## 4 \_ /72 SKETCH

OF THE

# BOTANY

OF

## SOUTH-CAROLINA AND GEORGIA.

IN TWO VOLUMES.

BY STEPHEN HLLIOTT, LL.D.

VOLUME II.

CHARLESTON:
PUBLISHED BY J. R. SCHENCK.
1824.

#### PREFACE.

AFTER many interruptions this Sketch of the phænogamous plants of South-Carolina and Georgia has at length been terminated. It was commenced when a work of this description was much wanted; it has been continued after that want has been in a great measure supplied, from a sense of obligation to those who had encouraged its publication.

That this work should be imperfect was una-The author has never had leisure or voidable. opportunity to visit every portion of the district whose plants it includes; he has had no access to Botanic Gardens where he might observe and examine those plants which had escaped his own researches; he has been able to consult but a very small number of the costly works, or even of the journals in which in Europe descriptions of the plants of North America are occasionally published, and he has had no opportunity of inspecting any herbarium but the one which through the kindness of his friends and his own exertions he has himself formed. Under such circumstances it will not be surprising if he shall

be found to have published under new names some species already known in Europe, some which may have been imperfectly or incorrectly described by preceding authors, or some which he himself may have mistaken. While therefore he hopes that the errors from these sources will not be numerous, he could yet only offer it as "a sketch" in which he has included all such plants within the limits of South-Carolina and Georgia as he has had an opportunity of examining, and such as had been ascribed to the same districts by Botanists on whose authority he thought himself compelled to rely.

He trusts, however, that this Sketch will be found to have somewhat extended the know-ledge of the Botany of the Southern States; that it contains descriptions of many plants not heretofore known; that it has rectified some errors; that it has elucidated some of the doubtful plants in the works of our older writers, and that it contains a careful, and he hopes a faithful description of such plants as he himself has seen.

In the time which has elapsed since the publication of the early numbers of this work many changes have taken place in Botanical nomenclature, many reforms which by limiting more strictly generic characters, have led to many subdivisions of old genera. The natural order of the Gramineæ in particular has been remodelled, and in some of the most natural families, the Cruciferæ, the Umbelliferæ, and the Compositæ, an almost entirely new distribution of

the species has taken place. It would require a new edition rather than a supplement, to indicate all of these changes, and any one who is conversant with the Genera as determined by Schreber and Willdenow, will readily comprehend the principles on which these changes have been made, and the characters of the new genera which have been adopted or proposed. Most of the alterations which have been made in American plants will be found in Nuttall's "Genera of North American Plants," or in the valuable Flora of the Northern States now publishing by Dr. Torrey of New-York.

If however the friends who have hitherto by their contributions added so much to the value of this work shall not find their patience exhausted; if they and if others who may be attracted to the study of this interesting science will continue to communicate to the author such plants as he may appear to have omitted, such as he may have inaccurately or imperfectly described, and will point out errors of any kind which he may have committed, he may hope at a future day to present this work in a form more worthy of their approbation.

To those friends he feels gratified to make public his acknowledgements. With the late Dr. Muhlenberg of Lancaster, Penn. he was accustomed for many years to compare and collate the plants of Carolina and Pennsylvania, and derived from this correspondence much instruction when his attention was first directed to Botanical pursuits.

To Dr. Lewis de Schweinitz he is indebted for notes on many genera and species of our plants, for a long and friendly correspondence, and for many specimens of plants from North-Carolina.

To Zaccheus Collins, Esq. of Philadelphia, he wishes to return his thanks for repeated acts of kindness, for many and very beautiful specimens of Northern plants which served him as standards of comparison, for some rare and interesting minerals, and for much information on subjects connected with his researches.

To Dr. John Torrey of New-York, he is indebted for many of the plants of New-Jersey and New-York, for an opportunity of comparing many doubtful species, and of ascertaining many of the plants of Pursh which were to him uncertain or obscure.

To Mr. Rafinesque of Lexington, Kentucky, he is under obligations for many plants of the Western States, and for the pleasure of an interesting correspondence.

To Dr. Bigelow and Mr. F. Boott of Boston, he wishes also to express his obligations for many very beautiful specimens of plants from the Eastern States.

To Mr. Nuttall he is also indebted for some rare plants from the Arkansaw and Missouri.

To those who have aided him in collecting the plants from which this sketch has been compiled, he feels his manifold obligations; he wishes to express them particularly to Mr. James Jackson of Louisville, Georgia, from whom he has received many new and many rare plants, and whose notes have always rendered his specimens more valuable.

To Dr. Samuel Boykin of Milledgeville, who residing in a most interesting district of country, has added much to his knowledge of its Flora by the valuable collection of specimens occasionally sent him.

To Mr. N. Herbemont of Columbia, South-Carolina, for many specimens of rare plants, collected around Columbia and in the upper districts of Carolina.

To Dr. Wm. Baldwin of the United States Navy, a Botanist of distinguished talents and indefatigable activity, who while residing in the southern districts of Georgia communicated many new species to the early numbers of this work, and would have continued to enrich it with his discoveries if he had not unfortunately been recalled to other stations and to climes less favourable to his health. In the pursuit of his favourite studies he died on the banks of the Missouri, in the expedition of Major Long to the Rocky Mountains.

But principally to the late Dr. James Macbride a tribute is due not only for the services which he himself actually rendered, but for the contributions which he induced others to offer. Devotedly attached to science, he had the talent

to make it popular wherever his influence ex-tended. Profoundly skilled in his profession and high in the confidence of his fellow citizens, he fell à victim to the fatigues and exposure of an extensive practice. In the midst of a brilliant career, with prospects of increasing usefulness and extended reputation, he died at the early age of 33. He left to many friends a mournful inheritance—the task of lamenting one so highly gifted, so prematurely lost. HIS MEMORY THIS VOLUME IS INSCRIBED AS a testimonial of long continued friendship and of unabated respect. It is among the incidents which embitter life that those who have shared in common labours should so often be separated before the termination of their pursuits.

The individuals who took most interest in the compilation of this sketch, scarcely lived to see the commencement of its publication. It is to THE DEAD THE AUTHOR HAS TO CONSECRATE THE RE-SULT OF HIS LABOURS.

#### 1. GLABRA, Vent.

T. foliis suborbiculato-cordatis, acuminatis, argute serratis, glabris; petalis apice truncatis; nuce ovali. Pursh, 2. p. 362.

Leaves cordate. nearly orbicular, acuminate, acutely serrate, glabrous; petals truncated at the summit; nut oval.

T. Americana, Sp. pl. 2. p. 1162. T. Canadensis, Mich. 1. p. 306.

Mich. arbr. Vol. 3. p. 311. t. 1.

A large and ornamental tree, growing in favorable soils, 70 to 80 feet high, and 3-4 in diameter. Leaves alternate, large, with large and very acute serratures, cordate at base, and sometimes obliquely truncated. Flowers in small cymes, of a greenish yellow colour. Peduncles, as in all the species of this genus, somewhat geniculate, and attached at base to the middle of an oblong, membranous, strongly veined and almost reticulate bractea.

The bark of this tree, commonly known under the name of bass-wood, spoon-wood, is thick and fibrous, and when macerated and prepared, is used on farms for many domestic purposes, where coarse cordage is required. The wood is white and soft, and is much used in the northern States by cabinet and carriage makers. In the southern States it is generally confined to the mountains. Mich.

Grows in rich, light soils, in the vallies of the Alleghany mountains. Flowers May-June.

#### 2. Laxiflora. Mich.

T. foliis cordatis, stylo petalis longiore.

Leaves cordate, sensim acuminatis, ra- | gradually acuminate, riter dentatis, mem- | sparingly toothed, branaceis, glabris; | membranaceous, glapaniculis | laxifloris ; | brous; panicles loosely flowered; style longer than the petals.

Mich. 1. p. 306. Pursh, 2. p. 363.

With this tree, whose description I have taken from Pursh, and which he considers as a species very distinct from the preceding, I am unacquainted. The reference to Michaux possibly belongs to the next species.

Grows along the sea coast from Maryland to Georgia.

Flowers May and June.

3. Pubescens.
T. foliis obliquis, cordatis truncatisque, acuminatis, denticulato-serratis, subtus pubescentibus; cymis confertifloris; stylo petalis subæquali; nuce globosa.

Leaves obliquely cordate and truncate. acuminate, denticulate and serrate, pubescent underneath; cymes with crowded flowers; style as long as the petals; nut globose.

Sp. pl. 2. p. 1162. Pursh, 2. p. 363. Mich. Arb. 3. p. 317.

A Tree 20-50 feet high, with the old branches glabrous, the young ones very pubescent. Leaves alternate, cordate, obliquely truncated, so as sometimes to efface the sinus at base, slightly acuminate, serrate, glabrous on the upper surface, underneath slightly scabrous and very pubescent when young, the down wearing off by age. Petiole and peduncles pubescent. mes axillary.—Bractea oblong oval, as long as the cymes, entire, veined, scabrous, of a yellowish green colour. Calyx deeply divided, deciduous; leaslets ovate, lanceolate, acute, white, somewhat woolly. nearly lanceolate, obtuse, white, longer than the calyx. Nectary composed of 5 small leaves, obovate, crenate, shorter than the calyx, enveloped by the petals, and attached with them to the base of the germ. Filaments numerous (nearly 50,) united in five clusters, splitting finally to the base; shorter than the corolla, white, 2 cleft at the summit; anthers incumbent, 2 lobed, with the lobes distinct. Germ superior, ovate, sulcate, hairy. Stigma Capsule globose, coriaceous, generally marked with sutures where the 5 valves unite, bursting tardily at base, at first 5 celled, but rarely maturing more than one seed. Seed round, smooth.

Grows in fertile soils along the sea coast of Carolina and Georgia.

Flowers May, June.

#### HELIANTHEMUM. Tourn.

Calycis laciniæ 5, extimis minoribus. Capsula 1-Petala 5. 3-valvis; locularis, medio septiferis.

Segments of the casæpius inæquales, 2 | lyx 5, often unequal, the 2 exterior small. Petals 5. sule 1-celled, 3-valved; valves bearing a partition in the middle.

\* Exstipulata; herbacea.

\* Herbaceous, with-out stipules.

1 Canadense.

H. foliis alternis, lineari-lanceolatis, planis, subtus tomentosis; paucifloris; calycis laciniis lato-ovatis, acuminatis; capsulis calyce brevioribus.

Leaves alternate. linear lanceolate, flat, undertomentose racemis terminalibus, | neath; racemes terminal, few flowered; segments of the calyx broad ovate, acuminate; capsules shorter than the calyx.

Mich. 1. p. 308. Pursh, 1. q. 363. Cistus Canadensis. Sp. pl. 2. p. 363.

Root perennial; Stem herbaceous, erect, 6-10 inches high, tomentose when young. Leaves oval, entire, rather obtuse, pubescent, and tomentose on the under surface, nearly sessile. Racemes few flowered, generally terminal, pedicels solitary. Flowers yellow.

Grows in dry soils. Flowers May-June.

2. RAMULIFLORUM. Mich.

H. foliis alternis, oblongis ovalibusque, oblong and oval, tosubtus tomentosis; ra- mentose underneath; mulis brevibus, sum branches short, genecalvcibus globosis. Mx.

Leaves alternate. subtrifloris; rally 3-flowered at the fructiferis | summit; calyx of the fruit globose.

Mich. 1. p. 307. Pursh, 2. p.

Whole plant tomentose, 6-10 inches high. Leaves generally oval, 2 exterior leaves of the calyx linear. Corolla yellow, and, with the leaves, longer than in the preceding species. Unless the H. ramuliflorum of Michaux has been misunderstood by our Botanists, it requires a careful comparison with the preceding species. Excepting in the size of the leaves and flowers, our Southern plant differs very little from specimens of the H. Canadense which I have received from New-York.

Grows in dry, sandy soils. Common along the sea-coast. Flowers April—May.

3. CAROLINIANUM. Walt.

H. hirsutum; foliis | ovalibus, subdenticu- val, sparingly toothed; latis; pedunculis soli- peduncles solitary, 1tariis,intra axillaribus unifloris; calyce cap- axils; calyx longer sulam superante.

Hirsute: leaves oflowered, between the than the capsule.

Mich. 1. p. 307. Pursh. 2. p. 364. Cistus Carolinianus. Walt. p. 152.

Root perennial. Stem erect, herbaceous, 8-12 inches high, generally purple, variegated with white stellular pubescence. Leaves nearly sessile, crowded at the base of the stem, sometimes nearly round, very villous, pubescence as on the stem stellular. Flowers few, near the summit of the stem, larger than those of any other of our species, bright yellow. Peduncles nearly an inch long. Calyx 5 leaved, persistent, the two exterior leaflets linear, generally expanding; the three interior, larger, ovate lanceolate, acuminate, 3 nerved, covering the capsule. Petals twice as long as the calyx. Filaments numerous (30-40,) attached to the base of the germ, unequal, much shorter than the corolla. Germ superior, ovate, glabrous. Style very short. Stgima globose, obscurely 3-lobed. Seed numerous, small, attached by the base to a central receptacle.

Grows in dry and moderately fertile soils.

Flowers May to June.

This is an ornamental plant, but its flowers, as in this whole genus, only expand for a few hours in the morning.

#### 4. Corymbosum. Mich.

valibus lanceolatisque, and lanceolate, totomentosis, subtus ca-nescentibus; corym-hoary; corymbs mabis multifloris, fasti- ny flowered, fastigiatis.

H. foliis oblongo-o- | Leaves oblong oval giate.

Mich. 1. p. 307. Pursh. 2. p. 364.

Roots creeping? perennial. Stem about a foot high, sometimes branching, very tomentose when young, pubescence (as perhaps in all of the species) stellular. Flowers very much crowded in the corymb.-Calyx villous, about as long as the capsule; the two exterior leaves long and linear. Corolla yellow. The flowers in this species are much smaller than those of the H. Carolinianum, but nearly equal in size those of our other species. Frequently in a corymb, one or two flowers rise conspicuously above the rest, and the capsules then become much larger.

Grows in poor, dry, sandy soils, along the sea-coast of Carolina and Georgia.

Flowers April, May, and again in October.

#### 5 Rosmarinifolium?

H. erectum, ramosum, tomentosum; foliis linearibus, marginibus revolutis; race-mis parvis, axillaribus, confertifloris.

Erect, branching, tomentose; leaves linear, with the margins revolute; racemes small, axillary; flowers crowded.

Pursh. 2. p. 364.

Stem erect, 12-18 inches high, apparently more frutescent than in any other of our species, branches simple and slender. Leaves and the whole plant, covered with a hoary down. Racemes about half as long as the leaves, many flowered. Calyx very small, the two exterior leaves Corolla twice or three times as large as the calyx, bright yellow.

This plant differs so much in habit and appearance from the other species of this genus, as to excite some suspicion of its real connection with them. I collected it whilst travelling hastily in the upper country without leisure Specimens which I sent to Dr. Muhlenberg, were to examine it. marked by him as a variety of the H. Canadense. Under this impression it remained in my Herbarium until lately, when having received specimens of the H. Canadense from New-York, from my friend Mr. Raffinesque, and perceiving their entire resemblance to one of our own common species, I was led again to examine this plant. My specimens appear to agree exactly with the H. Rosmarinifolium of Pursh, described from specimens collected by Mr. Enslen in the middle districts of Georgia. I have therefore described them under this name.

Grows at Rocky mount on the Catawba River.

Flowers June, July.

#### NYMPHÆA. GEN. Pl. 886.

lus. Petala plurima, germini sub staminibus inserta. Stigma radiatum, sessile, medio nectariferum.— sile, bearing a necta-

Calyx 4—5-phyl- | Calyx 4—5-leav-

Bacca multilocularis, ry polysperma.

1. ODORATA.

N. foliis orbiculatocordatis, integerrimis, subemarginatis, lobis divaricatis, acu- lobes divaricate, with mine obtuso; petalis their points obtuse; calcyi 4-phyllo æqual-ibus; stigmate radiis 4-leaved calyx; stig-· 16-24 erectis. Sp. pl. 2. p. 1153.

in the middle. Berry many celled, many seeded.

Leaves orbiculate cordate, entire, slightly emarginate, the ma erect, with 16— 24 rays.

Pursh. 2. p. 368. Nymphæa alba. Walt. p. Mich. 1. p. 311.

Root perennial, creeping, tuberous, nodosc and woody. Stem 0. Leaves on the summit of long, smooth, somewhat spiral petioles 1—6 feet long (so as to support the leaf always on the surface of the water,) peltate-cordate, circular in its outline, slightly emarginate, coriaceous, glabrous; dotted and strongly veined and generally coloured underneath. Peduncles, like the petioles, spiral, rising to the surface of the water, bearing one terminal flower. Calyx 4-leaved, leaflets lanceolate, coriaceous, glabrous. Petals about 30, large lanceolate, somewhat obtuse, very white. Filaments very numerous, the exterior ones larger, lanceolate, slightly acuminate. Anthers attached to the margins of the filaments. Germ thick, somewhat cylindrical. Style none. Stigma large, concave, yellow, bearing a globular nectary in the centre, with the margin radiated, and the rays linear, incurved. Fruit a rude berry, many celled. Seed small, oval, numerous in each cell.

The number of cells in the berry, is, I believe, always equal to the number of rays in the stigma, it might therefore be considered a polygy-

nous plant with the stigmas firmly united.

The flowers of this plant are among the most ornamental in our country. The white petals, and the yellow stamens and stigma, are all conspicuous from the brilliancy of their colors. When recently gathered, they are fragrant; but the odour in a short time becomes strong and disagreeable.

Grows every where in shallow stagnant or slowly running streams of

fresh water.

Flowers March to October.

#### NUPHAR. SMITH.

Calyx 5—6 phyllus. Petala plurima, receptaculo cum staminibus inserta, dorso nectarifera. ma radiato-sulcatum, sessile. Bacca multilocularis, polysper-

1. ADVENA?

foliis cordatis. integerrimis, lobis rotundatis; calyce 6phyllo; stigmate leviter umbilicato,10—14 radiato; pericarpio sulcato.

Calux 5—6-leaved Petals numerous, inserted on the receptacle with the stamens, nectariferous on the back. Stigma radiated, furrowed, sessile. Berry many celled. many seeded.

Leaves cordate. entire, with the lobes round; calyx 6-leaved; stigma slightly umbilicate, with 10rays; pericarp furrowed.

Pursh 2. p. 369. Nymphæa Advena. Sp. pl. 2. p. 1152. Mich. 1. p. 311. Nymphæa lutea. Walt. p. 154.

Root perennial, tuberous, creeping. Leaves on spiral petioles. large. exactly cordate (with lobes somewhat truncate,) coriaceous, glabrous, sometimes erect, sometimes floating on the surface of the water. Floaters solitary, terminal, on spiral peduncles, generally elevated a few inches above the surface of the water. The three exterior leaves of the calyx small, round, green; the three interior larger, round, yellow, tinged with green at base. Filaments very short. Stigma with 10 to 14 rays and the margin entire.

Grows in the fresh water rivers; abundant about the head of tide wa-

ter, rarely found in the vicinity of salt water.

Flowers from April to August; perhaps later.

2. SAGITTÆFOLIA. N. foliis elongatis, | sagittato-cordatis, ob- | date and sagittate,

Leaves long, cortusis; calyce 6-phyllo, | obtuse; calyx 6-leavpetalis nullis, antheris | ed; petals 0; anthers subsessilibus. nearly sessile.

Pursh. 2. p. 370. Nymphæa sagittifolia. Walt. 155. Nymphæa longifolia. Mich. 1. p. 312?

Leaves floating, oblong, 6-8 inches long, 2-3 wide, sagitate at base; thinner than usual in this genus and in its kindred genera. Pericarp rather small, ovate. Stigma with 14 rays, margin entire.

Grows in the Pee Dee river above the head of tide water.

To me a rare species. The flowers I have never seen. Found with mature fruit in the middle of November.

#### SARRACENIA. GEN. PL. 885.

Calyx duplex persistens exterior minor, 3-phyllus, interior 5-phyllus. Petala 5. Stigma maximum pentagonum, clypeatum persistens. Capsula 5-locularis, 5-valvis, polysperma.

1. PURPUREA.

S. foliis brevibus, tubo ventricoso, fauce the tube ventricose, .coarctato; ala ventrali amplissima, arcuata; appendice erecta, reniformi; flore purpureo.

Calyx double, perthe sistent, rior small, 3-leaved. the interior 5-leaved, Petals 5. Stigma very large, 5-angled, peltate peristent. Capsule 5-celled, 5valved, many seeded.

Leaves short with contracted at throat; longitudinal wing very large, arched; appendix erect, reniform; flowers pur-

Sp. pl. 2. p. 1150. Walt. p. 152. Mich. 1. p. 310. Pursh. 2. p. 367. Root perenmed. Leaves as in all of the species springing from the root, 4-6 inches high, hollow, tubular, bulging in the middle, contracted at the throat, the appendage large, reniform, emarginate very hairy on the inner surface. Scape about a foot high, bearing a solitary terminal flower, exterior Calyx very small, the interior large and coloured, (purple.) Corolla larger than the calyx. Petals obovate, bright purple. Stamens numerous, short. Germ superior. Style short. Stigma very large covering the stamens. Seeds attached to a central receptacle.

Grows in wet swampy lands in the middle districts of Carolina and

Georgia, rarely found along the sea coasts.

Flowers April and May.

#### Walt. 2. RUBRA.

S. foliis gracilibus, ala ventrali lineari: appendice ovata, erecta, obtusa, mucronata, sub coarctata; floribus rubro-purpureis.

slender, Leaves longitudinal wing linear; appendix ovate, erect, obtuse, mucronate, contracted base; flowers purple.

Walt. p. 152 Sp. pl. 2. p. 1150.

Leaves slender from 6 to 10 inches high; tube regular, increasing to the summit; throat not contracted; appendix slightly contracted at base, erect, cloathed with very fine hair on its inner surface, marginal wing narrow, nearly uniform in its whole length. Flowers much smaller than in the preceding species. Petals obovate, attenuated at base of a dark reddish purple.

The S. Psyttacina of Michaux, (vol. 1. p. 311.) has been usually referred to this species, yet in many respects particularly in its recurved, fornicated appendix, it appears materially to differ, and may possibly be found to constitute a distinct species.

Grows in bogs and swamps in the middle country of Carolina.

Flowers April and May.

#### 3. FLAVA.

S. foliis majusculis, infundibuliformibus, fauce patula; ala ventrali subnulla; appendice erecta, basi coflexis; floribus flavis.

Leaves large, funnel shaped, with the throat expanding, and scarcely any longitudinal wing; appendix arcta, lateribus retro- erect, contracted at base, reflected at the sides; flowers yellow.

Sp. pl. 2. p. 1150. Walt. p. 155. Mich. 1. p. 310. Pursh. 2. p. 367.

The largest species of this genus. Leaves 18-24 inches high, large and generally dilated at the summit of the tube; appendix large, reniform, mucronate, very much contracted at the base, with the sides reflected. cloathed on the inner surface, with very fine hair scarcely visible without the aid of a glass. Flowers very large. Petals oblong, obovate, yellow. Stigma nearly two inches in diameter, with each angle two cleft.

Grows in swamps, abundant in the middle districts of Carolina and

Georgia, rarely found along the sea coast.

Flowers in April.

#### 4. Catesbæi.

S. foliis stricte erectis; tubo infundibuliformi; ala ventrali lineari; fauce recto; appendice erecta, subreniformi, reticulata, venis coloratis.

Leaves firmly erect; tube funnel shaped, longitudinal wing linear; throat straight; appendix erect, somewhat reniform, reticulate with colored veins

Catesby, tab. 69. f. b.

Leaves 12—18 inches high, regularly tapering to the base; the upper part of the leaves and the appendix distinguished by their coloured yeins, the inner surface of the appendix covered by long and very conspicuous hair

This plant which has been probably united with the S. Flava, and which can be connected with no other species, appears to me sufficiently distinct; it differs by its rigidly erect leaves, by its throat which is straight and not expanding, and by its appendix of which the sides are not reflected. It differs also from the S. Flava by its darkly colored purple veins and hairy appendix. My specimens agree exactly with the figure in Catesby, to which I have referred and were collected by Dr. Machride along the margins of the rivulets amidst the high sand hills of Chesterfield district in S. Carolina.

The flowers I have not seen.

#### 5. Variolaris. Mich.

🥆 S. foliis paulo ven-

Leaves slightly tricosis, tubo superne | ventricose, with the dorso maculato; ap- | tube near the summit pendice fornicata, in- | spotted on the back; curvata; ala ventrali | appendix arched, in-

sub dilatata; floribus | curved; longitudinal | wing slightly dilated; | flowers yellow.

Mich. 1. p. 310. Pursh. 2. p. 367. S. Minor Walt. p. 153. Sp. pl. 2. p. 1150. S. Adunca. Smith Ex. Bot. 1. tab. 53.

Leaves 12-18 inches high. Tube a little ventricose, colored near the summit, and curiously marked on the back with transparent spots. Appendix arched and vaulted so as in this species nearly to cover the contracted throat. Wing along the central suture more dilated than in any other species except the S. purpurea. Petals spathulate-obovate, yellowish. Stigma acute at the angles.

Grows around pine barren ponds, very common along the sea coast of

Carolina and Georgia.

Flowers in April and May.

The plants belonging to this genus, form one of the most singular varieties which the vegetable creation exhibits. Their long tubular leaves always contain water, produced probably by secretion, and are generally filled for two or three inches, with dead and decaying insects. How far the water contained in these leaves may be necessary to the support of the plant, has not yet been sufficiently ascertained, but the insects although attracted and destroyed by its very remarkable structure, yet can have little or no connection with its existence. For the first accurate examination of these leaves, I believe, we are indebted to the late Dr. Macbride. Some of his observations on the Sarracenia have been published in the transactions of the Linnæan Society of London, (Vol. 12.) and some remain among the unpublished papers of the Literary and Philosophical Society of South-Carolina.

It may be sufficient here to remark that the throat or orifice of these leaves is generally covered with a saccharine secretion or exudation. Immediately below the throat for the space of nearly an inch, the surface is highly polished, while the lower part of the tube is covered with hairs all pointing downwards. When an insect attracted in the first instance by the secretion of the plant, or perhaps even by the water descends as it easily can do along this declining pubescence, it appears incapable of ascending by its feet alone and canonly escape by a flight so perpendicular as to surpass the power of most insects. Whenever they touch the bristly sides of the tube they are precipitated again to the bottom, and have to renew their efforts, and many insects even of a large size perish in this arduous and hopeless struggle.

## ARGEMONE. Gen. Pl. 882.

Calyx 3-phyllus, Calyx 3-leaved, dedecidus, Petala 6.

1. MEXICANA.

A. capsulis 5-val- | vibus; foliis pinnatifidis incisis spinosis; ched, spiny; flowers floribus axillaribus.

Capsules 5-valved: leaves pinnatifid, notaxillary.

Sp. pl. 2. p. 1148. Walt. p. 153. Pursh 2. p. 366.

Annual. Stem erect, about 3 feet high, branching, armed with small prickles, and when broken or wounded discharging a coloured sap. Leaves alternate, sessile, embracing the stem, lobed and angled somewhat glaucous, glabrous, but with the margins and veins underneath armed with Flowers solitary, axillary. Peduncles 1-3 inches long. by a caducous. Leastets broad, oval, concave, prickly, with the dorsal horn compressed and projecting beyond the summit. Petals 6, obtuse, much larger than the calyx, yellow. Stamens very numerous as long as the germ. Germ superior, furrowed, spiny. Style very short. dilated, 5 lobed with the lobes reflected, forming 5 cylindrical tubes. Capsule oval, spiny, divided about half way down into 5 valves; 1 celled. Seeds numerous, globose, reticulate, attached to the interior angle of the valve.

The variety with white flowers is an ornamental plant, and is probably a distinct species, but the notes which I formerly took have been mislaid, and I have had no opportunity for a few years past of comparing the two

plants in a living state.

Grows in dry soils around buildings and is probably a naturalized exotic

Flowers June to August.

#### SANGUINARIA. GGN. PL. 878.

Calyx 2 phyllus, ca-Petala 8-14. ducus. Capsula superior, utrinque attenuata, 2 valvis 1 locularis. Receptacula 2, filiformia, marginalia.

Calyx 2 leaved, caducous. Petals 8-14. Capsule superior, tapering at each end, 2 valved, 1 celled. Receptacles 2, filiform, marginal.

1. Canadensis.

spt pl. 2. p. 1140. Gron. Virg. p. 80. Walt. p. 153. Mich. 1. p. 809. Pursh. 2. 366. Bigelow Med. Bot. 1. p. 75. t. 7.

Root perennial, oblong, tuberous, succulent, externally brown, emitting when cut or broken a bright orange coloured juice. Stem 0. A single leaf and flower generally proceed from each bud of the tuber enveloped at base with glaucous and somewhat succulent sheaths. Petioles 2-4

inches long. Leaves reniform lobed, distinctly veined, glaucous, very glabrous, Flowers rising in front of the leaf by which it appears to be enfolded when young. Pedancle 2-6 inches long, smooth. Leaves of the calvx ovate, obtuse. Petals variable 8-10-12 or more, appearing sometimes like a double flower, white. Stamens numerous, shorter than the corolla. Style 0. Stigma thick, slightly furrowed. Capsule oblong lanceolate. Seeds numerous, compressed.

Grows in rich dry soils, meriting culture as an ornamental plant both on

account of its leaf and flower.

Flowers February, March.

## PODOPHYLLUM. GEN. PL.

Calyx 3-phyllus.

Calyx 3-leaved. Petala 9. Stigma pli- | Petals 9. Stigma catum, crenatum. plaited, crenate. Per-Per. bacca, 1-locula-ris, polysperma, led, many seeded.

#### 1. PACHYPODA. E.

A. foliis decompositis, foliolis ovatis, acuminatis, inciso serratis; baccis parvulis, pedicellis incrassatis suffultis.

Leaves decompound, leaflets ovate, acuminate, deeply serrate; berries small, supported on thick footstalks.

Big. Flor. Bos. page 129;

A. brachypetala, var. microcarpa. De Candolle Reg. Veg. 1. p. 385.

Root perennial. Leaves compound, acutely serrate, notched, slightly pubescent along the veins, the terminal leaflets frequently three lobed and somewhat cordate at base. Flowers crowded in terminal racemes. Berry small sitting on singularly thickened pedicells, which seem at base partly to embrace the stem and nearly equal in diameter the berry itself.—The Flowers I have not seen. Gathered by Dr. Macbride on the Saluda Mountains.

However nearly this plant may be allied to Cimicifuga; its berried fruit I think should preserve its as a distinct genus. Macrotys may be properly connected with Cimicifuga as they differ in no respect but in the number of their germs.

Root perennial. Stem herbaceous, 2-3 feet high, pubescent. Leaves decompound, acutely serrate, and notched. Flowers in long terminal, somewhat paniculated racemes. Calyx and Corolla small, caduc-Flowers nearly white. Stamens longer than the petals. Capsules 2-valved. Seeds imbricate. sometimes, though rarely, 2.

Grows very abundantly in the upper districts of Carolina and Georgia. Its long racemes of white flowers make it very conspicuous, but its odour is unpleasant if not offensive.

Flowers June, July.

## \*\* Flores Polygy- | \*\* Flowers Polyni.

#### 2. Podocarpa. De Cand.

C. germinibus 4-5, foliis decompositis.

Germs 4-5, pedicelpedicellatis, glabris; | late, glabrous; racemes racemis. paniculatis; | paniculate; leaves de-| compound.

C. Americana Mich. 1. p. 316. Actæa Podocarpa. De Candolle 1. p. 382.

Perennial; Stem herbaceous, 2 feet high, with the habit of C. racemosa. Calvx of five ovate concave leaves. Capsules 4 or 5, smooth, compressed, pointed with the styles, and each supported by a stalk half of its own length.—De Candolle.

Grows in the mountains of Carolina. Mich. Flowers August, September.

#### 3. Cordifolia. Purh.

C. germinibus 2-3, glabris, sessilibus; acemis paniculatis; b-liis biternatis, folidis 5-7 lobatis, serrais, basi cordatis. Push. 2. p. 373.

Germs 2—3, glabrous, sessile; racemes paniculate; leaves biternate, leaflets 5-7 lobed, serrate, cordate at base.

Actæa cordifolia. De Cardolle 1. p. 383.

Resembles C. racemosa and podocarpa, differing from the former in having numerous capsules, from the latter in their being sessile. Leaves smooth, Racemes long, smooth.

Grows in the mountain: of Carolina. Flowers July.

#### 4 PALMATA. Mch.

L. germinibus plurimis 12-15; foribus dichotome-paniculatis, subcorymbosis; capsulis brevissimi, subgloboso-capitatis; foliis simplicibus palmatis. Germs numerous, 12-15, flowers in a dichotomous panicle, somewhat corymbose; capsules very short, forming globular heads; leaves simple, palmate.

Mich. 1. p. 316. Prish. 1. 378. Actæa Palmata. D. Candolle 1. p. 388.

Root perennial. Sem 2-3 feet high, pubescent at the summit.— Leaves generally 2, pilmate, 5-lobed, strongly veined, lobes acutely servate, and notched. Flavers in corymb like panicles. Calyx and Corolla caducous. Stamens much longer than the styles. Capsules distinctly ribbed, forming small compact heads.

This plant, though belonging to the same natural family, yet differs in lade, in foliage, and in the number of its styles from the preceding species.

Grows among the mountains of Carolina. Flowers June, July.

#### DELPHINIUM GEN. PL.

Nectarium 2-fidum, postice in calcar cavum productum. Capsulæ 1-3

1. TRICORNE.

D. petiolis basi vix dilatatis, glabris; foliis 5-partitis; lobis 3-5 fidis, lobulis linearibus; nectario corolla breviore; capsulis a basi patulo—reflexis arcuatis.

Calyx 0. Petals 5. Nectarium 2-cleft at bise extends into a hdlow spur. Capsules 1-3.

Petiole at base scarcely dilated and glabrous; leaves 5 partel, lobes 3-5 cleft with the segments linear; nectary shorter than the corolla; capsules arched, expanding from the base.

Mich. 1. p. 314. Pursh. 2. p. 371. De Cardolle 1. p. 356.

Root perennial, somewhat tuberous. Stem \( -12 \) inches high, glabrous. Petioles 2—4 inches long, pubescent near th summit. Flowers in terminal racemes, large, bright blue, hairy on the outside. Spur straight, shorter than the corolla. Capsules 3, divaricae, acuminated with a persistent style.

. Grows among the highest mountains of Caroina. Mich.

Flowers April and May.

2. AZUREUM.

D. petiolis basi vix dilatatis; foliis 3—5 partitis, multifidis, lobis linearibus; racemo stricto; nectario apice barbato, basi et latere inferiore villosissimis.

Petals scarcely dilated at base; leaves 3—5 parted, many cleft, with the segments linear; racemes straight; nectary bearded at the summit, at base and on the lower side very villous.

Mich. 1. p. 314. Pursh. 2. p. 371. De Candolle 1. p. 356. D. earolinianum Walt. 135.

Root perennial. Stem 3-5 feet ligh and probably more, pubescent. Leaves on short petioles, pubescent, very much dissected, the segments all linear. Flowers in long terminal accemes, on short pubescent peduncles, pale blue, rather smaller than in the preceding species, the three upper petals, sprinkled with hair, particularly along the margins, the two lower, as described by Walter, spotted with yellow and very villous.

Grows in the middle districts of Cardina. Flowers May, June.

#### 3. EXALTATUM.

D. petiolis basi non dilatatis; foliis planis ultra medium 3-fidis, lobis cuneiformibus,apice trifidis, acumina- 3 cleft at the summit, tis, lateralibus bilobis; racemo stricto; calcare recto longitudine corollæ.

Petioles not dilated at base; leaves flat, 3cleft below the middle, lobes wedge shaped, and acuminate, the lateral ones often 2-lobed; racemes straight; spur straight, as long as the corolla.

Sp. pl. 2. p. 1230. Pursh. 2. p. 371. De Candolle 1. p. 357. D. tridactylum. Mich 1. p. 314.

Stem 2-4 feet high, branching, pubescent towards the summit. Petioles 2-5 inches long, pubescent when young, lower leaves divided into 3 -5 segments, segments generally tripartite, upper leaves tripartite, segments lanceolate or entire, all pubescent. Corolla bright blue, pubescent on the outer surface, the lower petals fringed. Spur straight, horizontal, as long as the calyx. Capsules 3, straight and pubescent,

Grows among the mountains of Carolina. Flowers June to August.

Sp. Pl. 2. page 1238. Mich. 1. p. 315. Pursh. 2. p. 372. De Candolle 1. p. 379.

Perennial. Stem twining, branching, pubescent only when very young. Leaves coriaceous, truncate at base, deeply lobed, lobes somewhat three ribbed. Flowers solitary, 3-4 near the summit of each branch on peduncles 1-2 inches long, two small bracteas, generally below the middle of the peduncles. Flowers of a bright violet purple, hood large, convex, tapering to an obtuse beak, wings nearly orbicular, the lower petals oblong lanceo-late, all a little hairy particularly near the margins. This very ornamental plant grows among the mountains of Carolina.

Flowers June to August.

#### AQUILEGIA. GEN. PL.

Calyx 0. Petala 5. Nectaria 5, calcarata | Nectaries 5, bearing inter petala. Capsulae 5, distinctæ.

Calyx 0. Petals 5. spurs between the petals. Capsules 5 distinct.

#### 1. CANADENSIS.

A. calcaribus rectis; stylis et staminibus exertis; floribus pendulis; foliorum segmentis 3-partitis, pice subobtusis, incisodentatis.

Spurs straight; styles and stamens exserted: flowers pendulous; segments of the leaves 3 parted, obtuse at the summit, notched and toothed.

Sp. Pl. 2. p. 1247. Walt. 1. p. 166. De Candolle 1. p. 337.

Root perennial. Stem 12-18 inches high, lower leaves on long three cleft footstalks, ternate and biternate, leaflets lobed and crenate, glaucous particularly underneath. Petals 5, deciduous. Nectaries 5 between the petals, extending into hollow straight spurs, callous at the point. Nectaries and Petals scarlet tinged with yellow. Stamens numerous, disposed into 5 or 10 parcels. Germs downy, with long slender styles. Cansules many seeded.

Grows in the upper and mountainous districts of Carolina and Georgia.

Flowers April—May.

#### ASCYRUM. GEN. Pl. 1225.

interioribus majoribus. Petala 4. Filamenta in 4-phalan- collected in 4-pha-ges, digesta. Capsu- lanxes. Capsule oba oblonga, 1-locula- long, 1-celled, 2-valris, 2-valvis, calyce inclusa.

1. Pumilum.

A. pusillum, prostratum. ramosissimum; foliis lineari-o- | linear-oval, obtuse; valibus, obtusis; pe- peduncles long, reflec-dunculis longis reflex- ted; flowers monogyis: floribus monogynis.

Calyx 4-phyllus, 2- | Calyx 4-leaved, the 2-interior larger. Petals 4. Filaments ved, included in the calyx.

> Small, prostrate, much divided; leaves l nous.

Mich 2. p. 77. Pursh. 2. p. 373.

Stem prostrate, somewhat woody, slightly winged, 6—10 inches long; Leaves opposite, sessile, very narrow, dotted, perennial. Flowers solitary, axillary, and in the division of the stem. Peduncles 1-2 inch to an inch long, reflected, with two stipules near the base. Large leaves of the calyx ovate, somewhat acute, and like the leaves marked with pellucid doy. Petale obovate, yellow, a little longer than the calyx. Stamene numerous, united at the base of the germ, the division into sections not distinct. Style 1, shorter than the germ. Capsule ovate. Seeds attached to the margins of the valves.

This appears to be the A. panciflorum of Nuttall. I have always considered it the A. pumilum of Michaux, but it is possible that the real plant

of Michaux may have escaped my notice.

Grows in dry pine barrens. Common in the upper parts of Chathana county, Georgia.

Flowers March—April.

#### 2. CRUX. ANDREÆ.

A. erectum, multicaule, diffusum; foliis sublanceolato—oblongis, obtusis; corymbo terminali; floribus subsessilibus, 2 gynis; caule subtereti.

Erect, much divided, spreading; leaves somewhat lanceolate, oblong, obtuse, corymb terminal; flowers nearly sessile, digynous; stem terete.

Sp. pl. 3. p. 1472. Walt. p. 191. Pursh. 2. p. 373.

