**Abstract.** This study is a contribution to the Lichen Biota of Turkey. As a result of the examination of lichens and lichenicolous fungi from 169 stations, 341 lichens and 23 lichenicolous fungi have been identified. While *Sphaerellothecium contextum*, a lichenicolous fungus, is new to Turkey, 19 lichenized and three lichenicolous fungi were found for the second time in Turkey.

**Key words:** Ascomycota, Bingöl, biodiversity, lichen, Turkey

## Introduction

Studies on lichens and lichenicolous fungi in Turkey have intensified in recent years but, although approximately 2000 lichenized and 250 lichenicolous fungi have been identified, it is known that there are many more areas that need to be studied on the subject (Güvenç & al. 2020). So far, 27 lichens and one lichenicolous fungus have been reported from the Bingöl Province (Çobanoğlu & Yavuz 2007, John & Türk 2017, John & al. 2020, Mayrhofer & Poelt 1979, Song & al. 2019, Steiner 1921, Szatala 1960, Yazıcı & al. 2019a,b; Yazıcı & Aslan 2021).

The first lichen reports from the Bingöl Province were made by Steiner (1921) of *Diplotomma epipolium* and by Szatala (1960) of *Acarospora gallica*, *Circinaria calcarea*, *Pyrenodesmia variabilis*, and *Xanthocarpia lactea*. Furthermore, there were two herbarium specimens belonging to *Aspicilia desertorum* and *Protoparmeliopsis laatokkaensis*, which are known to have been collected from the Bingöl Province in 1974 (John & Türk 2017). In the following years, 11 species (*Aspicilia cinerea*, *Circinaria caesiocinerea*, *C. contorta*, *Candelariella vitellina*, *Lecanora horiza*, *Myriospora rufescens*, *Physcia stellaris*, *Physconia grisea*, *Polycauliona candelaria*, *Protoparmeliopsis muralis* and

*Xanthocarpia lactea*) were registered from Bingöl by Çobanoğlu & Yavuz (2007), as well as three *Rinodina* species (*Rinodina calcarea*, *R. luridescens* and *R. milvina*) by Mayrhofer & Poelt (1979), and *Athallia pyracea* by Vondrák & al. (2016). Recently, the records of lichenized and lichenicolous fungi given as new for Turkey from the Bingöl Province include *Acarospora scotica* and *Megaspora rimisorediata* (Yazıcı & Aslan 2021), *Candelariella oleagineascens* and *Verrucaria murina* (Song & al. 2019), *Polycauliona phlogina* (Yazıcı et al. 2019a) and the lichenicolous fungus *Sclerococcum tephromelarum* (Yazıcı et al. 2019b).

According to the checklist of lichenized and lichenicolous fungi (John & Türk 2017) and further subsequent records (John & al. 2020), 18 lichenized and one lichenicolous fungi have been reported from the Bingöl Province. After the latest studies, lichen diversity of the Bingöl Province accounts for 27 lichenized and one lichenicolous fungi.

Apparently, these studies do not reflect the lichen and lichenicolous flora of the region.

The present paper is a contribution to the checklist of lichens of the Bingöl Province.

Bingöl Province, in the Upper Euphrates section of the Eastern Anatolia region, is located between 38°27' and 40°27' E and 41°20' and 39°54' N. The total area of the Province is 812 537 hectares, 7.28% of which is under agricultural land, 27.92% under forests, 10.25% subject to afforestation, 51% pastures, 2.2% meadows and 1.3% under other areas.

Bingöl is strongly mountainous, with heights exceeding 3000 m. Bingöl (3250 m), Genç (2940 m), Şeytan (2906 m), and Şerafettin (2544 m) are the major mountains. The height of the plateaus and plains there does not fall below 2000 m. The high parts of the mountains are covered with peaks and glacial lakes, while the mountain foots are strewn by moraine (moraletstone) rocks. The mountains are generally sparsely forested, and some of their southern parts are bare.

The Bingöl Plateau, Şerafettin, Çötele (Çotla) in Genç, Hırhal and Çavreş in Karlıova, Kiğı and Dağın Düzü in Kiğı, and Karer in Adaklı are some of the major plateaus. There are also important rivers such as Peri, Murat and Göynük (URL-1. 2022).

Bingöl, which has plenty of snow and rain, is cov-

ered with lush vegetation in spring. The valleys of the streams are especially green. The Province has meadows at high altitudes, steppes at low altitudes, and dry forests at the higher elevations around them (Baytop & Denizci 1963).

