*Stock is available in four-inch pots and one gallon containers.
Please call for a list of the plants we have available.*

*Wholesale Prices:
\$3.25/gallon container.
\$1.30/4-inch pots.*

Please order early for the best selection

We also grow rooted cuttings to order. Contact us for more information

Terms:

New customer's terms will be payment on delivery of shipment. Established customer terms are net 30 days. A service charge of 1.5% (18% per annum) will be assessed monthly on all past due accounts.

Prices:

These prices are for the wholesale trade. This list cancels all previous lists and quotations. Prices are FOB our nursery. We can arrange for delivery of large quantity orders within 100 miles of our nursery.

Claims:

Any claims must be made in writing within 10 days of receipt of goods. Please notify us promptly of any errors or unsatisfactory stock. Our plants are guaranteed to be true to variety and in healthy condition when they leave our nursery. At no time will we be responsible for more than the purchase price of the stock ordered and shipped.

Please copy the adjacent page on heather care and use for your customers.

About Heaths and Heather

Use

Heaths and Heather are long-lived evergreen shrubs. They average 12 inches in height but range from 2 inches to 10 feet. Heather are foundation plantings. Once established, they require very little care. A well-selected heather garden may have plants in bloom every month of the year. In addition, heather offers beautiful and changing foliage color in shades of green, gold, silver, orange and many hues of red.

In a landscape, heather may be used individually or planted in mass. They blend especially well with dwarf conifers and layer well with other shrubs or small trees. They may be added to a perennial border and small varieties work well in rock gardens. The winter bloomers are beautiful in combination with early spring bulbs.

Planting

Heather may be planted whenever the soil may be worked. Fall or early spring is best, so the plants may become established. These plants require good drainage. If your soil is heavy, a hillside, raised bed or mound of soil can help improve drainage. Dig a hole about twice as wide as the root ball and half again as deep. Work up the native soil - it may be amended with moist peat, compost or sand. Make vertical cuts the length of the root ball and across the bottom. Break up the roots and work in some soil. Water the plant once or twice a week when the soil is dry throughout the first season. After the plants are established they are drought tolerant.

Heather needs at least a half-day of sun. Full sun is better. The foliage colors are more intense if fully exposed to the elements.

Pruning

Pruning is essential for summer blooming varieties. Prune in late fall or early spring below old flowers on the branch. Round and shape the plant. Winter bloomers require only a light shearing in spring after blooming but before June. There is a tendency for some of the older Erica carnea plants to die out in the center. Shearing will keep the plant alive and growing.

Fertilizer

Fertilizer may not be necessary. If the plants are not thriving, use a low rate of fertilizer for acid-loving evergreen plants.

For more information on heather, visit The Heather Society website at <http://www.heathersociety.org.uk>.

Plant Descriptions

Calluna vulgaris “Scotch or Ling Heather”

These plants are the most varied and interesting of all heather. Leaves are small and scale like. Flowers are single or double. Their forms vary from small tufts to shrubs over two feet tall. Most are small bushes to 36 inches. Foliage color can be as beautiful as the flowers with golds, oranges, gray and many shades of green. These colors change with cold weather to red, orange, bronze and the dark green taking on plum tints. Some of the varieties have beautiful colors of new growth, with shades of pink, yellow, orange and cream. These heather do best in well drained, acid soil. They need sun for at least half the day for their best color. Callunas must be pruned or they will become leggy. Trim to below the old flowers in late fall or early spring. Zone 4 and warmer.

Daboecia cantabrica “St. Daboecia’s Heath”

Dark green, shiny upright evergreen leaves, white underneath. Flowers ½” long and egg shaped. Blooms May – October. Prefers to grow in moist, well-drained peaty soils. Prune plant below old flowers in late fall or early spring. Zone 6 and warmer.

Erica carnea “Winter Heath”

Needle-like foliage. Native to mountains of central and southern Europe. Flowers during period from October to April. Low and fast growing, well suited to be a ground cover. Forms a weed-smothering mat. Light shearing when the plant is young will form dense growth. This will help prevent the plant from forming bare wood in the center. Slightly acid to alkaline soils. Very hardy. Zone 4 and warmer.

Erica ciliaris “Dorset Heath”

Evergreen shrub occurring naturally in moist, acid sunny positions. Ovate leaves gray-green or dark green above, white underneath. Long racemes of flowers from mid summer to mid autumn. Large flowers sharply contracted at the mouth. Zone 7 with protection.

Erica cinerea “Bell Heather”

Leaves are short needles in bundles. Stiff branches, upright to 24 inches. Blooms early summer from May-September. Flower colors are some of the brightest and most vivid of all heather. Prune below old flowers in early spring. Prefers well-drained acid soil. Zone 5 and warmer.

Erica erigena “Irish Heath”

These heath bloom from November to May as the winter heath are finishing but before the summer varieties start. They have a dense bushy upright habit. Their height range is from 4 feet to 12 feet for taller varieties. The foliage is somewhat brittle and may be damaged by heavy snow cover. They grow in a wide range of soils and are found in bog areas in Ireland. Flowers have a honey fragrance. Zone 7 and warmer.

Erica vagans “Cornish Heath”

Plants grow symmetrically and make attractive hummocks. In the inflorescence the lower flowers fade and change to russet brown before the top blooms open. It grows low and spreading, making it a good ground cover. It grows naturally in neutral or slightly alkaline soils. It also does well in moderately acid soils and heavy soils. Zone 5 and warmer.

Erica tetralix “Crossed Leaf Heath”

Plants are named for their leaves which are arranged in a whorl of four forming a cross. As a variety they have gray-green foliage and bloom from May to October. Plants prefer acid soil and are found growing naturally in boggy areas but will tolerate drier conditions. Very hardy to zone 4 and warmer.

Erica x darleyensis

A hybrid of Erica carnea and Erica erigenia. Winter flowering with bright colored flowers blooming through winter months to May. Flowers open pale and then brighten as the season progresses. Leaves have pink or cream tips in spring. This plant is bushier than Erica carnea and grows to 1½ to 3 feet tall. Light shearing when plant is young is good. Prune to shape soon after blooming. Slightly acid to alkaline soils. Zone 5 and warmer.

Erica x stuartii “Stuart’s Heath”

A Natural hybrid between Erica mackaiana and Erica tetralix. The plant is native to Western Ireland. New growth is very showy with yellow and orange tips. These plants have a long blooming season, from May to October. Prefers acid soil. Zone 5 and warmer.

Erica x watsonii “Watson’s Heath”

A group of natural hybrids from Erica ciliaris and Erica tetralix first found in Turno Cornwall, England. Very soft foliage with colored tips on new growth in spring. Long flowering season with bottle shaped flowers. Acid, well-drained soil. Zone 5 and warmer.

Erica x williamsii “William’s Heath”

A natural hybrid between E. vagans and E. tetralix. The two varieties were found growing on the Lizard Peninsula in Cornwall. Beautiful foliage and good flowers borne in short clusters. A quick spreading ground cover. Soil must be lime free but does well in heavy soil. Zone 5 and warm