A. Multicaule, Mich.

Stem frutescent, 2—3 feet high. Leaves small, sensile, and with the calyx dotted. Flowers solitary, axillary, and terminal, on short peduncles. The two large leaves of the calyx cordate, ovate, acute, nerved, the interior? leaflets very small, ovate-lanceolate, membranaceous, 2 small bracteal leaves at the base of the calyx. Corolla yellow. Petals oblong, nearly elliptical. Filaments about 20, as long as the corolla. Styles 2. Stigmas single.

This species varies so much in the size and number of its leaves, in its peduncies, and in the number of its styles, that it merits culture to determine whether more than one species are not included under this name.

Grows in all soils excepting those which are inundated. Flowers through the whole summer.

#### 3. Hypericoides.

A. erectum, parceramosum, ramis ancipitibus; foliis oblongis basi biglandulosis; floribus terminalibus, solitariis, breviter pedicellatis, 3-gynis. Erect, sparingly branched, with the branches compressed; leaves oblong with 2 glands at base; flowers terminal, solitary, on short peduncles, trigynous.

Sp. pl. 3. p. 2473. Walt. 191. Pursh, 2. p. 374. A. Stans. Mich. 2. p. 77.

Stem about 2 feet high, sparingly branched near the summit, with the young branches conspicuously compressed. Leaves large (1 to 1 1-2 inches long) entire, dotted. Flowers solitary, axillary, frequently opposite. Peduncles 1 to 1 1-2 inches long. The exterior leaves of the calyx large, cordate-ovate, nearly round, dotted, nerved. Corolla yellow. Petals obovate, as long as the calyx. Filaments very numerous (60 to 100) shorter than the corolla. Germ pyramidal, 3 sided. Styles 3, alightly recurved. Capsule 3 valved.

Grows generally in damp soils. Flowers the whole summer.

#### 4. AMPLEXICAULE. Mich.

A. erectum, parceramosum; ramis ancipitibus; foliis ovatooblongis, amplexicaulibus, foliolis calycinis exterioribus cordatis; floribus 3-4-gynis. Erect, sparingly branched with the branches compressed; leaves ovate, oblong, amplexicaule; exterior leaves of the calyx cordate; flowers 3-4 gynous.

Mich. 2. p. 77. Pursh 2. p. 374.

Stem 1 to 2 feet high, branching towards the summit. Leaves cordate, obtuse, closely sitting, and with the calyx conspicuously dotted. Corolla yellow. Petals abovate. Stamens very numerous, about half as long as the corolla. Styles frequently 4.

Grows in the southern parts of Georgia, near St. Mary's.

Flowers through the summer.

### HYPERICUM. GEN. PL. 1224.

Calyx 5-partitus, laciniis subæqualibus. Petala 5. Filamenta vix basi connata. Capsula ovata; loculis numero stylorum, 1-2-3-5.

\* Trigyna, herbacea. Calyx 5-parted, with the segments nearly equal. Petals 5. Filaments slightly connected at base. Capsule ovate, 1-2-3-5 celled.

\* Trigynous, herbaceous.

#### 1. PARVIFLORUM.

H. erectum, ramosum, glabrum; caule
subtetragono; foliis ovato-oblongis, subcordatis, obtusis, nervosis,
sessilibus; paniculis
terminalibus dichotomo-corymbosis; petalis calyce lanceolato
brevioribus.

Erect, branching, glabrous; stem 4-angled; leaves oblong, ovate, somewhat cordate, obtuse, nerved, sessile; panicles terminal, dichotomous, corymbose; petals shorter than the lanceolate calyx.

Sp. pl. 3. p. 1456. Pursh, 2. p. 376.

H. quinquenervium. Walt. p. 190. Mich. 2. p. 79.

Root creeping. Stem erect, slender, 1—2 feet high, succulent; branches alternate and opposite. Leaves dotted, 5 nerved. Flowers solitary, in the division of the stalks. Peduncles 2—3 lines long. Calyx 5 leaved, leaves lanceolate, acute, 3—5 nerved, dotted, 3 large, 2 small. Corolla deciduous, yellow. Filaments numerous 12—15, longer than the corolla. Germ pyramidal. Styles 3, short, expanding. Stigmas globose. Capsule 1 celled, 3 valved.

Grows in damp soils, very common in ditches and around the margins

of ponds. Flowers June, September.

#### 2. CANADENSE.

H. floribus alaribus, pedunculatis, solitariis; foliis sessilibus, linearibus, basi attenuatis; caule herbaceo, tetragono, superne dichotomo; capsulis longis, conoideis, coloratis. Flowers solitary on winged peduncles; leaves sessile, linear, tapering at base; stem herbaceous, 4-angled, dichotomous towards the summit; capsules long, conical, coloured.

Sp. pl. 3. p. 1455. Walt. p. 189. Mich. 2. p. 79. Pursh, 2. p. 387.

Stem 1—2 feet high, slightly angled. Leaves linear, obtuse, dotted, obscurely 3 nerved, lower branches of the panicle opposite, the upper dichotomous. Corolla and Stamens about as long as the Calyx. Capsule much longer than the calyx, of a dull red colour.

Grows in wet Pine barrens. Flowers July—September.

#### .3, ANGULOSUM.

H. erectum; cauletetragono; foliis oblongo-lanceolatis, acutis, arcte sessilibus; panicula terminali, dichotoma; ramis divaricatis, distanter alternifloris: petalis dente unico laterali.

Erect; stem 4-angled; leaves oblong lanceolate, acute, sessile; panicle terminal, dichotomous; branchés divarieate with flowers distant, alternate; petals with one lateral tooth.

Sp. pl. S. p. 1454. Mich. 2. p. 78. Pursh, 2. p. 387. H. denticulatum Walt. p. 190.

Stem about 2 feet high, simple, branching towards the summit. Leaves appressed, dotted, somewhat amplexicaule at base. Flowers scattered in the Panicle and alternate, frequently in the division of the stem. Calyx somewhat tubular and angled at base. Cegments equal, dotted. Petals obovate twice as long as the calyx, almost orange colored. Filaments numerous, shorter than the corolla. Styles 3, frequently united. Capsule 3 valved, 1 celled.

Grows in wet Pine barrens. Flowers May—September.

#### 4. PILOSUM.

H. pilosnm; caule | liis patentibus, ovatis, acutis, basi attenuatis; pauciflora. panicula Nutt.

Hairy; stem virvirgato, simplici; fo | gate, simple; leaves expanding, ovate, a. cute, tapering at base; panicle few-flowered.

Walt. p. 190? Nuttall 2. p. 16. Plukenet t. 245. f. 6.

Mr. Nuttall, who has revived or established this species, remarks that it is perfectly distinct from the H. simplex of Michaux, as the latter produces oblog ovate leaves, partly connate at the base, and always pressed close withe stem, and the whole plant instead of being pilose, is covered with a short matted and somewhat scabrous pubescence. (Nutt. loc. cit.) I doubt, however, whether Walter did not mean by his H. pilosum the H. simplex of Michaux, as he mentions the appressed leaves as a part of its character, or, perhaps, as has heretofore been done, he confounded both under that name; if however I have not mistaken this plant, I must add VOL. 11.

. D •

that the pubescence differs in quantity, rather than in its properties; in both it is tomentose, but this is comparatively naked.

Grows in wet Pine barrens, 8 miles from Charleston.

Flowers June—September.

#### 5. SIMPLEX.

H. erectum, lanu. losum; caule virgato, simplici, tereti; foliis ovato-lanceolatis, arcte panicula pauciflora.

Erect, woolly; stem virgate, simple, terete; leaves ovate-lanceolate, closely sessile, sessilibus, adpressis; appressed; panicle, terminali | terminal, few flower-

Mich. 2. p. 80. Pursh, 2. p. 379. Nuttall 2. p. 16. Plukenet. Amalth. p. 120. tab. 421. fig. 3.

Stem 1-2 feet high, covered with a jointed tomentum. Leaves acute, dotted, and somewhat amplexicatie. Panicle small. Flowers alternate, and in the division of the stem. Leaflets of the calyx unequal, 2 narrower than the rest. Petals yellow, oblong, longer than the calyx. Stamens shorter than the corolla. Styles 3. Capsule 1 celled, 3 valved.

Grows in wet Pine barrens. Flowers June—September.

## 6. Acutifolium. E.

H. caule herbaceo? subramoso, glabro; foliis angusto lanceolatis acutis; panicula multiflora; capsulis vix calyce longioribus.

Stem herbaceous? branching, glabrous; leaves narrow lanceolate, acute; panicle, many flowered; capsules 'scarcely longer than the calyx.

Stem herbaceous? branching, slightly angled. Leaves sessile, 10-14 lines long, tapering at the base. Panicle many flowered, flowers alternate and in the division of the stem, on pedicels 1-2 lines long. Leaves of Petals yellow, nearly lanceolate, twice as long as the the calyx equal. calyx. Stamens numerous, longer than the calvx. Styles 3, united.-Capsule 1 celled, 3 valved.

This plant which was sent to me from Milledgeville in Georgia by Dr. Boykin, differs considerably from any species in my herbarium. It resembles most the H. Canadense, but differs in size, being in every respect larger, so as to make it doubtful whether it is really an herbaceous species, it differs also in its acute leaves, in the capsule, which is proportionally short, and in a panicle which is much more compact.

Flowers.

7. MACULATUM. Walt.

H. erectum, glabrum, nigro punctatum ; foliis cordato ovatis, ovalibusque, arcte sessilibus; paniterminalibus, densifloris, subcorymbosis.

Erect, glabrous dot-ted with black; leaves cordate-ovate and oval, sessile; panicles terminal; closely flowered, somewhat corymbose.

Walt. p. 189. Mich. 2. p. 80.

H. corymbosum. Sp. pl. 3. p. 1457. Pursh. 2. p. 377.

Stem about 2 feet high, terete, and with every part of the plant, except the filaments and styles, spotted with black dots. Leaves sometimes acute, sitting so closely as to embrace the stem. Flowers in a compound compact and somewhat pyramidal pamicle. Leaves of the calyx united and tubular at base; the segments equal. Petals obovate, twice as long. as the calyx. Filaments numerous, a little shorter than the corolla. Styles 3, longer than the stamens. Stigmas obtuse, purple. Capsule 3 celled, S valved.

Grows in dry pine barrens.

Flowers May, August.

The species of this section it has been proposed by Mr. Rafinesque and others, to separate from this genus, and to unite with the Sarothra, as they differ from the shrubby Hypericum's in their habit, and by their 1 celled capsule. It is probable however that the germs of these species are naturally 3 celled, but the partitions being very delicate are effaced by age. In the H. maculatum these partitions are at all times distinctly visible.

\*\* Fruticosa, trigyna.

#### 9. GALIOIDES.

H.floribus trigynis, paniculatis, terminalibus; stylis coadunatis; foliis linearibus, sessilibus, margine revolutis; caule suffruticoso. Willd.

Flowers trigynous; panicles · terminal: styles united; leaves. linear, sessile, with their margins revolute; stem somewhat shrub-

Sp. Pl. 3. p. 1451. Pursh. 2. p. 376.

Branches four angled. Stem about 2 feet high. Leaves fasciculate. Panicles terminal. Petals and Stamens equal and scarcely longer than the linear calyx. Pursh.

Does this really differ from the next species? Grows in sandy moist places. Flowers July-September.

#### 10. FASCICULATUM. Mich.

H. ramulis tetragonis, foliis confertis verticillatim quasi fasciculatis, filiformilinearibus, obtusis, sessilibus; pedunculis in apice ramulorum axillaribus, 1-3 floris; calycibus filiformibus, stylis coadunatis.

Branches 4-angled; leaves crowded as if in verticillate clusters. filiform, linear, obtuse, sessile; peduncles near the summit of the branches, axillary, 1-3 flowered: calyx filiform; styles united.

Mich. 1. p. 80. H. coris. Walt. p. 190.

Pursh. 2. p. 377. H. tenuifolium.

Stem shrubby 1-2 feet high, with the whole plant glabrous. Leaves thick, dotted. Flowers axillary, opposite; sometimes the peduncles become triflorous with the intermediate flowers sessile. Leaves of the calyx

exactly resembling the leaves of the plant. Stamens rather longer than the corolla, both much longer than the calyx. Petals yellow, oblong, eval. Styles 3, firmly united. Capsules 3 celled, 3 valved.

Grows in wet pine barrens. Flowers June-August.

#### 11. Rosmarinifolium?

H. ramulis teretibus; foliis lineari-lanceolatis, acutis, basi attenuatis, subfasciculatis; panicula elongata; pedunculis in apice ramorum axillaribus, trifloris; stylis coadunatis. Branches terete; leaves linear-lanceo-late, acute, tapering at base, somewhat clustered; panicle long; peduncles near the summit of the branches, axillary, 3-flowered; styles united.

Sp. pl. 3. p. 1450? H. fasciculatum. Sp. pl. 3. p. 1452. Pursh. 2. p. 376.

Stem shrubby, 2—3 feet high, with its numerous branches tercte, smooth, and generally coloured. Leaves shining, and as in most of the species, with the margins revolute, and the surface sprinkled with pellucid dots. Panicle very ornamental from the number of its flowers on its compoundly trichotomous branches. Calyx with its segments like the leaves, linear-lanceolate. Corolla yellow. Petals obovate, larger than the calyx. Filaments numerous, much shorter than the corolla. Styles 3, at first united, expanding after the flower decays. Capsule 3 celled, with the angles rounded.

I have found some difficulty in determining this plant. It is evidently the H. fasciculatum of Willdenow, but Willdenow has certainly mistaken the H. fasciculatum of Michaux, which he had probably already described as the H. galioides. This plant was considered by Dr. Muhlenberg as the H. rosmarinifolium of La Marck, and as the name is peculiarly appropriate, I have retained it.

It has always appeared to me remarkable that this, which in the low sountry of Carolina and Georgia, is the most common of our frutescent species, should have been overlooked by both Walter and Michaux.

Grows in damp soils.
Flowers June-August.

## 12. Ambieuum. E.

H. ramulis ancipitibus, foliis lineari-lanceolatis, acutis, mucronatis; floribus axillaribus terminalibusque; calycis foliolis inæqualibus, linearilanceolatis, corollam subæquantibus; petalis inapice unidentatis; stylis 3, coadunatis.

Branches compressed; leaves linear-lanceolate, acute, mucronate; flowers axillary and terminal; leaves of the ealyx unequal, linear lanceolate, as long as the corolla; petals toothed near the summit; styles 3, united.

Shrub 2—4 feet high with a scaly bank, and with its numerous opposite branches strongly compressed. Leaves tapering at base almost to a petiole, with the point nearly white. Flowers towards the summit of the branches, commonly 5—7 on each branch. Petals obliquely obovate, a little longer than the stamens, with a tooth or angle near the summit. Styles as usual, separating as the capsule matures. Capsule 3 celled.

In the shape and size of the leaf this plant strongly resembles the H. rosmarinifolium, it differs from it however widely in many respects; to the H. Kalmianum it has a much closer affinity, but its flowers are not at all corymbose, and I have found them invariably trigynous.

Grows near Columbia Flowers May—June.

## 13. Prolificum.

H. ramis ancipitibus; foliis angustolanceolatis, subacutis; panicula pauciflora; ramulis dichotomis; petalis staminibus paulo longioribus; stylis coadunatis. Branches compressed; leaves narrow, lanceolate, somewhat acute; panicle few flowered; branches dichotomous; petals a little longer than the stamens; styles united.

Sp. pl. 3. p. 1453. Pursh, 2, p. 375.

Shrub 2—3 feet high. Branches very much compressed. Leaves lanceolate, rather narrow, generally acute, about 2 inches long. Peduncles near the summit of the branches axillary, opposite, generally 3 flowered, the intermediate flower almost sessile, the others on peduncles nearly an inch long. Calyx leaflike, segments lanceolate, acute. Corolla and Styles rather longer than the stamens.

Grows near Columbia, South-Carolina.

Flowers June—August.

## 14. AMOENUM: Pursh.

H. diffusum; ramis ancipitibus; foliis ovalibus, subtus glaucis; floribus axillaribus, subsolitariis; calycis foliolis ovatis, acutis; petalis deflexis, staminibus longioribus.

Diffuse, with branches compressed; leaves oval, glaucous underneath; flowers axillary, in general solitary; leaves of the calyx ovate, acute; petals deflected; longer than the stamens.

Pursh. 2. p. 374.

A small shrub rarely exceeding 2 feet in height, but very much diffused and divided. Leaves rather large, somewhat attenuated at base, with the margins slightly undulate. Flowers much larger than those of any other of our species, solitary, generally opposite, on short peduncles. Stamens very numerous, forming a ball in the centre of the flower, and apparently depressing the petals by their number. Styles 3, at first united, separating as the fruit matures.

This elegant species has not been found to the north of the Oakmulgee river in Georgia.

Grows abundantly on the Flint river.

Flowers June—August.

## 15. FASTIGIATUM. E.

H. ramulis paulocompressis; foliis angusto-lanceolatis, acutissimis; corymbis terminalibus, multifloris, fastigiatis; stylis coadunatis. E. Branches somewhat compressed; leaves narrow-lanceolate, very acute; corymbs terminal, many flowered, fastigiate; styles united.

A shrub about 3 feet high. Leaves about 3 inches long, tapering yet connate at base, dotted, paler on the under surface. Flowers very numerous in fastigiate corymbs, with solitary flowers nearly sessile in the lower divisions of the corymb. Corolla and Stamens generally longer than the Styles firmly united, not separating as the pod matures.

Found in the Pine barrens of Scriven county, Georgia. Flowers May—July.

## 16. Nudiflorum. Mich.

H. ramis alatis; fonudatis, compositis; compound; corolla corolla calyce longilonger than the calyx; ore; stylis coadunatis. styles united.

Branches winged; liis oblongo-ovatis, ob- | leaves oblong-ovate tusis, sessilibus; pa- | obtuse, sessile; paniniculis terminalibus, | cles terminal, naked,

Sp. Pl. 3. p. 1456. Mich. 2. p. 78. Pursh. 2. p. 375. H. virginicum? Walt. 189.

Really frutescent, but many of its branches decay every year, and new ones are produced, which give it frequently an herbaceous appearance. Branches angled and winged. Leaves sometimes lanceolate, dotted, of a pale and somewhat glaucous complexion. Panicle compoundly dichoto-. mous, with a flower in each division of the stem on short peduncles. Leaves of the calyx lanceolate. Corolla obovate, nearly twice as long as the calyx. Styles 3, sometimes 4, united, but separated at their summits. Capsule 3 celled, coloured.

Grows around the margins of ponds, and in shallow swamps. Flowers August—September.

## 17. GLAUCUM?

H. caule tereti; focordato-ovatis liis semiamplexicaulibus, glaucescentibus; pa-nicula divaricato-dichotoma, foliosa; corolla calycem æquante; stylis coadunatis. | lyx; styles united.

Stem terete; leaves cordate-ovate, embracing the stem, somewhat glaucous; panicle divaricate, dichotomous, leafy; corolla as long as the ca-

Mich. 2. p. 78. Pursh. 2. p. 376.

A small straggling shrub, rarely exceeding 18 inches in height, with a few opposite branches. Leaves very smooth, dotted, and somewhat glaucous, particularly on the under surface. Flowers in the division of the stem, on peduncles 2-5 lines long. Leaves of the calyx ovate and slightly acuminate. Petals about as long as the calyx, with a tooth or angle near the summit. Stamens very numerous, little shorter than the corolla. Styles united at first, separating as the fruit matures.

Grows in ponds about a quarter of a mile to the north of Ogeechee

Ferry.

Flowers May—June.

## ELODEA. Adanson.

Calyx 5-partitus, æqualis. Petala 5, ungaibus nectariferis. Filamenta 9-15, in 3. [Filaments 9-15, uniphalanges connata. Glandulæ inter phalanges. Styli 3, divergentes. Capsula 3-locularis

Calyx 5-parted, equal. Petals 5, with nectariferous claws. ted in three phalanxes, with a gland between the phalanxes. Styles 3, diverging. Capsule 3-celled.

## 1. VIRGINICA.

E. foliis sessilibus amplexicaulibus cor-dato oblongis, obtu-sissimis; pedunculis peduncles axillary and sissimis; paucifloris, axillaribus | terminal, few flowerterminalibusque; sta- ed; stamens 9, slightminibas 9, levissime | ly united at base. basi coalitis.

Leaves sessile, am-

Nutt. 2. p. 17.

E. campanulata. Pursh. 2. p. 379.

Hypericum virginicum. Sp. pl. 3. p. 1455. Mich. 2. p. 81. Hypericum campanulatum. Walt. 191.

Root perennial. Stem herbaceous, about 2 feet high, terete, glabrous, with opposite branches. Leaves opposite, with pellucid dots, glaucous underneath. Pedancles axillary, triflorous, with the middle flower sessile; the terminal peduncle compound, naked, forming a small papicle of 9 or more flowers, common peduncle about an inch long. Segments of the catyx oval, seven nerved, glabrous, not dotted. Petals oval, twice as long as the calyx, dotted, of an obscurely red color. Stamens generally 9, as long as the corolla, united at base into 3 phalanxes, an ovate orange colored gland between the phalanxes. Styles 3, separate, as long as the stamens. Capsule 3 celled.

Grows in wet soils and ditches and around ponds. Flowers August and September.

#### 2. TUBULOSA. Walt.

E. floribus trigynis; corollis tubulosis; stacorporibus minum plusquam ad medium connatis; foliis sessilibus.

Flowers trigynous; corolla tubular; stamens united above the middle: leaves sessile.

Pursh, 2. p. 379. Nutt. 2. p. 17. Hypericum tubulosum. Waatt. p. 191.

This plant still rests on the authority of Walter. It is one of the verv few of his species which has not been identified.

Grows Flowers

#### 3. PETIOLATA. Walt.

 $\cdot$ usque connatis, capsu- $^{\prime}$ lis oblongis.

E. foliis petiolatis | Leaves on petioles, oblongo-ovalibus, obtuse; sis; floribus oppositis, flowers opposite, axaxillaribus, subsessili- illary, nearly sessile, bus, subternis; sta- generally by threes; minibus ad medium stamens united to the middle; capsule oblong.

Porsh. 2. p. 379. Nuttall. 2. p. 17. Hypericum petiolatum. Wal. 191. Hypericum axillare. Mich. 2. p. 81.

Root perennial. Stemmerbaceous, about 2 feet high, glabrous. Leaves opposite, emarginate, tapering at base, dotted, and somewhat glaucous underneath, petioles about half an inch long. Common pedancle 3-4 lines long, generally 3 flowered. Segments of the calyx oval, obtuse, nerved, with the margins membranaceous. Petals lanceolate, nearly acute, of a dull red colour and a little longer than the calyx. Filaments 9, united almost to the summit in 3 phalanxes. Capsule 3 celled.

Grows in ditches and around ponds. Flowers August and September.

While in compliance with the practice of modern botanists, I have removed the 3 last genera from Polyadelphia to Polyandria, it has at least led to a very anomalous insertion of this genus; for while the Hypericums of North America appear to be really polyandrous, and without the distinct features which belong to the class Polyadelphia, the genus Elodea is distinctly Polyadelphous, and is not Polyandrous. By a student of Botany, it certainly would never be sought for in this class. Its species are the most truly enneandrous plants that I have ever met with.

## POLYGYNIA.

# ILLICIUM. GEN. PL, 940.

Calyx 6-phyllus. Petala 27 (interdum 6 | Petals 27 (sometimes **—9.** Nuttall.) Capsulæ plures, in orbem digestæ, 2-valves, 1- into a circle, 2-valved, spermæ.

Calyx 6-leaved. 6-9. Nutt.) Capsules numerous, collected 1-seeded.

1. PARVIFLORUM.

I. foliis akernis, lanceolatis, integerrimis | lanceolate, entire and glaberrimisque, coriaceis, perennantibus; flotundatis, concavis.

Leaves alternate, glabrous, coriaceous, perennial; flowers ribus pusillis, cernuis; small, nodding; petals petalis calyceque ro- | and leaves of the calyx round, concave.

Mich. 1. p. 326. Pursh, 2. p. 380

A handsome shrub, growing sometimes 6-10 feet high, remarkable for its bright, smooth, perennial leaves. Leaves on short petioles, rather acute than obtuse, but never acuminate. Flowers small, axillary, generally cernuous, on peduncles scarcely 1-2 an inch long. Petale dull yellow, generally 6-8 but I believe not definite in their number. Stamens short. Capsules very handsomely arranged in a circle around a Germ superior. central receptacle.

This plant, originally, I believe, from the banks of St. John's, East-

Florida, is now common in our gardens, and is almost naturalized.

Flowers May-June.

## MAGNOLIA. Gen. Pl. 942.

Calyx 3-phyllus. Petala 6-9. Capsu- | Petals 6-9. la,

Calyx 3-leaved. læ 2-valves, 1-spermæ, | sules 2-valved, 1-seedin strobilum imbrica- ed, imbricated, form-Semina pendu- | ing an ovate strobilus. Seeds pendulous.

### 1. Grandiflora.

M. foliis perennantibus, ovali-lanceolatis, crassis, coriaceis, subtus ferrugineis; petalis dilatato-obovatis, abrupte in unguem angustatis.

Leaves perennial, oval lanceolate, thick, coriaceous, ferruginous underneath; petals obovate, abruptly contracted into a claw.

Sp. pl. 2. p. 1255. Walt. p. 158. Mich. 1. p. 326. Pursh, 2, p. 380. Mich. Arb. 3. p. 71.

This magnificent tree is almost too well known to need description. It rises sometimes 60, 70, or 80 feet in height, with a naked smooth colummar stem, and the head when not injured by accident is always regularly pyramidal, or semi elliptical. From May to August in favorable situations it is almost always covered with its brilliant white flowers, terminating the young branches. The petals are large, oval, or obovate, abruptly narrowed at base; concave, coriaceous, of a brilliant white, but becoming instantly ferruginous, when scratched or bruised. Letters can easily be written on them with the point of any sharp instrument. 'Stamens very numerous, imbricate, much shorter than the corolla. Germs superior a gregated on an oblong, ovate receptacle. Style short, recurved. Capsules gitting on the receptacle, imbricated, splitting longitudinally. Seeds 1 or 2 in each capsule, covered with a scarlet pulp, hanging for a few days after they quit the capsule by a thread attached to their base.

Grows in rich, light soils, very common all along the sea coast of Georgia and Carolina; rarely found in Carolina more than 40 miles from the sea coast-in Georgia it extends higher up the country being found in the neighbourhood of Milledgeville, and in the Alabama I saw it growing plentifully as high up as Fort Jackson.

Flowers May—August.

2. GLAUCA.

M. foliis ovali lanceolatis, subtus glau- olate, glaucous under-

Leaves oval lancecis; petalis obovatis, neath; petals obo-basi attenuatis. vate, tapering at base.

Sp. pl. 2. p. 1256. Walt. p. 158. Mich. 1. p. 327. Mich. arb. 3. p. 77.

A shrub frequently becoming a small tree, remarkable for its white or somewhat glaucous bark. Leaves alternate, on petioles about an inch long, acute, shining, and when young pubescent, underneath glaucous, pubescence when young having a silken lustre. Flowers solitary, ter minal. Leaves of the calyx oval, glabrous, membranaceous, sprinkled with pellucid dots, as long as the corolla. Petals generally 9, obovate, white, as long as the receptacle. Filaments very numerous, compressed, with the point acuminate and extending beyond the anthers. Anthers attached to the inner side of the filaments.

This is probably the most fragrant plant in our forests. It grows in great profusion along the margin of the rich swamps which border our rivers, and in the morning and evening during the period of its flowering, the atmosphere of our streams is often literally perfumed with its fragrance.

We have a variety with perennial leaves which sometimes becomes a tree 50-60 feet high. I have been able to discover no other distinction

between these two plants than this difference of habit.

Grows in swamps and wet soils, though extremely abundant in the low country of Carolina—it is very rarely found upon the islands which border the sea coasts.

Flowers April—May.

3. ACUMINATA.

cuminatis, subtus pu- nate, pubescent unbescentibus; petalis o- | derneath; petals obo

M. foliis ovalibus, a- | Leaves oval, acumibovatis, obtusiusculis. | vate, rather obtuse.

Sp. Pl. 2. p. 1257. Walt. p. 159. Mich. 1. p. 329. Pursh. 2. p. 381. Mich. Arb. 3. p. 82.

A tree which in favourable soils and situations, particularly in the fertile vallies among the mountains of Tennessee, grows 70 feet high, with a trunk 2—3 feet in diameter. Leaves oval, sometimes broad and lanceolate, acuminate, soft and pubescent underneath. Petals oval or obovate, of a dull yellow colour tinged with blue. Fruit cylindrical 2—3 inches long.

Grows in the upper and mountainous districts of Carolina and Georgia, not found along the sea-coasts.

Flowers June-July.

Cucumber Tree.

#### 4. TRIPETALA.

M. foliis amplis, cuncato lanceolatis, junioribus holosericeis; petalis 9, ovali lanceolatis, acutis, exterioribus reflexis.

Leaves large, cuneate-lanceolate, acute, when young silky; petals 9, oval-lanceolate, acute, the exterior ones reflected.

Sp. Pl. 2. p. 1258. Walt. p. 159. Mich. 1. p. 327. Pursh. 2. p. 381. Mich. Arb. 3. p. 90.

A tree which sometimes attains the height of 30—35 feet, though generally smaller, and contrary to the usual habit of this genus, remarkable for the irregular direction and growth of its branches. Its leaves are very large 15—20 inches long, and 6—8 wide, gradually tapering at base and slightly acuminate at the summit, alternate but crowded near the extremity of the branches. Petals oblong lanceolate, white, about 3 inches long. Cone oval or obovate.

Grows in every part of the Southern States in very rich soils, though rare along the sea-coast, and very rare upon the islands.

Flowers May-June.

Umbrella Tree.

## 5. CORDATA.

M. foliis lato-ovali vel ovato-lanceolatis, basi subcordatis, subtus subtomentosis; petalis oblongo lanceolatis, acutis.

Leaves broad, oval or ovate-lanceolate, at base slightly cordate, somewhat tomentose underneath; petals oblong lanceolate, acute.

Mich. 1. p. 328. Pursh. 2. p. 382. Mich. Arb. 3. p. 87.

A tree which is said by Michaux. to grow sometimes to the height of 40 or 50 feet, though generally about 24-40, Leaves 4-6 inches long, 3—5 wide, sometimes nearly round, and in general very slightly cordate at base. Leaves of the calyx small. Petals oblong-lanceolate, yellowish, faintly streaked with red. Cones cylindric, about 3 inches long.

Grows in the upper districts of Carolina and Georgia, more common around Augusta, than in any other part of the country with which I am acquainted.

Flowers April—May.

#### 6. AURICULATA.

M. foliis obovatolanceolatis, acutis, u- | lanceolate, acute, green trinque viridibus, basi on each surface, corcordatis, auriculatis; date and auriculate at petalis lanceolatis.

Leaves obovatebase; petals lanceolate.

Sp, Pl. 2. p. 1158. Mich. 1. p. 328. Pursh. 2. p. 382. Mich. arb. 3. p. 94.

M. Fraseri Walt. 159.

M. pyramidata? Baitram.

A tree 30-40 feet high, with a stem about 1 in diameter. Leaves large 8-12 inches long, 4-6 wide, very acute, glabrous, in none of my specimens glaucous underneath, tapering to the base and cordate with rounded lobes. Petale lanceolate, 2-3 inches long, white, fragrant.

Grows among the mountains of Carolina and Georgia, but said by Michairs, to have been seen at the Sisters-ferry, 35 miles above Savannah og Sevangah-river.

Flowers April—May.

I have inserted the M. Pyramidata of Bartram, which has eluded the researches of recent botanists, as a variety of the M. auriculata, yet it must be remarked, that the specimens I possess of the M. pyramidata, are distinguished by leaves much shorter and proportionally wider, and the sinus at the base is more abrupt and angular. Its habitat too may excite some suspicion of a difference in the species. This plant was discovered by Bartram along the sea coast of East Florida. Mr. Kin of Phladelphia assures me he found it on the south bank of the Altamaha mearly opposite to Darien, while Michaux the younger remarks that the M. auriculate is so exclusively confined to the mountains, that excepting the plant he discovered at the Sisters' Ferry, he had never met with it between the mountains and the ocean. May not this low country plant of Michaux really belong to the pyramidete of Rommen ?

### 7. Macrophylla.

M. foliis amplissimis, oblongo subcuneato-obovatis, basi sinsubauriculatis. nato subtus glaucis, petalis 6, ovatis, obtusis.

Leaves very large, oblong, cuneate, obovate, sinuate and auriculate at base, glaucous underneath; petals 6, ovate, obtuse

Mich. 1. p. 327. Mich. arb. 3. p. 99. Pursh, 2. p. 381.

A small tree, but rarely exceeding 30-35 feet in height: The stem and very fragile branches covered with a white bark. The leaves alternate. and crowded near the summit of the branches, exceed in magnitude those of any other of our plants, they have been found 35 inches long, and 9-10 inches wide. They are acute at the summit; tapering and cordate. but scarcely auriculate at base, glaucous underneath, and when young clothed with a silvery silken pubescence. Petals 4-5 inches long, ovate, white, tinged with purple at the base, fragrant. Cone oval.

To complete the view of this interesting genus, I have inserted this species although it has never yet been found within the limits strictly assigned to this work, yet, in Lincoln county, North-Carolina, it approaches so near the frontiers of this State, that it would be a matter of some surprise if it should not yet be discovered along the southern declivities of the Sa-

luda Mountains.

Grows 10 or 12 miles to the South-cast of Lincoln Court-house, North-Carolina, and in Tennessee.

Flowers May to July.

## LIRIODENDRON. GEN. PL.

3-phyllus. | Calyx Samarae | Petals 6. Petala 6. spermae, non dehiscentes.

Calux 3-leaved. Capsules. imbricatae in strobi- (Samaræ) imbricated, c, non dehis- 1—2 forming a strobilus, e, non dehis- 1—2 seeded, not opening.

1. TULIPIFERA.

L. foliis abscissolyce triphyllo.

Leaves truncated, truncatis, 4-lobatis, ca- | præmorse, 4-lobed; calvx three leaved.

Sp. plantarum. 2. p. 1254. Walter 158. Mich. 1. p. 326. Mich. Arb. 3. p. 302. Pursh. 2. p. 382.

This is one of the largest trees of the American forests. In the low country of Carolina and Georgia, it is somewhat rare, and seldom exceeds 3 feet in diameter, but in the fertile soils of the western country in Kentucky, Tennessee and Alabama, it is sometimes found 7 to 9; and 120 to 140 feet in height. The wood of this tree though soft is durable. The leaves are alternate, 3 lobed, with the middle lobe truncate, and varying with the angles of the lobe obtuse, acute, and accuminate, glabrous, on petioles 2 to 3 inches long. Flowers solitary, terminal. Leaves of the calvx concave. Petals obovate, lanceolate, of a dull yellow colour tinged with red. Stamens numerous, disposed in a simple series shorter than the Germs numerous on a conical receptacle.

Grows in most fertile soils. Flowers May—June.

#### ASIMINA. ADANSON.

Calyx 3-phyllus. Petala 6, interiora minora. Stigmata ses-Baccæ silia obtusa. plures aut abortione subsolitariæ. Semina plurima, unica? serie disposita.

1. PARVIFLORA.

A. foliis cuneatoobovatis, mucronatis, subtus ramulisque rufo-pubescentibus; petalis exterioribus calyce vix duplo longi- | cence; exterior petals oribus.

Calux 3-leaved. Petals 6, the interior small. Stigmas sessile, obtuse. Berries? many, or by abortion solitary. Seeds numerous, arranged in a single? series.

Leaves cuneate. obovate, mucronate, underneath and with the branches covered with a rufous pubesscarcely twice as long as the calvx.

Decandolle 1. p. 478. Porcelia parviflora, Parsh, 2. p. 388. Orchidocarpum parviflorum. Mich. Amer. 1. p. 329.

A small shrub rarely exceeding 2 feet in height, with a few branches mear the summit. The young branches clothed with a velvet like, ferruginous pubescence. Leaves alternate, obovate, abruptly scute and slightly acuminate, a little hairy on the upper surface, pubescent undermenth, on very short petioleg. Flowers solitary, nearly sessile. Calyg very pubescent, deciduous. Corolla greenish purple, the 3 exterior petals twice as long as the calyx, the 3 interior as long as the calyx, all ovate, nearly acute, pubescent. Stamens shorter than the corolla. Fruit about an inch and a half long, irregularly oval, rarely ripening.

The species of this genus are all remarkable for the strength of their

bark and for the foetid odour which it diffuses when bruised.

Grows in sandy pastures along the sea coast of Carolina and Georgia. Flowers April—May.

### 2. Triloba.

A. foliis glabrius-culis oblonge cuneato-obolo longioribus, subro- calyx, nearly round. tundo-ovatis.

Leaves glabrous, long, cuneate-obovate; vatis; petalis exterio- exterior petals fourribus calyce quadrup- times as long as the

De Candolle 1. p. 479.

Anona triloba sp. pl. 2. p. 1267. Wak. 158. Mich. Arb. S. p. 161.

Orchidocarpun arietinum Mich. 1. p. 329.

Porcelia triloba Pursh. 2. p. 383.

A small tree generally 15-20 feet high. Branches alternate, slender, nearly glabrous. Leaves alternate on very short petioles, obovate, cuneate, acuminate, entire, glabrous and shining on the upper surface, slightly pubescent underneath. Flowers solitary, on short peduncles, shooting from the bud of the preceeding year. Corolla much larger than the ca-lyx, brownish purple, the exterior petals larger, nearly round. Stamens much shorter than the corolla. Germs numerous, rarely more than 1 or 2 fertile. Fruit 2-3 inches long, pulpy, eatable, though insipidly sweet. Seeds 6-8.

Grows in rich soils, along the margin of creeks and rivers in the middle and upper country, descending along the large streams to the head of tide water: Beck's ferry on Savannah river.

Flowers March—April.

# 3. GRANDIFLORA.

A. foliis cuneato-

Leaves cuneate, obovatis, obtusis, sub- obovate, obtuse, the tus ramulisque rufo- under surface and pubescentibus; petalis branches cloathed with exterioribus obovatis, a rufous pubescence;

calyce multoties am-plioribus, exterior petals obo-vate, much larger than the calyx.

De Cand 1. p. 480. Anona obovata. Sp. pl. 2. p. 1269. Anona grandiflora, Bartram trav. tab. 2. Orchidocarpum grandiflorum. Mich. 1. p. \$80. Porcelia grandiflora. Pursh, 2. p. 383.

A shrub rarely exceeding 18 or 24 inches in height, sometimes very much branched, with creeping? roots. The young leaves, branches, and calyx soft, flexible, tomentose, ferruginous. Flowers few, scattered along the stem on short peduncles, shooting with the young branches from the bud of the last year, very large for the size of the plant, the exterior petals obovate or nearly round, the interior smaller, oblong, all yellowish white. The fruit I have not seen.

Not found. I believe to the North of the Altamaha. Yery common in

the dry pine barrens between that river and the Satilla.

Flowers March—April

#### 4. Pygmæa.

A. foliis sublongofinearibus, cuneatis, ob- | cuneate, obtuse, coritusis, coriaceis, ramu- aceous and with the lisque glabris; petalis | branches glabrous; exterioribus calyce exterior petals much multoties majoribus, larger than the calyx, obovato-oblongis.

Leaves long, linear, obovate, oblong.

De Candolle 1. p. 479. Anona pygmæa. Bartram p. 21. Sp. pl. 2. p. 1268, Orchidocarpum pygmeum. Mich. 1. p. 880 Porcelia pygmæa. Pursh, 2. p. 383.

A small shrub 6—18 inches high. Leaves nearly sessile 4—6 inches long, very narrow, reticulate, perennial? Flowers solitary, axillary, large, on short peduncles. Petale reddish brown, the exterior obovate oblong, the interior elliptic, small.

Grows in the southern frontier of Georgia and in East-Florida.

Flowers March—April.

## CLEMATIS. GEN. PL.

Calyx 0. Petala | Calyx 0. Petals 4—6. Semina com- 4—6. Seeds compres-

pressa in caudam sæ. | sed, generally termipius barbato-plumo- nated with a long feasam producta.

C. scandens; foliis | ternatis, foliolis ovatis | ternate, leassets ovate, subcordatis. dentatis **fl**oribus dioicis.

thered tail.