In Bingöl, which is one of the the forest-richest provinces in Eastern Anatolia, oak forests prevail. These forests reach 1900 m in altitude. However, after a long-term deforestation and in places where the forests are completely destroyed, steppe vegetation has set in. Oak forests still persist in the lower parts of the mountains, below 1200 m. Broad-leaved trees are common, such as *Salix*, *Populus*, *Juglans*, *Prunus*, and *Fraxinus*, observed especially in the village settlements along rivers, streams and in lowlands (Baytop & Denizci 1963).

Bingöl has the harsh continental climate of Eastern Anatolia. It is open to humid-cool air masses coming from the north and, due to the altitude factor, the winter season in Bingöl is quite cold and long, while the summer season is hot and dry. Snowfall is plentiful. One-third of the year the Province is covered with snow. The average temperature in January, which is the coldest month in Eastern Anatolia, is -4.2 °C. The average temperature in July, the hottest month, is 24.2 °C, while the annual average temperature is 10.2 °C. The average annual total precipitation amounts to 579.4 millimeters, and most of it comes in the winter and spring seasons. It rains heavily in spring. The climate values in Bingöl are generally above the regional averages (Akman 1999).

The place with most common volcanic fields is the region between Göynük and Peri water. This volcanic region with its depressions and elevations changes the general character of the mountains. The mountainous areas at an altitude of more than 2000 m and the hilly areas at an altitude of 1500-2000 m had been formed by the tectonic shifts in the 3<sup>rd</sup> geological period (Mesozoic Tertiary). Basalt and andesites generally constitute the structure of Bingöl mountains. In the mountains, flowing lava, partly of bezel-type and partly of andesite-type, occurs extensively. After the ruptures caused by tectonic events at the end of the 3<sup>rd</sup> period, the lava that came to the surface had spread around like a cover. Meanwhile,

as a result of fractures, some masses of that cover had collapsed, while others rose. It was then that the mountains that gave the name to the Bingöl Province were formed (Afshar 1965).

## Material and methods

The lichens and lichenicolous fungi were collected at 169 different localities in the Bingöl Province, between 31.07.2018 and 18.09.2020 (Table 1, Fig. 1). Lichen samples were studied under a Nikon SMZ1500

stereomicroscope and a Nikon Eclipse 80i light microscope by standard identification methods for lichenized and lichenicolous fungi (Arup & al. 2013; Blanco & al. 2004; Brodo & al. 2001; Calatayud & al. 2002; Darmostuk 2016; Dobson 2005; Esslinger 1997; Etayo & Calatayud 1998; Galloway & Moberg 2005; Giralt 2001; Navarro-Rosinés & al. 2009; Nordin & al. 2010; Smith & al. 2009). Specimens are deposited in the Herbarium of the Biology Department, Faculty of Science, Karadeniz Technical University, Turkey (KTUB).

## Results and discussion

A total of 341 lichenized and 23 lichenicolous fungi, of which six are varieties, have been identified from 169 different localities in the Bingöl Province (Turkey). Lichenicolous fungus *Sphaerellothecium contextum* is new to Turkey. Three hundred and seven lichens and 22 lichenicolous fungi have been reported for the first time from Bingöl (Çobanoglu & Yavuz 2007; John & Türk 2017; John & al. 2020; Mayrhofer & Poelt 1979; Song & al. 2019; Steiner 1921; Szatala 1960; Yazıcı & al. 2019a,b; Yazıcı & Aslan 2021). Nineteen lichens and three lichenicolous fungi were found for the second time in Turkey (John & Türk 2017; John & al. 2020).

The taxa are listed alphabetically. The used indications are: “\*” for the new records for Turkey, “+” for a lichenicolous fungus, and “-“ for a lichenicolous lichen.

Five lichens, namely *Acarospora hospitans*, *Acarospora scotica*, *Erichansenia epithallina*, *Lambiella insularis*, and *Pisutiella grimmiae*, have been identified as lichenicolous lichens found on other lichens.

*Protoparmeliopsis muralis* is the most common species found in 132 out of 169 stations in the Bingöl

Province. Other most common species are *Candelariella vitellina* (116 stations), *Rhizocarpon geographicum* (109) and *Aspicilia cinerea* (105).

