (1997). Many species described in several smaller papers by J. L. Barnard, James D. Thomas, and others were added.

The list of Isopoda was derived mainly from Markham (1978, 1985), Kensley (1980), Menzies and Kruczynski (1983), Schultz and Johnson (1984), Kensley and Schotte (1985), and Kensley *et al.* (1995).

The list of pelagic Euphausiacea was taken from Mikkelsen (1987). Although neither strictly benthic nor shallow-water organisms, euphausiaceans that come to the surface or into shallow water at night were included in this list because they may be captured by

benthic sampling gear near shore on the east coast of Florida.

The list of shallow-water Decapoda was extracted from the larger list of Florida's decapods published by Abele and Kim (1986). A few species they inadvertently omitted plus additional, recently described species were added, and the taxonomic arrangement was updated.

Lettered species (*e.g.*, "Genus name" sp. A) were included if they met two criteria: 1) the lettered designation was published in a peer-reviewed journal, and 2) I was confident that voucher material exists and is retrievable. A few deeper-water species were included even though there is no published record of their occurrence from depths as shallow as 37 meters. These relatively rare species may be found in shallower waters in the future.

Several taxa are not included in the list for various reasons. The following orders of marine malacostracan Crustacea are not treated here: Lophogastrida (cosmopolitan, oceanic, pelagic swimmers; about 40 species worldwide); Amphionidacea (monotypic: *Amphionides reynaudii* (H. Milne Edwards, 1833), oceanic, pelagic); and Mictacea (in the western Atlantic, known only from marine caves in Bermuda and the Guyana Basin) (Brusca and Brusca, 1990). The hyperiidean amphipods were not included because they are planktonic. I have not included the whale lice (Amphipoda: Cyamidae), although whales sometimes become stranded on Florida's coasts. Finally, several shallow-water, benthic species that live near Florida and could be expected to occur here are not included in this list. Islandic species recently described from Cuba and the Bahama Islands may one day be found in Florida, especially in the Florida Keys. Shallow-continental-shelf species from nearby states, such as the mysidacean *Pseudomma heardi* Stuck, 1981, known from off Mississippi, or the pinnotherid crab *Gemmotheres chamae* (Roberts, 1975), known from off North Carolina, may also be found here in the future but are not listed.

The classification of taxa follows that used in the most recently published works, with exceptions. Within the Amphipoda, a mixture of proposed classifications is used, and families are arranged alphabetically within suborders, as was suggested by the reviewers, because amphipod taxonomists have not reached a consensus about the higher classification of that group.

Acknowledgments

The late Douglas H. Farrell, formerly of the Florida Department of Environmental Regulation, Tampa, gave me a copy of a draft list of Florida amphipods that he had prepared. He and I intended to complete it and make it available to Florida benthologists. Doug should be a co-author of the present list, and I dedicate this effort to his memory. The late J. L. Barnard, formerly of the Smithsonian Institution, Washington, D.C., provided me with a list of the cataloged holdings of amphipods from the vicinity of Florida in the U.S. National Museum of Natural History as well as with a computer file of his geographic index to worldwide Amphipoda. I appreciate his generosity and similarly dedicate this effort to his memory. John E. Miller, formerly at Harbor Branch Oceanographic Institution Museum, Fort Pierce, Florida, provided lists of cataloged holdings of amphipods from Florida in that museum. Richard W. Heard and Sara E. LeCroy, both at Gulf Coast Research Laboratory, Ocean Springs, Mississippi, provided a list of benthic macroinvertebrates that they had identified from sites off the Florida coast. I could not have produced the list of Peracarida without the advice of Sara LeCroy, who, through innumerable e-mail transmittals over a short period, taught me more about Florida peracarids than I had ever

known. I am very grateful for her time and her patience. Lawrence G. Abele, Florida State University, Tallahassee, provided all of the computer files and original illustrations from his and Won Kim's (1986) work, *An Illustrated Guide to the Marine Decapod Crustaceans of Florida*. I am grateful for his generosity and trust.

Many taxonomic experts reviewed portions of the draft list, and each one made significant improvements to it. Stomatopoda were reviewed by Raymond B. Manning, Smithsonian Institution. Mysidacea were reviewed by Wayne Price, Tampa University, and by Richard F. Modlin, University of Alabama at Huntsville. Amphipoda were reviewed by James D. Thomas, Nova University, Dania, Florida, and by Richard Heard and Sara LeCroy. Isopoda were reviewed by Brian F. Kensley, Smithsonian Institution, and by John C. Markham, Arch Cape Marine Laboratory, Arch Cape, Oregon. Tanaidacea were reviewed by Kim Larson, The Australian Museum, Sydney, and by Richard Heard. Cumacea were reviewed by Iorgu Petrescu, Musée National d'Histoire naturelle "Grigore Antipa," Bucharest, and by Richard Heard. Decapoda were reviewed by Austin B. Williams, NOAA, National Marine Fisheries Service, Systematics Laboratory, Smithsonian Institution, and by Raymond B. Manning. Errors remaining in the list are attributable only to me.