Climbing; leaves inciso- | somewhat cordate. lobatisque; notched, toothed and paniculatis, lobed; flowers in panicles, dioecious.

Sp. pl. 2. p. 1290. Walt. p. 157. Mich. 1. p. 318. Pursh, 2. p. 385. De Candolle 1. p. 142.

Plant climbing over shrubs and sometimes covering with its foliage and flowers small trees 15-20 feet high Stem terete, glabrous, pubescent when young. Leaves opposite, leaslets acute and acuminate, with the veins and margins pubescent. Corymbs or panicles, axillary, opposite, somewhat trichotomously compound, with two small leaflets at each division. Petals 4, oval, pubescent, white, fragrant. Germs in the male, and stamens in the female flowers abortive. Seed small, the tail clothed with milken hair.

Grows in fertile soils. Flowers in August.

#### 2. Catesbeyana. Pursh.

C. floribus paniculatis, subdioicis; foliis | somewhat dioecious; biternatim sectis; segsubcordatis, mentis trilobis.

Flowers paniculate leaves divided, biternate, segments slightly acuminate and 3lobed.

Pursh, 2. p. 786. De Candoffe 1. p. 142.

Similar to the preceeding species; scandent, pubescent. Leaves doubly ternate, the segments slightly cordate, 3 lobed, lobes entire, acuminate with the nerves underneath pubescent. Panicle divaricate, dichotomous. Flowers small, the female florets bearing abortive stamens. Petals 4 oblong, downy on the outer surface. Stamens shorter than the petals. Styles bearded. De Cand.

Grows in South-Carolina. Catesbey-Pursh.

Flowers.

## 3. HOLOSERICEA. Pursh.

C. scandens, foliis ternatim sectis, segmentis oblongo-lance-olatis, integris, utrinque pubescentibus; floribus paniculato-corymbosis, dioicis, petalis linearibus staminibus longioribus.

Climbing; leaves divided, ternate, segments oblong-lanceolate, entire, pubescent on both surfaces; flowers in a paniculate corymb, dioecious; petals linear, longer than the stamens.

Pursh, 2. p. 384. De Candolle 1. p. 145.

The whole plant silky. Corymbs trichotomous, few flowered. Flowers small, white. Tails of the seed long, feathered.

Described by Pursh from the herbarium of Walter.

Grows in Carolina.

Flowers.

## 4. LINEARILOBA. De Candolle.

C. pedunculis unifloris, petalis acutissimis; foliis pinnatim sectis, glabris, segmentis integris aut tripartitis, lobis linearibus. De Cand.

Peduncles one flowered; petals very acute; leaves divided, pinnate, glabrous, with the segments entire or 3-parted.

Stem terete, slender, glabrous. Leaves glabrous, segments 3—4 pair, the lower ones tripartite, others undivided, lobes all linear, entire, acute, more than an inch long, scarcely 2 lines wide. Petioles tortuous resembling cirrhi. Peduncles terminal, solitary, 1-flowered, shorter than the leaves. Petals nearly an inch long, acute, externally glabrous, pubescent along the margins, nearly twice as long as the stamens. De Cand.

Described from specimens collected by Fraser in the low country of

Carolina.

Flowers.

5. Walteri. Pursh.

C. scandens; foliis | Climbing; leaves pinnatim sectis, triju- | divided, pinnate, leaf-

gis, foliolis divaricatis, petiolatis, linearilanceolatis, acutis, integerrimis, subtus glaucis; floribus solitariis, petalis ellipticis, staminibus duplo Jongioribus. lets in 3 pair, divaricate, petiolate, linear lanceolate, acute, very entire, glaucous underneath; flowers solitary; petals elliptic, twice as long as the stamens.

Pursh, p. 384. De Candolle 1. p. 155.

Leaves terminating with tendrils. Flowers white.

Described by Pursh from specimens in the Herbarium of Walter. Grows in Carolina. Pursh. Flowers.

### 6. VIORNA.

C. scandens; foliis glabris, pinnatim sectis, segmentis ovalilanceolatis, utrinque acutis, trifidis integerrimisque; floribus solitariis, campanulatis; petalis crassis, acuminatis.

Climbing; leaves glabrous, divided, pinnate, segments ovallanceolate, acute at each end, 3-cleft and entire; flowers solitary, campanulate; petals thick, acuminate.

Sp. pl. 2. p. 1288. Walt. p. 156. Mich 1. p. 318. Pursh. 2. 385. De Candolle 1. p. 156.

Stem pubescent, leaflets broad, lanceolate, acute, sometimes notched but generally entire, pubescent particularly along the margins and veins of the under surface. Peduncles solitary, axillary and terminal, sometimes 3-flowered De Cand. Petals coriaceous, rugose, purple, pubescent along the margins, with the summits acute, reflected, not dilated as in C. Crispa. Stamens nearly as long as the tube of the corolla. Tails of the useds long, plumose.

Grows in the middle and upper District of Carolina and Georgia. Flowers May—August.

#### 7. CYLINDRICA.

C. scandens; foliis pinnatim decompositis, segmentis ovatis, utrinque acutis, glabris, simplicibus, pedicellatis; pedunculis terminalibus, solitariis; corollis cernuis, cylindricis, petalis subcoriaceis, undulatis; aristis seminum plumosis.

Climbing; leaves pinnate, decompound, segments ovate, acute at each end, glabrous, simple, on petioles; peduncles terminal, solitary; corolla nodding, cylindrical, petals coriaceous, undulate, tails of the seed plumose.

Pursh p. 385. De Candolle 1. p. 156.

Nearly allied to C. Viorna, Reticulata and Crispa. From C. Viorna it differs, in having all the segments of the leaves entire, flowers twice as large, and petals thin with the margins undulate. From C. Reticulata is differs, by its leaves thin and not corraceous, scarcely veined, not reticulate. From C. Crispa, which it nearly resembles in habit and inflorescence, it differs by a larger flower, by the margin of the corolla undulate, not revolute, and particularly by the long and bearded tails of the seed. De Cand.

Grows in Carolina. Flowers in the summer.

## 8. RETICULATA. Walt.

C. scandens; foliis eoriaceis, reticulatim nervosis, glabris, pinnatim sectis, segmentis ovatis, omnibus integris petiolatisque, membranaceis; floribus solitariis; petalis subcoriaceis; aristis seminum plumosis.

Climbing; leaves coriaceous, reticulately nerved, glabrous, divided, pinnate, segments ovate, all entire and on petioles, membranaceous; flowers solitary; petals coriaceous; tails of the seed plumose.

Walt. p. 156. Mich. 1. p. 318. Pursh p. 335. De Cand. 1. p. 157.

A vine running over small shrubs, glabrous. Leaves pinnate, with 3 or 4 pair of leaflets. Leaflets ovate, very glabrous, distinctly veined on both surfaces, rigid, coriaceous, sometimes obtuse, but sometimes acute and Flowers solitary, terminal, of a dull purple colour, on even mucronate. Tails of the seed long and conspicuously feathered. small branches.

Grows in the middle and upper districts of Carolina and Georgia. Flowers May to August.

#### Hort. Kew. 9. OCHROLEUCA.

C. erecta, simplex, plicibus, calycibusque ovate, entire, flore inclinato.

Erect, simple, pupubescens; foliis sim- | bescent; leaves simple sericeis; pedunculo | young leaves and caterminali, solitario; | İyx silky; peduncle terminal, solitary; flower leaning.

Sp. Plant. 2. p. 1294. De Candolle 1. p. 159. C. Sericea Mich. 1. p. 319. Pursh. 2. p. 385.

Root perennial. Stem firmly erect, very villous, particularly near the summit. Leaves opposite, large, simple, entire, ovate, rather acute, reticulately veined, very pubescent, or villous on the under surface, on very short footstalks. Flowers solitary, terminal, yellowish. Seeds large, very conspicuously tailed and feathered.

Grows in the upper districts of Carolina and Georgia, Mr. Herbemont: among the Saluda Mountains, Dr. Macbride.

Flowers May—July.

#### 10. OVATA. Pursh.

C. erecta; foliis ovatis, acutis, glabris, utrinque reticulato venosis, infimis subcordatis; pedunculis unifloris; floribus erectis; aristis seminum plumosis.

Erect, leaves ovate, acute, glabrous, reticulate on both surfaces, the lower slightly cordate; peduncles 1flowered; flowers erect; tails of the seed plumose.

Pursh. 2. p. 736. De Candolle 1. p. 159.

Stein simple. Leaves ovate, acute, on short petioles. Peduncle tari minal, solitary. Tails of the seed very long. Pursh.

Described by Pursh, from specimens collected in Carolina by Catesby.

Flowers

11. CRISPA.

C. scandens; foliis pinnatis ternatisque, segmentis divaricatis, ovato-lanceolatis, acutis, trilobis integerri- | te, 3-lobed or entire; misve; floribus solita- flowers solitary; co-riis; corollis campanulate; pelatis; petalis acumina- tals acuminate, revotis, revolutis, margine undulatis; aristis seminum subulatis, nudis.

Climbing; leaves pinnate and ternate: segments divaricate. ovate-lanceolate, aculute, with the margins undulate; tails of the seed subulate, naked.

Sp. pl. 2. 1289. Walt. p. 157. Mich. 318. Pursh 2. p. 384. De Candolle 1. p.

Root perennial and somewhat creeping. Stem pubescent, climbing over small shrubs. Branches opposite, divariente. Leaves glabrous, though sprinkled occasionally with a few hairs. Flowers scattered, solid tary, on the summit of small branches, campanulate, of a bright purple, Petals coriaceous, rugose, towards the summit dilated, then acuminate, the margins undulate. Stamens very numerous, shorter than the tube of the corolla. Anthers attached to the sides of the filaments. Germs very numerous, tomentose. Styles longer than the stamens.

Grows in cluse, damp, rich soils, very common in the river swampe in

the low country.

Flowers April—May.

## THALICTRUM. GEN. PE.

De Candolle 1. p. 173. T. pubescens. Pursh 2. p. 383.

Stem slender, glabrous, erect. Leaves bi or triternate; with the segments ovate, slightly cordate, or cuneate, entire or 3-lobed, with the lobes acute, the margins when dry slightly revolute, somewhat rugose on the upper surface, cloathed on the under with a fine tomentum. Panicle terminal, nearly naked, pedicels divaricate, longer than the leaves. 4-5, oval. Anthers yellow, oblong, mucronate at the summit. De Cand.

Grows in the lower districts of Carolina. Fraser. Flowers June—August.

## 2 Dioicum.

T. floribus dioicis. filamentis filiformibus; foliorum segmentis sucordatis, brotundis, obtuse lobatis, glabris; pedunculis axillaribus, folio brevior-De Cand.

Flowers dioecious. filaments filiform; segments of the leaves nearly round, cordate, obtusely lobed, glabrous; peduncles axillary, shorter than the leaves.

Sp. Pl. 2. p. 1296. Pursh 2, p. 388. De Candolle 1. p. 173. T. Lævigatum Mich. 1. p. 322.

Root perennial. Stem herbaceous, 1-2 feet high. Leaves generally triternate, very glabrous. Flowers sessile, in small axillary clusters of Footstalks of the umbels generally shorter than the leaves, sometimes extending and becoming compound and paniculate. Corolla small, white. Stamens in this genus generally longer than the corolla. Seeds deeply striate.

Grows in the mountains of Carolina. Mich. Flowers May-July. Pursh.

#### 3. CAROLINIANUM. Bosc.

T. floribus dioicis. filamentis filiformibus: foliorum segmentis ovatis. glabris, subtus glaucis; | brous, glaucous unpedunculis axillaribus. folio longioribus. De Cand.

Flowers dioecious; filaments filiform; segments of the leaves o-3-5 dentatis, vate, 3-5 toothed, gladerneath; peduncles axillary, longer than the leaves.

De Candolle 1. p. 174. T. rugosum. Pursh 2. p. 588.

Allied to T. dioicum, but differs in having the segments of the leaves oval, less round, or cordate, and more glaucous underneath, and by its peduncles longer than the leaves, more paniculate and divaricate. Fruit ovate, tapering at each end, stipitate, striate, with the ribs acute. Cand.

Grows in the mountains of Carolina. Flowers

#### 4. Rugosum.

T. caule erecto, tereti, striato; panicula erecta multiplici; floribus confertis: foliorum segmentis ovatis. subcordatis, grosse 3 -5 crenatis, subtus glaucis, superne luci-De Cand.

Stem erect, terete, striate; panicle erect, much divided; flowcrowded: ments of the leaves ovate, slightly cordate. coarsely crenate, glaucous underneath, shining above.

Sp. pl. 2. p. 1298. Pursh 2. p. 388. De Candolle 1. p. 185.

Root perennial. Stem 2 to 5 feet high. Leaves compound, with the lobes somewhat acute. Leaves shining and deep green on the upper surface. Flowers in terminal panicles frequently dioecious. Corolla small, white.

Grows in the mountains of Carolina. Pursh. Flowers June—August.

### 5. Anemonoides.

T. radice grumosa; involucrum constitu- ing an involucrum. entibus.

Root grumous; flowfloribus umbellatis; fo-liis floralibus petiola- leaves on petioles, ditis, biternatim sectis, vided, biternate, form-

Mich. 1. p. 322. De Candolle 1. p. 186. Anemone thalictroides. Sp. Pl. 2. p. 1284. Pursh. 2. p. 389.

Root tuberous, perennial. Leaves all radical on long footsalks. Scape 6-12 inches high, terminating in a small umbel surrounded by an involucrum of 6 or 7 pedicellate leaves. Leaflets of the involucrum resembling exactly those from the root. Umbels 3-6 flowered. Peduncles scarcely exceeding an inch in length. Petals generally 6, lanceolate, white. Seeds deeply striate.

This plant appears to connect the genus Anemone with that of the Thalictrum. It resembles the Anemone in its inflorescence and habit. The Thalictrum in its foliage and seed. Its place in the system, therefore has often been changed. I have followed Michaux and De Candolle in uniting it with the Thalictrum.

Grows in the Mountains of Carolina.

Flowers March—May.

## 6. RANUNCULINUM.

Leaves simple, lo-

Willd. Enum, 585. Push. 2. p. 389.

I have no knowledge of this plant but from the short notice which Pursh has copied from Willdenow. Grows in Carolina.

## ANEMONE.

Involucrum trifolia- Involucrum 3-leav-tum, dissectum. Pe- ed, dissected, Petals Semina plurima.

Involucrum 3-leav-

Walt. 1. CAROLINIANA.

A. foliis ternatis, incisis serra**f**oliolis tisque; involucro tri- | serrated; involucrum foliato, foliolis trifidis; | 3-leaved, leaflets 3petalis 14 to 20 ovalibus.exterioribus sub- | val, the exterior somecoriaceis.

Leaves ternate. leaflets notched cleft, petals 14-20 owhat coriaceous.

Walt. p. 157. De Candolle 1. p. 201. A tenella? Pursh 2. p. 386.

Root perennial. Leaves on petioles 2-8 inches long. Scape 1-flowered, slender, 8-16 inches long, covered particularly towards the summit, with a silky down. Involucrum near the middle of the scape, the leaflets very regularly 3-cleft. Petals oblong, oval, white, the exterior 6-8 thicker and sprinkled with purple specks, the interior 8-14 very thin and Filaments short yellow. Stigma hooked. Seed sitting on a cylindrical receptacle, covered with a silky down.

This beautiful and fragrant plant, has probably escaped the notice of all our botanists, except Walter, for it is very doubtful whether the A. tenella of Pursh, is the same plant. Its habitat in this country is very limited. The taste is acrid, but fugitive. The petals are persistent, covering the

seed, and the scape continues to grow until the seed ripens.

Found hitherto only in one or two places in the oak lands bordering the Santee swamps, near Laneau's ferry.

Flowers generally between the 8-16th of March.

## 2. Nemorosa.

A. foliis ternatis, o-lobatis, dentatis, a- | toothed acute: cutis; caule unifloro; corollis 5-6 petalis; seminibus ovatis, sty lo brevi uncinatis.

Leaves ternate. foliolis cuneatis, incis- | leaflets cuneate, lobed. one flowered; corolla 5-6 petalled; seeds ovate, with a hooked point.

Sp. pl 2. p. 1281. Mich. 1. p. 319. Pursh 2. p. \$86. De Candolle 1. p. 203.

Stem about 6-12 inches high, leaves of the involucrum on petioles, leasiets lanceolate acute more or less deeply notched. Pedancle pubescent near the summit. Petals white, tinged with purple.

Grows in the moutains of Carolina,

Flowers March-April.

### 3. VIRGINIANA.

A. caule dichotomo; foliis ternatis, superioribus oppositis, foliolis inciso lobatis serratisque, acutis; pedunculis solitariis, unifloris, elongatis; seminibus mucronatis, in receptaculo oblongo, lanato, aggregatis.

Stem dichotomous; leaves ternate, the upper opposite, leaflets lobed and serrate, acute; peduncles solitary, one flowered, long; seeds mucronate, collected on an oblong woolly receptacle.

Sp. pl. 2. p. 1279. Walt. p. 157. Mich. 1. p. 320. Pursh, 2. p. 388.

Root tuberous, small. Stem herbaceous, simple, pubescent, almost villous, 2—3 feet high, divided; at the first involucrum producing 1—4, 1-flowered peduncles. Leaves of the involucrum similar to those of the root, all rugose, hairy. Petals generally 5, of an obscure white colour, the two exterior green and pubescent on the outer surface, lanceolate, acute, three interior obovate, obtuse and also pubescent on the outer surface. Stamens very numerous, much shorter than the corolla. Germs very numerous collected into an oblong ovate capitulum; receptacle woolly. Seeds compressed mucronate.

Grows in shaded fertile soils, found within three miles of Charleston-Flowers July-August.

## 4. WALTERI. Pursh.

A. foliis radicalibus palmatis, longius petiolatis; pedunculo radicali, longo, erecto, unifloro; petalis 5; radice tuberosa.

Root leaves palmate, on long petioles; peduncle from the root, long, erect, one flowered; petals 3; root tuberous.

Pursh 2. p. 387.
Thalictrum Carolinianum. Walter

Following Pursh and De Candolle, I add this plant of Walter, as probably a species of Anemone, without having it in my power to add any information on the subject, or to ascertain what plant was really described under this name.

## HEPATICA. WILLD.

## 1. CANADENSIS.

Sp. pl. 2. p. 1340. Mich. 1. p. 317. Pursh, 2. p. 369. De Candelle 1. p. 218.

Root perennial, yellow. Stem herbaceous, alternately 2-leaved. Leaves slightly cordate, palmate, the segments acutely serrate, glabrous. Flowers solitary, terminal. Petals of a pale rose colour. Stamens shorter than the petals. Germs numerous, aggregated in a convex capitulum, somewhat pulpy, maturing but one seed, though said by Michaux to contain generally when young rudiments of two.

Grows in rich soils in the mountains.

Flowers April-May.

## RANUNCULUS. GEN. Pl. 953.

Calyx 5-phyllus. Petala 5, intra basin unguiculatum poro mellifero, sæpius squamula obtecto. Semina nuda.

\* Semina (vel pericarpia) transverse rugosa striata; petala alba ungue flava fovea nectarifera notata. Ratrachium.

1. HEDERACEUS.

R. caule repente, foliis subreniformibus sub 3-5 lobis, lobulis latis, integris, obtusissimis; petalis oblongis, calyce vix longioribus; staminibus 5-12; carpellis glabris. De Candolle 1. p. 233.

Sp. pl. 2. p. 1351.

Calyx 5-leaved. Petals 5, bearing near the base of their claw a melliferous pore generally covered with a scale. Seeds, naked.

\* Seeds rugose transversely streaked; petals white, marked with a nectariferous cell in their claws. Batrackium.

Stem creeping. leaves nearly reniform, generally 3-5 lobed, lobes broad. entire, very obtuse; petals oblong, scarcely longer than the calyx; stamens 5-12; seeds glabrous.

This species, originally a native of Europe, was found by Bosc growing and apparently naturalized around Charleston. If not extinct it lives become rare.

Grows in ditches and wet places. Flowers in the summer.

2. Pantothrix.

R. caule natante;

Stem swimming; foliis omnibus capilla- leaves all capillary, ceo multifidis; petalis obovatis calyce majoribus, seminibus glabris. De Candolle 1. p. 235.

many cleft; petals obovate, larger than the calyx; seeds glabrous.

Sp. pl. 2. p. 1333. Pursh, 2. p. 395.

Root perennial. Stem flexible, floating, branching. Leaves alternate, very finely dissected. Flowers on axillary peduncles 1—2 inches long. Grows in tranquil streams in the upper Districts of Carolina. Pursh. It does not occur in the low country. Flowers June—August.

\*\* Floribus luteis; foliis integris dentatisve, radice fibrosa.

\*\* Flowers yellow; leaves entire or toothed; root fibrous.

3. Pusillus. Pursh.

R. glaber; foliis omnibus petiolatis, denticulatis, inferioribus subcordato-ovatis, superioribus lineari-lanceolatis, supremis linearibus; pedunculis oppositifoliis, solicariis, unifloris; petalis calycis longitudine.

Glabrous; leaves all petiolate, denticulate, the lower ovate, slightly cordate, the upper lanceolate, and linear; peduncles opposite the leaves, solitary, one flowered; petals as long as the calyx.

Pursh, 2. p. 392. De Candolle 1. p. 249. R. flammula? Walt. p. 159.

Root fibrous, perennial? Stem herbaceous, generally decumbent, sparingly branched, 6—12 inches high. Leaves on petioles (the lower 2—3 maches long) very obtuse and sometimes slightly cordate at base. Flowers very small at the summit of the small branches. Leaves of the calyx covate, obtuse, deciduous. Petals scarcely larger than the calyx, about 1-line long, nearly round, yellow, the pore near the base of the petal not on the clave. Stamens 7—8, shorter than the calyx. Germs numerouss, ag-

gregated in a hemispherical head. Styles 0. Stigma sessile, obtuse. Seeds ovate, compressed, acute at the summit, slightly rugose.

Grows in wet soils, very common Flowers February—April.

## 4. Oblongifolius.

R. foliis petiolatis, denticulatis, inferioribus oblongo-ovalibus, oblong-oval, the up-superioribus lineari per linear lanceolate; lanceolatis; caulibus | stems branching; peramosis; petalis calyce paulo longioribus; tals a little longer than the calyx; seeds gloseminibus globosis, bose, not pointed, muticis. lævibus.

Leaves petiolate, | denticulate, the lower per linear lanceolate: | smooth.

Root fibrous. Stem 1-2 feet high, generally erect or declining, glabrous, smooth, branching and from the smallness of the upper leaves appearing naked towards the summit. Leaves oblong, irregularly denticulated, glabrous, the lower on petioles 1—3 inches long. Peduncles 10— 15 lines long. Calyx at first closely appressed. Petals rather longer that the calyx. Seeds smooth without a vestige of the style, globose, with a slight longitudinal cicatrice.

This species which I propose with hesitation, differs from the preceding much in size, and appears to differ in the corolla and seed. It requires

however, to be further examined.

Grows in ditches and wet places. Collected 12 miles from Savannah on the Augusta road. St. John's Berkley. Dr. Macbride.

Flowers May-July.

\*\*\* Floribus luteis; foliis incisis multifidisve; radice fibrosa; pericarpiis lævibus.

\*\*\* Flowers yellow; leaves notched or many cleft; root fibrous; seeds smooth.

Sp. Pl. 2. p. 1314. Walt. p. 159. Pursh 2. p. 392. De Candolle 1. p. 268.

Root fibrous, perennial. Radical leaves cordate or reniform, on petioles 1—3 inches long. Flowers small. Petals yellow, about as long as the calyx, with a large scale at their base. Seeds smooth, collected in an oval capitulum.

Grows in wet grounds. Not common in the low country of Carolina. Flowers

#### 6. Sceleratus.

R. foliis glabris, radicalibus petiolatis, tripartitis, lobis trilobatis, obtuse subincisis, summis tripartitis, lobis oblongo linearibus integris, floralibus oblongis; calyce glabro; carpellis minibro; carpellis mis in spicam oblong- oblong; calyx am dispositis.  $\overline{\mathbf{D}}\mathbf{e}$ Cand.

Leaves glabrous; those from the root on petioles, 3-parted, brous; seeds small, forming an oblong

Sp. pl. 2. p. 1315. Pursh, 2. p. 393. De Candolle 1. p. 268. R. nitidus. Walt. p. 159.

Root perennial? fibrous. Stem about a foot and a half high, fistulous slightly angled, glabrous, branching and dichotomous. Lower petioles 4 -5 inches long; embracing the stem with their dilated base. Flowers solitary, opposite the leaf, or in the division of the stem. Peduncles 5-10 lines long. Calyx sprinkled with bair, yellowish, finally reflected. Corolla small, shining, pale yellow, a little longer than the calyx, with a round pore at the base of the petals. Filaments 12-16, shorter than the corolla. Germs many, forming at first an ovate head, extending afterwards into a cylindrical spike. Seeds a little roughened.

Grows in wet grounds common around Charleston.

Flowers April-June.

### 7. Repens.

R. foliis pinnatim trisectis, segmentis cuneatis, trilobatis, inciso dentatis; caule suberecta flagellis repentibus; calyce adpresso; seminibus acumine recto. De Cand. Leaves pinnately 3 parted, segments cuneate, 3 lobed, notched and toothed; stem nearly erect, creeping; calyx appressed; seeds with a straight point.

Sd. pl. 2. p. 1325. Pursh 2. p. 394. De Candolle 1. p. 285.

This species is said by De Candolle, to vary very much in Europe, which is probably its native country. It is found with stems all prostrate and creeping, or with the central stem erect, or with all erect and without runners; with the surface of the leaves, when growing in dry soils, villous or pubescent, when in water very glabrous and lucid, and frequently spotted; with the segments of the leaves trifid or three parted and the segments frequently many cleft; with the flowers single or double, &c.

I have inserted this plant while I entertain much doubt whether it belongs to the Southern States. I formerly found along the banks of the Edisto, plants which I referred to this species, but they were glabrous, and

Pursh describes the American R. repens as hirsute.

Grows in shady wet woods, particularly in the mountains- Pursh.

Flowers July—August. Pursh. In Spring and Summer. De Candolle.

## 8. NITIDUS. Muhl. Cat.

R. foliistripartitis, inaequaliter trifidis, lanceolatis, subincisis
dentatisque, glabris;
calyce reflexo; petalis
ovalibus, calyce duplo
longioribus; seminibus
acumine subrecurvo.
E.

Leaves 3 parted, segments unequally 3 cleft, lanceolate, notched, toothed, glabrous; calyx reflected; petals oval, twice as long as the calyx; seed with a curved point.

Root fibrous, perennial. Stem procumbent and erect, about two feet high, furrowed, and a little hairy. Leaves with the lateral segments unequal at the base, the middle one sometimes on a long petiole, all shining, glabrous, with a few hairs along the under surface of the veins, petioles of the root leaves sometimes 1 foot long Flowers on peduncles 2—6 inches long. Calyx a little hairy. Petals 7-8, bright yellow, glossy, veiny, with a square scale at base. Filaments 60-80 very short. Germa 20 or more, collected in a globose he.ad. Seeds compressed, with a very distinct border, and the point recurved.

This plant, the R. nitidus of Muhlenberg's Catalogue, but not of Walter, is nearly allied to the R. repens, but differs from it by the want of sunners, by its reflected calyx, by its petals that are simply obtuse, never obcordate nor even emarginate, by the recurved summit of its seed, and by its leaves, which if we judge by the figure of the R. repens in Smith's English Botany, are larger, with the segments more distinctly separated, more regularly lanceolate and more acutely serrate.

Grows in wet grounds. Very common in the river swamps of Georgia.

Flowers March and April.

#### 9. PALMATUS? E.

R. pilosus, pilis adpressis; foliis omnibus petiolatis, radicali-bus palmato triparti-tis, lobis dentatis; su-all on footstalks, those of the root palmately 3 parted, with the loperioribus trifidis integrisve; seminibus ! marginatis acumine recto. E.

Hairy, with the hairs appressed; leaves bes toothed, the upper 3-cleft or entire; seeds margined, with the point straight.

Root fibrous. Stem 12 to 18 inches high, branching, hairy, and with the hair as in every part of the plant, closely appressed. Leaves obtuse at base, 3 parted with the lobes expanding and dentate, the upper leaves with 2 lateral teeth, when small, entire. Petioles of the root leaves 4-5 inches long. Flowers opposite the leaves, on long slender peduncles.-The calyx and corolla I have not seen. Seed compressed, smooth, and like the seed of many of our species, with an incrassated margin.

Grows in St. John's Berkley.

Flowers April—May.

## 10. CAROLINIANUS.

R. caule erecto sub-Stem erect, branch. petiolisque | ing and with the petioramoso,

adpresse pubescentibus; foliis glabriusculis, trisectis trilobisve, lobis ovatis, subincisis, dentatis; calyce glabriusculo, reflexo, petalis paulo breviore.— De Cand. les hairy with the hair appressed; leaves glabrous,3-cleft or 3-lobed, lobes ovate, acutely toothed; calyx glabrous, reflected, a little shorter than the petals.

De Candolle 1. p. 292.

Radical leaves trisected or three lobed, segment and lobes ovate, obtuse, and obtusely toothed. De Cand.

This plant appears to resemble the preceeding species, but in the R. palmatus, the leaves as far as I have seen them, are never divided to the base, and are very hairy.

Grows in the low country of Carolina. Bosc

Flowers

#### 11. Hispidus.

R. caule erecto, ramoso petiolisque patentim pilosissimis; foliis tri-sectis tri-partitisve, segmentis ova libus, acutis, incisodentatis; pedicellis adpresse pubescentibus; calyce adpresso.

Stem erect, branching, and with the petioles densely cloathed with expanding hair; leaves 3-cleft or 3-parted, segments oval, acute, sharply toothed; peduncles with the hair appressed; calyx appressed.

Mich. 1. p. 321. Pursh 2. p. 395. De Candolle 1. p. 289.

Root fibrous, perennial. Root leaves 3 parted, with the segments generally separated, the middle one on a petiole sometimes nearly an inch long, segments deeply 3-lobed, with the lobes acutely toothed, all very hairy, petioles sometimes 6—8 inches long, very hispid, with the hair expanding. Stem 12—18 inches high sparingly branched. Flowers on long peduncles, less hairy than the petioles, and with the hair generally appressed. Petals obovate, much longer than the calyx or stamens. Seed smooth, compressed, with a short straight point.

Grows in very rich shaded soils.

Flowers from April—July.

### 12. RECURVATUS.

R. caule erecto petiolisque patentim pilosissimis; foliis tripartitis adpresse villosis, partitionibus ovalibus subinciso-dentatis; calyce reflexo; carpellis stylo uncinato.

Stem erect and with the petioles cloathed with expanding hair; leaves 3 parted, villous, with the hair appressed, segments oval, sharply toothed; calyx reflected; seed with a hooked point.

Pursh 2. p. 394. De Candolle 1. p. 290.

Root perennial, fibrous, somewhat tuberous at the crown. Stem 12—18 inches high. Leaves 3 parted, but not to the base, the segments ovate and acutely serrate. Flowers small, on long peduncles. Seeds collected in a globose head.

Grows in shaded woods. Pursh. Flowers June to August. Pursh.

In Carolina. Bosc.

### 13. Pennsylvanicus.

R. caule erecto, petiolisque rigide patentimque pilosis; foliis trisectis adpressius villosis, segmentis subpetiolatis, acute trilobis, inciso serratis; calyce reflexo, carpellis stylo recto. De Cand.

Stem erect, and with the petioles hairy with rigid expanding hair; leaves 3-cleft, villous, with the hair appressed; segments somewhat petiolate, acutely 3-lobed, sharply serrate; calyx reflected; seed with a straight point.

Sp. pl. 2. p. 1923. Pursh 2. p. 392. De Candolle 1. p. 290.

Stem erect, 1—2 feet high, branching, hair of the stem and petioles rigid and expanding, of the peduncles and leaves appressed. Flowers small yellow. Petals elliptic, as long as the calyx. Seeds compressed, smooth, collected in an ovate head. De Cand.

The Ranunculi of the U. States still require further examination. I have specimens from Milledgeville, in Georgia, which I can refer to no other described species, yet they differ from the above description, by having the corolla twice as long as the calyx, and the seed slightly hooked at the summit.

Grows in the upper districts of Carolina and Georgia, Flowers in the Summer.

### 14. Tomentosus.

R. caule patentim villossissimo ascendente 1-2 floro; foliis | hair expanding, 1-2 petiolatis tomentosis, flowered; leaves on trisectis, summo ses- petioles, tomentose, 3sili, ovato, integro; | cleft, the upper ones calvce villosissimo sessile, ovate, entire; subreflexo. De Cand.

Stem ascending, very villous with the calyx very villous, somewhat reflected.

Pursh, 2. p. 394. De Candolle 1. p. 292.

Root fibrous, perennial. Stem short, ascending at the summit, loaded with soft expanding hair. Leaves three parted, segments 3 lobed, lobes ovate, toothed, with the hair appressed. Petals obovate a little longer than the calyx. De Candolle.

Grows in the upper Districts of Carolina. Bosc.

Flowers.

berculosis, echinatisve. | cled or prickly.

De Cand.

acuminatum | tubercles, terminating in a straight acuminate point.

Sp. pl. 2. p. 1329. Mich. 1. p. 321. Pursh, 2. p. 395. De Candolle 1. p. 298.

Root annual. Stem procumbent, branching, 12-18 inches high, succulent, sprinkled with a few white hairs, which, as usual, are more numerous near the summits. Lower leaves simple, slightly cordate and nearly round, shining and bright green, 3-lobed, the lobes deeply toothed, glabrous underneath, sprinkled on the upper surface with a hispid pubescence, upper leaves trifoliate and simple, leaflets, sometimes cuneate and dentate, the simple leaves lanceolate. Corolla on peduncles about an inch long. Leaves of the calyx lanceolate, reflected. Petals obovate, bright yellow, with a scale at base, longer than the calyx. Stamens numerous, about 16, shorter than the corolla. Germs numerous, compres-Styles 0. Stigmas simple. Seed surrounded by a strong thick margin, the centre translucid and thickly muricated with translucid obtuse prickles, point broad, straight or very slightly recurved.

Grows in cultivated land and along the road side. Common near

Charleston. Probably an exotic.

Flowers March—May.

# 16. TRACHYSPERMA. E.

R. caule petiolis foliisque patentim villosis: foliis trisectis, hair mine uncinato.

Stem, petioles and leaves villous with the expanding; lobis acute incisis; leaves 3-cleft with the pedunculis brevibus oppositifoliis; seminibus tuberculosis, acu- site the leaves; seed tubercled with point hooked.

Stem erect, 12-15 inches high, branching, thinly clothed with soft expanding hair. Leaves small, generally divided to the base, the segments acutely notched and toothed, rather more hairy than the stem. 7-3 inches long. Seeds compressed, conspicuously muricated on both surfaces, with the point short and hooked, smaller and less distinctly thickened along the margins, than those of the R. muricatus. The calyx and corolla I have not seen.

Collected in St. John's Berkley, by Dr. Macbride.

Flowers April and May.

## CALTHA. GEN. PL. 959.

Calyx 0. Petala 5—9. Capsulæ plurimæ, compressæ, 1-loculares, polyspermæ.

Calyx 0. Petala 5—9. Capsules numerous, compressed, 1-celled, many seeded.

#### 1. Ficarioides.

C. caule erecto unifloro, unifolio; foliis radicalibus cordato-o-vatis, obtusissimis, paucidentatis, multinervibus; petalis ellipticis.

Stem erect, 1-flowered, and with 1-leaf; root leaves cordate-ovate, very obtuse, sparingly toothed, many nerved; petals elliptic.

Pursh, 1. p. 389. De Candolle. Ranunculus ficaria. Walt 159.

Root perennial. Stem herbaceous. Flowers yellow. This plant with which I am unacquainted, I have inserted from Pursh. Grows in Cedar swamps. Pursh. Flowers June—July.

## BRASENIA. GEN. PL. 938.

Calyx 6-phyllus persistens. Corolla 0. Capsulæ 6-12 oblongæ, dispermæ.

Calyx 6-leaved, persistent. Corolla 0. Capsules 6-12 oblong, 2-seeded.

### 1. Peltata.

Pursh 2. p. 389. Nut. 2. p. 24. Hydropeltis purpurea. Mich. 1. p. 324, T. 29.

Root perennial. Stem 1-10 feet long. Leaves alternate, somewhat crowded near the summit of the stem, elliptic, peltate, entire, floating on the surface of the water, glabrous and shining on the upper surface, the under surface purple, and together with the petioles stem and peduncle completely enveloped in a tenacious gelatinous fluid. Petioles 3-6 inches long. Flowers solitary, axillary. Peduncles 3-6 inches, and with the whole plant except the upper surface of the leaves, purple. Leaves of the calyx oval, nearly equal, the three interior membranaceous. Stamens 20—30, a little shorter than the calvx. Germs 8—12, slightly compressed, pubescent. Styles oblique. Stigma decurrent. Capsules a little ventricose, acute at each end, pubescent, 1-celled. each capsule, attached by the point to the dorsal suture.

For a very excellent description of the structure of the leaves of this plant, consult Nutall's Genera of North American Plants, a work abounding in acurate information respecting the plants of this country.

Grows very common in stagnant water

Flowers May-August.

# CYAMUS. SALIST.

indisco truncato foveis | lowed on its truncate plurimis monospermis | disk into many oneexcavatus. Nuces o- seeded cells. Nut ovatæ, stylo persistente | vate, crowned with the coronatæ.

### 1. Luteus.

C. foliis peltatis, or- | Leaves peltate, or-biculatis, integerrimis; | bicular, entire; corol-corolla polypetala; an-theris superne lineari- | ther linear near the bus.

summit.

Cyamus flavicomus. . Pursh 2. p. 398. Nymphea Nelumbo. Walt. p. 155. Nelumbium Luteum Sp. pl. 2. p. 1259. Mich. 1. p. 317.

Root perennial. Leaves larger than those of any other species of our equatic plants, peltate, orbicular, entire, generally floating, but sometimes, rising above the surface of the water. Petioles and Peduncles slightly

muricate. Flowers large. Petals of a pale yellow colour. Pericarp woody, 3-4 inches in diameter, with a truncated disk, perforated with 15 or 20 cells, each containing an oval nut, about the size of an acorn.

This plant seems capable of growing in deeper water than either the Nymphæa or the Nuphar. Its leaves appear late in the spring, and its flowers do not expand until mid-summer. The upper surface of the leaves possess in a greater degree, than the leaves of any other plant with which I am acquainted, the power of repelling water.

# 2. Pentapetalus.

C. foliis peltatis or-biculatis integerrimis; bicular, entire, calyx calyce pentaphyllo; 5-leaved; corolla 5corolla pentapetala.— Walt.

petalled.

Cyamus pentapetalus Pursh 2. p. 389. Nelumbium pentapetalum. Sp. pl. 2. p. 1259. Nymphæa pentapetala. Walt. p. 155.

This species and the succeeding, still rest on the authority of Walter. No botanist, has recently seen them. They should probably be sought for in the lagoons, along the Santee-river.

### 3. Reniformis.

C. foliis reniformibus, corolla polypeta-la. Walt.

Leaves reniform; corolla polypetalous.

Cyamus reniformis. Pursh. 2 p. 398. Nelumbium reniforme Sp. pl. 2. p. 1260. Nymphæa reniformis. Walt. p. 155

Corollæ labium su-perius infra basin fis-sum, divaricatum. Upper lip of the corolla divided be-yond the base. Seg-Stamina Smith.

1. CANADENSE.

extantia. | ments divaricate. Stamens projecting.

T. foliis ovato lan- | Leaves ovate lanceceolatis, petiolatis, a-cute serratis pubes-centibus, subtuscanes-olate, on petioles, a-cutely serrate, pubes-cent, underneath hoacentibus; racemis sub- | ry, racemes somewhat verticillatis, terminali- verticillate, terminal; bus: bracteis calyce duplo longioribus.

bracteas twice as long as the calvx.

Sp. pl. 3. p. 22. Walt. p. 161. Mich. 2. p. 1. Pursh, 2. p. 405. Smith in Rees' Cyclop.