Eighteen lichenized and one lichenicolous fungi have been reported from the Bingöl Province in the checklist of lichenized and lichenicolous fungi (John & Türk 2017) and in the further records (John & al. 2020). After recent studies, lichen diversity of the Bingöl Province consists of 27 lichenized and one lichenicolous fungi. As a result of the examination of lichens and lichenicolous fungi from a total of 169 stations, 341 lichens, five of which lichenicolous, and 23 lichenicolous fungi have been identified. Lichenicolous fungus *Sphaerellothecium contextum* is new to Turkey. Three hundred and seven lichenized fungi have been recorded for the first time from the Bingöl Province. Eighteen lichens (*Aspicilia glomerulans*, *Aspiciliella cupreoglauca*, *Buellia caldesiana*, *Candelariella antennaria*, *C. kuusamoensis*, *Calogaya pusilla*, *Caloplaca soralifera*, *Dermatocarpon minutum* var. *cirsodes*, *Immersaria usbekica*, *Lathagrium undulatum* var. *granulosum*, *Lecania cuprea*, *Lecanora subcarnea* var. *soralifera*, *L. kjachtenensis*, *Polyozosia flowersiana*, *Pertusaria chiodectonoides*, *Placynthium lismorensense*, *Protoparmelia atriseda*, and *Trapelia placodiooides*) and four lichenicolous fungi (*Cercidospora melanophthalmae*, *Endococcus verrucosus*, *Intralichen baccisporus*, *Sclerococcum montagnei*) were found for the second time in Turkey.

Of the earlier reported species from the Bingöl Province (John & Türk 2017), *Lecanora horiza*, *Rinodina luridescens* and *Polycaulina candelaria* have not been detected in this study.

It has been found that lichenized and lichenicolous lichens develop on a total of 15 different substrates. Some lichens have been widely distributed on many substrates, while others on only one type of substrate. The most tolerant species in terms of substrate preference are *Athalialia pyracea*, *Caloplaca cerina*, *Candelariella antennaria*, *Candelariella antennaria*, *Lecidella elaeochroma*, *Melanohalea exasperata*, *Oxneria fallax*, *Phaeophyscia orbicularis*, *Physcia adscendens*, *Physcia aipolia*, *Polyozosia dispersa*, *Physcia aipolia* *Physcia aipolia*, *Polyozosia hexagelii*, *Rinodina pyrina*, and *Seawardiella lobulata*.

Considering the general state of lichen cover in the

Province, lichens have been mostly found in large communities and on large stretches of land covered by oak trees, where the lichen taxa can develop. Bark and leafy lichens develop mostly on abundant rocks and on extensive stretches of soil, otherwise extremely poor for lichen development. Lichens can develop mostly on rocks in the region. Leafy lichens have been found to develop on tree trunks, especially of *Quercus*. Lichens growing on soil and on the highways have been much less in number than the lichen taxa developing on rocks and tree trunks.

Some studies have been carried out in Bingöl before, and 27 lichens and one lichenicolous fungus have been reported. Nineteen lichens and three lichenicolous fungi were found for the second time in Turkey.

Except for the lichenicolous fungi, 261 lichens were crustose, 67 foliose, seven fruticose, and another seven leprose taxa. While 83 of the identified taxa (with the exception of lichenicolous fungi) were epiphytic, 67 were exclusively epiphytic, 251 were detected on rocks (saxicolous), 242 were exclusively saxicolous, 27 were exclusively musicolous (on moss), and 13 were exclusively terricolous (on soil). Forty-eight taxa were observed to grow on mosses. While a total of 42 taxa have developed on trees, 34 taxa were observed to de-

velop exclusively on trees (Table 2).

Although there have been communities formed by broad-leaved trees, such as *Quercus*, *Crataegus*, *Fraxinus*, etc., crustose species have been mostly found on rocks, because the forest areas are very poor.

With the exception of lichenicolous fungi, 261 lichens are crustose, 67 foliose, seven fruticose, and seven leprose taxa. While 83 of the identified taxa (except for the lichenicolous fungi) have been epiphytic, 67 have been exclusively epiphytic, 251 taxa have been detected on rocks (saxicolous), 242 taxa have been exclusively saxicolous, 27 have been exclusively musicolous (on moss), and 13 have been exclusively terricolous (on soil). Forty-eight taxa have been observed to grow on mosses. While a total of 42 taxa have developed on trees, 34 taxa have been observed to develop exclusively on trees.