Checklist of Shallow-Water Echinodermata of Florida

William G. Lyons

Methods

Names on the initial draft of this list were extracted from *Echinoderms of Florida and the Caribbean* (Hendler *et al.*, 1995) and then supplemented or confirmed by information from many other published sources, which are listed in the accompanying compendium of pertinent references. Some of the more comprehensive references consulted during preparation of the list are the following, listed in alphabetical order: A. M. Clark and Downey (1992), Downey (1973), Durham *et al.* (1966), Frizzell *et al.* (1966), Harold and Telford (1990), Hendler (1995), Hopkins (1988), Kier and Grant (1965), Messing (1978), Miller and Pawson (1984), Ruppert and Fox (1988), Serafy (1979), Spencer and Wright (1966), Thomas (1962), Thomas (1973), and Tortonese and Downey (1977). Many additional papers on the systematics of Florida taxa were consulted, most of which dealt with only one or a few species; included in this group are several papers each by R. H. Chesher, A. H. Clark, E. Deichmann, D. M. Devaney, M. E. Downey, G. Hendler, P. M. Kier, J. E. Miller, D. L. Pawson, D. K. Serafy, R. L. Singletary, L. P. Thomas, and R. L. Turner, as well as a few others included in the list of pertinent references. In several instances, the database of the Florida Marine Research Institute Marine Specimen Collection was searched for depth records to indicate whether a species should be listed. The draft list of names was then sent to three reviewers (see Acknowledgments), one of whom suggested several additions to and deletions from the list and all of whom helped by filling in missing information on the authorities (authors' names and dates of introduction) for some of the higher taxa.

This list of shallow-water taxa includes all echinoderms known to occur in Florida's estuaries and coastal waters offshore to depths of about 37 m (120 feet; 20 fathoms). A few of the listed species are principally deeper-water organisms whose ranges extend only slightly into shallow coastal waters. The ranges of species in this group, which includes the echinoids

Genocidaris maculata and *Stylocidaris affinis*, the ophiuroid *Astroporpa annulata*, and perhaps a few others, begin at about 30-35 m and extend offshore to much greater depths on the continental shelf. Those species are included here for completeness, but it is unlikely that most of them will be found in shallower depths.

The ophiuroid *Amphioplus abditus* is known to occur from Maine southward to Sapelo Island, Georgia, typically in shallow water but also out to depths of 40 m (Hendler, 1995). The species is listed here on the suspicion that any species found at Sapelo Island, Georgia, may eventually be found in coastal waters of extreme northeastern Florida.

The classification of taxa follows that used in the most recently published revisions, but with one exception. The ophiuroid *Amphipholis atra* (Stimpson, 1865) has customarily been classified in the genus *Amphiodia* Verrill, 1899 (e.g., Hendler *et al.*, 1995) but is listed here in *Amphipholis* Ljungman, 1867, following the advice of Dr. R. L. Turner.

Acknowledgments

Draft lists of echinoderms were reviewed by Dr. David L. Pawson, Department of Invertebrates, U.S. National Museum of Natural History, Smithsonian Institution, Washington, D.C.; Mr. Roger Portell, Department of Invertebrate Paleontology, Florida Museum of Natural History, Gainesville; and Dr. Richard L. Turner, Department of Biological Sciences, Florida Institute of Technology, Melbourne. Each of the reviewers contributed comments that improved the list. I am especially grateful to each of them for providing hard-to-find information on authorities for some of the higher taxa; that information proved to be quite troublesome to locate for some groups. Sandra LaGant, Florida Department of Environmental Protection, Florida Marine Research Institute, also assisted by providing depth records for several taxa from the database of the Institute's Marine Specimen Collection.

Genus *Poraniella* Verrill, 1914

Poraniella echinulata (Perrier, 1881)

Family Oreasteridae Fisher, 1911

Genus *Oreaster* Müller & Troschel, 1842

Oreaster reticulatus (Linnaeus, 1758)

Order Spinulosida Perrier, 1884

Family Echinasteridae Verrill, 1870

Genus *Echinaster* Müller & Troschel, 1840

Subgenus *Othilia* Gray, 1840

Echinaster (Othilia) echinophorus (Lamarck, 1816)

Echinaster (Othilia) graminicola Campbell & Turner, 1984

Echinaster (Othilia) paucispinus A. M. Clark, 1987

Echinaster (Othilia) sentus (Say, 1825)

Echinaster (Othilia) spinulosus Verrill, 1869

Order Forcipulatida Perrier, 1884

Family Asteriidae Gray, 1840

Genus *Asterias* Linnaeus, 1758

Asterias forbesii (Desor, 1848)

Class Ophiuroidea Gray, 1840

Brittle Stars, Basket Stars

Order Phrynophiurida Matsumoto, 1915

Family Ophiomyxidae Ljungman, 1867

Genus *Ophiomyxa* Müller & Troschel, 1840

Ophiomyxa flaccida (Say, 1825)

Family Gorgonocephalidae Ljungman, 1867

Genus *Asteropora* Örsted & Lütken, 1856

Asteropora annulata Örsted & Lütken, 1856