Root perennial. Stem herbaceous, erect, 2-8 feet high. Anuare. with the angles rounded, furrowed, somewhat jointed, pubescent. Leaves opposite, brachiate, somewhat rugose, hoary and almost tomentose underneath, on very short petioles. Racemes terminal. Flowers generally verticillate, 4-6 in each whorl, the upper flowers irregular; bracteas subulate at the base of each peduncle, about as long the calyx. Calyx pubescent, ribbed, erect, 5-cleft, the three upper segments broad, the two lower narrower, all acute. Corolla pubescent, pale blue or violet coloured, the tube as long as the calyx, the upper lip divided into two distant acute segments, the fissure extending into the tube, the lowthe lip elongated, 3-cleft, the middle lobe extended and rounded. Filaenents 4, prominent between the division of the upper lip. Style as long us the stalmens. Stigmas 2, acute. Seeds 4, covered by the persistent calyx.

The two American species of this plant, are still insufficiently discriminated. It will be perceived by the foregoing description, that our southern plant agrees in its bracteas and perhaps its petioles with the next spe-

cies, while its leaves belong to the T. canadense.

Grows in wet soils, very common. Flowers July—September.

## 2. Virginicum.

T. pubescens; foliis ovato-oblongis serratis, superioribus subsessilibus, caule erecto; racemis verticillatis. confertis; bracteis | longitudine calycis.

Pubescent; leaves ovate, oblong, serrate, the upper ones nearly sessile; stem erect; verticillate, racemes crowded; bracteas as long as the calyx.

Sp. 51. 3. p. 22. Walt. 1. p. 61. Pursh 2.

This doubtful or obscure species is said to grow in bogs. have however a specimen sent me from Pennsylvania by Mr. Nuttall as the T. virginicum, in which the leaves are more ovate, on longer footstalks and evidently less discoloured than in our common species. I can in this specimen discover no other difference.

Grows in wet ground from Pennsylvania to Carolina.

Flowers probably like the other species from July to September.

#### HYSSOPUS. GEN. PL. 963.

Corollæ labium inferius tripartitum, lacinula intermedia crenata. Stamina recta, distantia.

M. glabra; foliis o.] vato-lanceolatis, serru- ovate lanceolate, serlatis, petiolatis; spica rulate, on petioles; gracili, terminali, ver— spike slender, terminal, ticillis minimis inter— with verticills very rupta; staminibus inclusis.

Glabrous: leaves with verticills very small, distant at base; stamens shorter than the corolla.

Mich. 2. p. 2. Pursh 2. p. 405. M. Viridis. Walt?

Root perennial. Stem procumbent, and assurgent, 1-2 feet long, 4angled, glabrous, branching, throwing out roots at the joints, and with the whole of the plant punctured with glandular dots. Leaves opposite, geherally acute, delicate, on petioles, about 3-4 lines long. Flowers

Whorls rather distant at the base of the spike, bumerous in each whorl. crowded near the summit. Cally x tubular, glabrous, ciliate, erect with 5equal and very acute teeth. Corolla funnel formed, bluish, the tube a little longer than the calyx, the border almost equally 4-cleft, the segments obtuse and a little expanding, the upper one emarginate. Stamens very short, included in the tube of the corolla, equally distant, not approximated by pairs. Anthers white. Style longer than the corolla. Stigmas two, acute, revolute. Seeds 4-oval, protected as in all of this order, by a persistent calvx.

Grows in wet ground, rare, found around a spring, near the Club-house, about 3 miles from Beaufort.

Flowers August—September.

Several European species of Mentha are becoming naturalized in our country, this is the only species I have seen which appears indigenous.

## LAMIUM. GEN. PL.

Corollæ labium superius integrum, fornicatum, labium inferius bilobum; faux utrinque margine dentata.

Upper lip of the corollæ entire, vaulted, lower lip 2-lobed; throat with the margin toothed at each side.

Floral leaves ses-

•

Sp. pl. 3. p. 90. Walter 1. p. 61. Pursh 2. p. 206.

A small annual plant, the steme branching at base, about a foot high, square and pubescent. Leaves opposite, nearly round, notched, rugose, pubescent, the upper ones sessile, the lower on petioles from half an inch to an inch long. The flowers in axillary whorls, in the bosom of the upper leaves. Calyx tubular, hairy, with the border five cleft. Corolla bilabiate, the tube twice as long as the calyx, bright purple, the throat and lower lip marked with paler spots. Stamens included in the upper lip of the corolla. Style about as long as the stamens. Stigmas two, acute. A plant probably imported; now every where in cultivated lands.

Flowers February—April.

#### STACHYS. GEN. PL.

Calyx 5-fidus, aris-Corollæ latatus. bium superius fornicatum; labium inferius lateribus reflexum; lacinia intermedia emarginata. najore Stamina deflorata versus latera reflexa.

Calyx 5-cleft, awned. Upper lip of the corolla vaulted, lower lip with the sides reflected, and the intermediate segment large, emarginate. Stamens when fading, reflected towards the sides.

#### 1. Hyssopifolia.

S. glabriuscula, gracilis, erecta; foliis sessilibus lineari-lanceolatis linearibusque, rariter subdentatis, verticillis subquadrifloris.

Somewhat glabrous, slender, erect; leaves sessile, linear lanceolate and linear, rarely toothed; whorls generally 4-flowered.

Mich. 2. p. 4. Pursh 2. p. 407. S. palustris. Walt?

Stem crect, smooth, 12-15 inches high, generally simple. Leaves sessile, very finely serrulate, about an inch long, glabrous, frequently linear; at the base of the leaves are found a few bristles performing probably the func-Flowers sessile. Calyx glabrous, the teeth very acute. almost spinous. Corolla much longer than the calyx, a little hairy on the Stamens nearly as long as the corolla. Anthers two lobed, incuminside. Stigmas two, acute.

Grows like all the other species of this Genus, in wet pine-barrens,

most common in the middle country of Carolina and Georgia.

Flowers June—August.

### 2. HISPIDA.

foliisque S. caule hispidis; foliis petiolatis, ovato-oblongis, a-

Stem and hispid; leaves on petioles, ovate-oblong, cutis, obtuse serratis,; acute, obtusely serfloris; calycibus glabriusculis.

subquadri- rate; whorls generally cibus gla- 4-flowered; calyx gla- brous.

Pursh 2. p. 407. S. arvensis Walter p. 162.

Stem about 2 feet high, square, hispid along the angles, the bristles generally retrorse. Leaves nearly sessile, very oblong, ovate, acute, serrulate rather than obtusely serrate, somewhat hispid on both surfaces. generally 4 in each whorl, the teeth prominent and very acute, their margins and the angles of the calyx pubescent. Corolla larger than in our other species, rather longer than the stamens, yellowish purple.

Grows in the wet pine barrens of Carolina.

Flowers June—August.

#### 3. Aspera.

S. caulibus erectis, calycibus divaricatospinescentibus.

Stems erect, retroretrorsum hispidis; fo- | sely hispid; leaves liliis lineari lanceolatis, | near lanceolate, serserratis, glabriusculis; rate, nearly glabrous; verticillis subsexfloris, whorls generally 6-I flowered; teeth of the calvx divaricate, spiny.

Mich. 2. p. 5. Pursh 2. p. 407.

I am uncertain whether I am not referring to the S. Aspera of Michaux a plant which may belong to another species. Stem 18-24 inches high, square, the angles fringed with retrorse bristles. Leaves long (2-3 inches) very narrow, sessile, acute, finely serrulate, the margins fringed and the veins sprinkled with short acute bristles. Flowers generally 6 in a whorl. Teeth of the calyx very acute, somewhat divergent and with the angles fringed with short bristles. Corolla much longer than the calyx, Stamens as long as the corolla.

Grows in the pine barrens of Carolina.

Flowers June—August.

## 4. TENUIFOLIA.

S. caule erecto, an-gulato, sublævi; foliis nearly smooth; leaves petiolatis, ovali lanceo. on petioles, oval-lancentissimis.

latis, serratis, acumi- | ceolate, serrate, acunatis; verticillis sex- | minate; whorls 6-flowfloris; calycibus pubes- ered; calyx very pubescent.

Sp. pl. 3. p. 100. S. Annua Walt. 161.

Stem 18 to 24 inches, angled, nearly glabrous, sprinkled with a few hairs, particularly at the summit and near the joints.

### MARRUBIUM. GEN. PL. 976

dum, lineare, rectum. | straight.

Calyx hypocrateri-formis, rigidus, 10- | Calyx hypocrateri-form, rigid, 10-streakstriatus. Corollæ la- ed. Upper lip of the bium superius bisi- | corolla 2-cleft, linear,

1. VULGARE.

M. foliis subrotunbus dentibus setaceis, uncinatis.

Leaves ovate, neardo-ovatis, dentatis, ru- | ly round, toothed, rugoso-venosis; calyci- gose; teeth of the calyx setaceous, hooked.

Sp. pl. 3. 111. Pursh 2. 408.

A perennial plant, growing in dense tufts. Stems about a foot high, branching at base, square, with the whole plant tomentose and hoary. Leaves very rugose, attenuated at base into petioles about half an inch long. Flowers in axillary whorls, very numerous. Teeth of the calyx acute, and somewhat spinous. Corolla small, white, lower lip 3-lobed. Stamens and styles shorter than the corolla.

This plant though originally a foreign one, is now naturalized. It grows very common about buildings in dry soils. Flowers during the

greater part of the summer.

### LEONURUS.

Calyx 5-gonus, 5- | Calyx 5-angled, 5-dentatus. Corollæ labium superius villo- | of the corolla villous,

sum, planum, inte- | flat, entire; the lower grum; inferius tripar- 3-parted, with indivisa.

titum, lacinia media | middle segment undivided.

#### 1. CARDIAGA.

L. foliis obovatis. trilobis, dentatis, basi cuneatis; corollis calyce pungente majoribus, lacinia media labii inferioris acuta.

Leaves obovate, 3. lobed, toothed, cuneate at base; corolla longer than the sharp toothed calyx, the middle segment of the lower lip acute.

Sp. pl. 3. p. 114. Pursh 2. p. 408.

Root biennial or perennial. Stem about 3 feet high, 4 angled, with the angles pubescent. Leaves generally 3 lobed, sometimes dentate, the upper ones entire, pubescent along the veins, cuneate at base, erect, supported on petioles rather more than half an inch long. Flowers in axillary whorls extending along the greater part of the stem. Calyx nearly glabrous with 5 very acute expanding teeth. Corolla small, very villous on the outer surface. Anthers sprinkled before they burst with white globalar points. Stamens shorter than the corolla.

Grows in rich soils about buildings, a foreign plant becoming naturali-

Flowers May-August

### HYPTIS.

Calux 5-dentatus. Corolla ringens, labium superius bifidum, inferius tripartitum, lacinia media sacculiventri inserta, declinata.

Calyx 5-toothed. Corolla ringent, the upper lip 2-cleft, the lower 3-parted, middle segment formformi. Stamina tubi- ing a small sack. Stamens inserted in the middle of the tube, declining.

#### 1. RADIATA.

H. capitulis oppositis; bracteis lanceolatis calyce longioribus, foliis oblongo lanceolatis, dentatis, basi attenuatis.

Heads of flowers opposite; bracteas lanceolate, longer than the calyx; leaves oblong lanceolate, dentate, tapering at base.

Sp. pl. 3. p. 84. Pursh 2. p. 408. Clinopodium rugosum Walt. p. 164.

Root perennial somewhat creeping. Stem herbaceous, erect, 3-4 feet high, 4-angled, pubescent, and somewhat scabrous near the summit, Leaves opposite, sessile, pubescent, dotted underneath, sometimes 2 or 3 of the teeth very large, the base very long and tapering. Flowers on axillary heads, on long peduncles, the lower peduncles sometimes as long as the internodes, the upper ones much shorter. The involucrum many leaved (about 12) persistent, the leaflets generally in two series, unequal, the exterior ones larger, but all much longer than the calyx. Calyx somewhat tubular, very pubescent, villous at base, the border 5-toothed, the teeth long, linear, equal. Corolla white, a little sprinkled with purple, the lower lip 3-cleft, the lateral segments small and obtuse, the intermediate long, with a scale at base. Stamens shorter than the corolla. Anthers incumbent, reflexed. Style as long as the stamens. tuse. Seed 4, oval.

Grows in damp soils in pastures, very common. Flowers July to September.

## 2. CAPITATA.

H. capitulis oppositis; pedunculo internodiis longitudine; bracteis lanceolatis, calyce frugifero brevioribus; foliis oblongis, utrinque attenuatis, inæqualiter serratis.

Heads of flowers opposite; peduncle as long as the internodes; bracteas lanceolate, shortter than the calyx of the fruit; leaves oblong, tapering at each end, unequally serrate.

Sp. pl. 3. p. 84. Mich. 2. p. 9. Pursh 2. p. 408.

I doubt much whether this West Indian species notwithstanding the references to Mich. and Pursh, belongs to our Flora. Mich. describes but one species, and the preceding is diffused every where over our country. Michaux besides was so cautious in proposing new species, that he hesitated to separate our plant from the original species of Jacquin, and Pursh's information respecting our southern plants was not always accurate.

### 1. INCANUM.

P. foliis oblongo-ovatis, acutis, subserratis, cano-tomentosis, petiolatis; capitulis compositis, lateralibus terminalibusque; bracteis setaceis.

Leaves oblong o. vate, acute, somewhat serrate, hoary, tomen. tose, on petioles: heads compound, lateral and terminal: bracteas setaceous.

Mich. 2. p. 7. Pursh 2. p. 409. Nutt. p. 33. Clinopodium incanum, Sp. pl. 3. p. 132. Walt. p. 164.

Root perennial. Stem herbaceous, branching, 3-6 feet high, 4-angled, with the angles rounded, glabrous at base, very pubescent near the summit. Leaves opposite, acute at each extremity, pubescent, the pubescence on the lower surface of the lower leaves, and on both sides of the upper, double, the shorter in floccose spots, giving the leaves a discoloured appear Flowers in heads, composed of compact cymes,, the lateral ones on short footstalks, bracteas linear or setaceous, longer than the calvx.

Calyx tubular, tomentose, striate, with the border 5-toothed. Corolla yellowish, spotted with purple, pubescent on the inner surface, the upper lip small and nearly round, the lower longer, 3-parted. Stamens scarcely longer than the corolla. Anthers incumbent. Styles as long as the sta-Stigmas 2, acute. Seed 4, rugose.

Grows in dry fertile soils. Flowers August—September.

#### 2. ARISTATUM.

P. foliis angusto | lanceolatis, subserra- | ceolate, slightly sertis, brevissime petio- rate, on very short latis, subcandicantibus; capitulis terminalibus; bracteis aristatis.

Leaves narrow,lanpetioles, somewhat hoary; heads terminal; bracteas awned.

Mich. 2. p. 8. Pursh 2. p. 409. Nutt. 2. p. 33. Nepeta virginica. Sp. pl. 3. p. 56.

Stem 2—3 feet high, square, much branched, and with the whole plant, pubescent. Leaves in my specimens very narrow, nearly entire, bracteas subulate, and with the teeth of the calyx terminated by long awns. Corolla small, white, smooth on the inner surface.

Grows on the mountains of Carolina.

Flowers July-August.

## 3. Montanum. Mich.

P. foliis ovali lanceolatis, serratis, sub- | olate, serrate, nearly sessilibus; capitulo | sessile; head sessile; sessili; bracteis cilia- | bracteas fringed, acutis, acuminatis; caly- minate, calyx erect cibus erectis, breviter | with short teeth. dentatis.

Leaves oval lance-

Mich. 2. p. 8. Pursh 2. p. 409. Nuttall 2. p. 33-

Stem purple, smooth, about 1 foot high. Whorls sometimes 1 or 2 below the terminal one. Orifice of the corolla pubescent. Stamens exserted. Corolla purplish, spotted. Seed bearded at the summit. Grows on the highest mountains of North and South-Carolina. Flowers.

#### 4. Monardella.

P. pubescens; foliis abrupte petiolatis subcordato-ovalibus serratis; bracteis magnis, coloratis, ciliatis; calycibus summitate barbatis.

Pubescent; leaves abruptly petiolate, oval, slightly cordate, serrate; bracteas large, coloured, fringed; calyx bearded at the summit.

Mich. 2. p. 8. Pursh 2. p. 409. Nutt. 2. p. 83.

Stem 2—3 feet high. Leaves on petioles nearly an inch long, very obtuse, rather 'than cordate at base, slightly acuminate and strongly servate. Bracteas about twice as long as the calyx. Corolla small, pale red.

In my specimens which were collected by Dr. Macbride on the Saluda, mountains, the stem and the leaves, except along the margins are nearly glabrous, if they had exhibited whorls below the terminal one, according to the habit of the genus, they would pretty accurately represent the Origanum Clinopodioides of Walt. p. 165.

Grows on the Saluda mountains.

Flowers July—August.

## 5. NUDUM. Nuttall.

P. glaberrimum; caule sub simplici; foliis oblongo-ovatis, integerrimis, sessilibus; capitulis pedicellatis, paucifloris, nudis; staminibus exsertis.

Nutt. Gen. 2. p. 34.

Very glabrous; stem simple; leaves oblong-ovate, entire, sessile; heads pedicellate, few flowered, naked; stamens exserted.

Stem 2 feet high. Leaves very smooth, about an inch long, prominently veined, heads numerous and small, subtended by bracteas about the same length. Plowers distinct. Bracteas smooth, lanceolate, and with the calyx awnless, both conspicuously covered with resinous punctures. Orifice and exterior of the corolla pubescent. Lobes of the lower lip nearly equal. Seeds smooth. Nutt.

Grows in the mountains of Carolina and Georgia.

## 6. VIRGINICUM.

P. pubescens; foliis sessilibus, linearilanceolatis, integris, punctatis; capitulis terminalibus, corymbosis; bracteis acuminatis.

Pubescent; leaves sessile, linear lanceolate, entire, dotted; heads terminal, corymbose; bracteas acuminate.

Nutt. 1. p. 33. P. lanceolatum. Pursh 2. p. 410. Thymas virginicus. Sp. pl. 3. p. 145.

Stem erect, and the branches generally erect. The heads terminal, forming irregular clustered corymbs. The Bracteas and Calyx villous. The Corolla externally pubescent, white and spotted, the middle segment of the lower oblong, incurved at the point.

Grows in damp lands in the middle and upper country of Carolina.

Flowers July-August.

## 7. Linifolium.

P. glabrum; foliis linearibus, integerrimis, nervosis, punctatis, acutis; capitulis terminalibus, subcorymbosis; bracteis breviter aristatis; staminibus vix corolla longioribus.

Glabrous; leaves linear, entire, nerved, dotted, acute; heads terminal, somewhat corymbose; bracteas with short awns; stamens scarcely longer than the corolla.

Pursh 2. p. 409. Nutt. 2. p. 33. Brachystemum virginicum. Mich. 2. p. 6. Thymus virginicus. Sp. pl. 3. p. 143.

Stem erect and much branched, branches fastigiste. Leaves generally clustered, terminal, capituli hemispherical and very compact. The bracteas ovate, ciliate and with the calyx award. Flowers hairy, internally spotted, the middle segment of the lower lip oblong and incurved at the point. Stamens about as long as the corolla.

This and the preceding species which are very nearly allied, were both included by Linneus under the T. virginicus. They differ much in ap-

pearance from the other species of this genus, I have followed Mr. Nuttall generally in their arrangement and characters.

Grows in damp soils in the mountains of Carolina.

Flowers July—August.

\*\* Staminibus in- | \*\* Stamens incluchisis.

8. MUTICUM.

P. foliis lanceolatis, leviter rariterque dentatis, nervoso-costatis, glabellis; bracteas lanceolate, acute. teis lanceolatis, acutis.

Leaves lanceolate

Pursh 2. p. 410.

Brachystemum muticum. Mich. 2. p. 6.

A plant 18-24 inches high. Leaves sessile, very sparingly toothed, glabrous and with the whole plant dotted. Capituli somewhat loosely flowered. Bracteas scarcely longer than the heads. Bracteas and teeth of the calvx acute, but neither acuminate nor awned. Teeth of the calyx fringed. Corolla pubescent, whitish, small.

Grows in the upper districts of Georgia and Carolina. Dr. Baldwin

and Michaux.

Flowers.

9. VERTICILLATUM.

ceolatis. denticulatis, pubes-centibus, verticillis whorls compact; brac-compactis; bracteis teas acuminate. acuminatis.

P. foliis ovato lan- | Leaves ovate, laninterdum | ceolate, sometimes

Pursh 2. p. 410.

Brachystemum verticillatum. Mich. 2. p. 6.

Stem 18-24 inches, square, branching, when young very pubescent. Leaves sessile, very acute, many of them very distinctly though remotely denticulate, pubescent and not as distinctly ribbed as the preceding species. Bracteas acuminate and with the calyx almost villous, teeth of the calyx short but slightly acuminate, the whole plant dotted; the calyx sprinkled with resinous atoms, flowers small.

Grows in the mountains of Carolina.

Flow as July-August.

### DRACOCEPHALUM. GEN. Pl. 984.

Calyx 5-fidus, densubæqualibus. tibus Corollæ faux inflata, labium superius concavum.

Calyx 5-cleft with teeth nearly equal. Throat of the corolla inflated, the upper lip concave.

#### 1. VIRGINIANUM.

D. spicis elongatis confertifloris; bracteis parvulis, subulatis; | bracteas small, subucalycis dentibus bre-vibus, subæqualibus; foliis lineari-lanceola- | qual; leaves linear lantis, acute serratis.

Spikes long with the flowers crowded; late; teeth of the calyx short, nearly eceolate, acutely serrated.

Sp. pl. 3. p. 149. Mich. 2. p. 10. Pursh 2. p. 411.

Root perennial and in all the species creeping. Stem glabrous, square, 2-3 feet high, pubescent near the summit. Leaves opposite, sessile, 2-3 inches long, narrow, very acutely serrate towards the summit, serratures almost acuminate. Spikes terminal. Flowers generally opposite. Brac teas subulate, slightly acuminate, scarcely half as long as the calyx, and with the calyx very pubescent. Corolla inflated at the throat, bright purple, handsome, two or three times as long as the calyx, longer than the stamens.

Grows in mountain meadows. Pennsylvania to Carolina. Pursh.

Flowers July-September.

# 2. VARIEGATUM. Venterat.

**D.** spicis brevibus tetragonis; bracteis acuminatis, ovatis, calycem æquantibus;

Spikes short. square; bracteas ovate, acuminate, as long as the calyx; teeth calycis dentibus pau- of the calyx a little lo inæqualibus; foliis | unequal; leaves closearcte sessilibus, ob- ly sessile, oblong lanlongo lanceolatis, su- | ceolate, toothed near perne denticulatis. | the summit.

Pursh 2. p. 411. Prasium incarnatum. Walt. p. 165.

Stem about 3 feet high, square, glabrous, with the angles cartilaginous. Leaves long, lanceolate, very acute, obtusely serrulate or denticulate particularly towards the summit, semiamplexicaule, but the lower ones much attenuated above the base, all glabrous. Bracteas and Calyx pubescent. Corolla ringent, bright purple, pubescent, 4 times as long as the calyx, inflated, the border 4 cleft, the upper segment large, rounded, the 3 inferior oblong, emarginate, the intermediate one streaked and spotted. Filaments hairy, shorter than the corolla. Anthers two lobed, ashering only at the summit, toothed at base, dark purple with a white fissure. Style hairy. Stigmas two, acute. A gland longer than the germs is attached to their base, slightly angled, tapering, obtuse. Seeds ovate, an gled on the inner side.

Grows in marshy soils, on the margins of rivers.

Flowers May—June.

#### 3. Denticulatum.

ticulatis.

D. spicis elongatis, Spikes long with remotifioris; bracteis flowers distant; bracparvulis, lato-subulate; tis; calycis dentibus teeth of the calyx subæqualibus; foliis o- nearly equal; leaves vato?-lanceolatis, den- ovate lanceolate, slightly toothed.

Sp. pl. 3. p. 150. Pursh 2. p. 411. Prasium purpureum. Walt. p. 166.

Smaller than D. Virginicum. (Pursh.) Stem square, glabrous and very minutely pubescent at the summit. Leaves closely sitting, oblong and generally ovate lanceolate, rather acutely serrulate than denticulate, glabrous. Bracteas about half as long as the calyx, and with the calyx minutely pubescent. Corolla moderately large, handsome, variegated on the lower lip, longer than the stamens.

My specimens appear to differ in their leaves at least from the original description of the D. denticulatum of Aiton, but they agree minutely with the figure in Curtis's Botanical Magazine, Vol. 6. tab. 214.

Grows in the mountains. Carolina to Pennsylvania.

Flowers July—September.

### 4. OBOVATUM. E.

D. spicis brevibus; foliis sessilibus, cuneato-obovatis, superne dentatis; bracteis minimis, ovatis, acuminatis. E.

Spikes short; leaves sessile, cuneate, obovate, toothed near the summit; bracteas very small, ovate, acuminate.

Stem about 15 inches high, square, glabrous, pubescent at the summit. Leaves about an inch and a half long, semiamplexicate at base, strongly tooothed towards the summit. Flowers opposite, not crowded in the spike. Bracteas smaller than in any of the preceding species, with the calyx pubescent, teeth of the calyx nearly equal. Corolla pubescent.

If my specimen gives a fair exhibition of this species, it is, when compared with the preceding species, a smaller plant, with the corolla less inflated. Can this have been the original D. denticulatum of Aiton? Collected near St. Mary's Georgia by Dr. Baldwin.

Flowers May-July.

#### MACBRIDEA. E.

Calyx subturbinatus, trifidus; laciniis duabus majoribus.
Corolla bilabiata, labio superiore integro, inferiore tripartito.
Antheræ bilobæ,lobis divaricatis, spinoso tiliatis.

Calyx turbinate, 3cleft, with 2 segments large. Corolla two lipped, the upper entire, the lower 3-parted. Anthers 2-lobed, the lobes divaricate, fringed with small spines.

## 1. Pulchra. Nutt. 2. p. 36.

•Thymbra caroliniana. Walt. p. 162.

Root perennial, creeping. Stem herbaceous, erect, simple, 12 to 18 inches high, square, glabrous, a little hairy at the joints. Leaves opposite, lanceolate, acute, serrulate, dotted, ciliate, glabrous underneath, a little hairy on the upper surface, the upper ones sessile, the lower attenuated at base as if on petioles about half an inch long. Flowers verticil

ate in terminal spikes, whorls 4-flowered, a bractea at the base of each flower nearly as long as the calyx, ovate, acute, dotted, fringed and sprinkled with capitate glandular hair. Calyx erect, striate, the border 3-cleft, 2 segments, large, rounded, the third narrow, obtuse, a little shorter. rolla bilabiate, the tube longer than the calyx, streaked with bright purple and white, the upper lip entire, large, slightly vaulted, the lower lip shorter, 3-lobed, the lobes obtuse and reflexed. Filaments shorter than the corolla, a little hairy, appressed to the upper lip, the anthers 2-lobed, nearly black, villous, the lobes divaricate, very acute and as it were fringed with short spines. Germs 4, glabrous. Style as long as the two shorter stamens. Stigmas 2, simple, acute. A white oval gland larger than the germs is placed at their base.

This plant, nearly allied to Melittis, appears to differ in its calyx, corolla, anthers and perhaps by its glands. I have therefore inserted a minute description that it may be compared with that genus. Its habit is peculiar, each whorl when in flower appears to be on the summit of the stem, two flowers generally shoot up at a time, these are large for this order, rather exceeding an inch in length, and are fancifully said to resemble two ears, sometimes, though very rarely, all the flowers of the whorl expand at the same time. While the first whorl is flowering, the stem insensibly extends, and when the first flowers have decayed a second whorl sppears on the summit of the stem ready to expand its two most forward There are rarely more than three or four whorls, on each stem. I have named this genus in commemoration of the late Dr. James Macbride whose untimely death, Medicine and Natural History, and an admiring country equally deplore.

Grows in the narrow swamps, through the pine barrens in the middle districts of Carolina. Very abundant between Saltcatcher bridge and Murphy's bridge on the Edisto river.

Flowers August—September.

## PRUNELLA. GEN. PL.

Corollæ labium su- | Upper lip of the perius dilatatum. Filamenta bifurca, altero
apice antherifera.
Stigma bifidum.

corolla dilated. Filaments forked, one
summit bearing an
anther. Stigma 2-

## 1. Vulgaris.

P. foliis petiolatis | Leaves on petioles, oblongo-ovatis, basi oblong ovate, toothed dentatis; calycis la- | at base; lips of the

biis inæqualibus, superiore truncato, aristato, caule adscendente.

calyx unequal, the upper one truncated and
awned; stem ascending.

Sp. pl. 3. p. 176. Walt. p. 163. Mich. 2. p. 11. Pursh 2. p. 412.

Stem branching near the base, perennial, creeping, square, pubescent along the angles, hairy at the summit. Leaves ovate, a little denticulate near the base, a little hairy, particularly along the margin, on long hairy petioles. Flowers in cylindrical, compact spikes, axillary and terminal, a pair of leaves at the base of each spike. Bracteas reniform, rounded, fringed, and coloured on the margin. Calyx hairy on the angles and along the margin of the teeth and of the upper lip. The upper lip 3-award. The teeth of the lower lip very acute and just as long as the upper. Corolla rather more than twice as long as the calyx, violet, varying, sometimes more deeply coloured. The upper lip rounded and emarginate, the lower 3-lobed and minutely toothed. Filaments shorter than the corolla, forked at the summit, bearing an anther upon one fork. Style about # long as the stamens. Stigmas 2 acute.

Our plant appears to be but a variety of the P. Vulgaris, it is however very much diffused and is found with us generally in woods and

not around habitations.

Grows in stiff clay soils. Flowers May. July.

## SCUTELLARIA. GEN. PL.

Calyx ore integro, post florescentiam clauso, operculato. Corollæ tubus elongatus.

Calyx with the mouth entire, closed and covered with a lid after flowering. Tube of the corolla

## 1. Integrifolia.

S. dense pubescens; foliis inferiorioribus, ovatis, crenatis, basi attenuatis,
superioribus lineari-

lanceolatis, obtusis, entire, sessile; raintegerrimis, sessili- cemes loosely flowerbus; racemis laxiflo- ed, leafy. ris foliosis.

Sp. pl. 3. p. 173. Mich. 2. p. 12. Pursh 2 p. 412.

Root creeping, perennial. Stem about 2 feet high, 4 angled, frequently branching. The lower leaves attenuated at base into a short petiole, obtuse, the upper ones narrow, almost linear. Flowers in vigorous plants paniculate. The panicles composed of simple opposite branching racemes. Flowers opposite. Bractea a leaf at the base of each peduncle, lanceolate, entire, longer than the peduncle and calyx. Calyx bilabiate, lips nearly equal, entire, the upper one furnished with a transverse appendage like a crest on its back. Corolla 2-lipped, villous, pale blue, spotted in the throat with white, the upper lip 3-cleft, the lateral segments small, slightly reflexed, the intermediate compressed, vaulted, emarginate, the lower lip shorter, 2 cleft, obtuse. Stamens shorter than the corolla. Anthers hairy. Style about as long as the stamens. Stigmas 2, acute. Seed globose dotted, 1, 2, or 3, frequently abortive.

This plant when young has frequently all of its leaves entire, in this state , it is said to be the S. Hyssopifolia of Linnæus, it varies however so much not only in the leaf but in the size of the flower, as to make it doubtful whether two species are not yet included under this name. The name itself ought to be changed. Integrifolia is surely missapplied when given to a plant of which every mature leaf has its margin indented.

Grows in ditches and damp lands, very common along the sides of roads.

Flowers May—August.

# 2. CAROLINIANA. Lamark.

S. ramosa, glaberrima; foliis petiolatis,
lineari-lanceolatis, acutis, integerrimis;
racemis laxis, foliosis;
calycibus obtusis.

Branching, glabrous; leaves on petioles, linear lanceolate,
acute, entire; racemes loose, leafy;
calyx obtuse. Lam. encyc. 7. p. 706.

Pursh 2. p. 412.

With this plant I am unacquainted. Mr. Nuttall hints that it is probably a smooth variety of the preceding species. But Lamark must have possessed at least good specimens of the plant, since he published a figure of it. And no one can doubt that many unknown plants, particularly among the small and herbaceous species are still concealed in our forests. Grows in Carolina. Fraser.

Flowers.

#### 3. SERRATA.

S. ramosa, pubescens; foliis ovatis, aserratis, cuminatis, breviter petiolatis; racemis terminalibus, cemes terminal, looselaxifloris, plerumque ly flowered, frequentpaniculatis; bracteis | ly paniculate; braclanceolatis, brevibus. | teas lanceolate, short.

Branching, pubescent; leaves ovate. acuminate, serrate, on short petioles; ra-

Pursh 2. p. 413.

Stem erect, tall, 4 angled, and with the whole plant minutely pubescent. Leaves sometimes oval, very acute at base, dotted on the under surface, on petioles about half an inch long, acuminate, and the serratures on the lower leaves frequently rounded. Flowers distant on the racemes, large, pale blue. Stamens shorter than the corolla.

Grows in fields and meadows. Virginia and Carolina. (Pursh.) Not

common along the sea coast.

Flowers June—September.

#### 4. VILLOSA. E.

S. caule erecto, ramoso, villoso; foliis majusculis, lanceolatis. utrinque acutis grosse dentatis, subtus villosis, supra sub hispidis; racemis paniculatis, confertifloris.

Stem erect, branching, villous; leaves large, lanceolate, aend. cute at each coarsely toothed, villous underneath, hispid above; racemes paniculate, with flowers crowded.

Stem firmly erect, 2-3 feet high, very villous, almost tomentose. Leaves large, 3-41-2 inches long, 2 wide, exactly lanceolate, the under surface, particularly along the veins, villous, the upper hairy and somewhat hispid, supported by petioles about half an inch long. Panicle composed of opposite, brachiate racemes. Bracteas lanceolate, entire, with a long attenuated base, apparently longer than the calyx. The Flowers I have not seen, I suspect from the composition of the panicle they are not large.

Grows in Georgia between the Oakmulgee and Flint Rivers, along the road leading from Fort Hawkins to the Indian Agency.

Flowers May-July.

#### Mich. 5. PILOSA.

S. pilosa; foliis remotis, ovatis, obtusis, rotundato crenatis rugosis, petiolatis, infe- | petioles, teis lanceolatis, integris.

Hairy; leaves distant, ovate, obtuse, crenate, rugose, on the rioribus subcordatis; slightly cordate; ra-racemis paniculatis, cemes paniculate, with confertifloris; brac- the flowers crowded; bracteas lanceolate. entire.

Pursh 2. p. 413. Mich. 2. p. 11. S. Caroliniana. Walt. p. 163.

Stem erect, generally about 18 inches high and tinged with purple. The lower leaves cordate and very obtuse, the upper ones ovate and nearly acute, all rugose, hairy and dotted on the under surface. The lower petioles an inch and a half long, the upper very short. The calyx hispid. Corolla nearly hispid on the outer surface glabrous within, almost white but tinged with violet at the throat and summit. Anthers very villous.

Grows in dry and somewhat fertile soils. Flowers May—July.

#### Muhl. 6. Cordifolia.

S. pubescens; foliis | cordatis, obtuse denta-

Pubescent; leaves cordate, obtusely tis, acutis, longe peti-olatis; racemis oppo-sitis terminalibusque, laxifloris, bracteis spa'thulato-ovatis, acutis | bracteas spathulate oacuminatisque.

vate, acute and acu-

Muhl. Cat. p. 56. S. Versicolor? Nutt. 2. p. 38.

Stem 2-3 feet high, pubescent. Leaves strictly cordate, acute, but not at all acuminate, somewhat rugose, pubescent or rather hairy on both surfaces, on petioles 1-3 inches long. Bracteas longer than the peduncle and calyx, abruptly attenuated at base, the lower ones acuminate, the upper simply acute. Calyx villous, tinged with purple. The upper lip of the corolla, bright bluish purple, the lower lip paler, almost white.

I have described this species from excellent specimens sent me by my friend Mr. Collins of Philadelphia.

Grows in Carolina. Muhl. Flowers July-August.

#### 7. LATERIFLORA.

ramosissima, glabriuscula; foliis merous, nearly gla-longissime petiolatis, ovatis, dentatis, cau-linis subcordatis; ra-linis subcordatis; ra-linis subcordatis; ralinis subcordatis; racemis lateralibus foliosis.

Branches very nuon the stem slightly cordate; racemes lateral, leafy.

Sp. pl. 3. p. 172. Mich. 2. p. 11. Pursh 2. p. 412.

Stem about 2 feet high, square, glabrous, except at the angles, not furrowed as in all of the preceding species. Leaves ovate, very obtuse at base, acuminate, with the serratures very acute, the lower ones on moderately long petioles, the upper sessile. Branches very numerous, all terminating in leafy racemes and bearing also axillary racemes. Calyx nearly glabrous, smooth, the operculum or crest somewhat conical. Flowers ry small, blue.

This is the species which has laterly acquired so much celebrity in the cure of Hydrophobia, but whose virtues I fear are more than doubtful.

Grows in the upper and mountainous districts of Carolina and Georgia Flowers Jane—September.

### CALAMINTHA.

Calyx defloratus villis clausus. Corolla fauce inflata, labio superiore emarginato, cinia intermedia integra, subemarginata, aut crenulata.

1. Grandiflora.

C. suffruticosa; foliis ovatis, obtusis, crenat:s, lævibus; verticillis

Calyx after flowering closed with hair. Throat of the corolla inflated, the upper lip inferiore tripartito; la- emarginate, the lower 3-parted, with the intermediate segment entire, slightly emarginate, or crenulate.

Suffruticose: leaves ovate, obtuse, crenate, smooth; whorls many multifloris, subpedun- flowered, on short peculatis, folio breviori- duncles, shorter than the leaves.

Pursh 2. p. 414. Nutt. 2. p. 39. Thymus Carolinianus. Mich. 2. p. 9

A small suffruticose plant, growing from 12-18 inches high, the stem round and a little pubescent. Leaves slightly toothed, somewhat ribbed, dotted. Flowers in opposite dichotomous clusters. Peduncles about as long as the calyx. The calyx tubular, ribbed, glabrous, the upper lip 3toothed, the lower 2-cleft, the throat of the calyx closed with hair. rolla pale rose colour, spotted on the lower lip with purple, pubescent, the tube longer than the calyx, the upper lip erect, slightly emerginate, the segments of the lower obtuse, equal. Stamens shorter than the corolla. Anthers two lobed, somewhat crescent shaped, hollow and purple at each Styles longer than the stamens Stigmas two, acute.

Grows in the drift sand along the margins of rivers in the middle and

upper country, abundant near Columbia, S. C.

Flowers June—August.

## CERANTHERA. E.

Calyx bilabiatus, labio superiore emar-ginato, inferiore bifido. Calyx two lipped, the upper lip emargi-nate, the lower 2-cleft.

Corollæ labium superius 2-lobum, inferius 3-partitum. Stamina exserta distantia. And distant, exserted. And theræ incumbentes u. I thers incumbent, awntrinque aristatæ.

l ed at each end.

#### 1. Linearifolia.

Root annual. Stem about a foot high, glabrous, branching. Leaves opposite, linear, dotted, about an inch long, sometimes clustered. Flowers in terminal racemes, peduncles opposite, generally 2-flowered. Calyx striate, dotted, minutely pubescent at the summit, generally tinged with purple, upper lip short, segments of the lower lip acuminate. Corolla glabrous, twice as long as the calyx, of a pale pink colour, beautifully spotted with violet, tube small, throat inflated, the upper lip rather longer than the lower. Stamens four, distant, longer than the corolla. Anthers 2-lobed, lying horizontally on the summit of the filaments, terminating at each point with an awn rather longer than the anther itself. Style longer than the stamens, minutely hispid. Stigmas 2, equal, acute. Seeds four, oval. Grows abundantly in the high pine barren ridges between the Flint and Chatahouchie rivers.

Flowers September and October.

## TRICHOSTEMA. GEN. PL.

T. foliis ovato-lan- | Leaves ovate lan-

Sp. pl. S. p. 170. Walt. p. 164. Mich. 1. p. 10. Pursh. 2. p. 414.

Annual. Stem erect, 1-2 feet high, four angled, with the angles rounded, branching. Leaves opposite acute at base, rather obtuse at the summit, entire, cloathed with a very soft pubescence. Flowers in dichotomous panicles, solitary in the divisions of the branches. Pedanoles about Melf so inch long with the calyx almost hispid. Calyx somewhat two lipped and ribbed, the upper lip much larger, 3 cleft, the lower small, 2 cleft. Corolla 2 lipped, of a deep bright blue, the tube very short, the upper lip 2 cleft with the segments somewhat falcate, the lower 3 cleft. Filaments unequal, four times as long as the corolla, incurved and with the style of a deep bright blue. Style nearly as long as the stamens. Stigmas 2, obtue. Seeds 4, nearly round, slightly rugose.