Localities with the highest number of taxa are: 13 (52 taxa), 14 (46 taxa), 107 (45 taxa), 54 (43 taxa), 57 (43 taxa), 59 (40 taxa), 61 (26 taxa), 120 (23 taxa), 5 (22 taxa), 8 (20 taxa), 80 (18 taxa), 126 (18 taxa), and 121 (17 taxa).

Although the forest area in the Bingöl district accounts for 38.17 %, the observed development of lichens on mosses has been poor.

Lichen flora of the Bingöl Province is mostly com-

posed of crustose lichens and predominantly develops on rocks. The most common species growing on these substrates are: *Acarospora cervina*, *A. fuscata*, *A. hospitans*, *A. veronensis*, *Aspicilia cinerea*, *A. desertorum*, *Athallia pyracea*, *Blennothallia crispa*, *Calogaya saxicola*, *Caloplaca cerina*, *Candelariella antennaria*, *Candelariella aurella*, *Candelariella vitellina*, *Circinaria caesiocinerea*, *Circinaria calcarea*, *Circinaria contorta*, *Immersaria athroocarpa*, *Lathagrium cristatum*, *Lecanora rupicola*, *Lecidea fuscoatra*, *Lecidella carpathica*, *Lecidella elaeochroma*, *Lecidella stigmatica*, *Lobothallia radiosa*, *Phaeophyscia orbicularis*, *Polyozosia dispersa*, *Polyozosia hagenii*, *Protoparmeliopsis bolcana*, *Protoparmeliopsis muralis*, *Pyrenodesmia atroflava*, *Pyrenodesmia variabilis*, *Rhizocarpon geographicum*, *Rinodina bischoffii*, *Rinodina milvina*, *Romjularia lurida*, *Seawardiella lobulata*, *Scytinium lichenoides*, *Thalloidima sedifolium*, *Verrucaria nigrescens* and *Xanthocarpia crenulatella*.

Species such as *Agonimia tristicula*, *Calogaya schistidii*, *Catapyrenium squamulosum*, *Cladonia pyxidata*, *Gyalolechia bracteata*, *Gyalolechia fulgens*, *Lathagrium auriforme*, *Lepraria nivalis*, *Scytinium gelatinosum*, and *Scytinium lichenoides* have been identified more frequently fn mosses. Such species as *Blennothallia crispa*, *Enchylium tenax*, *Peltigera rufescens*, *Psora vallesiaca*, *Romjularia lurida*, *Thalloidima sedifolium*, and *Tonina squalida* have been observed to grow on soil.

There have been some studies on lichens performed in the eastern part of Turkey. Many common crustose species found during these surveys have been also seen and identified in the present research area. Since Ardahan, Artvin, Bitlis, Gümüşhane, Erzincan, İğdır, and Muş regions are similar to the Bingöl region in terms of climate and terrain, lichen diversity in the above-mentioned provinces is similar to that in the study area in terms of crustose, foliose and fruticose taxa (Yazıcı & Aslan 2003, 2016a,b, 2019; Osyczka & al. 2011; Yazıcı & al. 2011a,b, 2013, 2018, 2020a,b; Yazıcı & Etayo 2014; Krisai-Greilhuber & al. 2017; Yazıcı & Aptroot 2017).

When lichen diversity of the Bingöl Province is compared with the best studied neighboring provinces (Elazığ, Erzurum, Muş), the greatest similarity has been found in Muş (68%), followed by Elazığ (51%). These neighboring provinces are located at the same latitude as Bingöl. Lichen diversity of the Bingöl Province is compared to that in the Erzurum Province located farther north and has shown similarity of 39%. The number of common species between Bingöl and Muş provinces is 211, 133 with Elazığ Province and 112 with Erzurum Province. Similarities between Bingöl and Muş provinces based on lichen diversity were noted down also by Güvenç & al. 2020.

Lichen cover (in terms of lichens that can grow on trees and mosses) in the Province of Bingöl remains relatively poor as compared to that in the above-mentioned provinces. The general state of the lichen cover in the Bingöl Province reflects, in addition to lands without forests with mostly common oak trees, occasionally abundant bare areas, with rare rocks and trees, as well as areas where the soil is very poor in terms of lichen growth. In that region, the lichens develop mostly on rocks. Common bark and foliose lichens also develop on oaks that do not form forest areas.