Grows in dry soils, very common in old pastures.

Flowers July—September.

## 2. Linearis. Walter.

T. foliis linearibus, staminibus longissi- | mens very long. mis. Nuttall.

Leaves linear, glaglabris, sessilibus, u- brous, sessile, acute trinque acutis; denti- | at each end; teeth of bus calycis aristatis; the calyx awned; sta-

Walter, p. 164. Nutt. 2. p. 39. T. dichotoma, Var. linearis. Pursh 2. p. 414.

This species resembles the preceding very much in habit and in its flowers, it appears however to be sufficiently distinct; Mr. Nuttall remarks that it is always smaller, the leaves invariably smooth and rather thick, while the rest of the plant is covered with a viscid pubescence, and that the teeth of the calyx are conspicuously awned.

Grows like the preceeding in dry soils, more common in the middle

and upper country of Carolina than along the sea coasts.

Flowers July—September.

## PHRYMA.

Calyx cylindricus, Calyx cylindrical, supra longior, trifidus, | upper lip longer, 3.

infra bidentatus. Co- | cleft, the lower one 2rollæ labium superius | toothed. Upper lip of emarginatum, inferius | the corolla emarginate, majus. Semen uniĉum.

much smaller than the lower. Seed one.

#### 1. LEPTOSTACHYA.

Sp. pl. Walt. p. 166. Mich. 2. p. 16. Pursh 2. p. 415.

Root perennial. Stem herbaceous, erect, about a foot high, sparingly branched and with the whole plant very pubescent. opposite, spathulate ovate, acute, toothed, the lower ones on petioles about an inch long. Flowers opposite on an erect simple terminal spike. Bracteas three at the base of each flower, subulate, persistent, half as long as the calyx. Calyx after flowering reflected, closely appressed to the stem, tubular, 5 ribbed, 2 lipped, the upper lip with three setaceous segments, the lower lip longer, 2 cleft. Corolla somewhat tubular, two lipped, white tinged with purple, the upper lip short, obtusely two toothed, the lower one larger, 3 lobed. Seed one.

Grows in shady light rich soils. Flowers June to September.

## VERBENA. GEN. PL.

5-fidus. Corolla infundibuliformis, tubo incurvo, i limbo inæquali, 5-fido. Semina 2-4.

Calyx 5-cleft. Corolla funnel shaped, with the tube curved and the border unequal, 5-cleft.

### 1. Aubletia.

V. assurgens; spicis solitariis pedunculatis, imbricatis; corollarum laciniis emarginatis; foliis ovalibus, inciso serratis, dissectisque, petiolatis.

Assurgent; spikes solitary, imbricate, on long peduncles; segments of the corolla emarginate; leaves oval, deeply serrated, and divided on petioles.

Sp. pl. 1. p. 119. Michaux 2. p. 13. Pursh 2. p. 415. Anon. Caroliniensis. Walter p. 164.

Root perennial. Stem creeping, throwing out roots and offsets, finally assurgent, four angled and with the whole plant hairy. Leaves opposite, ovate, landeolate, somewhat 3-lobed, with the lobes notched and toothed; dotted on the upper surface, tapering at base to a slightly winged petiole about an inch long. Flowers in terminal spikes so crowded that when flowering they resemble a corymb, bracteas linear at the base of each flower, about half as long as the calyx. Calyx angled with the border 5 cleft, segments setaceous, unequal. Corolla somewhat hypocrateriform, purple, tube nearly twice as long as the calyx, enlarged at the summit and cloathed with hair, border 5 cleft, expanding. Filaments very short in the tube of the corolla, the longer pair very villous. The Style as long as the tube. Stigma obliquely capitate. Seeds four, oblong, dot-

Grows in the dry pine barrens of the middle country of Carolina and Georgia.

Flowers April—September.

## 2. Spuria.

V. caule decumbente, ramosissimo, divaricato; foliis multifido laciniatis, spicis filiformibus; bracteis calyce superantibus.

Stem decumbent, branching, divaricate; leaves laciniate, much divided; spikes filiform; bracteas longer than the calyx.

Stem decumbent.

Sp. pl. 1. p. 119. Mich. 2. p. 14. Pursh 2. p. 416.

Nearly glabrous. Stem angled. Leaves sessile, deeply laciniate. somewhat pinnatifid, tapering at base, segments serrate, acute. Spikes somewhat paniculate. Flowers at first crowded, afterwards by the clongation of the stem distinct and scattered. Corolla small, purples

Grows in Carolina. Muhl.

Flowers.

## 3. HASTATA.

Sp. pl. 1. p. 118. Mich. 2. p. 14. Pursh 2. p. 416.

Perennial. Stem 2-4 feet high, pubescent or hairy. Leaves generally lanceolate and acuminate, the lower or early leaves have frequently lateral lobes and become hastate, but this is not the general character of the plant, all the leaves somewhat rugose and a little hairy particularly on the under surface. Spikes linear, short. Bracteus ovate, acuminate, rather shorter than the calyx. Corolla small, purple. Stamens and Styler much shorter than the corolla.

Grows in the middle country of Carolina and Georgia, generally in dry

Flowers July—August.

### 4. Paniculata. Lamark.

V. erecta, scabri- | uscula; foliis lanceo- leaves

coarsely serrate, undivided; spikes filiform, imbricate, forming a corymbose paniculatis.

Pursh 2. p. 416.

Stem 4-6 feet high, with the whole plant scabrous and hairy, almost hispid. Leaves long, lanceolate, very acutely serrate. Spikes numerous near the summit of the stem, linear. Bracteas subulate, shorter than the calyx. Flowers small, purple.

Grows among the mountains of Carolina. Pursh. Flowers July—August.

## 5. URTICIFOLIA.

tis; spicis filiformibus, petiolate; spikes fili-

V. erecta, subpu-bescens; foliis ovatis, acutis, serratis, petiola-vate, acute, serrate,

distinctifioris, axillari-bus terminalibusque. | form, axillary and terminal, with the flowers distinct.

Sp. pf. 1. p. 119. Walt. p. 162. Mich. 2. p. 15. Pursh. 2. p. 416.

Perennial. Stem herbaceous, 2-3 feet high, 4 angled, hairy, almost hispid, with many slender branches. Leaves opposite, scabrous, covered with short rigid hair, abruptly narrowed at base. Bracteas subulate, shorter than the calyx. Teeth of the calyx equal. Corolla small, bearded in the throat, white, tinged with purple, the border 5-cleft, segments oval, nearly equal. Stamens shorter than the tube of the corolla, in which they are inserted. Style as long as the stamens. Stigma? globose, seated in the division of the style. Seeds 4, somewhat united at the inner angles.

Grows in damp soils; very common. Flowers July-October.

## 6. STRICTA. Willd.

V. caulibus rigide erectis: foliis sessili- leaves bus, obovatis, serratis, subtomentoso-hirsutissimis, albicantibus; spicis strictis, imbricatis, subfasciculatis.

Stems rigidly erect; sessile, vate, serrate, hirsute, hoary; spikes straight, imbricate. clustered.

Pursh, 2. p. 417. V. Rigens. Mich. 2. p. 14.

Spikes straight long pubescent. Corolla large, pale blue. Michaux.

With this plant I am unacquainted, it is inserted here on the somewhat doubtful authority of Pursh.

Grows in Carolina and the Illinois country. Flowers July and August.

## 7. CAROLINIANA.

V? erecta, scabra; | Erect, scabrous; foliis oblongo-obova- leaves oblong, oboter serratis, basi attenuatis. subsessilibus; spicis longissimis, filiformibus, distinctifloris.

tis obtusis, inæquali- | vate, obtuse, unequally serrate, tapering at base, nearly sessile; spikes very long. filiform, with the flowers distinct.

Sp. pl. 1. p. 119. Mich. 2. p. 14. Pursh. 2. p. 417. Phryma Caroliniensis.

Stem about two feet high, simple, four angled, scabrous, hairy and with the calyx viscid. Leaves acutely and irregularly serrate, sometimes slightly lobed, the interior obtuse, the upper ones acute, rugose, the veins pellucid. Bracteas subulate, shorter than the calyx. Calyx tubular, teeth unequal. Corolla twice as long as the calyx, pale purple, hairy within, the border 4 cleft, somewhat two lipped, the upper segment short, wide and emarginate, the three lower oval. Filaments very short. Anthers almost sessile in the tube of the corolla. Style very short, with a lateral tooth, beneath the capitate stigma. Capsule? very hard, almost a nut, oblong, 4 celled, not opening. Can this be called a naked seed with four celts?

This plant has entirely the appearance of a Verbena; by its corolla and seed it differs from that genus. I have little doubt from its fruit that it is the plant Walter intended by the Phryma Caroliniensis,

Grows in dry soils, common. Flowers May-July.

## ZAPANIA. Scopoli.

Flores capitati. Calvx 5 dentatus? Corolla 5 fida. mina 4-fertilia. Stigma peltato-capitatum, obliquum. Fructus tectus; utriculus vanescens nectens semina 2.

Flowers capitate. Calyx 5 toothed? Co. rolla 5-cleft. mens 4, fertile. ma capitate, oblique. Fruit covered, an eutriculus vanescent connecting the seeds,

#### 1. Nodiflora.

Z. foliis obovatis, cuneiformibus, supe me serratis; spicis capitato-conicis, solitariis, elongato-pedunculatis; caule herbaceo repente.

Leaves obovate, cuneate, serrate near the summit; spikes solitary, on long peduncles, forming conical heads; stem herbaceous, creeping.

Pursh 2. p. 417. Verbena nodiflora. Sp. pl. 1. p. 117. Anon. repens. Walt. p. 160. Lippia nodiflora. Mich. 2. p. 15.

Stem procumbent, branching, creeping, somewhat scabrous. Leaves opposite, glabrous, attenuated at base to a very short petiole. Flowers closely imbricated in small oval or cylindric heads, on axillary peduncles, 4—6 inches long. Bractea broad, ovate, with a short point scarious and purple along the margin. Calyx two leaved, compressed, persistent, much smaller than the bractea, white and hairy along the back. Corolla white, small, the tube as long as the bracteas, border 2 lipped, the upper small, emarginate, reflexed, the inferior 3-cleft. Stamens very short in the tube of the corolla. Style very short. Stigma capitate. The fruit somewhat compressed, divisible, covered with a persistent bractea and callys. Seeds 2.

I have described this plant as it appears to me. It will be perceived that my description, in some respects, and especially in the calyx, does not agree with the commonly received character.

Grows in almost all soils, prefering those that are damp.

Flowers through the whole summer.

## 2. LANCEOLATA.

Z. foliis lineari-lanceolatis argute serratis; spicis capitato-conicis, solitariis, elongato pedunculatis; caule herbaceo, repente.

Leaves linear lanceolate, acutely serrate; spikes solitary, on long peduncles, forming conical heads; stem herbaceous, creeping.

Pursh 2. p. 418. Lippia lanceolata, Mich. 2. p. 15.

Excepting in the leaf I have been able to see no difference between this and the preceding species. The leaves are more strictly lanceolate and more acutely serrate. Its character after all is obscure.

Grows in Carolina near Ashley River. Mich.

Flowers through the Summer.

#### LANTANA. GEN. PL. 1026.

Flores capitati. -Calyx obsolete-4-Corollæ dentatus. limbus 4-fidus, inæ- the corolla 4-cleft, unqualis; fauce pervia. equal, with the throat Stigma uncinato refractum. nuce biloculari lævi.

Flowers capitate. Calyx obtusely 4. toothed. Border of open. Stigma refracted, hooked. Drupe containing a smooth, 2-celled nut.

#### 1. Camara.

L. foliis oppositis, | ovato lanceolatis, crenato-serratis, scabris; caule inermi, asperato; floribus capitato! umbellatis, aph yllis. E.

Leaves opposite, ovate lanceolate, crenate and serrate, scabrous; stem rough, not prickly; flowers in umbellate heads, without leaves.

· 'Sp. pl. 3. p. Pluk. alm. t. 114. £ 4.

A shrub 2-4 feet high, branching. Stem square, not prickly but always rough. Leaves opposite, scabrous on both surfaces, a little rugose, pubescent along the veins, tapering at base to a short petiale. Peduncles axillary, opposite, about 2 inches long, thickened towards the summit. Flowers numerous in each head. Bracteus subulate, longer than the calyx. Corolla bright yellow or orange color. Stamens included in the tube of the corolla. Drupes globular, forming a very compact head of a dark blue color when ripe.

The roots of this flower were sent to me from St. Mary's by Dr. Baldwin. I am uncertain however, whether they were collected in Georgia

er Florida.

Flowers June—November.

#### HERPESTIS. GAERTNER.

Calyx 5-phyllus, inæqualis. Corolla tubulosa, subbilabiata. Stamina inclusa. Capsula bivalvis, 2-locularis, dissessimento valvis parallelo.

Calyx 5-eleft, unequal. Corolla tubular, somewhat 2-lipped. Stamens included. Capsule 2-valved, 2-celled, with the partitions parallel with the valves.

\*\*Bracteis 2 ad basin calycis.

\* Bracteas 2 at the base of the calyx.

#### 1. Cuneifolia.

H. glaberrima; foliis cuneato-obovatis, superne obsolete-sub-crenatis; pedunculis folia subæquantibus; corolla quinquesida.

Very glabrous; leaves cuneate, obovate, obscurely crenate near the summit; peduncles as long as the leaves; corolla 5-cleft.

Pursh 2. p. 418. Monniera cuncifolia. Mich 2. p. 22.

Root perennial. Stem prostrate, branching, creeping and with the whole plant very glabrous and succulent. Leaves opposite, sessile, somewhat amplexicaule. Flowers solitary, axillary, peduncles various in their length, generally shorter than the leaves. The three exterior leaves of the calyx broad, generally unequal among themselves, the two interior very narrow, acute. Bracteas 2, small, linear lanceolate, at the base of the calyx. Corolla nearly campanulate, pale purple, border 5 cleft, the segments oval, nearly equal and expanding. Stamens very short in the tube of the corolla. Style short. Stigma capitate. Seeds numerous, slightly reticulate, attached to a central receptacle.

Grows on sandy shores that are occasionally overflowed by salt-water. Flowers May-October,

\*\* Bracteis nullis.

\*\* Bracteas want-

2. RUTUNDIFOLIA.

H. minutim pubescens; foliis subovali-orbiculatis, multinervi-bus; pedunculis passim | leaves oval, nearly round, many nerved; peduncles opposite, as oppositis folia subæquantibus; quadrifida.

Finely pubescent; long as the leaves; corolla | corolla 4-cleft.

Pursh 2. p. 418. Monniera rotundifolia. Mich. 2. p. 22.

I have specimens collected in this State agreeing exactly with the H. rotundifolia. excepting in the length of the peduncle, a character somewhat variable in this genus. Stem procumbent creeping and finally assurgent, hairy, the hairs pellucid and jointed Leaves nearly orbicular, slightly serrulate, a little hairy, leaves half embracing the stem. Peduscles about half as long as the leaves, sometimes longer. The three outward leaves of the calyx large, the first almost leaf-like, the two interior subulate, very small. Corolla azure, the border 4-cleft, the segments obovate and emarginate. Stamens short, inserted between the segments of the corolla. Anthers sagittate. Style short, 2-cleft. Stigma simple. Seed oblong, truncate, dotted.

Grows along the margin of ponds in wet soils in the middle country of

Carolina and Georgia.

Flowers July—September.

#### 3. AMPLEXICAULIS.

H. caulibus lanatis; foliis cordato-ovali-"bus, amplexicaulibus. integris, obtusis, pe- tuse; peduncles shortdunculis folio brevioribus; corolla quadri- | corolla 4-cleft. fida.

Stem woolly; leaves cordate, embracing the stem, entire, ober than the leaves;

Pursh 2. p. 418. Monniera amplexicaulis. Mich. 2. p. 22. Obolaria caroliniana. Walt. p. 166.

To this plant the description of the preceding will apply almost entirely. The Leaves are narrower, less nerved and denticulate, but merely in proportion to their size. The Peduncles are shorter, and Mich. remarks that the corolla is larger. These two species require to be further examined. They differ in appearance very much from the plants with which they are associated—they are both very fragrant, particularly when bruised, so that you can discover them when riding through the grounds in which they grow by the aromatic odour which they exhale under the hoofs of your horses. In this respect they differ very much from the insipid earthy smelling species of Gratiola, Lindernia and other plants to which they are allied. They will perhaps constitute a distinct geaus.

From character and from tradition I can have no hesitation in referring to this plant the Obolaria Caroliniana of Walter—with the Obolaria Virginica he appears to have been unacquainted.

Grows in the pine barren ponds of the middle country, rare in the im-

mediate neighbourhood of the ocean.

Flowers July-September.

# 4. MICRANTHA

H. glabra, succulenta; foliis arcte sessilibus, ovatis ovalibusque, obtusis, integerrimis, striato-nervosis; pedunculis folio brevioribus; calyce 5-phyllo; stylo bifido.

Glabrous, succulent; leaves closely sessile, ovate and oval, obtuse, entire, nerved; peduncles shorter than the leaves; calyx 5-cleft; style 2-cleft.

Pursh 2. p. 418. Gratiola repens? Sp. pl. 1. p. 103.

A small plant prostrate and creeping. Leaves sometimes nearly round, very glabrous, half embracing the stem. Peduncles axillary, short. The three outer leaves of the Calyx large, the two interior subulate. Flowers very small, white.

I neglected to notice, and my specimen will not now determine, whether the corolla is 4 or 5 clest. The calyx however separates all of the plants

placed in this genus, very distinctly from Lindernia.

Grows on the margins of fresh water rivers in soils subject to inundation. To me a rare plant, I have only met with it upon the banks of the Ogeechee river.

Flowers September-October.

# SCROPHULARIA. GEN. PL. 1014.

Sp. pl. 3. p. 209. Pursh 2. p. 419. Mich. 2. p. 21. S. nodosa var. americana

Root perennial. Stem herbaceous, 2-4 feet high, very much branched, 4angled, glabrous, but sprinkled near the summits of the branches with capitate hairs. Leaves opposite, ovate, lanceolate, rugose, a little hairy, the lower ones sometimes slightly cordate. Flowers in long compound ter-minal panicles, on pubescent peduncles. Calyx somewhat campanulate, 5-cleft, with the segments equal, erect. Corolla glabrous, greenish, tinged with purple; the tube globose, twice as long as the calyx, the border 5-cleft, with segments unequal, the four upper ones erect, the lower small, reflexed. A small spathulate purple appendage is attached to the tube of the corolla just below the base of the upper segment. Stamens longer than the tube of the corolla, the two longer ones appear to be later than the other two, in coming to maturity. Filamente hairy, dilated towards the summit. Anthers 1-celled, opening transversely. Style longer than the stamens. Stigma obtuse. Capsule ovate, somewhat compressed, opening at the summit. Seeds numerous, a little rough.

Grows in rich, shaded, loose soils.

Flowers August-October.

Sp. pl. 3. p. 296. Mich. 2. p. 25. Pursh 2. p. 419, Bignonia crucigera. Walt. p- 169.

A vine, climbing over small trees and shrubs, but not adhering to them, Leaves opposite, conjugate, somewhat lanceolate but cordate at base, glabrous, entire, the margins and petiole sometimes coloured. Peduncles axillary, 1-flowered, sometimes many from each axil. Calyx obtusely 5toothed. Corolla large, of an obscure red colour on the outer surface, yellow within, the segments obcordate. (Capsule flat, linear. Mich.)

Grows in dry soils. Flowers March—April,

# 2. RADICANS.

B. foliis pinnatis, foliolis ovatis, dentatis, acuminatis; corymbs terminali; tubo corollæ calyce tri- | corolla thrice as long plo longiore; caule | as the calyx; stem radicante. radicant.

Sp. pl. 3. p. 301. Walt. p. 169. Mich. 2. p. 25. Pursh 2. p. 420.

A luxuriant ornamental vine, climbing over buildings and the loftiest trees, throwing out radicles all along the stem by which it attaches itself firmly to walls, fences or the bark of trees. Leaflets somewhat ribbed, smooth on the upper surface, pubescent underneath, particularly along the veins. Flowers in corymb like racemes, on peduncles about half an inch Corolla tubular, a little ventricose underneath, of a blood red colour, the inside tinged with yellow, the tube twice as long as the calyx, border 5-cleft, the segments nearly round and equal. Stamens nearly as long as the corolla, inserted in the tube, within which is perceptible the rudiment of a fifth filament. Anthers divaricate at base. Style as long as the stamens. Stigma compressed, flat. Silique very long, terete. Seeds winged.

Grows very common, preferring damp, rich soils.

Flowers June—September.

# RUELLIA. GEN. PL. 1050.

Calyx 5-partitus. Corolla subcampanulata. limbo 5-fido. Stamina conjugata. | campanulate, with the Stamina conjugata. | border 5-cleft. Sta-Capsula utrinque at- | mens tenuata, dentibus elastice dehiscens. Semina · pauca.

Calyx 5-parted. Corolla somewhat campanulate, with the conjugate. Capsule tapering at each end, toothed, oelastically. Seeds few.

# 1. STREPENS.

the tube of the co-

Sp. pl. 3. p. 363. Mich. 2. p. 24. Pursh 2. p. 420. Anon. Caroliniensis. Walt.

Stem 18-20 inches high, 4-angled, and with the whole plant hairy. Leaves ovate and oval, lanceolate, entire, attenuated at base into a petiole half an inch long. Flowers axillary, generally 3 in each exil. The larger Bracteal leaves as long as the calyx, the lesser about half as long. Calyx 5-parted, linear lanceolate, the upper half almost setaceous, very hispid. Corolla pale blue, the tube longer than the calyx, the border somewhat campanulate, 5-parted, with the segments rounded, nearly equal. Stamens shorter than the corolla. Style longer than the stamens, slightly 2-cleft at the summit. Stigmas equal. Seeds few, (4, Walter.) in each cell of the elastic capsule.

I know not how Pursh could have called the segments of the calyx lanceolate, they are very accurately represented by Dill. Hort. Elth. T. 249. F. 321. excepting that in number 5 and 6 the setaceous points are not sufficiently extended, but in number 1 from which he derived the epithet Comosa, the representation is very accurate.

Grows generally in damp soils, may be found in great luxuriance in the high ridges in river swamps.

Flowers through the whole Summer, beginning in May.

## 2. HIRSUTA. E.

R. hirsuta, ramo-sa; foliis ovali-lanceolatis, sub acutis, sessilibus; calycis laci- segments of the calyx superantibus. paulo

Hirsute, branching; leaves oval lanceolate, nearly acute, sessile, niis subulatis, hispi- subulate, hispid, a litdis, tubum corollæ tle longer than the tube of the corolla.

Stem erect, 12 to 18 inches high, very obtusely 4-angled, sparingly branched, very hirsute. Leaves opposite, acute at each and, slightly undulate, almost hispid. Flowers generally one in each axil. Segments of the Calyx regularly subulate, rather longer than the tube of the corolla-Corolla pale blue. Style very long. Every part of the plant much smaller than in the preceding species.

I have introduced this plant, though not collected strictly within the limits of Georgia, on account of its close affinity to the R. hybrida of Pursh which Mr. Nuttall rejects as a var. of R. oblongifolia. To that plant however this species has no affinity.

Grows near the Alabama River in dry soils.

Flowers probably through the summer. Found in flower at the commencement of October.

# 3. CILIOSA. Pursh.

R. erecta, ramosa; foliis subsessilibus, ovato-oblongis, margine nervis venisque pilis albis longe ciliatis; bracteis lanceolatis, brevibus; calycis laciniis subulatis tubo corollæ quadruplo brevioribus. P. 2. p. 420.

Erect, branching; leaves nearly sessile, ovate oblong, with the margins, nerves and veins fringed with long white hair; bracteas lanceolate, short; segments of the carlyx subulate, as long as one fourth of the tube of the corolla.

Described by Pursh from specimens collected in Georgia and principally near Savannah by Mr. Enslen. Distinguished, if the character should prove permanent, by the short segments of the calyx.

Flowers through the summer.

# 4. OBLONGIFOLIA: Mich.

R. repens, assurgens, pubescens; folios sessilibus, obovatis ovalibusque, obtusis; floribus subsolitariis; calycis laciniis filiformibus, longitudine tubi corollæ.

Creeping, assurgent, pubescent; leaves sessile, obovate and oval, obtuse; flowers generally solitary; segments of the calyx filiform, as long as the tube of the corolla.

Mich. 2. p. 23. Pursh 2. p. 420. R. biflora?

Root perennial, creeping. Stem about a foot high, obtusely 4-angled, occasionally branched. Leaves all obtuse, with a margin slightly undulate, the lower ones nearly round. Calyx with a short tube, the segments subulate, almost setaceous, hispid; in the former species the calyx is generally divided to the base. Border of the Corolla equally 5-cleft, slightly emarginate, pale blue or purple, spotted with a dusky yellow. Stamene shorter than the corolla. Anthers sagittate. Germ surrounded at base with an orange coloured glandular ring. Style a little longer than the sta-Stigmas simple. Seeds few in each cell of the capsule.

The R. Biflora of Linnæus probably belongs to this species, I have omitted the name as evidently incorrect; the habit of the plant is to produce in the first instance one flower in each axil, if it grows luxuriantly two lateral opposite flowers are next produced, so that the axils are 1 or 3 flowered and may increase afterwards regularly by pairs. It may occasionally happen that one of the lateral buds will prove abortive, or one may shoot up and expand before the other, in either of these cases a biflorous specimen may be collected, but this is accidental and not the habit of the genus.

Grows in sandy pine barrens. Flowers from May to the close of the summer.

#### Mich. 5. Humistrata.

R. glabriuscula, diflis linearibus.

Glabrous, diffuse, fusa, radicans; foliis | radicant; leaves atin petiolum longius- | tenuated at base into cule angustatis, ovali- | a long petiole, oval, bus, obtusis; floribus | obtuse; flowers nearsubsessilibus; capsu- | ly sessile; capsule linear.

Mich. 2. p. 23. Pursh 2. p. 421.

Found by Michaux in the Southern parts of Georgia. I have found no species exactly agreeing with the description.

Flowers probably through the whole summer.

The plants described under this head will undoubtedly belong to Ruelin, however the genus may be limited. In fact they agree so much among themselves, that it is difficult to find specific distinctions. But between the almost campanulate flower of the Ruellia and the bilabiate somewhat ringent, corolla of the Justicia, at least as the species are presented to us in this country, the difference is so great that nothing but the capsule appears to connect the two genera. See Smith's observations on RUEL-LIA in Rees' Cyclopædia.

# BUCHNERA. GEN. PL. 1035.

Calyx 5-dentatus.

Corollæ limbus 5-fidus, æqualis, lobis obcordatis.

Capsula 5-dentatus.

Calyx 5-toothed.

Border of the Corolla

5-cleft, equal, with the lobes obcordate.

Capsule 5-celled.

#### 1. AMERICANA.

B. caule simplici; | Stem simple; leaves foliis lanceolatis, sub- | lanceolate, slightly dentatis, asperis, tri- nervibus; spicis re- ved; spikes with the flowers remote.

Sp. pl. 3. p. 334. Walt. p. 169. Mich. 2. p. 18. Pursh 2. p. 424

Perennial. Stem from 1-2 feet high, terete and with the whole plant scabrous and a little hairy. Leaves opposite, sessile. Flowers at first crowded on the spikes, becoming remote as the spike lengthens. Bractea, leaf at the base of each flower, ovate, acute, nerved, with two lateral leaves smaller, linear-lanceolate. Calyx cylindrical, slightly incurved, nerved, with the border somewhat bilabiate, the upper lip 3-cleft, the lower 2-parted, the segments all erect; acute. Corolla hairy, purple, the tube twice 25 long as the calyx, and a little incurved, the two upper segments of the border rather smaller than the lower. Stamens very short, in the tube of the corolla. Style shorter than the stamens. Stigma obtuse. Seeds several in each cell of the capsule, furrowed, attached to a central receptacle.

Grows in damp pastures. Common. Flowers from May to September.

# ANTIRRHINUM. GEN. Pt. 1007.

vis. | palate prominent. | Capsule 2-celled, 2-val-valved.

# 1. Canadense.

A. assurgens, glabrum, simplicissimum; linearibus, obtusis; floribus racemosis: stolonibus procumbentibus.

Assurgent, glabrous, simple; leaves foliis sparsis, erectis, scattered, erect, linear, obtuse; flowers in racemes; suckers (or sterile branches) procumbent.

Sp. pl. 3. p. 255. Walt. p. 169. Mich. 2. p. 20. Pursh 2. p. 421.

The Root of this species appears in this country to be perennial, the whole plant glabrous, the sterile branches 4-6 inches long, procumbent, the fertile assurgent 12-18 inches long. Leaves dotted, by threes or verticillate on the sterile, alternate, but clustered at base on the fertile branch-Calyx deeply 5-parted? gibbous at the base; segments lanceolate, acute, pubescent. Corolla blue, tube short, the upper lip 2-cleft and reflexed, the lower larger, 3-cleft, the spur at base long, slender, subulate. mens short. Style shorter than the stamens. Stigma capitate. Capsule compressed, oval. Seeds angled, truncate, attached to a central recepta-

Grows very common in almost all soils. Flowers March—April.

# GERARDIA. GEN. PL. 1004.

Calyx 5-toothed. Corolla somewhat campanulate, unequally 5-cleft, with the segments round. Capsule 2-celled, opening at the summit.

YOL. M

## 1. Appreza Nuttall.

G. caule nudo, subsimplici, squamis oppositis, ovatis, parvulongioripedunculo bus.

Stem naked, nearly simple, with scales opposite, ovate, small, lis, deciduis; corollis | deciduous; corolla longer than the peduncle.

Nutt. 2. p. 38.

Annual. Stem about 3 feet high, erect, very sparingly branched. Very minute leaves are sometimes, but sparingly found. In their place, are minute, sphacelate scales. Calyx minutely 5-toothed. Corolla rather small. Capsule ovate, longer than the calyx. Nuttall. First discovered by Dr. Baldwin in E. Florida.

Grows sparingly along the coast as far as Wilmington, N. Carolina.

Flowers probably during the summer.

#### E. 2. PLUKENETII.

G. caule ramosissifoliis setaceis, glabris; floribus axillaribus terminalibusque; pedunculis folio brevioribus; calvcis dentibus setaceis, brevissimis.

Stem much branched; leaves setaceous, glabrous; flowers axil-Tary and terminal; peduncles shorter than the leaves; teeth of the calyx setaceous, very short.

Phyt. T. 12. F. 4. Pluk.

Stem erect, about 2 feet high, slightly angled, very much branched. Leaves scarcely an inch long, perfectly setaceous, incurved when dry. Flowers numerous near the summit of the branches, generally terminal, sometimes opposite and axillary. Peduncles about half as long as the leaves. Calyx truncate, with 5 minute, acute teeth. Corolla rather small for this genus, pubescent. Capsule globular, longer than the calyx.

This plant agrees minutely with the figure of Plukenet to which I have referred, and which is alluded to in Linnaeus as a variety of his G. Pur-

purea.

Grows in wet spungy soils, very common between the Oakmulgee and Chatahouchie Rivers, and probably extends through the middle country of Carolina and Georgia.

Flowers August—October.

## 3. Setacea. Pursh.

G. caule ramosissimo; foliis setaceis, ed; leaves setaceous, glabris; floribus ter- | glabrous; flowers ter-minalibus axillaribus- | minal and axillary, que sparsis; pedun-culis folio multo lon-scattered; peduncles much longer than the gioribus.

Stem much, branchleaves.

Pursh 2. p. 422. Nuttall 2. p. 47. G. erecta? Mich. 2. p. 20.

Apparently annual. Stem slender, about 2 feet high, slightly angled, glabrous. Leaves opposite, about an inch long, with the margins a little rough. Peduncles opposite and alternate, and as they frequently bear leaves and branches, they may all be considered as real branches bearing terminal flowers, but to the eye the upper ones resemble simple peduncles about 2 inches long. Calyx truncate, teeth subulate, small, acute. Corolla rather small, purple, white in the tube, with 2 yellow streaks, hairy, the border equally 5-cleft, segments rounded, fringed. Filaments shorter than the corolla, the longer pair villous. Anthers sagittate, very villous and as in all of this genus 2 cleft and mucronate at base. Style about as long as the stamens. Stigma thick, extending along the side of the style. Capsules ovate.

Grows in damp lands along the margins of swamps and dry galls. Flowers August-October.

#### E. 4. FASCICULATA.

G. caule rigido, erecto, superne ramo-so; foliis oppositis ternisque, interdum linearibus, alternis, fasciculatis, scaberri- linear, clustered, very mis; floribus majusculis; pedunculis folio multo brevioribus.

Stem rigid, erect, branching near the summit; leaves opposite and by threes, sometimes alternate. scabrous; flowers peduncles large; much shorter than the leaves.

Root annual. Stem firmly erect, 3-5 feet high, marked with lines decurrent from the leaves, very scabrous. Leaves linear, acute, producing in each axil, small branchlets, with 8 or 10 small leaves, these towards the summit of the stem, become real branches. The Leaves and Flowers near the summit of the branches are sometimes alternate, but this is evidently accidental. The Peduncles are very short, rarely exceeding 2 lines in length. Calyx truncate, the teeth subulate, acute, longer than any other species in this division. Corolla as large as that of G. Purpurea., bright purple, hairy along the side of the tube, marked with 2 yellow streaks, spotted with red, the border equally 5-cleft, the two upper segments emarginate, reflexed and very villous, 3 lower pubescent and fringed. Filamente very villous, the 2 longer as long as the tube of the corolla. Style longer than the corolla. Stigma obtuse. Seeds very numerous and small, attached to a central receptacle.

Grows principally in lands subject to occasional inundation from the

ocean—on Eding's Island near Beaufort very common.

Flowers August—October.

# 5. FILIPOLIA. Nuttall.

G. caule tereti, ramoso; foliis filiformiglabris, alternis; ca- glabrous, alternate; lycis laciniis acute segments of the calyx dentatis; pedunculis folio longioribus. Nutt. 2. p. 48.

Stem terete.branching; leaves filiform, subfasciculatis, somewhat clustered, acutely toothed; peduncles longer than the leaves.

Leaves filiform, about an inch long, nearly terete, smooth and very slen der, collected in axillary clusters. Flowers purple, as large as those of G. Purpurea. Orifice of the Corolla pubescent and ventricose. Peduncles nearly an inch and a half long. Nuttall.

This species has a close affinity to the preceding, but its smooth leaves and long peduncle render it sufficiently distinct. The leaves perhaps

are only accidentally as in the preceding species alternate.

Found by Dr. Baldwin near St. Mary's and along the coast of E. Florida.

Flowers probably from August to October.

# 6. Purpures.

G. caule ramosissi- | Stem much branchmo; foliis linearibus, ed; leaves linear, autringue acutis, sca- cute at each end, ve-

berrimis; floribus ma- | ry scabrous; flowers jusculis, subsessilibus; large, nearly sessile; calycis dentibus subulate, short, acute.

Sp. pl. 3. p. 221. Walt. p. 170. Mich. 2. p. 19. Pursh 2. p. 422. Icon. Pluk. Mant. T. 388. F. 1.

Root annual? Stem 2-4 feet high, scabrous and very much branched. The Leaves sometimes nearly 2 inches long by 1 1-2 lines wide, larger and more linear lanceolate than in any of the preceding species. Corolla large, pubescent, bright purple. Peduncles rarely more than 2 lines in length, Anthers scarcely as long as the tube of the corolla. Style longer than the stamens.

This species differs from G. Fasciculata in its habit which is more diffuse and spreading, and by its leaves which are larger and more distinctly linear lanceolate, though still very narrow and not fasciculate. From all the other species it is sufficiently distinct.

Grows in damp soils, very generally diffused, Flowers August-October.

#### 7. TENUIFOLIA.

G. caule ramosissimo, lævi; foliis linearibus, utrinque acutis, lævibus; floribus
parvulis; calycis dentibus parvis, acutis;
pedunculis folio paulo
brevioribus.

Stem much brancned, smooth; leaves
linear, acute at each
end, smooth; flowers
small; teeth of the
calyx small, acute;
peduncles a little
shorter than the
leaves.

Sp. pl. 3. p. 222. Pursh 2. p. 422. Nutt. 2. p. 47.

Stem very much branched, diffuse, about 2 feet high, four angled, nearly smooth. Leaves about 1 1-2 inches long, acute at each end and smooth, except along the margins. Pedancles about an inch long, a little shorter than the leaves but longer than the corolla. Teeth of the calyx very minute. Corolla ventricose, scarcely an inch long, pubescent. The border equally 5-cleft, segments ciliate, purple. The tube nearly white, marked with two yellow streaks speckled with purple. The 2 longer filaments and all the Anthers very villous. The 2 shorter filaments only hairy at the base. Style as long as the stamens. Stigma compressed.

This species resembles the G. Purpurea in the size and form of its leaves, but differs by its smoothness, and very widely in its corolla and peduncle.

The plants I have examined, appear also to differ in many respects from the G. Tenuifolia of Nuttall, perhaps many species remain yet to be distinguished.

Grows in dry sandy soils, about 2 miles from Beaufort on the Battery road, to me very rare.

Flowers August—October.

# 8. Linifolia. Nuttall.

G. caule tereti, virgato; foliis linearibus, acutis, lævibus, appressis; calyce truncato, denticulato; corolla majuscula, extus pubescente, intus villosa; pedunculis folio paulo brevioribus.

Stem terete, virgate; leaves linear, acute, smooth, appressed; calyx truncate, denticulate; corolla large, pubescent without, villous within; peduncles a little shorter than the leaves.

Nuttall 2. p. 47. Anon. Erect? Walt. p. 170.

Root perennial, creeping, Nutt. Stem 2—3 feet high, virgate, with slender, erect, twiggy branches. Leaves as in the two preceding species very narrow, linear lanceolate, in general closely appressed to the stem. Peduncles, during the expansion of the flower, shorter than the leaves, before the capsules ripen as long or longer. Calyx very minutely 5-toothed. Corolla large, purple. Stamens about half as long as the corolla. Style as long as the stamens. Stigma acute.

This species is very remarkable by its erect virgate branches, Its leaves in general are not shorter than the peduncles, yet if it it is not the G. Erecta of Walter that species remains to be detected.

Grows in and around pine barren ponds. Flowers August—September.

9. Cuneifolia.

G. paniculato-ramosa, ramis erectis; foliis cuneato-lanceo-latis, inæqualiter sertatis, superioribus alternis; pedunculis axillaribus, folio longioribus; calycibus 5-partitis.

Branching; branches erect; leaves cuneate, lanceolate, unequally servate, the upper ones alternate; peduncles axillary, longer than the leaves; calyx 5-parted.

Pursh 2. p. 423.

Described by Pursh from specimens in the Herbarium of Sir J. Banks, collected in Georgia by Bartram.

With this plant I am unacquainted, and I think it probable as suggested by Mr. Nuttall that it does not belong to this genus.

\*\* Floribus flavis. |

\*\* Flowers yellow.

10. FLAVA

G. pubescens; caulibus subsimplicibus; foliis lanceolatis, integerrimis vel dentatis, inferioribus subpinnatifido-incisis; floribus axillaribus, oppositis, subsessilibus.

Sp. pl. 3. p. 223. Walt. p.

Pubescent; stem generally simple; leaves lanceolate, entire or dentate, the lower ones notched and pinnatifid; flowers axillary, opposite, nearly sessile.

Mich. 2. p. 19. Pursh 2. p. 423.

Perennial. Stem rarely more than 2 feet high, obtusely 4-angled, pubescent, simple or but sparingly branched. Lower leaves sometimes deeply serrate, all attenuated at base to petioles of various lengths, generally very short. Flowers on very short peduncles. Segments of the calyx subulate, nearly as long as the tube. Corolla large, yellow.

I have not been accustomed to see this plant in its living state and therefore cannot point out with satisfaction to myself the distinction between this and the succeeding species. They differ much in size and perhaps in pubescence, and the leaves of this species are, I think, thinner in substance and the laciniate leaves less dentate than those of G. Quercifolia. The petioles and peduncles afford no certain character. I have for the present used Pursh's description of this species though dissatisfied with it.

Grows in dry shaded and rocky soils—found in the upper and mountainous districts of Carolina and Georgia.

Flowers July—September.

# 11. Quercifolia. Pursh.

G. glabra; caule erecto, ramosa; foliis
petiolatis, pinnatifidis,
summis lanceolatis, integerrimis, scabrius culis; floribus axillaribus, oppositis, pedicellatis; calycis laciniis sublanceolatis, tubum æquantibus.

Glabrous; stem erect, branching;
leaves on petioles,
pinnatifid, the upper
lanceolate, entire,
slightly scabrous;
flowers axillary, opposite, on pedicels; segments of the calyx
somewhat lanceolate,
as long as the tube.

Pursh 2. p. 423. G. Heterophylla. Muhl. Cat. Rhinanthus Virginica. Sp. pl. 3. p. 191.

Root perennial, creeping. Stem firmly erect, 3—6 feet high, branching, obtusely angled, purple, glabrous except near the summit. Upper leaves lanceolate, acute, slightly mucronate, with translucent veins, the upper surface and margins slightly scabrous, the lower leaves pinnatifid, the segments acute and toothed, and somewhat scabrous on both surfaces. Peduncles about 3 lines long. Calyx when young, pubescent, when old glabrous. Corolla about 2 inches long, ventricose, yellow, hairy on the inner surface, the border equally 5 cleft. Filaments nearly as long as the corolla, very villous at base, the long pair fringed along the back. Anthers hairy, bifid, and awned at base. Style as long as the stamens. Stigma obtuse. Capsule a little compressed at the summit.

This is probably the G. flava of Walter.

Grows in dry rich soils, very common. Flowers from May to September,

#### 12. PEDICHEARIA.

G. villosa. ramosissima; foliis oblongis duplicato-inciso serratis, pinnatifidisque; axillaribus oppositis pedicellatis; calvcis laciniis foliaceis inciso-dentatis.

Villous. much branched; leaves oblong, doubly notched, serrated and pinnatifid; flowers axillary. opposite on pedicels; segments of the calvx leaflike, notched and toothed.

Sp. pl. 3. p. 223. Walt. p. 170. Mich. 2. p. 19. Pursh 2. p. 424.

Root apparently annual. Stem 2-3 feet high, branching from its base, terete, purple, and with the whole plant viscid and clothed with very soft and dense pubescence. Leaves sessile, opposite, variously dissected. Peduncles about half an inch long. Segments of the Calyx foliaceous, incised and serrate. Corolla large, yellow, villous on the outside. Stamens shorter than the corolla, villous. Style longer than the stamens. Stigma obtuse. Capsule slightly compressed at the summit. Seeds numerous, very small, attached to a central receptacle.

Grows in dry sandy pine barrens, common in such situations. Flowers July-September.

# SEYMERIA. Pursie

Calyx profunde 5partitus. Corolla campanulata, sub æqualiter 5-fida. Filamenta 4, brevia, sub qualia, fauce inserta. Antheræ biloculares, poris apice dehiscencoso-ovata, 2-valvis,

Calyx deeply 5parted. Corollacampanulate, equally 5-Filaments 4, short, nearly equal, inserted in the throat of the corolla. 2-celled. opening Capsula ventri- | through pores at the summit. Capsule 0cens.

2-locularis apice dehis- | vate, ventricose, 2. valved, 2-celled, opening at the summit.

# 1. Tenuifolia. Pursh.

glabriuscula, ramosissima; **foliis** composite pinnatifidis,

Glabrous, profusely branched; leaves compoundly pinnatifid, laciniis oppositis alter- | with the segments opnisque, filiformibus; posite and alternate, corolla sub rotata; cap- filiform; corona what rotate; capsules glabrous.

Pursh 2. p. 737. Nuttall 2. p. 50. Gerardia Afzelia. Mich. 2. p. 20. Afzelia Cassioides. Gmel. Sys. Nat. Anonymos Cassioides. Walt. p. 171.

Root annual? Stem 3-4 feet high, with numerous brachiate branches, terete, rough. Leaves opposite, sessile, about an inch long, compoundly pinnatifid. Flowers near the summit of the branches axillary, opposite, on peduncles about an inch long. Calyx somewhat campanulate, the segments subulate, about twice as long as the tube. Corolla about half an inch long, of an obscure yellow, sprinkled in the throat with purple, pubescent, the border 5-cleft. Filaments villous at base, rather shorter than the corolla. Anthers incumbent, yellow, opening at the summit, the cells separate, and mucronate at base. Style declining, longer than the stamens. Stigma obtuse. Capsule compressed at the summit. Seeds numerous, very small.

The Anthers in this species, of which alone I can speak with certainty, bear a striking affinity to those of the Cassia. Hence and not from the co-

-rolla the specific name of Walter.

Grows very common in the low country in wet pine barrens.

Flowers August—September.

#### 2. Pectinata. Pursh.

S. viscido pubes-cens, ramossissima; foliis pectinato pinna-tifidis; laciniis indivi-sis, linearibus, acutis;

Viscidly pubescent, profusely branched; leaves pectinately pin-natifid, with the seg-ments undivided, lin-

corolla subrotata; cap- i ear, acute; sulis pubescentibus.

somewhat rotate; capsules pubescent.

Pursh 2. p. 737. Nuttall 2. p. 49.

The specific character above recited contains the character of the S. pectinata as given by Pursh and Nuttall. The observations which follow apply to a species which has been many years in my herbarium under the trivial name of S. Jacksoni, and which I refer to this species with some hesitation.

Root annual? Stem 2-4 feet high, profusely and brachiately branched, obtusely 4-angled and with the whole plant cloathed with a viscid pubescence. Leaves lanceolate in their outline, the lower always pinnatifid, 1-2 inches long, the upper small, and frequently entire. Flowers ax. illary, opposite, on peduncles longer than the upper leaves. Corolla somewhat rotate, of an obscure yellow. Stamens as long as the corolla. Capsule pubescent?

First sent to me from Louisville, Ga. by Mr. Jackson. Along the direct road from Milledgeville to the Alabama, by the Indian agency, it occurs not unfrequently. In the low country I have not seen it.

Flowers August-October.

#### PEDICULARIS. Gen. Pl. 1003.

Calyx 5-fidus. Corolla ringens, labio superiore emarginato, Capsula | compresso. 2-locularis, mucronata, obliqua. Semina tunicata.

Calyx 5-cleft. Co. rolla ringent, with the upper lip emarginate, compressed. Capsule 2-celled. mucronate. oblique. Seeds coated.

# 1. CANADENSIS.

P. caule simplici;

Stem simple, leaves foliis pinnatifidis, in pinnatifid, notched ciso-dentatis; capitu- and toothed; head lo basi folioso, hirsuto; hirsute, leafy at base; corollis galea setaceo- helmet of the corolla

bidentata; calycibus with 2 setaceous teeth; calyx obliquely truncated.

Sp. pl. 3. p. 211. Walt. p. 171. Mich. 2. p. 18. Pursh 2. p. 425.

Root perennial, creeping. Stem 6—12 inches high, terete, succulent and very pubescent. Radical leaves crowded, stem leaves alternate, all lanceolate in their outline, pinnatifid, with the segments notched and toothed, somewhat reticulate underneath, when young very pubescent, when old glabrous. Petioles compressed and slightly fringed. Flowers in crowded leafy spikes. Bracteas resembling the leaves. Calyx slightly angled, 2-cleft at the summit, obliquely truncated backwards so as to have no under lip. Corolla twice as long as the calyx, yellowish, tinged with purple, the lower lip 3-lobed, the intermediate lobe the smallest. Stamens a little shorter than the corolla, the 2 longer filaments bearded near the summit. Style longer than the corolla. Stigma slightly capi-Capsule compressed and opening at the summit. Seeds few in each cell, slightly angled.

Grows in rich shaded soils, rare along the sea coasts. Flowers March—April.

# MIMULUS. GEN. PL. 1049.

Calyx prismaticus, | 5-dentatus. Corolla ringens, labio superi-ore lateribus replicato. ringent, the upper lip with the sides folded Stigma Capsula 2-locularis, polysperma,

Calyxprismatic, *Corolla* 5-toothed. crassum. back. Stigma thick. 2-locularis, Capsule 2-celled, many seeded.

# 1. RINGENS,

M. erectus, glaber; Erect, glabrous; foliis sessilibus, lanceo leaves sessile, lanceo latis, acuminatis, ser-ratis; pedunculis ax-illaribus, oppositis, lary, opposite, longer flore longioribus; den- than the flowers;

tibus calycis oblongis, | teeth of the calyx obacuminatis. long, acuminate.

Walt. p. 172. Mich. 2. p. 23. Pursh. 2. p. 426. Sp. pl. 3. p. 360.

Perennial. Stem erect, 4-angled. Leaves opposite, narrow, lanceolate, slightly acuminate, serrate, sessile, semiamplexicaule, and with the whole plant glabrous. Flowers opposite, axillary near the summit of the stem, on peduncles nearly as long as the leaves. Calyx angled, the segments subulate, long. Corolla pale blue, the tube rather longer than the calyx, the lower lip larger than the upper, 3-lobed. Stamens very short, in the tube of the corolla. Style about as long as the stamens. many in each cell, small, oval, attached to a central receptacle.

Grows in damp soils in the middle and upper country of Carolina. Flowers July-September.

#### 2. ALATUS:

M. erectus, glaber; foliis petiolatis, ovatis, acuminatis, serratis; pedunculis axillaribus, oribus; dentibus calvcis rotundatis mucronatis; caule tetragono, alato.

Erect, glabrous; leaves petiolate. vate. acuminate. serrate; peduncles axiloppositis, flore brevi- | lary, opposite, shorter than the flower; teeth of the calyx round, mucronate; stem 4angled, winged.

Sp. pl. 3. p. 361. Pursh 2. p. 426.

Stem 1-2 feet high, square, slightly winged along the angles. Leaves broad, lanceolate, sometimes ovate lanceolate, serrate, when large almost dentate, like the whole plant glabrous, tapering at base to petioles half an inch long. Flowers on peduncles about as long as the petioles. of the calyx acuminate mucronate. Corolla very similar to that of the preceding species, pale blue, tinged in the throat with the yellow.

These two species have many points of resemblance, the former can be distinguished by its sessile leaves, long peduncles, and larger corolla. This by its larger leaves and stem more distinctly winged.

Grows in the flat pine barrens of Carolina. Flowers August—September.

# CHELONE. GEN. Pl. 1005.

Calyx 5-partitus, 3-bracteatus. Corolla ringens, ventricosa. Filamentum quintum gent, ventricose. A sterile, cæteris bre- lifth filament sterile, vius. Capsula 2-loc- shorter than the rest. ularis, 2-valvis. Se- Capsule 2-celled, 2mina plurima, margine membranacea..

Calyx 5-parted, with 3 bracteal leaves at base. Corolla rinvalved. Seeds many, with the margin membranaceous.

## 1. GLABRA.

lanceolatis, acumina ceolate, acuminate, tis, serratis, subsessili- | serrate, nearly sessile, bus, glabris; floribus | glabrous; albis.

C. folius oblongis, Leaves oblong, lan-

Mich. 2. p. 24. var. alba. Pursh 2. p. 427. Sp. pl. 3. p. 225. Nutt. 2. p. 51.

Root perennial. Stem herbaceous, angled, taking root at the joints, 2-3 feet high. Leaves generally opposite, 2-4 inches long, slightly acuminate, nearly sessile, and rather obtuse at base, somewhat rugose yet glabrous. Flowers in all the species, in compact, imbricate, terminal spikes. Bracteas shorter than the calyx. Segments of the calyx obtuse, nearly round. Corolla large, white, bearded internally on the lower lip. Stamens shorter than the corolla. Anthers as in the whole genus, woolly

Var. Lanceolata. Nuttall.

Leaves lanceolate, conspicuously acuminate, serrate, sessile, under surface pubescent. Bracteas scarcely dilated. Segments of the calyx oblong. Probably a distinct species. Nutt. Near Columbia and through the middle country the C. Glabra of Walter (p. 172.) is found and agrees very nearly with this variety. The leaves are larger than those of any specimens I have seen from the Northern States, pubescent, almost hairy underneath, the flowers large, numerous and very compactly imbricated: Sent me by Mr. Herbemont.

Flowers in the summer. (July—August. Pursh.)

# 2. OBLIQUA.

C. foliis petiolatis, Leaves petiolate, obliquis, lanceolatis, oblique, lanceolate, opfloribus posite; flowers puroppositis; purpureis.

Sp. pl. 3. p. 225. Nutt. 2. p. 51. C. glabra. Var. A. purpurea. Mich. 2. p. 24. Pursh 2. p. 427.

With this plant I am unacquainted. Michaux and Pursh consider it as a variety of the C. Glabra. Linnæus, (after Miller,) Muhlenberg and Nuttall admit it a species. Miller remarks that it differs from the preceding by roots less disposed to creep, broader leaves more deeply serrated and by its purple flowers. Plukenet however, to whom Linnæus refers, describes and figures his Purpurea with very narrow leaves, but as distinctly petiolate.

Grows in the mountains of Carolina and Georgia. Mich. Pursh.

Flowers August.

#### 3. Lyoni Pursh.

Pursh 2. p. 787. Nutt. 2. p. 51.

A fine large species, with purple flowers. Collected in the upper districts of Carolina and Georgia by Mr. Lyons. Pursh. Near Wilmington, N. C. Nuttall.

Flowers July—September.

# 4. Latifolia: Muhl. Cat.

acuminatis, basi at minate, tapering

C. glabra; foliis Glabrous; leaves lato-ovatis ovalibus-que, serratis, abrupte serrate, abruptly acu-

tenuatis, floribus ciliatis.

petiolatis; | base, on petiolės; confertis; | flowers crowded; braccalycibusque | teas and calyx ciliate.

This plant which was discovered also by Mr. Lyon along the base of the mountains of Carolina, but principally in Burke county N. C. I have always supposed to be the C. Latifolia of Muhlenberg's Catalogue. Plant generally about 2 feet, obtusely angled, very glabrous. Leaves opposite, on petioles nearly an inch long, tapering and somewhat acuminate at base, in my specimens not even obtuse much less cordate, about 4 long by 2 wide. Flowers as usual in a dense terminal spike. Segments of the calyx oblong and their margins with those of the bracteal leaves pubescent or rather finely fringed. Corolla rose coloured, rather smaller than those of the first species.

Flowers August.

# PELITSTEMON. GEN. PL. 1758.

Calyx 5-phyllus. Corolla bilabiata. ventricosa. Filamen-tum quintum sterile, cæteris longius, subarbatum. perne Capsula 2-locularis, merosa, subglobosa.

Calyx 5-leaved. Corolla bilabiate, ventricose. A fifth filament sterile, longer than the rest, bearded towards the summit. Capsule 2-celled, 2-2-valvis. Semina nu- | valved. Seeds numerous, globose.

#### 1. LÆVIGATUM

P. caule glabro;

Stem glabrous; foliis lævigatis, ovato blongis, amplexicau- blong amplexicau- slightly denticulate, ticulatis, inferioribus | the lower ones entire; integerrimis; floribus | flowers paniculate, the

paniculatis, filamento | sterile filament beard-

Sp. pl. 3. p. 228. Mich. 2. p. 21. Pursh 2. p. 427. Nutt. 2. p. 52. Chelone Pentstemon. Walt. p 172.

Root perennial. Stem 1-2 feet high, nearly terete, generally a little pubescent. Leaves of the root lanceolate, acute, frequently entire, sometimes sparingly denticulate, attenuated at base into a petiole 3-5 inches long, slightly winged; of the stem opposite, ovate, acuminate and sometimes pubescent near the base. Flowers in terminal panicles. Leaves of the calyx ovate lanceolate, externally hairy. Corolla pale purple, streaked with deeper tints, pubescent, hairy, within, upper lip 2-cleft with the segments slightly reflected, the lower 3-cleft. Stamens shorter than the corolla, the sterile filament sometimes divided. Style shorter than the stamens. Stigma simple. Capsule ovate, acuminate, sometimes 3 celled.

Grows in dry fertile soils. Flowers June—September.

#### 2. Pubescens.

P. caule pubescente; foliis serrulatis, leaves serrulate, lanlanceolato oblongis, ceolate oblong, sessessilibus, amplexi-caulibus; floribus pan-iculatis; filamento ste-the sterile filament rile ab apice infra me.. | bearded from the sumdietatem barbato.

Stem pubescent; mit below the middle.

Sp. pl. 3. p. 227. Mich. 2. p. 21. Pursh 2. p. 428. Nutt. 2. p. 52.

Perennial. Stem herbaceous, 1-2 feet high, pubescent, almost tomentose. Leaves sessile, amplexicaule, long, tapering, acutely serrulate, pubescent, those of the root sometimes oval and generally denticulate. Panicle as in the preceeding species. Corolla pale purple.

Grows in dry soils in the upper country of Georgia and Carolina. Flowers May—Sept.

## 3. Dissectum. E.

P? foliis oppositis, | Leaves opposite, sessilibus composite sessile, compoundly VOL. II.

dissectis, laciniis line- | dissected, the segaribus plerumque ob-tusis; floribus panicu-erally obtuse; flowers latis.

in panicles.

Stem about 2 feet high, slightly pubescent. Leaves glabrous, divided to the base, compoundly dissected or pinnatifid, the segments irregular in length, not pectinate, all linear, and generally obtuse. Flowers in a panicle composed of opposite branches, bearing a few flowers near and at the summit of the stem. Corolla purple, segments of the upper lip longer than those of the lower and more obtuse. Stamens shorter than the corolla, sterile filament as long or longer. Style nearly as long as the stamens. Stigma simple.

This remarkable species was sent me as a Pentstemon from Louisville, Georgia, by Mr. Jackson, its leaves have some affinity to the Seymeria, but the structure of the panicle and of the flower as far as the specimen permitted me to examine it, is exactly similar to the other species of this

genus.

Flowers.

# MARTYNIA. GEN. PL. 1010.

rolla ringens. sula lignosa, cortica- sule woody, coated, 4ta, 4-locularis, 2-val- celled, 2-valved, the vis, rostro hamato.

Calyx 5-fidus. Co- | Calyx 5-cleft. Co-Cap- | rolla ringent. valves terminating in a hooked beak.

# 1. PROBOSCIDEA.

M. caule ramoso; foliis alternis, rotun- leaves alternate, cordato cordatis, sub re- date, nearly round, pandis, integerrimis. | slightly repand, entire.

Stem branching;

Sp. pl. 3. p. 264. Pursh 2. p. 428. Nutt. 2. p. 53.

Annual. Stem generally procumbent, 1-2 feet high, branching, fistulous, and with the whole plant foetid, viscid and pubescent. Leaves sometimes opposite, on petioles 2-6 inches long. Flowers axillary, on peduncles 1-3 inches long. In this species there are two lanceolate, small, persistent leaves attached to the base of the calyx and forming in some measure an exterior calyx, the proper calyx is split on the under side to the base, the border 5 cleft, the 2 lateral lobes round, the intermediate longer and acute. Corolla of an obscure yellow, with brighter streaks and spotted with purple and brown, border 5 cleft, the 2 upper segments reflected, the 3 lower expanding. Stamens shorter than the corolla which contains also the rudiment of a fifth filament. Style longer than the stamens, dilated towards the summit. Stigma two lobed, compressed, possessing some irritability. Capsule rather large, with the surface furrowed like bark, tapering to the summit and each valve terminating in an incurved beak 2—3 inches long. Seeds ovate, covered with a pulpy coat.

Grows in dry soils, about buildings, Beaufort, Columbia, generally dif-

fused but I suspect not indigenous.

Flowers June—August.

# SCHWALBEA. GEN. PL. 1001.

Calyx ventricosotubulosus, 4-fidus, lacinia superiore minima, infima maxima, emarginata. Corolla ringens. Capsula 2-locularis, 2-valvis, dissepimento duplicato. Semina paleacea.

Calyx tubular, ventricose, 4-cleft, the upper segment very small, the lower very large, emarginate. Corolla ringent. Capsule 2-celled, 2-valved with a double partition. Seeds winged.

## 1. AMERICANA.

Sp. pl. 3. p. 201. Walt. p. 167. Mich. 2. p. 428. Pursh 2. p. 423. Nutt. 2. p. 54.

Root perennial. Stem herbaceous, about 2 feet high, angled and with the whole plant pubescent. Leaves alternate, sessile, lanceolate, entire, somewhat 3 nerved. Flowers alternate in a terminal raceme. Peduncles 1—2 lines long. Bracteas 2, linear lanceolate, as long as the calyx. Calyx furrowed, 4-cleft, with the lower segments gradually increasing in length. Corolla twice as long as the calyx, of a dull purplish yellow colour, the upper lip arched, entire; the lower shorter, 3 cleft. Stamens shorter than the corolla. Anthers somewhat crescent shaped. Style

longer than the corolla. Stigma simple. Capsule ovate, (dissepiment, composed of the inflected margin of the valves, and parallel with the longitudinal receptacle. Seeds numerous, imbricated, linear, winged. Nutt.)

Grows in pine barrens. Finwers May—June.

## EUCHROMA. NUTT.

Calyx spathæformis, 2-fidus, plus minusve bipartitus. Corolla bilabiata, labio superiore longiore, lineari; inferiore 3-fido. Antheræ lineares, co-Capsula hœrentes. 2-valvis. 2 locularis. Semina plurima, vesiculo membranaceo inclusa.

Calyx spathe shaed, 2-cleft, more Corolla less divided. 2 lipped, the upper long, linear, the lower lip 3 cleft. Anthers linear, cohering. Capsule 2-valved, 2-cel-Seeds numerous inclosed in a membranous vesicle.

Leaves and colour-3-fidis; calyce | cately 3 cleft; calyx" 2 cleft, as long as the corolla with the segments retuse, emarginate.

Bartsia Coccinea. Sp. pl. S. p. 185. Walt. p. Mich. 2. p. 17. 167. Pursh 2. p. 429.

Annual or biennial. Stem 12-18 inches high, pubescent. Root leaves lanceolate, 3 nerved, entire, hairy. Stem leaves alternate narrow, long, divided into 3 almost linear segments, pubescent. Flowers in a terminal spike. Bracteas large, persistent, alightly lobed, enfolding the flower, red, frequently very brightly coloured near the summit. Corolla yellowish, long, the upper lip narrow enclosing the stamens, the lower much shorter, with the segments plaited, acute. (Anthers long, linear, with the lobes unequal, cohering, producing a polleniferous disk. Nutt.)

Grows in damp soils in the middle and upper districts of Carolina and

Georgia.

Flowers June—August.

# MELAMPYRUM. GEN. PLANT. 999.

Calyx 4 fidus. Corollæ labium superius compressum, margine replicato. Capsula 2 dehiscens. Semina 2 in loculo singulo.

Calyx 4 cleft. Upper lip of the corolla compressed with the margin folded back. locularis, obliqua, hinc | Capsule 2 celled, oblique, opening on one side. Seeds 2 in each cell.

# 1. Lineare. Lamark.

M. foliis inferioribus linearibns, integris, floralibus lanceo-Aoribus axillaribus distinctis.

Lower leaves linear, entire, the upper lanceolate, toothed at latis postice dentatis; | base; flowers axillary, solitary.

Sp. pl. 3. p. 200. Pursh 2. p. 430. Nutt. 2. p. 58. M. Americanum. Mich. 2. p. 16.

Annual. Stem about 12 inches high, branching, terete, slightly pubescent. Lower leaves linear, the upper generally lanceolate, all opposite, on short petioles, the youngest dentate near the base. Flowers axillary, small, on short peduncles. Corolla pale yellow, 2 lipped, the lower lip 3 cleft. Stamens nearly equal. Capsule oblique, compressed, acute, reflected? Seeds cartilaginous, oblong.

Grows in the mountains of Carolina. Dr. Macbride.

## OBOLARIA. GEN. Pl. 1044.

Calyx 0? Corolla campanulata, 4 fida. Stamina æqualia i cleft. Stamens equal ex divisuris corollæ. In the divisions of the Stigma bifidum. Cap- | corolla. Stigma 2sulā 2 valvis, 4 locu- | cleft. Capsule 2 vallaris? Semina pluri- | ved, 4 celled? Seeds ma, parva.

Calyx 0? Corolla campanulate, 4numerous, small.

#### 1. VIRGINICA.

Sp. pl. 3. p. 346. Pursh 2. p. 431. Nutt. 1. p. 103.

Root perennial? Stem herbaceous, 4-6 inches high, smooth. Leaves obovate, obtuse, sessile, and slightly decurrent, entire, smooth, glaucous. Flowers generally 2-3 on the summit of small, opposite, axillary branches, sometimes sessile. Bracteas? 2 leaves similar to the leaves of the stem at the base of each flower, performing perhaps the functions of a calyx. Corolla campanulatr, deeply divided, white; segments equal, acuminate, sometimes fimbriate. Filaments inserted in the divisions of the corolla, about half as long as the segments. Germ superior. Style rather longer than the filaments. Stigma deeply 2 cleft. Capsule 2 valved, 4 celled? or perhaps 1 celled with the rudiments of partitions. Seeds very small.

This plant, from the structure of the corolla and the insertion of the stamens, certainly belongs to the class Tetrandria where it has been cor-

rectly placed by Mr. Nuttall.

Grows in rich soils, near Clouter's spring, 6 miles from Charleston.

Flowers March?

# OROBANCHE. GEN. PL. 1045.

Calyx 4—5 fidus. Corolla sub-ringens, 5-fida. Capsule ovata, acuta, 1-locularis, 2-valvis. *Semina* plurima, minima. Glandula sub basi germinis.

Calyx 4-5 cleft. Corolla somewhat ringens, 5-cleft. Capsule ovate, acute, 1-celled, 2-valved. Seeds numerous, very small. A gland under the base of the germ.

#### 1. AMERICANA:

exertis.

O. caule simplicis- | Stem very simple, simo, squamis ovato-lanceolatis, imbricatis, obtecto; spica termi-scales; spike terminal, nali, glabra; corollis | glabrous; corolla rerecurvatis; staminibus | curved; stamens exserted.

Sp. pl. 3. p. 351. Walt. p. 166. Mich. 2. p. 26. Pursh 2. p. 431. Nutt. 2. p. 58.

Root perennial, somewhat tuberous, parasitic? Stems clustered, forming compact patches, 1-2 feet in diameter, simple, carnose, clothed with long ovate scales, tapering towards the summit, of a pale brown colour. Flowers in a terminal spike, one or more from each bud, covered and protected by the scales of the stem. Calyx 5? parted unequally, with 2 small bracteal leaves at base. Corolla slightly incurved, 5 lobed, nearly white, a little longer than the calyx. Style nearly as long as the corolla-Stigma capitate.

Grows in rich shaded soils. Flowers March—April.

#### 2. UNIFLORA.

vata.

O? scapis nudis u- | Scapes naked, one midoris; calyce corac- flowered; calyx withteato; corolla recur- out bractea; corolla recurved.

Sp. pl. 3. p. 352. Walt. p. 166. Mich. 2. p. 26. Pursh 2. p. 431. O. Biflora. Nutt. 2. p. 59.

Roof perennial, somewhat tuberous. parasitic. Stems very short, numerous from each root, covered with scales, bearing one or two flowers near the summit. Flowers in my specimens invariably solitary, on naked, pubescent scapes, 2-4 inches long. Calyx somewhat campanulate, deeply 5-cleft, pubescent. Corolla 3 times as long as the calyx, slightly curved, of a yellowish white colour, with deeper veins, border 5-cleft, segments oval, edged with a very fine blue fringe. Stamens and Style much shorter than the corolla. (Anthers obcordate with the filaments smooth. Stigma bilammellate, perforated, lobes rounded and acuminate, the lower lobe arched over the stamens. Nutt.)

Grows in the pine barrens of the middle country of Carolina. Dr.

Macbride.

Flowers April.

#### 3. VIRGINIANA.

O? caule ramoso; floribus alternis distantibus; corollis deciduis, 4-dentatis; capsulis oblique truncatis, hinc dehiscentibus.

Stem branching; flowers alternate, distant; corolla deciduous, 4-toothed; capsule obliquely truncated, opening on one side.

Sp. pl. 3. p. 351. Walt. p. 166. Mich. 2. p. 26. Pursh 2. p. 431. Epifagus Americana. Nutt. 2. p. 60.

Root parasitic, somewhat tuberous, perennial. Stem 12—18 inches high, branching, smooth, carnose, bearing small remote scales. Flowers alternate, distant, nearly sessile, the lower ones bearing fruit, the upper ones generally abortive. Calyx short, 4-toothed. Corolla 4-toothed, the sterile flowers much larger than the fertile, white, streaked with purple. Stamens about as long as the corolla. Style simple. Stigma capitate. Capsule nearly round, dilating, after it opens, very much in the shape of a cup.

Grows on the roots of Beech trees, to which tree it is exclusively at-

tached.

Flowers August—September.

These three plants probably belong to distinct genera. The O. Americana alone resembles strongly the European species of this genus. Mr. Nuttall, and I believe Mr. Rafinesque before him has pointed out the propriety of separating the O. Virginica from the other species. I am not able at present to turn to the observations of Mr. Rafinesque whose name would have at least the claim of priority, and I have continued to use the ancient arrangement.

Leaves fleshy, glabrous, spathulate-ovate, sinuate; lobes obtuse, toothed; lower joint of the pod somewhat terete, the upper compressed,

Nuttall 2. p. 62. C. Maritima. Pursh 2. p. 434.

Root annual. Stem erect, with expanding branches, slightly angled towards the summit. Leaves alternate, not glaucous, the upper ones lanceolate, the lower almost hastate. Flowers in terminal racemes, but forming corymbose clusters when they first begin to expand; common peduncle 1 -3 inches, the partial 2-3 lines long. Calyx 4-leaved, deciduous; leaflets linear lanceolate, slightly gibbous at base. Corolla cruciform. Petals 4, obcordate, white, with claws a little longer than the calyx. Filaments 6, of which 2 are shorter than the others. Germ superior, slightly compressed, jointed below the middle. Style 0. Stigma thick. Glands 4, two at the base of the shorter filaments, and one between the base of each longer pair. Pod 2-jointed, without valves. Seed 1 in each joint, oval, glabrous.

Grows in the drifting sands along the margins of the ocean. Cultiva-

ted sometimes for the table, and much commended.

Flowers April—July.

## DRABA. GEN. PL. 1076.

Silicula integra, o- Pod entire, oval vali-oblonga, valvis oblong; valves some-planiusculis, dissepi- what flat, parallel with the partition.

### 1. CAROLINIANA.

D. foliis ovali-lan-ceolatis, hirsutissimis; ramulis floriferis nu-dis; siliculis longo-linearibus, glabris, ap-proximatis.

Leaves oval lance-olate, very hairy; flower bearing stems naked; pods linear, glabrous, approxi-mate.

Walt. p. 174. Nutt. 2. p. 62. D. hispidula. Mich. 2. p. 28. Pursh 2. p. 433.

Root annual. Stem very short, covered like the leaves with a stellular pubescence, and divided almost at the surface of the earth into 4 or 5 naked flower bearing branches, each about 2 inches long. Leaves clustered on the stem, small, more or less acute, and covered with a stellular pubescence. Flowers on the summit of the branches. Calyx 4 leaved, deciduous. Corolla 4-petalled, oblong, with a base tapering to a claw, white, in the later florets probably wanting. Stamens half as long as the petals. Style very short. Stigma quadrifid. Pod 3-4 lines long, linear lances late. Seeds many. Disseptiment generally persistent.

Grows in sandy sails, James' Island, St. John's Berkley, Augusta. Flowers in February, March.

### CORONOPUS. GERT.

Silicula reniformis, compressa, corrugata; loculis evalvibus, monospermis.

Pod reniform, compressed, corrugate; cells one seeded, without valves. ospermis.

### 1. DIDYMA.

tifloris.

C. siliculis emarginatis, didymis, reticulato-rugosis; stylo obsoleto; corymbis multifloris.

Pods emarginate, in
pairs, reticulate, rugose; style obsolete;
corymb many flowered.

Pursh 2. p. 435. Nuttall 2. p. 64. Lepidium didymum. Sp. pl. 3. p. 439. Biscutella apetala. Walt. 174. Cochlearia humifusa. Mich. 2. p. 27.

Root fibrous, in our climate almost perénnial. Stem branching, prestrate, 1 to 2 feet long, a little hairy. Leaves alternate, sessile, glabrous, pinnatifid; the segments linear lanceolate, sometimes toothed, mucronate. Flowers in small corymbs opposite the leaves. The Rachis as in most of this class increasing in length after flowering, and forming racemes when in fruit. Calyx 4-leaved, leaves lanceolate, acute, glabrous, 2 appressed, the others expanding, all somewhat persistent but falling before the fruit matures. Corolla 0. Filaments 2 fertile, subulate, as long as the calyx, 4 sterile, 2 at the base of each fertile filament. Anthere incumbent, erect. Germs superior, compressed, orbicular. Style none. Stigma sessile. Pod 2-lobed, emarginate at each end, without valves. Seeds 1 in each cell.

Grows very common in open grounds and pastures, is eaten freely by cattle early in the spring and communicates to their milk and butter. a disagrecable flavor.

Flowers from February to July.

Pepper Grass.

# 2. Ruellii.

C. siliculis integris | Pod entire, with a cristato-muricatis; sty- | muricated margin;

lo porrecto; corymbis | style prominent; copaucifloris. rymb few flowered.

Pursh 2. p. 435. Nutt. 2. p. 64.

This plant which I have inserted from Pursh and Nuttall has escaped my observation. It is said to grow in pastures intermingling with the C. Didyma, and to be a larger species.

## LEPIDIUM. GEN. PL. 1077.

Mich. 2. p. 29. Pursh 2. p. 439. Nutt. 2. p. 67.

A plant has been sent me by Dr. Anderson from Claremont county, S. Carolina, as the C. Spathulata of Michaux, which though differing a little from the description, I know not where else to refer. Root annual? Stem erect, 6-12 inches high, hairy, and the pubescence on the stem and leaves stellular. Root Leaves lanceolate, spathulate, rather obtuse, scarcely an inch long. Stem naked below, leaves towards the summit of the stem linear lanceolate. Flowers in racemes axillary and terminal. Calyx 4leaved, hairy, leaflets oval. Corolla white, petals oblong and obovate, twice as long as the calyx. Stamens nearly as long as the corolla. Style very short. Stigma capitate. Pod terete, linear, about an inch long.

None of the pods in my specimen were mature, but they appeared to

exhibit the character of this genus.

Grows in the middle districts of Carolina.

Flowers March—April.

### 2. VIRGINICA.

C. glabra, erecta; foliis pinnatis, foliolis lanceolatis, subauriculatis; siliquis stricte Glabrous, erect; leaves pinnate, leassets lanceolate, somewhat auriculate; pods long, erectis.

erect. straight.

Sp. pl. 3. p. 488. Mich. 2. p. 29. Pursh 2. p. 439. Nutt. 2. p 67.

Root perennial? Stem 8-12 inches high, a little hairy. Leaves alternate, pinnate, leaflets somewhat lanceolate, generally angled on the under side, the upper ones larger. Flowers in terminal racemes, small, Corolla white, a little longer than the calyx. Pod terete, linear.

Grows in the upper districts of Carolina.

Flowers April—May.

### 3. Pennsylvanica.

C. glabra, ramosa; | Glabrous, branch-foliis pinnatis, foliolis | ing; leaves pinnate, subrotundo-obtusis an-gulato-dentatis; sili-obtuse, toothed and quis angustis, erectis.

angled; pods narrow,

Sp. pl. 3. p. 486. Pursh 2. p. 440. Nutt. 2. p. 67. Sisymbrium Nasturtium? Walt. p. 174.

Root annual? Stem erect, about a foot high, branching, angled and glabrous. Leaves pinnate or rather pinnatifid, glabrous, leaflets 4-6 pair, obtuse, toothed, entire when very small. Flowers in terminal racemes. Leaflets of the calyx linear lanceolate, glabrous, deciduous. Petals twice as long as the calyx, obovate, white. Stamens a little longer than the germ. Style 0. Stigma obtuse. Pod about an inch long, terete and very slender.

To the preceding species this bears much resemblance, it is distinguished however, by its glabrous stem and leaves, by its larger and more distinctly toothed leaflets, and by a pod longer and much more slender. The two species have probably been united by Michaux.

Grows in wet lands. Very common in the tide swamps, resembling very much in flavour the garden cress, for which it is frequently used as a substitute.

Flowers February—April.

#### SISYMBRIUM. Gen. Pr. 1089.

Siliqua rostro bre- | vi, tereti, dehiscens, valvulis rectiusculis. Calyx, Corollague patentes.

Pod with the beak short, terete, opening, the and straight. Calux and Corolla expanding.

## 1. Nasturtium.

S. siliquis declinatundis, repando-dentatis.

'Pods declining, tis brevibus; foliis pin- | short; leaves pinnate, natis, foliolis subro- | leaflets nearly round, repand, sparingly toothed.

Sp. pl. 3. p. 489. Pursh 2. p. 440. Nutt. 2. p. 67.

Root perennial. Stem 12-18 inches high, branching. Root Leaves 2-5 inches long, pinnatifid, with the upper segments much dilated, very glabrous. Flowers in terminal racemes. Leaves of the calyx ovate. Petals twice as long as the calyx, obovate, bright yellow. Stamens shorter than the corolla. Pods about an inch long, many seeded, slightly in-

. This plant, the common cress of our gardens, is becoming naturalized in our country, but in the low country of South-Carolina, it certainly is not indigenous.

Grows in close and damp soils, Flowers February—May.

### 2. PALUSTRE.

vioribus.

S. siliquis declina- | Pods declining, obtis oblongo-ovatis; fo-liis pinnatifidis serra-tis; petalis calyce bre-tals shorter than the calyx.

Sp. pl. 3. p. 490. Pursh 2. p. 440. Nutt. 2. p. 67.

With this species I am unacquainted. (Root annual. Flowers yellow. Pursh.)

Grows in inundated and low ground, from Canada to Carolina. Pursh. Flowers July-August.

## 3. WALTERI E.

S. ramosissimum, procumbens; foliis procumbent; leaves pinnatifidis, laciniis obtusis, sinuato-denta- obtuse, sinuate-denprocumbens; tis, supremis confluen- tate, the upper conflutibus; siliquis brevi- ent; pods short, genbus, sub erectis. E.

Much branched. erally erect.

S. tanacetifolium. Walt. p. 174.

Root perennial? Stem generally procumbent, 6-14 inches long, angled and sprinkled with a transparent pubescence. Leaves pinnatifid, glabrous, toothed and sinuate, the segments very gradually increasing in size towards the summit. Flowers in simple racemes; racemes axillary, opposite the leaves and terminal. Leaves of the Calyx lanceolate, a little hairy, appressed. Petals nearly linear, tapering at base, scarcely as long as the calyx, yellow. The long Stamens just equal to the germ. Anthers somewhat globose. Style very short. Stigma capitate. Pod scarcely half an inch long, terete, slightly incurved, opening from the base. Very nearly allied to the preceding species, from which it appears to differ by its procumbent stems and terete pod.

Grows in damp soils. Common around Charleston and Beaufort.

Flowers February—May.

# 4. Amphibium.

tis oblongo ovatis; fo-liis oblongo lanceola-tis pinnatifidisve, ser-long ovate; leaves oblong, lanceolate, sometimes deeply serratis; petalis calyce longioribus.

S. siliquis declina- | Pods declining, obrate and pinnatifid; petals longer than the

Sp. pl. 3. p. 491. Pursh 2. p. 440. Nutt. p. 67. Sisymbrium indicum.

Root perennial? Stem erect, about a foot high, branching, angled, glabrous. Leaves lanceolate, acute, deeply toothed, the lower ones pinnatifid, sinuate, and tapering at base. Flowers in terminal racemes. Leaves of the Calyx oval, appressed, deciduous, a little hairy near the nummit. Petals pale yellow, sometimes wanting. Pod short. about half an inch long, ascending, terete.

Grows along the margins of ditches and in wet places. Common in

the river swamps of Ogeechee.

Flowers March—April and sometimes in the autumn.

#### 5. CANESCENS. Nutt.

S. foliis bipinnatifibrevioribus.

Leaves doubly pindis, can escentibus, laci- natifid, hoary; seg. niis dentatis, obtusis, ments dentate, ob-interdum obovatis; tuse, sometimes obopetalis calycem æ-quantibus; siliquis sub angulatis, adscen-dentibus, pedunculo tuse, sometimes obdevates, vate; petals as long as the calyx; pods slightly angled, ascen-ding, shorter than the peduncle.

Nutt. 2. p. 68. S. Sophia. Pursh 2. p 440. Erysimum pinnatum. Walt. p. 174.

Stem 1-2 feet high, erect, branching, with the leaves Root annual. very pubescent. Leaves 2-3 inches long, hoary and with segments variously toothed. Flowers in terminal racemes. Leaves of the Calyx oval erect, pubescent. Petals obovate, as long as the calyx, expanding, yellowish. Stamens longer than the germ. Style short. Stigma capitate. Pod short, distinctly angled, sometimes splitting at the angles as if four valved. Seeds many in each cell, obovate, slightly roughened.

While looking over my specimens I have had reason to believe that we have another species in this country closely allied to the present, with leaves more finely dissected and with longer pods, but I have not materials to complete its character.

Grows in sandy pastures, very common.

Flowers March—April.

## ERYSIMUM. GEN. Pl. 1090.

Siliqua columnaris, Pod columnar, tetraeda. Calyx clausquare. Calyx classes. ed.

### 1. OFFICINALE.

E. siliquis spicæ ad Pods appressed to pressis; foliis runcina- the stem; leaves runtis.

Sp. pl. 3. p. 509. Mich. 2. p. 31. Pursh 2 p. 436. Nutt. 2. p. 68.

Root annual. Stem 1-3 feet high, erect, glabrous, with expanding branches. Lower Leaves large and runcinate, the upper ones somewhat hastate. Flowers on long, very slender racemes, very small. Corollar pale yellow, a little longer than the calyx. Pod 6—8 lines long, tapering to an acute point, closely appressed to the stem.

An European plant, partially naturalized in our country.

Grows along the road side from Canada to Carolina. Pursh. Not found in the low country of Carolina.

Flowers May—June. Pursh.

## ARABIS. GEN. PL. 1049.

crown longer than the corolla.

Sp. pl. 3. p. 621. Walt. p. 233. Mich. 2. p. 39. Pursh 2. p. 445. Nutt. 2. p. 78.

Root perennial, composed of thick, fleshy, creeping fibres, sometimes swelling into tubers. Stem herbaceous, voluble, sometimes climbing 20 to 30 feet high. Leaves alternate, finely pubescent along the veins, the lateral lobes unequal, the intermediate lanceolate, all serrate and slightly acuminate. Petioles about an inch long. Tendrils axillary, 6-8 inches long, spiral towards the summit. Flowers axillary, solitary, on a jointed peduncle 3-5 inches long. Involucrum situated near the joint of the peduncle; leaflets short, obovate, acuminate. Calyx 5-parted, pubescent; segments oval, slightly angled on the back with a projecting point near the summit. Petals 5, oval, as long as the calyx to the base of which they are attached, white. Nectary in a triple series, the 2 exterior composed of radiating filaments as long as, or longer than the corolla, forming a double crown, purple with a pale nearly white circle at some distance from the centre; the interior composed of short, erect, incarnate rays, surrounding the base of the pedicel of the germ. Filaments 5, about half an inch long, compressed, speckled, attached to the summit of the pedicel of the germ, united at base into a tube. Anthers incumbent, oblong. Germ superior, oval, pubescent, supported on a speckled pedicel nearly half an inch long. Styles 3, slightly recurved, thickened near Stigmas globose, viscid. Berry? oval, glabrous, about the size of an egg, covered with a leathery coat, pale yellow when ripe. Seeds very numerous, small, enveloped in a gelatinous edible pulp.

Grows in dry soils. Flowers May to July.

### 2. Lutea.

Root perennial, composed of thick and somewhat fleshy fibres. Stem herbaceous, slender, climbing over small shrubs, a little hairy. Leaves

small, obtusely 3 lobed, of a very pale green, smooth on the upper surface. Peduncles 1—2 inches long, each bearing a single flower. Flowers small, the petals and nectary of a greenish yellow colour. The fruit

Grows in close damp soils, very generally diffused over the country but not very common.

Flowers May-July.

#### OPLOTHECA. NUTTALL.

Calyx duplex, exterior diphyllus, truncatus; interior longior, monophyllus, 5 fidus, tomentosus. Co-Utriculus | rolla 0. muricato inclusus.

Calux double, the exterior two leaved. truncate; the interior longer, one leaved, 5 cleft, tomentose. Corolla 0. Utriculus monospermus, calyce one seeded, inclosed in the muricate calyx.

### 1. FLORIDANA:

Nutt. 2. p. 79.

Root perennial? Stem herbaceous, erect, sparingly branched towards the summit, pubescent, 3 to 4 feet high, tumid at the joints with long internodes. Leaves opposite, sessile, linear lanceolate, entire, a little scabrous on the upper surface, lanuginous underneath. Flowers in long compact spikes 1-3 inches long, forming a loose straggling terminal panicle. Exterior Calyx membranaceous, half the length of the interior—the interior ovate, slightly compressed, 5 cleft at the summit and covered with a cotton like tomentum. Staminiferous tube (Lepanthium) cylindric, bearing 5 stamens nearly as long as the interior calyx. Seed finally inclosed by the interior calyx which hardens and becomes muricated with 2 crested margins and 2 dorsal protuberances on each side near the base.

This plant which has been very acurately described by Mr. Nuttall. was first found by Dr. Baldwin in Florida. It grows very abundantly on the high pine ridges between the Flint and Chatahouchie rivers along the

Federal road.

Flowers through the summer.

Diffuse, pubescent; leaves opposite, 5 lobed, lobes three cleft; peduncles two flowered; petals emarginate as long as the villous.

Sp. pl. 3. p. 711. Walt. p. 175. Mich. 2. p. 38. Pursh 2. p. 449. Nutt. 2. p. 80.

Root annual, fusiform. Stem procumbent and assurgent, di and trichotomously divided, pubescent with the hairs reflected. Leaves opposite at the division of the stem, 5-7 lobed, the lobes generally 3 cleft and the segments again notched and divided, the margins of the leaves as well as the stem are frequently tinged with purple. Petioles 4-6 inches long. Stipules 2, subulate, at the base of each petiole. Flowers in the division of the stem. Peduncles 2—4 inches long, 2 flowered. Calyx 5 leaved. angled, persistent; leaves ovate, 3 nerved, fringed and mucronate. Petals obovate, emarginate, hairy at base, pale purple, as long as the calyx. Stamens 10, about half as long as the corolla, 5 exterior and a little shorter than the others; all slightly united at base but scarcely monadelphous. Nectary? 2 yellow glands at the base of each shorter filament. Germ superior, very villous. Styles 5? united. Stigmas 5, thick, oblong. Arilli black, hairy, mucronated with the straight persistent style. Seeds 2 in each arillus, oval.

Grows in all cultivated grounds very abundantly. Flowers from March to May.

## 2. MACULATUM.

G. erectum, retror-

Erect, retorsely pusum pubescens; caule bescent; stem dichodichotomo; foliis op- tomous; leaves oppopositis 3—5 partitis, site, 3—5 parted, incisis; pedunculis e- notched; peduncles longatis bifloris; pe- | long,2flowered; petals talis obovatis.

Sp. pl. 3. p. 705. Walt. p. 175. Mich. 2. p. 38. Pursh 2. p. 448. Nutt. 2. p. 80.

Root tuberous, perennial. Stem 6—12 inches high, sparingly divided, pubescent with the hairs reflected. Root leaves on long petioles; stem leaves opposite, the upper pair nearly sessile; all 5 parted, the lobes obovate, notched and toothed, pubescent. Peduncles few, terminal, 2 howered. Calyx hairy, conspicuously mucronate. Corolla purple. Petals twice as long as the calyx, not emarginate.

The flowers of this species are conspicuous and ornamental.

Grows in the rich oak lands of the upper country.

Flowers April—May.

### SCHRANKIA. WILLD.

Calyx tubulosus, 5 dentatus. Petala 5.
Stamina 8—10 exerta. Siliqua 4 valvis. Calyx tubular, 5 toothed. Petals 5.
Stamens 8—10 exerted. Pod 4 valved.

### 1. UNCINATA.

Sp. pl. 4. p. 1043. Pursh 1. p. 305. Nutt. 2. p. 81. Mimosa Intsia. Walt. p. 252. Mimosa horridula. Mich. 2. p. 254.

Root perennial. Stem herbaceous, prostrate, 2-3 feet long, angled, thickly armed with retrorse uncinate prickles. Leaves alternate, abruptly bipinnate. Common petioles about 3 inches long, angled, prickly and glabrous like the stem, pinnate, opposite. Leaflets small, nearly elliptic, gibbous at base, thinly sprinkled with hair, irritable, closing at the touch as quickly and as completely as any species of the Mimosa. Flowers numerous, aggregated in spherical heads. Peduncles in pairs, axillary, from 1-2 inches long, prickly like the stem. Calyx very minute, 5 toothed. Corolla tubular, small, but many times longer than the calyx, 5 cleft, of a bright purple. Stamens generally about 10, 2-3 times as long as the corolla, slightly cohering at base. Anthers incumbent, 2 lobed, somewhat elliptic, yellow. Germ superior, long, slender. Style as long as the stamens. Stigma simple. Legumen oblong, prickly, 4 valved. Seeds several in each valve.

Grows in dry sandy pine barrens.

Flowers from May-July,-perhaps through the summer.

### POLYANDRIA:

## SIDA. GEN. PL. 1129.

Calyx simplex, angulatus. Stylus multipartitus. Capsulæ plures, 1—3 spermae. Calyx simple, angulatus. Stylus multipartitus. Capsulæ parted. Capsules nuplures, 1—3 seeded.

### 1. Gracilis. E.

S. caule gracili, glabro; foliis linearibus serratis; pedunculis solitariis, axil-

laribus, longitudine pe-tiolorum; capsulis (10) bicornibus, glabris. long as the petioles; capsules (10) two horned, glabrous.

Root fibrous, perennial. Stem herbaceous, 2-3 feet high, glabrous, sparingly branched and with the branches very slender. Leaves alternate, obtuse at base, glabrous, sometimes sprinkled with a few hairs; the lower ones narrow, lanceolate. Petioles 4-8 lines long, pubescent. Stipules linear, as long as the petioles. Calyx 1 leaved, angled, persistent, a little hairy, 5 cleft. Petals 5, expanding, striate, yellow, obovate with the summit obliquely sinuate. Staminiferous column short, pubescent, many cleft; segments 3-4 lines long. Anthers incumbent. Germs superior, depressed, glabrous. Style as long as the stamens, many cleft. Stigmas capitate. Capsules 10, united in a depressed spherical head, glabrous. Seed 1 in each capsule, reniform.

Grows in sandy soils upon the Sea Islands. Common about Beaufort.

Flowers August—September.

# 2. HISPIDA.

S. hispido-pilosa; Hispid; leaves lan-foliis lanceolatis, ser-ratis; pedunculis soli-duncles solitary, axil-

tariis, axillaribus, lon- lary, as long as the pegitudine petiolorum; tioles; exterior calyx calyce exteriore fili- filiform. Pursh 2. p. formi. 452.

Among the undetermined specimens in my herbarium, I have one which

may possibly belong to this species.

Root perennial? Stem 12-18 inches high, branching, tomentous rather than hispid, pubescence stellular. Leaves lanceolate, somewhat rhomboidal, serrate, a little hairy on both surfaces, on petioles 1-2 lines long. Flowers on small axillary branches, so crowded and so nearly sessile that shough strictly solitary on each axil, they appear fasciculated. Stipules subulate, hairy, longer than the petioles or peduncles. Calyx angular, hairy. Petals yellow, a little longer than the calyx.

The mature capsule I have not seen,

This plant has no exterior calyx, but in the dried specimens the stipules are very often found adhering to the calyx as if connected with it.

Grows in sandy soils. Flowers July-August.

### 3. RHOMBIFOLIA.

S. foliis oblongolanceolatis, dentatis, ceolate, toothed, cubasi cuneiformibus, integerrimis; pedunculis petiolis multo longioribus; capsulis bicornibus.

Leaves oblong, lanneate and entire at base; peduncles much longer than the petioles; capsules two horned.

Sp. pl. 3. p. 740. Mich. 2. p. 43. Pursh 2. p. 452. Nutt. 2. p. 81.

Root perennial, stoloniferous. Stem suffruticose, 1-2 feet high, branching, covered as well as the under surface of the leaves with a stellular pubescence. Leaves in alternate clusters, a little hairy on the upper surface slightly glaucous underneath. Petioles 2-3 lines long. Stipules setsceous, as long as the petioles. Flowers axillary, in general solitary. Peduncles 2-3 inches long. Calyx 5-angled, pubescent, persistent, 5-cleft. Petals obovate, yellow, about an inch long. Staminiferous column scarcely half as long as the corolla. Style as long as the stamens. Cap sules about 12, aggregated in a depressed spherical head. Seed 1 in each capsule.

Grows in dry pastures.

Flowers from July—October.

### 4. Spinosa.

S. caule patulo, axillis subspinosis; foliis cordato-ovatis, dentatis; pedunculis solitariis, axillaribus; stipulis setaceis, pedunculo longioribus; capsulis birostratis.

Branches expanding, with the axils somewhat spiny; leaves cordate ovate, toothed; peduncles solitary, axillary; stipules setaceous, longer than the peduncles; capsules two horned.

Sp. pl. 3. p. 736 Walt. p. 176. Mich. 2. p. 48. Pursh 2. p. 452.

Root annual? Stem 1—2 feet high, branching, pubescent. Leaves alternate, ovate, very obtuse or cordate at base, coarsely serrate, pubescent, particularly on the under surface. Petioles about an inch long. Stipules setaceous, erect. Flowers axillary, solitary. Peduncles 1—2 lines long. Calyx angled, pubescent. Tube short; border deeply 5-cleft. Petals obovate, yellow, scarcely longer than the calyx. Staminiferous column about half as long as the corolla. Style longer than the stamens, 5-cleft. Capsules 5, with 2 erect beaks, hairy on the angles, united in an ovate head.

I have seen nothing in this plant, as growing with us or in the specimens that have been sent me, which could authorise the trivial name of Spinosa.

Grows in sandy soils. Flowers May—July.

## 5. CRISPA.

S. foliis oblongocordatis, acuminatis,
crenatis, summis sessilibus; pedunculis solitariis, petiolo longioribus, fructiferis deflexis; capsulis inflatis, muticis, undulatocrispis.

Leaves oblong, cordate, acuminate, crenate, the upper ones sessile; peduncles solitary, longer than the petiole, deflected when in fruit; capsules inflated, unawned, waved and curled.

Sp. pl. 3. p. 747. Pursh 2. p. 453.

With this plant I am unacquainted. Flowers white, small. Pursit. Grows on the sea coast of Carolina. Pursh. Flowers July to September.

## 6. ABUTILON,

S. foliis subrotun. do-cordatis, acuminatis, dentatis, tomentotatis, truncatis.

Leaves cordate, nearly orbicular, acuminate, toothed, tosis; pedunculis solita-riis, petiolo breviori-solitary, shorter than bus; capsulis biaris- the petiole; capsules two awned, truncate.

Sp. pl. 3. p. 750. Pursh 2. p. 453.

Root annual. Stem erect, 2-6 feet high, branching, covered like the leaves with a very soft tomentum. Leaves alternate, nearly orbicular. acuminate, deeply cordate, crenulate, 4—6 inches in diameter. Petioles 4—6 inches long, pubescent. Stipules subulate, caducous. Peduncles axillary, solitary, 3-flowered, sometimes compoundly 3-flowered, generally maturing only the fruit of one flower. Peduncles 1-1 1-2 inches long. pointed towards the summit. Bracteas two at each joint, lanceolate, acuminate, 3-4 lines long, caducous. Calyx somewhat campanulate. scarcely angled. Petals obovate, obliquely emarginate, a little longer than the calyx. Staminiferous tube shorter than the corolla, many part-Style pubescent, as long as the stamens, many (12-14) parted. Capsules 12-14, hairy, conspicuously 2-horned, collected into a campanulate head. Seeds 3 in each capsule, reniform, glabrous.

Grows in the middle country of Carolina and Georgia, very luxuriantly in the river swamps near Granby, S. C. Flowers May July.

## MALVA. GEN. Pl. 1134.

Calyx duplex, ex- | Calyx double, theterior 3-phyllus. Pe- exterior 3-leaved. Pe-

tala 5. Capsulæ plu- tals 5. Capsules nurimæ, evalves, 1-sper- merous, without walves, one seeded.

## 1. ROTUNDIFOLIA.

M. caule prostrato; Stem prostrate; foliis cordato-orbiculatis, obsolete 5-lobis; pedunculis fructiferis peduncles declining when in fruit.

Sp. pl. 3. p. 786. Pursh 2. p. 454.

Root perennial. Stem procumbent, 1-2 feet long, hairy. Leaves alternate, nearly round, cordate, 5-7 lobed, a little hairy; lobes very obtuse. Petioles 5-8 inches long, when young almost hispid. Flowers in small axillary clusters. Peduncles 4—6 lines long. Exterior Calyx 3leaved; leaves subulate, as long as the interior. Interior 1-leaved, 5-cleft both hairy. Corolla white, scarcely longer than the calyx. Staminiferous tube and style shorter than the corolla. Style many cleft. Capsules, numerous, collected in a flattened orbicular head. Seeds 1 in each cap-

An exotic becoming naturalized in our country.

Grows about buildings. Flowers May to July.

### 2. CAROLINIANA.

foliis 5-lobis | Leaves 5-lobed or palmatisve, inciso-dentatis; pedunculis petiotothed; peduncles longer than the petiles integris; fructu villoso; caule prostrato, fruit villous; stem prostrate.

Sp. pl. 3. p. 784. Walt. p. 176. Mich, 2. p. 44. Pursh 2. p. 454.

Root annual? Stem prostrate, branching, a little hairy. Leaves alternate, very obtuse or cordate at base, 3-5 lobed, with the lobes varionly dissected, a little hairy. Stipules 2 at the base of each petiole, small, ovate-lanceolate, ciliate when young. Flowers axillary, solitary. Pedancles about an inch long. Exterior Calyx 3-leaved; leaves linear, lanceolate, shorter than the interior calyx. Interior calyx 1-leaved, somewhat campanulate, 5-cleft, both hairy. Petala 5, spathulate, nearly round at the summit, red and longer than the calyx. Staminiferous columns short. Anthers 12—15. Germ very hairy. Style as long as the stamens, many cleft, 15-20. Stigmas globose, dark red. Capsules numerous, 15-20, hispid, 2-horned, united in a truncated head. Seeds 2 in each capsule, compressed, nearly round, emarginate at base. Grows very common about buildings and in rich soils.

Flowers April—June.

## 3. ABUTILOIDES.

M. tolus 5-angu-lari-lobatis, tomento-sis; pedunculis sub-4-floris, bifidis, axillar-ibus; capsulis polyspermis.

M. foliis 5-angu- | Leaves with 5 an-

Sp. pl. 3. p. 780. Pursh 2. p. 454.

This plant, a native of the Bahama Islands, I have never seen growing in an indigenous state in this country. I believe it is sometimes cultivated in gardens.

# MALOPE. GEN. Pl. 1136.

terior 3-phyllus. Cap- exterior 3-leaved, sulæ absque ordine Capsules clustered glomeratæ, monosper- without order, one

obtusis, integris, cre- tuse, entire, crenate, natis, supra glabris; glabrous on the up-pedunculis solitariis, per surface; pedunpedunculis solitariis, axillaribus.

M. foliis oblongis, | Leaves oblong, obcles solitary, axillary.

Gen. Pl. 1136. Walt. 176. Pursh 2. p. 455. Nutt. 2. p. 82.

Plant annual, 12-18 inches high, sparingly branched. Stem nearly covered towards the summit with white transparent hair. Leaves ovate, dentate, very obtuse at base, nearly glabrous on the upper surface, hairy along the veins underneath. Petioles about an inch long. Flowers are

illary, solitary. Stipules lanceolate, hairy. Peduncles 2-3 lines long. Exterior Calyx setaceous, nearly as long as the interior. Interior 5-cleft, both hairy. Petals about twice as long as the calyx, yellow. Staminiferous tube and style about as long as the calyx. Capsules hispid, collected in a depressed globular head. Seeds 1 in each capsule, compressed, emarginate at base.

This is the plant which has been referred to by Mr. Nuttall as seen in my herbarium. I have little doubt that it is the plant described as a Malope by Walter, I must however add that a specimen sent to me from Pennsylvania by Dr. Muhlenberg, as the Malva Americana, is unquestionably the same plant; it certainly is not the Malva Americana of Willdenow although it apparently belongs to that genus. I did not however examine the only living plant I have seen with sufficient care to enable me now to arrange it with any thing like certainty.

Grows probably near the mountains from Pennsylvania to Carolina.— The plant I saw sprung up in a box, where seeds from the central Districts of Virginia had been planted, in soil dug from the pastures around

Charleston.

### HIBISCUS.

Calyx duplex, exterior polyphyllus.

Petala 5. Capsulæ

5-loculares, polyspermæ.

Calyx double, the exterior many leaved.

Petals 5. Capsules

5-celled, many seeded.

### 1. Moscheutos.

H. foliis ovatis, a- 1 cuminatis, subtrilobis, sub-5-ner-vibus, subtus incano-tomentosis; petiolis rally 3-lobed and 5-nerved, hoary and to-mentose underneath;

Leaves ovate, acuserratis, | minate, serrate, genefloriferis; calycibus tomentosis; capsulis flower; calyx tomentose; capsules glabris.

Sp. pl. 3. p. 806. Mich. 2. p. 47. Pursh 2. p. 455. Nutt. 2. p. 82.

Root perennial. Stem as in all the rest of the species, herbaceous or suffruticose, erect, 4-6 feet high, branching, a little rough, and purple.

Leaves as in all of the genus alternate, ovate, acuminate, entire, obtasely toothed, 3-nerved, cordate; above sprinkled with short hair, underneath tomentose and glaucous. Petioles 1-2 inches long. Flowers growing towards the summit of the stem, solitary, axillary, attached to the petiole. The proper peduncle about an inch long, pubescent. The petiole after the junction of the peduncle, dilated and obtusely winged. Calyx persistent, pubescent; the exterior 15 leaved, leaves subulate, acute, about half as long as the interior calyx: the interior 1-leaved, campanulate, 5-parted, with the segments acuminate and nerved. Petale oboyate, white, with a purple base, pubescent on the outer surface, 3-4 inches The staminiferous column 1-2 inches long, furrowed, toothed at its naked summit. Proper Filaments 4-6 lines long, growing by pairs. Germ superior, ovate, glabrous, 5-furrowed. Style shorter than the corolla, 5-cleft at the summit. Stigmas nearly spherical, glandular, white. Capeule ovate, 5-celled, 5-valved. Seeds many in each cell, obovate.

Grows on the margins of ponds. Flowers from June to September.

## 2. PALUSTRIS.

H. foliis lato-ovatis, obtuse-serratis, subtri- vate, obtusely serrate,

Leaves broad. on lobis, 3-nervibus, subtus tomentosis; pedunculis axillaribus, petiolo longioribus.

vate, obtusely serials, subtusely serials,

Sp. pl. 3. p. 808. Walt? p. 176. Pursh 2. p. 455. Nutt. 2. p. 82.

Plant 3-4 feet high. Leaves rather broader than in the preceding species, more generally angled or 3-lobed, glaucous underneath and conspicuously acuminated. Flowers rather smaller than the H. Moscheutos, (purple. Pursh.) inserted in the base of the petiole.

I feel doubtful whether Walter ever saw the real H. Palustris, and whether his H. Moscheutos and Palustris are distinct species. This species has never occurred to me in the low country of Carolina, and Pursh

speaks of it as a Northern plant.

Grows in wet soils.

Flowers July—September.

### 3. Grandiflorus.

H. foliis amplis, co- Leaves large, coririaceis, cordatis, trilo- aceous, cordate, 3-lo-

bis, utrinque tomento-sis, subtus incanis; capsulis tomentosis, subtruncatis. bed, tomentose on both surfaces, hoary underneath; capsules tomentose, slightly

Mich. 2. p. 46. Pursh 2. p. 455. Nutt. 2. p. 82.

Stem 5-7 feet high. Leaves very large, 3-lobed, covered with a soft, velvet like tomentum, glaucous on both surfaces though more conspicuously so on the under. Petioles 6 inches long. Peduncles axillary, 2-4 inches long, jointed, inserted at the base of the petiole. Calyx like the leaves covered with a fine tomentum; the exterior 12 leaved. Petals nearly 6 inches long, obovate, ribbed, finely reticulate, flesh coloured, with a deep red base. Seeds as in all of the species, numerous in each cell and generally attached in 2 rows to a central receptacle.

Grows around ponds in the Southern parts of Georgia.

Flowers July-September.

## 4. INCANUS.

cuminatis, obtuse ser- minate, obtusely serratis, utrinque inca- rate, hoary and tono tomentosis; pe- | mentose on both surdunculis axillaribus; faces; peduncles ax-calycibus tomentosis, illary; calyxes tomen-subæqualibus. tose, nearly equal.

Stem 2—4 feet high, and with the leaves tomentose and scabrons, the lower and upper leaves cordate, ovate, acuminate, the intermediate and fully grown 3-lobed, the lateral lobes short and slightly angled, the petioles 1-4 inches long. Flowers in paniculate racemes. Peduncles about 2 inches long. Calyx tomentose, the exterior 8 or 9 leaved, leaves subulate and very narrow. Petals about 2 inches long, bright purple, tringed and hairy on the outer surface. Capsule hispid, 5-angled, with the angles

Grows in wet soils, very common on the Islands near the ocean.

Flowers July—September.

#### Muhl? 6. CAROLINIANUS.

H. foliis cordato ovatis, acuminatis, ser-ratis, utrinque lævi- rate, smooth on both bus, interdum lævis- surfaces, sometimes sime trilobis; floribus | slightly 3-lobed; flowpurpureis; seminibus ers purple; seeds hishispidis. E.

Leaves cordate, opid.

Stem 4-6 feet high, smooth. Leaves large, sometimes 6 inches long, obscurely 3-lobed when old, veins prominent on the under surface. Petioles as long as the leaves. Flowers axillary. Peduncles 2-3 inches long, slightly adhering to the petioles. Calyx a little scabrous, the exterior 12 leaved. Petals 4 inches long, smooth on the outer surface and pubescent on the inner. Capeule nearly round, hairy on the inside. Seeds obovate, a little angled, hispid with short rigid hair.

This plant was raised in my garden from seeds collected by Mr. Oem-

bler on Wilmington Island, Georgia.

Flowers July—September.

## 7. MILITARIS.

H. glaberrimus; fo- | Glabrous; leaves 3 liis 3-lobo-hastatis, a- lobed, hastate, acumirolla tubulato-campanulata; capsulis ovatis, acuminatis, glabris; seminibus holosericeis.

cuminatis serratis; co- | nate, serrate; corolla tubular, slightly campanulate; capsules ovate, acuminate, glabrous; seeds silken.

Sp. pl. 3. p. 808. Pursh 2. p. 456. H. Virginicus. Walt. 177. H. Hastatus. Mich. 2. p. 45.

Root perennial. Stem herbaceous, smooth, 9-4 feet high, branching. Leaves at first ovate lanceolate, afterwards hastate, serrate, the middle lobe, long and acuminate. Petioles long, terete. Flowers solitary, axillary. Peduncles about 2 inches long, jointed. Exterior Calyx 10-leaved, leaves subulate; the interior 5-cleft. Petals about 3 inches long, obovate. finely pubescent, of a pale rose colour, with a red base. Staminiferous column. about 2 inches long, 5-cleft at the summit. Proper Filaments frequently forked. Style 5-cleft at the summit, a little hairy. Capsula ovate, 5-valved, 5-celled, glabrous, hairy within. Seeds obovate, hispid,

Grows along the margin of rivers in the middle and upper country,

found though rarely in the swamps near Savannah.

Flowers July-September.

### 8. SCABER.

bis; calycibus hispi- lyxes very hispid. dissimis.

Mich. 2. p. 45. Pursh 2. p. 457. H. Aculeatus. Walt. 177

Root perennial. Stem about 3 feet high, very scabrous, covered as well as the leaves, petioles, peduncles and calyx with small glands frequently coloured, from which proceed rigid hair. The early Leaves are said by Walter to be angular, cordate and serrate—the upper are deeply S or 5 lobed, with the margins of the lobes irregularly dentate and angled. Retioles 1-2 inches long. Flowers solitary, axillary. Peduncles 2-3 lines long, not adhering to the petioles. Exterior Calyx 12-leaved, leaves. subulate, 2 cleft at the summit; the interior calyx twice as long as the experior, 5-cleft, the segments 3 ribbed. Petals about 3 inches long, hairy

on the outer surface, yellow with a bright purple base. Staminiferous column. bright purple. Style and Stigmas yellow.

Grows in damp clayey soils. Flowers from June to September.

#### 9. Speciosus. Ait.

H. glaberrimus, foremote-serratis; rolla patula.

Very glabrous; liis palmatis, 5-parti- | leaves palmate, 5-partis, laciniis lineari-lan- | ted, the segments linceolatis, acuminatis, ear lanceolate, acumico- nate, distantly serrate; corolla expanding.

Sp. pl. 3. p. 822. Mich. 2. p. 47. Pursh. 2. p. 456. H. Coccineus. Walter 177.

Stem 4-6-7 feet high, branching. Leaves alternate, cordate, deeply divided, the lobes irregularly toothed, the veins generally coloured. Petioles 4-8 inches long, tinged with purple. Stipules very small, setaceous. Flowers solitary, axillary. Peduncles 3-4 inches long, jointed near the summit. Exterior calyx 12-15 leaved; leaves subulate, a little shorter than the interior. Petals 4-5 inches long, obovate, a little pubescent near the base, of a deep red colour. Staminiferous column nearly as long as the petals. Capsule glabrous, ovate, acute and somewhat angled. Seeds pubescent.

I know not why the name of Bartram and Walter has been superseded,

it is at least as appropriate as that of Aiton.

Found in damp soils in Florida and perhaps in the southern parts of Georgia. It is enumerated by Walter among the plants of Carolina, but I have never seen it in the woods, although it is a common inhabitant of our gardens.

Flowers from July to September.

#### GORDONIA. GEN. PL. 1144.

Calyx 5-phyllus. Petala 5, basi connata. Stylus 5-gonus, Semina columnare. bina, ala foliacea.

## 1. LASIANTHUS.

G. foliis lanceolato oblongis, glaberrimis, oblong, very glabrous, nitidis, coriaceis; flori- | shining, coriaceous; bus longe peduncula- | flowers on long peduntis; capsulis conoi- cles; capsules conical, deis. acuminatis.

Leaves lanceolate, acuminate.

Sp. pl. 3. p. 840. Walt. p. 177. Mich. 2. p. 44. Pursh 2. p 451.

A tree sometimes growing to 60-80 feet in height. Leaves alternate, long, lanceolate, serrate, glabrous, lucid, coriaceous, perennial. Petioles scarcely half an inch long. Flowers solitary, axillary towards the summit of the branches. Peduncles 2-3 1-2 inches long, furnished towards the summit with 2 or 4 caducous scales. Calyx 5-leaved, persistent; leaves ovate, nearly round, fringed and covered with a velvet like pubescence. Petals 5, obovate, united at base with a staminiferous tube, the exterior ones fringed on the outer surface. Stamens very numerous, not half as long as the corolla, inserted on a 5-lobed tube. Anthers incumbent, yel-Germ superior, ovate, slightly angled. Style as long as the sta-Stigma 5-cleft. Capsule ovate, acuminate, 5-celled, 5-valved.

This tree, which when young is one of the handsomest in our forests. begins to decay from the summit at a very early age. It is remarkable for the superficial direction of its roots which appear to spread almost entirely on the surface of the ground. The bark is said to be nearly, if not quite equal to that of the oak for the uses of the tanner, and its wood resembles mahogany in colour, but its grain is rather too coarse to be used for fine articles of farniture.

Grows in springy lands, in shallow swamps, and particularly in what are called turfy soils.

Flowers from May to August.

### 2. Purescens.

G. foliis cuneato, lanceolatis, serrulatis, subtus pubescentibus, deciduis; capsulis sphericis.

Leaves cuneate, lanceolate, serrulate, pubescent underneath, deciduous; capsules spherical.

A tree 40-50 feet high, spreading more widely than the G. Lasianthus, the young branches very smooth and finely pubescent at the summit. Leaves sessile, glabrous and lucid on the upper surface, pubescent underneath. Flowers solitary, axillary, on short thick peduncles. Leaves of the calyx rounded, covered with a silky tomentum. Corolla white, externally pubescent, segments obovate, slightly undulate. Stamens very numerous, unequal, inserted into the thickened base of the corolla. Filaments about one third the length of the corolla, orange coloured. Anthers erect, yellow. Germ villous. Style short. Capsule nearly globular, 5celled.

The habitat of this tree appears to be very limited, a few trees were found by Bartram near Fort Barrington on the Altamaha, and from the same spot all the plants now in the gardens have been derived.

Flowers through the summer.

## STUARTIA. GEN. PL. 1142-1143.

### 1. VIRGINICA.

S. foliis ovatis, acuminatis; floribus axillaribus subbinis; calycibus ovatis, obtusis; petalis integris; stylis coalitis.

Leaves ovate, acuminate; flowers axillary, generally in pairs; calyx ovate, obtuse; petals entire; styles united.

Mich. 2. p. 43. Pursh 2. p. 451. Nutt. 2. p. 84. S. Malachodendron. Sp. pl. 3. p. 840. Walt. 176.

A handsome shrub 6-12 feet high, with branches a little geniculate and when young pubescent. Leaves lanceolate, acuminate, serrate, very ptbescent on the under surface. Petioles 2-3 lines long. Flowers nearly sessile, axillary, generally solitary though sometimes by pairs. Bractess 2 at the base of the calyx, ovate, acuminate, covered like the calyx with a silken pubescence. Calyx 1-leaved, campanulate, persistent, 5-cleft with the segments mucronate. Petals 5, obovate, erose, a little hairy, white and united at base with a staminiferous tube. Stamens much shorter than the corolla, hairy at base, bright purple. Germs superior, ovate, hair,

tapering to a short style. Stigma capitate, 5-lobed. Capsule? globose, liairy, resembling a juiceless pome, very austere to the taste, 5-celled. Seeds 2 in each cell.

Grows in dry rich soils. Flowers April—May.

### 2. Pentagyna.

S. foliis ovatis acuminatis; floribus axillaribus, solitariis; calycibus lanceolatis, calyculatis; petalis undulato incisis; stylis distinctis.

Leaves ovate, acuminate; flowers axillary, solitary; calyx lanceolate, calyculate; petals waved and notched; styles distinct.

Sp. pl. 3. p. 840. Pursh 2. p. 452. Nutt. 2. p. 84. Malachodendron ovatum. Mich. 2. p. 43.

This species, which on account of its 5 styles has been proposed as a distinct genus, appears too nearly allied to the preceeding to be separated from it. In its general habit and appearance it closely resembles the S. Virginica, its flowers however are rather larger, and of a cream colour rather than white.

Grows in the mountains of Carolina and Georgia. Flowers May-July.

A small tree, rarely exceeding 15—18 feet in height, and frequently not growing beyond the size of common shrubs. Stem erect, breaches expanding, smooth, generally trichotomous. Leaves alternate, crowied near the summit of the branches, lanceolate, somewhat acuminate, setrulate, smooth and lucid on the upper surface, a little glaucous and pubescent underneath. Petioles about half an inch long. Flowers sessile, in axillary clusters, 6—14 in each cluster, 4 or more obtuse scales clothe the base of each calyx. Calyx 1-leaved, campanulate, rather perigynous than superior. Petals 5, oval, yellow, 5 times as long as the calyx. Filaments numerous, united into 5 phalanxes, 5—7 in each phalanx, longer than the corolla. Germ clothed at base with the calyx, 5 at the summit. Style as long as the stamens. Stigma capitate.

This tree appears to ripen its fruit very sparingly in the low country,

This tree appears to ripen its fruit very sparingly in the low country, its leaves afford a yellow dye, are very sweet, and as they are nearly perennial they are eaten with avidity by cattle and horses during the winter

season.

Grows in all rich soils not liable to inundation.

Flowers in March.

Spike cylindric, pesubulate, as long as the

Mich. 2. p. 49. Pursh 2. p. 461. Nutt. 2. p. 85.

Root perennial. Stem 2-3 feet high, glabrous. Leaves in alternate fasciculate clusters, pinnate, generally with three pair of leaslets and an odd one. Leaslets linear lanceolate, entire, small. The common petiole rarely an inch long, entire, glabrous. Flowers in terminal cylindrical heads. Bracteas subulate, when young much longer than the calyx, giving the spike a square appearance, but not longer than the calyx when in Calyx ovate, striate, glabrous, 5-toothed, deeply cloven on the upper side, the teeth when young pubescent on the inner surface. Petals obovate, on long claws, the upper one larger than the rest and slightly emarginate, all brilliantly white. Stamens and Style nearly as long as the corolla.

This plant which grows in great abundance on the sand hills between the Flint and Chatahouchie rivers, notwithstanding the colour of its corolla agrees in too many respects with the P. Carneum of Michaux to be separated from it without a careful examination of his original plant. Specimens which I have received from Florida under this name differ much in their general aspect from the one I have described .- There are probably still some unknown species in the extensive pine forests along the southern line of Georgia and in East-Florida.

Flowers July—August.

# 2. Corymbosum.

P. pedunculis pani- | Peduncles in paniculato-corymbosis; ca- | cled corymbs; calyx lycibus plumosis; fo- | plumose; leassets linliolis linearibus, muti- | ear, unawned. eis.

Root perennial. Stem erect, branching, glabrous, about 2 feet high-Leaves generally 3-4 pair. Leaflets linear, entire, glabrous, dotted unHerneath. The common petioles scarcely an inch long. Stipules 2, small, subulate, at the base of the petioles. Flowers in heads forming serminal corymbs. Pedancles or small branches angled, roughened with small glands. Bractea, a scale around the base of each flower, nearly round, membranaceous, detted, fringed, mucronate, sometimes with three approximate points, the 8 or 10 inferior bracteas generally without flowers, the lowest with their joints frequently dilated into leaves. Calyx deeply 5-parted, the segments linear, plumose. Petals white, upper one with a claw as long as the calyx and attached to its base, the 4 others alternating with their stamens. Germs ovate, very villous. Style as long as the stamens. Stigma simple, obtuse. Legumen small, included in the calyx. Seed 1, oblong.

Grows in dry sandy pine barrens. Flowers September-October.

# HEXANDRIA.

### DICLYTRA. Mocnek.

Petala 4, 2 exteriora basi æqualiter calcarata aut gibbosa.
Siliqua bivalvis, polysperma.

Petals 4, the 2 exterior either gibbous
or bearing a spur at
base. Pod 2-valved,
many seeded.

### 1. FORMOSA.

D. calcaribus 2, subincurvis, obtusis; curved, obtuse; scape naked; raceme somesubcomposito; stigmate biangulato.

Spurs 2, slightly curved, obtuse; scape naked; raceme somewhat compound; stigmate 2-angled.

De Candolle Sys. Nat. 2. p. 109. Corydalis Formosa. Pursh 2. p. 462. Nutt. 2. p. 86.

Root tuberous, perennial. Leaves all radical, on petioles 4-6 inches long, deeply and triternately notched, with the segments acute. Scape 6 -10 inches long, branching towards the summit. Flowers somewhat crowded on the scape. Bracteas subulate Calyx 2-leaved, slightly toothed along the margin. Corolla somewhat goblet shaped, of a bright purple colour, the 2 exterior petals concave, with a short slightly incurved spur at base. Stamens 6, attached to the base of the petals. Germ oblong. Stigma sessile. Pod 2-valved, compressed, many seeded.

Grows in the fissures of the rocks on the mountains.

Flowers May-July.

# CORYDALIS. VENTENAT.

Petals 4, one bearbasi calcaratum. Si- | ing a spur at base. liqua bivalvis, com- Pod 2-valved, com-pressa, polysperma. pressed, many seeded.

### 1. Aurea.

C. caule ramosa, diffusa; foliis glaucis, Candolle

Stem branching, diffuse; leaves glaubipinnatisectis, lobis cous, doubly pinnati-oblongo linearibus; fid, the lobes oblong, bracteis oblongis, acuminatis; siliquis line-aribus, pedicello quad-ruplo longioribus. De long, acuminate; pods linear, four times as long as the pedicel.

Willd. enum. 740. Pursh 2. p. 468. Nutt. 2. p. 86. De Cand. Sys. Nat. 2. p. 125.

A plant slightly glaucous. Stem 6-10 inches high, branching. Leaves alternate, variously dissected, segments linear, acute. Racemes opposite the leaves and terminal. Bracteus linear, acuminate, nearly as long as the pedicel. Calyx 2-leaved, very small. Petals yellow, about half an inch long. Spur straight, obtuse, much shorter than the flower. Pod compressed, slightly arched, pointed with the style.

I have specimens of this plant from Pennsylvania and from the mountains of Carolina, in the latter the flowers appear to be smaller, and the leaves though dissected after the manner of the genus are much less ex-

tended and divided.

Grows among the mountains in the fissures of rocks.

Flowers May—July.

### FUMARIA.

Petalum unicum basi gibbum aut calcar- or spurred at base. atum. Fructus (cari- Fruit (a cariopsis) 1. opsis) indehiscens, 1sperma.

One petal gibbous seeded, not opening.

Nutt. 2. p. 87.

P. Senega. var. rosea. Mich. 2. p. 53.

- var. b. Pursh 2. p. 465.

Root perennial. Stem herbaceous, 8-12 inches high, with virgate branches. Leaves alternate, on short petioles, strongly veined, soft and pubescent. Peduncles 2-4 lines long. Bracteas minute, deciduous. Upper leaves of the calyx very small with glandular fringe, calycine wings large, veined, persistent, at first tinged with pink, when old entirely green. Corolla rose coloured. Vexillum 0? Carina three lobed, hairy at base, the intermediate lobe compressed, enclosing the germ, yellow and slightly tuberculated at the summit. Stamene 8, monadelphous, very short. Anthere 1-celled. Style long, bearded at the summit. Stigma obtuse. Pericarp oblong, slightly winged, pendulous. Seeds solitary, one in each **c**ell, hispid.

This is probably the P. Viridescens of Walter. The erect capsules ascribed by Walter to that species is the only point in which they appear to

Grows in dry soils, very common. Flowers from May to August.

### 3. POLYGAMA.

P. caule a basi ramoso; foliis angustis, cuneato-lanceolatis;racemis corollatis, radicalibus apetalis humistrațis.

Stem branching from the base; leaves narrow, cuneate, lanterminalibus | ceolate; terminal racemes bearing a corolla, those of the root without petals and prostrate.

Walt. p. 179. Pursh 2. p. 465. Nutt. 2. p. 75.

Root fibrous, perennial. Stem about a foot high, branching at the very base, glabrous, angled, almost winged by the decurrent leaf. Leaves sessile, glabrous, with the margins rough, the lower ones almost obovate. The Flowers on peduncles 2 lines long. Bractea as long as the peduncle, deciduous. Stipules 2, setaceous, persistent, the calycine wings at first bright purple, after flowering becoming green. Keel of the corolla 3-lobed, intermediate lobe fimbriated at the summit. Stamens very short, 7-8. Style short. Stigma 2-lobed, with a globular plumose gland, atsached to the upper lip. Pericarp pendulous when mature. Seed hairy.

The remarkable racemes of this plant, which run just under the surface of the earth, have neither corolla nor calycine wings, yet appear to ripen their seeds; the florets near the end of these racemes are always

abortive.

If this plant is the P. Rubella of Willd. with which it appears very accurately to agree, it is very widely extended over the United States.as Mr. Nuttall found that species very abundant in the pine forests around Lake Michigan.

Grows in light oak lands. Flowers from May to July,

### 4. Senega.

P. caule erecto.simplici; foliis lanceola- leaves lanceolate, atis, acuminatisque; spi- cute and acuminate; ca terminali, filiformi. spikes terminal, fili-

Stem erect, simple;

Sp. pl. 3. p. 894. Walt. p. 178. Mich. 2. p. 53. Pursh 2. p. 464.

Root fibrous, perennial. Stem 8-14 inches high, slightly pubescent. Leaves nearly sessile, lanceolate and oval, sometimes very wide, when fully grown, generally acuminate. Flowers somewhat clustered in a terminal spike, sessile, white. Seed hispid.

Grows in the mountainous districts of Carolina. Flowers June-August.

### 5. VERTICILLATA.

P. caule erecto, ramoso; foliis verticil- ing; leaves verticillatis, linearibus; spi-cis setaceis, peduncu-taceous, pedunculate; tincte alternis, approximatis.

Stem erect, branchfloribus dis- | flowers approximate, distinctly alternate.

Sp. pl. 3. p. 897. Mich. 2. p. 53. Pursh 2. p. 466.

Stem 8-12 inches high, slightly angled. Leaves opposite, verticillate, sometimes solitary, linear, acute, glabrous, finely serrulate. Bractess purplish, shorter than the calyx, deciduous. Calycine wings white, tinged with purple. Corolla nearly white, fimbriate, with two segments, prominent. Stamens 6, very short. Capsule sessile, erect. Seeds slightly hispid.

Grows in soils somewhat sandy.

Flowers June—July.

### 6. SETACEA.

P. caule setaceo, | subaphyllo, simplici, summitate subramoso; sparingly branched foliis parvis, setaceis, near the summit; sparsis; floribus mi- leaves small, setanutis, dense spicatis.

Stem setaceous, ceous, scattered; flowers minute, in a compact spike.

Mich. 2. p. 52. Pursh 2. p. 485.

Stem erect, angled, divided at the summit into a few long, simple, setaceous branches, almost aphyllous, bearing a few short scattered bristles. Flowers minute, incarnate, not crested. Mich.

Grows in Carolina. Mich. Flowers July—August.

## 7. CRUCIATA.

P. caule erecto, ra-moso, alato-anguloso; ing, angled and wing-

foliis quaternis, linear-ibus, punctatis; flori-bus confertis, sessili-bus, rachi squarrosa. | linear, dotted; flowers crowded, sessile, on a squarrose rachis.

Sp. pl. 3. p. 897. 'Walt. p. 179. Mich. 2. p. 52. Pursh 2. p. 466.

Stem 8-12 inches high, angled, with the angles slightly winged. Leaves generally by fours, sometimes an inch and a half long, tapering at base. Spike terminal, 1-2 inches long. Bracteas persistent. Calycine wings cordate, ovate, acuminate, mucronate, purple, tinged with green. Corolla slightly fimbriate. Capsules small.

Grows in the upper districts of Carolina and Georgia.

Flowers June-July.

### 8. SANGUINEA.

P. caule fastigiatim ramoso; foliis linearibus; spicis confertis; floribus imberbibus; rachi squarrosa. Nut. Stem bearing fastigiate branches; leaves linear; spikes crowded; flowers not fimbriated; rachis squarrose.

Sp. pl. 3. p. 896. Pluk. Mant. t. 498. f. 5. Nutt. 2. p. 88. Mich. 2. p. 52.

Stem 12—18 inches high, slightly striate, branching near the summit. Leaves linear, lanceolate, sessile, alternate. Spikes, with us, generally about an inch long. Bracteas persistent. Calycine wings obovate, longer than the capsule, of a bright pink tinged with green. Seeds hairy.

This plant agrees perfectly with the figure of Plukenet, and is therefore in all probability, as suggested by Mr. Nuttall, the original P. Sanguinea of

Linnæus.

Grows in flat pine barrens, abundantly near Purysburgh. Flowers May—July.

### 9. Purpurea. Nutt.

P. caule subfastigiatim ramoso; foliis alternis, lineari-lanceolatis; floribus subimbricatis; spicis cylindricis, obtusis; rachisquarrosa. Nutt. 2. p. 88.

Stem bearing fastigiate branches; leaves alternate, linear lanceolate; flowers somewhat imbricate; spikes cylindrical, obtuse; rachis squarrose.

P. Sanguinea. Pursh 2. p. 465.

Plant much more robust than in the preceding species, and in my specimens more irregularly branched, the *Leaves* much larger, the *Spikes* more compact, the *Calycine wings* broader and more obtuse, green, tinged with purple, longer than the capsules.

Grows throughout the United States. Nutt.

I have never met with this species in the low country of Carolina, my specimens are from Pennsylvania.

Flowers June—August.

# 10. INCARNATA.

P. caule simpliusculo, erecto, glauco; foliis sparsis, subulatis; spicis ovali oblongis; | spikes oval, oblong; corollis tubo gracili, tube of the elongato.

Stem nearly simple, erect, glaucous; leaves scattered, subulate: long, slender.

Sp. pl. 3. p. 871. Walt. p. 178. Mich. p. 52. Pursh 2. p. 464.

Stem erect, simple, 1-2 feet high, slightly angled. Leaves alternate, subulate, dotted, very glabrous. Flowers in a long and somewhat loose, terminal spike. Bracteas subulate, caducous. Calycine wings oval, green, with the margins tinged with pink. The keel of the corolla twice as long as the calycine wings, bright purple. The lateral lobes crenate. the intermediate lobe conspicuously fimbriate. Seeds hairy.

Grows in dry soils, preferring oak lands.

Flowers May-August.

tatis.

\*\*\* Floribus capi-is. \*\*\* Flowers capi-tate.

# 11. LUTEA.

P. caule simplici ramosoque; foliis inferi- | branching; oribus spathulatis, superioribus lanceolatis: floribus globoso capitatis, luteis; alis calycinis lanceolatis, acuminatis.

Stem simple lower leaves spathulate, the upper lanceolate; flowers in globular heads, yellow; calycine wings lanceolate, acuminate.

Mich. 2. p. 54. Walt. p. 178. Pursh 2. p. Sp. pl. 3. p. 894. 465. Nutt. 2, p. 88.

Stem 8-16 inches high, generally simple, but sometimes bearing a few branches. Radical leaves obovate and obtuse. Stem leaves lanceolate, entire. Flowers in compact, globose heads. Bracteas persistent. lycine wings lanceolate, acuminate, bright yellow. Keel of the corolla yellow, with the intermediate segment fimbriate. Seed a little hairy.

Grows every where in damp soils. Flowers through the whole summer.

### 12. VIRIDESCENS.

P. caule simplici; foliis cuneato-obovatis, obtusis; capitulis cylindraceis, squarrosis; floribus viridescentibus; alis calycinis longe acuminatis. E.

Stem simple; leaves cuneate, obovate, obtuse; heads cylindrical, squarrose; flowers greenish; calycine wings conspicuously acuminated.

Sp. pl. 3. p. 895. Nutt. 2. p. 88. P. lutea var. nana. Mich. 2. p. 54.

Stem simple, 1—4 inches long. Leaves cuneate or spathulate, with the attenuated base sometimes 2 inches long. Flowers in a long cylindrical head. Calycine wings twice as long as the corolla, lanceolate, and with a setaceous point, giving the head a squarrose appearance, green, just tinged with yellow. Keel of the corolla yellowish at the summit, fimbriate. Stanens, as in most of the capitate species, 6. Seeds a little hairy.

Grows in damp pine barrens. Flowers through the summer.

\*\*\*\* Floribus co- | rymbosis.

\*\*\*\* Flowers in corymbs.

# 13. RAMOSA:

P. caule erecto, fere ab imo ramoso; foliis inferioribus spathulato-obovatis, caulinis linearibus, æqualibus; floribus capitato-corymbosis.

Stem erect, branching from the base; lower leaves spathulate obovate, stem leaves linear, equal; flowers somewhat capitate, the heads forming corymbs.

### P. Corymbosa. Nutt. 2. p. 89.

Stem 8—12 inches high, angled, branching sometimes almost from the base. Lower leaves obovate, spathulate; stem leaves linear, lanceolate, nearly of the same size to the summit of the stem. Flowers in small loose heads, forming a very irregular corymb. Calycine wings much longer than the capsule, oval, lanceolate, mucronate, but never forming compact, squarrose heads as in the following species. Calycine wings and the

keel of the corolla greenish yellow. Seeds under a microscope slightly hispid.

Grows in ponds in the flat pine barrens intermingled with the P. Co-

rymbosa.

Flowers June—August.

#### Nutt. 14. BALDUINI.

P. caule erecto, superne ramoso; foliis inferioribus spathulatis, obtusis; caulinis pitulis squarrosis, alis calycinis setaceo-acuminatis.

Stem erect, branching near the summit; lower leaves spathulate, obtuse; stem lanceolatis; floribus ca- | leaves lanceolate; flowpitato-corymbosis, ca- ers capitate, heads squarrose, corymbose; calycine wings with a setaceous acumination

Nutt. 2. p. 90.

Stem 2-3 feet high, slightly angled. (Radical leaves spathulate, obtuse; Nuttal:) stem leaves small, diminishing towards the summit, lanceolate. Flowers in small heads, forming an irregular corymb, very squarrose from the setaceous acumination of the calycine wings. Calycine wings and Corolla yellowish white. Carina scarcely if at all imbriated. Seeds minutely hispid.

This plant was sent to me by the late Dr. Baldwin, as the P. Acuminata, a name which the structure of the calycine wings renders very appro-

priate.

Grows in the southern districts of Georgia near St. Mary's.

Flowers June—August.

# 15. CORYMBOSA.

P. caule erecto, tereti, sub nudo; foliis inferioribus longis,lineari-lanceolatis, caulinis subulatis, superne minutis: floribus racemoso-corymbosis;

Stem erect, terete, nearly naked; lower leaves long, linear-lanceolate, stem leaves subulate, minute near the summit; flowers in corymbose

rachi squarrosa.

cemes; rachis squarrose.

Mich. 2. p. 54. Pursh 2. p. 789. P. Cymosa. Walt. p. 179. P. Attenuata. Nutt. 2. p. 90.

Stem erect, terete, tapering, 3-5 feet high. Root leaves 2-5 inches long, very narrow, linear, lanceolate; lower stem leaves nearly similar to the root leaves, scattered diminishing towards the summit to a mere scale, giving the stem a naked appearance. Flowers in a regular corymb, composed of simple racemes 1-2 inches long; rachis as the flowers decay, rendered squarrose by the persistent bractess. Calycine wings oval, slightly mucronate, much longer than the capsule, greenish yellow. Seeds smooth.

The flowers of this species when dry, become a dark green, almost black, the two preceding species generally retain a yellowish hue.

Grows in the shallow ponds in the pine barrens, very common.

Flowers June—August.

# DECANDRIA.

# 1. STAMENS ALL CONNECTED, MONADEL-PHOUS.

# AMORPHA. Gen. Pt., 1170.

Calyx campanulatus, 5-fidus. Corollæ | late, 5-cleft. vexillum ovatum, con | with the vexillum ocavum. Alæ carina- vate, concave. Wings que nullæ. Legumen and keel wanting. tum.

tuse and one acuminate; pods few seed-

Sp. pl. 3. p. 970. Walt. p. 179. Mich. 2. p. 64. Pursh 2. p. 466.

A shrub 10-16 feet high, with its young expanding branches very pubescent. Leaves alternate, unequally pinnate, deciduous. Leaflets oval, obtuse, sometimes slightly emarginated with a short point, pubescent. Flowers clustered, in terminal racemes. Racemes 4-6 inches long, generally by threes. Calyx persistent, slightly pubescent, turbinate, border short and 5-cleft, the lower segment acuminate, longer than the rest, the two lateral acute, the upper ones broad and obtuse. Vexillum of the corolla obovate, obtuse, twice as long as the calyx, dark purple. Filaments 10, unequal, longer than the corolla, purple, monadelphous. Anthers yellow.

Grows along the margins of rivers, very common in what are called in this country, tide lands.

Flowers in April.

### 2. Pubescens.

A. humilis, frutescens; foliis brevissime petiolatis, utrinque obtusis, pubescentibus; spicis paniculatis, elongatis, pubescentibus; calycibus subsessilibus, dentibus omnibus acuminatis.

Small, shrubby; leaves on very short petioles, obtuse at each end, pubescent; spikes long, panicled, pubescent; calyx nearly sessile, with the teeth all acuminate.

Sp. pl. 3. p. 970. Pursh 2. p. 467. A. Herbacea. Walt. 179. Nutt. 2. p. 91. A. Pumila. Mich. 2. p. 64.

A small plant rather shrubby than herbaceous, 2-4 feet high. pubescent and slightly muricate. Leaves equally pinnate, (about 24 pair.) Leastets obtuse, mucronate, with pellucid dots, very pubescent and somewhat hoary. Calyx purple, the segments nearly equal. Vexillum of the corolla obcordate, white, longer than the calyx. Filaments 10, white, monadelphous.

Grows in damp soils. Flowers June-July.

### 1. HERBACEA.

E. pumila; foliis ternatis, rhombeis, glabris; spicis longissibrous; spikes very long; stem herbaceaculeato.

Small; leaves ternate, rhomboidal, glabrous; spikes very long; stem herbaceaculeato.

Sp. pl. 3. p. 912. Walt, p. 180. Mich. 2. p. 61. Pursh. 2. p. 467. Nutt. 2. p. 92.

Root tuberous, very thick, Stem herbaceous, 2-4 feet high, glabrous, streaked with purple, armed with a hooked prickle at the base of each petiole. Leaves alternate, compoundly trifoliate, leaflets dilated towards the base and almost hastate, glabrous, a little glaucous underneath, and hairy on the veins. Flowers in terminal spikes, the buds alternate and 3-flowered. Calyx cylindrical, truncated, slightly emarginate above, underneath furnished with a small tooth. Vexillum of the corolla nearly 2 inches long, emarginate, with the sides compressed bright scarlet, wings and two leafed keel, scarcely as long as the calyx, paler than the vexillum. Stamens diadelphous, unequal, as long as the vexillum. Seeds many in each pod, bright scarlet.

Grows in rich light soils.

Flowers in May.

# LUPINUS. GEN. Pl. 1176.

### 1. Perennis.

L. perennis, repens: caule foliisque glabrius culis : foliis digitatis; foliolis (8— 9) lanceolatis, obtusiusculis; calycibus alternis, inappendiculatis? labio superiore emarginato, inferiore integro.

Perennial, creeping; stem and leaves nearly glabrous; leaves digitate; leaflets 8-9 lanceolate, obtuse; calyx alternate, without lateral segments? the upper lip emarginate, the lower entire..

Sp. pl. 3. p. 1022. Walt. 180. Mich. 2. p. 55. Pursh 2. p. 467.

Root perennial, stoloniferous. Stem herbaceous, procumbent, slightly pubescent, branching. Leaves 7-9, parted to the base, segments lanceolate or obovate, glabrous above, hairy underneath. Petioles 2-6 inch-Stipules 2, at the base of each petiole, subulate, persistent. Racemes simple, clustered, (4-6) near the termination of the branches. Bracteas as long as the bud. Calyx 2 lipped, pubescent, the upper lip 2 cleft, with acute segments, the lower longer, keeled, 3 cleft, the lateral segments setaceous, very small. Corolla of a beautiful violet colour. Petals nearly equal, vexillum reflected, spotted in the centre, carina fringed along the margins. Stamens 10, monadelphous. Filaments unequal.

This species appears to me to have two very small setaceous segments

at the base of the calyx.

Grows in light poor sandy soils.

Flowers April.

### 2. VILLOSUS.

L. villosus, sericeus; foliis' simplicibus, ob-longo-lanceolatis; pe-lanceolate; petioles tiolis stipulisque fili-and stipules filiform, formibus, densissime densely lanuginous; lanuginosis; calyce | calyx with lateral segappendiculato. Nutt. ments.

Villous, silken;

Sp. pl. 3. p. 1029. Pursh 2. p. 468. Nutt. 2. p. 93. L. Pilosus. Walt. p. 180. Mich. 2. p. 56.

Biennial? Stem decumbent, thickly clothed with long, soft, silken hair. Stipules 10-15 lines long. Petioles 2-3 inches. Leaves 3-5 inches long, acute, beautifully villous when young. Calyx with lateral seg-Spikes long. Flowers rather irregular on the spikes. Corolls handsome, of a bright reddish purple, most deeply coloured in the centre of the vexillum. Legume very lanuginous, resembling a ball of silky wool. Seeds small, variegated.

Grows in the dryest sands.

Flowers in the beginning of April,

#### 3. Diffusus, Nutt.

L. villosus, sericeus; caulibus plurimis, diffusis, decumbentibus; fuse, foliis simplicibus, oblongo-obovatis; peti- | obovate; petioles and olis stipulisque brevi- | stipules short and nabus, nudisque. Nutt. **2.** p. 93. <sup>-</sup>

Villous, silken : stems numerous, difdecumbent; leaves simple, oblong, ked.

Perennial, spreading diffusely in large patches. The petioles rarely exceeding an inch in length, and destitute of long woolly hairs. Stipules 2 -3 lines long. Leaves obtuse, attenuated towards the base, 2-3 inches long.

I have adopted this species from Mr. Nuttall, without having had it in my power to determine how far it differs essentially from the preceding. Grows very abundantly on the poor sand hills in the middle country. Flowers April,

#### CROTALARIA. GEN. PL. 1172.

Corollae vexillum cordatum, magnum; | rolla cordate, large; carina acuminata. Fi- the keel acuminate. lamenta connata cumfissura dorsali. Legumen pedicellatum, turgidum.

Vexillum of the co-Filaments united, with a dorsal fissure. Pod turgid, pedicellate.

### 1. SAGITTALIS.

C. hirsuta, erecta, ramosa; foliis simplicibus, oblongo-lanceolatis; stipulis sagittatis, acuminatis, decurrentibus; racemis oppositifoliis, subtrifloris; corollis calyce minoribus.

Hirsute, erect, branching; leaves simple, oblong lanceolate; stipules sagittate, acuminate, decurrent; racemes opposite the leaves, generally 3-flowered; corolla smaller than the calyx.

Willd. Sp. pl. 3. p. 972. Walt. p. 81. Mich. 2. p. 55. Pursh 2 p. 469.

C. Lævigata? Pursh 2. p. 469.

Annual. Stem 8—18 inches high, more or less hairy. Stipules sometimes very long, decurrent. Flowers nearly opposite the leaves. Corolla yellow, nearly as long as the calyx. Legumen inflated, nearly black when mature. Seed very small, attached by pedicells to the valves of the legume.

Grows in almost all soils which are not inundated and appears to vary

much in its pubescence.

Flowers April-July.

### 2. PARVIELORA.

C. hirsuta, erecta, ramosa; foliis simplicibus, lineari-lanceolatis; stipulis superioribus decurrentibus, brevissime bidentatis; racemis oppositifoliis; corollis calyce minoribus.

Hirsute, erect, branching; leaves simple, linear lanceolate; upper stipules decurrent, with 2 very short teeth; racemes opposite the leaves; corolla smaller than the callyx.

Willd Sp. pl. 3. p. 973. Pursh 2. p. 469. C. Sagittalis var. linearis. Mich. 2. p. 55.

This species is generally found in damp or shady soils, and is distinguished by its narrow leaves and its narrow, short and somewhat irregular

VOL. II. B 2

stipules. It appearss to me however, that culture will be necessary to determine whether it is really distinct from the preceding species. Flowers from April to July.

### 3. Ovalis. Pursh.

C. hirsuta, diffusa, ramosa; foliis simplicibus, petiolatis, oval- | ple, petiolate, oval; ibus; stipulis summis upper stipules scarce-vix decurrentibus, bre-vissimis; racemis op-short; racemes oppopositifoliis, elongatis; site the leaves, long; corollis calycem æ- corolla as long as the quantibus.

Hirsute, diffuse, branching; leaves simcalyx.

Pursh 2. p. 469. Nutt. 2. p. 94. C. Sagittalis b. ovalis. Mich. 2. p. 55.

C. Rotundifolia. Walt. p. 81.

Root fusiform, perennial. Stems herbaceous, procumbent, branching, scarcely a foot high. Leaves nearly sessile, elliptic, mucronate, pubescent. Racemes nearly opposite the leaves, simple, 3-6 flowered. Stipules short, sagittate, sometimes wanting. Calyx 2-lipped, the upper lip 2-cleft, the lower 3-cleft, the segments all acute. Corolla as long as the ealyx, yellow; vexillum round, reflected; carina ciliate on the margin. Filaments 10, connate at base, unequal. Anthers on the long filaments round, sterile; on the short oblong, opening along the sides. Style longer than the stamens. Stigma obtuse, bearded. Legume and Seed like those of the C. Sagittalis.

Grows in dry sandy soils. Flowers from April to July,

# § 2. STAMENS DIADELPHOUS.

Mich. 2. p. 57. Pursh 2. p. 475.

Root tuberous, perennial. Stem herbaceous, having somewhat of a shrubby appearance, 2-3 feet high, branching. Leaves on very short petioles, entire, thickly sprinkled with glands. Peduncles axillary, much longer than the leaves, bearing 4-7 flowers near the extremity. Calyx for this genus large, deeply divided, coloured, (brownish,) hairy and very distinctly marked with dark coloured glands. Corolla yellowish, longer than the calyx.

Grows in sandy soils in the middle of Carolina and Georgia.

Flowers May-July.

#### Mich. 2. Lupinellus.

P. glaber; foliis digitatis, longe petiola- | digitate, on long petitis; foliolis filiformi-bus; racemis multi-floris, foliis longiori-ed, longer than the bus; leguminibus rugosis.

Glabrous; leaves leaves; legumes ru-

Mich. 2. p. 58. Pursh 2. p. 476. Nutt. 2. p. 103.

Root perennial? Stem about 2 feet high, sparingly branched. Leaves on petioles rather more than an inch long. Leaflets 5-7, not larger than the petiole, exhibiting distinctly the glands which characterize this genus. Pedancles much thicker than the petioles, 3-5 inches long. Calyx small, glandular, with the lower segment a little longer than the rest. Corolla 3 times as long as the calyx, of a pale violet colour.

Grows in the arid barren sandhills at Fort Barrington on the Altamaha, and is found occasionally in similar situations in other parts of Georgia

and Carolina.

Flowers May-July.

\*\* Spicis cylindri- | cis, melilotoidea. (Poi- cal, resembling Melikadenia.)

\*\* Spikes cylindri-

#### 3. VIRGATA. Nutt.

P. caule virgato, subpubescente; foliis simplicibus, distantibus, lineari-lanceola- | ear lanceolate; spikes tis; spicis axillaribus, | axillary, shorter than foliis brevioribus.

Stem virgate, somewhat pubescent; leaves simple, distant, linthe leaves.

Nutt. 2. p. 104.

Stem about 2 feet high, sparingly branched. Radical leaves oblong, evate; leaves of the stem on petioles nearly an inch long, very narrow, glabrous, 3-5 inches long, scarcely more than two or three lines wide. Flowers in compact cylindrical spikes, the naked base of the common peduncle scarcely longer than the petiole. Bracteas ovate, acuminate, deciduous, and like the calyx dotted with glands. Calyx 5-cleft. Corolla violet coloured, a little larger than the calyx. Legume 1-seeded.

Discovered by Dr. Baldwin near St. Mary's, Georgia, and sent to me

under the name of P. Angustifolia.

Flowers.

#### Mich. 4. Melilotoides.

P. parce pubescens: lis oblongo-lanceolatis; leaslets oblong, lan-spicis oblongis; brac- ceolate; spikes obteis lato-cordatis, lon- long; bracteas broad, gissime acuminatis; leguminibus rotundatis, nervoso-rugosissimis.

Sparingly pubesfoliis ternatis, folio- | cent; leaves ternate, cordate, conspicuously acuminate; pods round, nervose, very rugose.

Mich. 2. p. 58. Pursh 2. p. 475. Trifolium psoralioides. Walt. p. 184.

Root perennial? Stem herbaceous, diffuse, branching, pubescent, nearly 2 feet high. Leaves ternate, pubescent, rounded at base and punctured with glandular dots. Spikes axillary and terminal, on peduacles much longer than the leaves. Bracteus nearly round, abruptly acuminate, tinged with purple, dotted with glands, covering two flowers, deciduous. Calyx hairy, 5-cleft, dotted with glands, purplish, with green spots. Corolla purple, the carina very small. Stamens diadelphous. Legume oval, rugose, mucronate. Seed 1, glabrous.

Grows in dry soils moderately rich.

Flowers May-June.

# 5. EGLANDULOSA. E.

P. pubescens, eglandulosa; foliis ter- | glands; leaves ternate, natis, oblongo lanceo-latis; spicis oblongis; bracteis lato-lanceo-latis, longe acumina-tis calycibusque villosis. E.

Pubescent, without lvx villous.

Melilotus psoraloides. Nutt. 2. p. 104?

This plant is very similar to the preceding species, with which I suspect it has always been confounded. It is however more pubescent, is bracteas not so remarkably acuminate, and its calyx, particularly along the margins, much more villous. It is probably the plant described by Mr. Nuttall, but its affinity to the preceding species, in habit and in every character except the glands, induces me to retain it in this genus. The plants of this section will however, probably constitute a new genus, as they appear to be very closely allied among themselves, and almost equally connected with this genus and the Melilotus.

Grows in dry, moderately fertile soils.

Flowers May-June.

### 6. Multiuga.

P. caule ramoso; foliis pinnatis, multiju- | leaves pinnate, leaslets

Stem branching; gis(9—10); foliolis oblongo lanceolatis, obtusis, pubescentibus; spicis oblongis; bracteis parvulis, membranaceis, eglandulosis. | branaceous, without E. | glands.

Stem apparently 1-2 feet high, thick, furrowed, and nearly glabrous. Leaves irregularly pinnate, leassets small, hairy on the under surface, and under the microscope apparently covered with minute black glands. pules broad, ovate, membranaceous, without glands, sparingly fringed. Flowers on peduncles much longer than the leaves, and like the preceding species, the spikes when young are closely imbricate. Bracteas small, not above half the length of the calyx. Segments of the calyx very long, acute and villous along the margins. Corolla violet coloured, the carina rarely as long as the vexillum. The Legume I have not seen, but from the appearance of the germ it is monospermous.

This plant I have thrown, though with some hesitation, into this section from the strong resemblance which it has in habit and in its mode of flowering, to the three preceeding species. It was collected some years ago. in Abbeville District, by Mr. Gourdine, and sent to me by Dr. Macbride.

Flowers May—June.

### MELILOTUS.

Calyx tubulosus, 5- | dentatus. simplex, alis et vexil- | ple, shorter than the lo brevior. Legumen wings and vexillum. calyce longius, rugo- Pod longer than the si.

Calyx tubular, 5-Carina toothed. Carina simsum. Flores racemo- | calyx, rugose. Flowers in racemes.

### 1. OFFICINALIS.

M. caule erecto; foliolis obovatis, serra- obovate, tis; spicis axillaribus, spikes axillary, panipaniculatis; legumini-bus dispermis, rugo-rugose, acute. sis, acutis.

Stem erect; leaflets

Pursh 2. p. 477. Nutt. 2. p. 104. Trisolium officinale. Sp. pl. 3. p. 1355.

Root annual. Stem 2-3 feet high, angular, glabrous. Leaves trifoliate; leassets obovate, serrate, glabrous. Flowers in long compact spikes, bright yellow, keel and wings nearly as long as the rexillam.

This plant, a native of Europe, is now completely naturalized in the neighbourhood of Charleston. It grows very luxuriantly, but no species of domestic stock appears willing to eat it.

Grows in close soils. . Flowers April—May.

I have among my specimens one collected in the state of New-York by Mr. Whitlow, with leaves nearly elliptical, flowers very small, whitish or white, and scattered along a very long raceme or spike, which appears to me evidently a distinct species.

# TRIFOLIUM. GEN. PL. 1211.

Legumen calyce tectum, evalve, 2—4 spermum. Flores subcapitati.

Pod covered with the calyx, without valves, 2—4 seeded. Flowers generally in heads.

#### Mich. 1. CAROLINIANUM.

T. pusillum, procumbens; foliolis obcordatis, (supremis tantum emarginatis,) pilosis, dentatis; stipulis bifidis, capitulis umbellaribus,pedunculatis, reflexis, paucifloris; corollis vix exsertis; leguminibus 3— 4. spermis.

Small, procumbent; leaslets obcordate, (the upper only emargi-nate,) hairy, toothed; stipules 2-cleft; heads or umbels pedunculate, reflected, few flowered; corolla scarcely exserted; pods 3—4 seeded.

Mich. 2. p. 58. Pursh 2. p. 477. T. repens? Walt. p. 183.

Root somewhat fusiform, probably perennial. Stem divaricate, prostrate, assurgent at the summit, hairy, 3-10 inches high. Leaflets ternate, slightly glaucous underneath, 3—5 lines long, 3—4 wide, on petioles 1— 2 inches long. Stipules 2 at the base of each petiole, obliquely lanced late, acuminated, toothed, with the nerve divided at the summit. Flowers numerous, (16-20) on small umbels, erect when expanded, afterwards reflected, the common peduncles terminal and axillary,2-3 inches

long. Calyx persistent, 5-cleft, the upper segments very short, sometimes Corolla white, tinged with purple, the vexillum alone longer than the calyx, the keel very short. Legume a little turgid, hairy, generally 4-seeded.

Grows in dry sandy pastures.

Flowers March—May.

### 2. Repens.

T. repens, subglaoblongis, emarginatis, serrulatis, dentibus traspermis.

Creeping, nearly brum; foliolis ovato- glabrous; leaflets ovate oblong, emargicapitulis | nate, serrulate, heads subglobosis; calycinis | nearly globose; teeth subæquali- of the calyx generalbus; leguminibus te- | ly equal; pods 4-seed-

Sp. pl. 3. p. 1359. Mich. 2. p. 59. Pursh 2. p. 477.

Root creeping. Stem prostrate and creeping, sprinkled occasionally with a few hairs. Leaves ternate, sometimes orbicular, generally emargimate, the lower ones occasionally obcordate, acutely serrulate, nearly glabrous, and of a very bright green. Petioles 2—8 inches long. Umbells many flowered, axillary and terminal, on peduncles 4-10 inches long. Flowers when expanded, erect, afterwards reflected. Calyx nearly glabrous, the upper segments a little shorter than the lower. Corolla white, the vexillum nearly twice as long as the calyx, wings and keel short. Legume cylindrical, turgid, 4-seeded.

Grows in close damp soils.

Flowers March—May.

White Clover.

This species of clover is now very much diffused in the low country of Carolina, and grows very luxuriantly during the spring in soils adapted to In summer it disappears. It is however eaten but sparingly, and apparently with reluctance, by stock of any description. It affects very sensibly the salivary glands, sometimes producing complete salivation.

### 3. Pratense.

T. adscendens, glavalibus, subintegerri- | nearly entire; stipules VOL. II.

Ascending, briusculum; foliolis o- | brous; leaflets oval, mis; stipulis aristatis; awned; spikes thick, spicis densis, ovatis; ovate; lower tooth of calycis dente infimo, the calyx shorter than tubo corollæ monope- the tube of the montalæ, inæqualis, breviore.

opetalous, unequal corolla.

Sp. pl. 3. p. 1366. Pursh 2. p. 478.

Root perennial. Stem ascending or erect, 2-3 feet high. Leaves ovate, finally serrulate, nearly glabrous. Flowers in ovate heads on short peduncles. Calyx and Bracteus very hairy. Corolla bright purple, much longer than the calyx.

This, perhaps the most valuable species of Trifolium, is found occasionally in the low country of Carolina, like the preceding species it grows luxuriantly in the spring but disappears during the steady heat of summer.

Grows in close rich soils. Flowers April—May.

Red Clover.

### 4. Reflexum.

T. decumbens, pubescens; foliolis obovatis; stipulis oblique cordatis; capitulis multifloris; floribus pe- flowered; flowers on dunculatis, demum omnibus reflexis; leguminibus sub 4-spermis.

Decumbent, pubescent; leaflets obovate; stipules obliquely cordate; heads many pedicels, all finally reflected; pod generally 4-seeded.

Willd. Sp. pl. 3. p. 1357. Walt. p. 183. Mich. 2. p. 59. Pursh 2. p. 477.

Stem herbaceous, decumbent, 12-18 inches high, very pubescent. Leaves ternate, somewhat rhomboidal, pubescent, the upper ones acute, the lower emarginate. Petals 3-4 inches long. Flowers in compact, oblong heads, after expansion reflected; common peduncle scarcely an inch Calyx hairy, with the segments nearly equal. Vexillum of the corolla twice as long as the calyx, rose coloured: Wings and keel short, nearly white. Legione glabrous, compressed, slightly winged, 4-seeded.

This species of Trifolium, which under the name of Buffalo Clover, grows I believe freely in the upper districts of Georgia, is rare in the low country. Its leaves and flowers are larger than those of any other of our species. With our cattle it does not appear to be a favorite food.

Grows in close soils. Flowers April—May.

### 5. ARVENSE.

T. erectum, villosum; foliolis lineari lanceolatis, apice serrulatis; spicis villosissimis, subcylindraceis; dentibus calycinis setaceis, corolla longioribus.

Erect, villous; leaflets linear lanceolate, serrulate at the summit; spikes very villous, somewhat cylindrical; teeth of the calyx setaceous, longer than the corolla.

Sp. pl. 3. p. 1373. Walt. p. 183? Mich. 2. p. 59. Pursh 2. p. 478.

Stem erect, like the whole plant, hairy. Leaves ternate, very simple, leaflets almost linear. Stipules united at base, summits acute and almost setaceous. Flowers in terminal cylindrical spikes. Calyx with the tube a little inflated, the segments setaceous, long, and with the tube so villous to make the spike resemble an oblong mass of hair. Corolla shorter than the calyx, flowers white with a red spot on each wing.

Grows, but I believe sparingly, in the upper districts of Carolina.

Flowers.

# STYLOSANTHES. GEN. PL. 1203.

Calyx tubulosus, longissimus, corollifer. Germen sub corolla. Lomentum 1—2 articulatum, hamatum.

Calyx tubular, very long, bearing the corolla. Germ under the corolla. Lomentum 1—2 jointed, hooked.

1. ELATIOR.

S. caule uno latere pubescente; foliolis lanceolatis, glabris; bracteis lanceolatis, ciliatis, pauci-floris.

Stem pubescent on one side; leaslets lanceolate, glabrous; bracteas lanceolate, fringed, few flowered.

Sp. pl. 3. p. 1167. Nutt. 2. p. 106. S. Hispida. Mich. 2. p. 75. Pursh 2. p. 480. Arachis aprica. Walt. p. 182.

Root perennial. Leaves ternate, leaslets lanceolate and acute, entire, the leaves surrounding the capitulum simple and a little hairy. Flowers in terminal compact heads, closely compressed, with leaves and hispid bracteas, flowers in each head numerous, though it seldom occurs that more than two mature their seed. Calyx superior, somewhat 2-lipped, fringed, the upper lip 2-cleft, the lower 3-parted. Corolla attached to the calyx vellow. Stamens monadelphous, unequal. Anthers 5 round, 5 oblong Tomentum 1-celled, coriaceous, hooked at the summit.

Grows in dry sandy soils. Flowers May—August.

#### LESPEDEZA. Mich.

Calyx 5-partitus, | laciniis subæqualibus. | segments nearly equal. Corollæ carina trans- | Keel of the Corollæ verse obtusa. Lomen- | transversely obtuse. tum lenticulare, in- | Pod lenticular, erme, 1-spermum.

1. Sessiliflora.

L. erecta, subramosa; foliolis oblongis; leaflets oblong; clusfasciculis florum ses- ters of flowers numesilibus, numerosis; lomentis calyce minuto | cute, scarcely covered subnudatis, acutis.

Calyx 5-parted, armed, 1-seeded.

Erect, branching; rous, sessile; pods aby the minute calyx.

Mich. 2. p. 70. Pursh. 2. p. 480.

Stem 2-3 feet high, slender, sparingly branched, slightly pubescent. Leaves ternate, elliptic, mucronate, sprinkled with hairs on the upper surface, very hairy underneath, common petiole about an inch long. Flowers in small sessile clusters, sometimes in small racemes. Calvx hairy. Corolla and Legume both longer than the calyx, corolla of a pale violet colour, legume conspicuously mucronate and hairy.

Grows in sandy lands. Flowers September.

#### 2. Stuvei. Nutt.

L. simplex, erecta, | Simple, erect, vilvillosa; foliis ovali- lous; leaves oval;

bus; spicis peduncula-tis, paucifloris, foliis longioribus; lomentis nudis, pubescentibus. spikes on peduncles, few flowered, longer than the leaves; pods naked, pubescent.

Nutt. 2. p. 107.

Stem 2-3 feet high, clothed with a soft pubescence. Leaves ternate, hairy on both surfaces, common petiole not half an inch long. Racemes axillary, rarely bearing more than 5-6 flowers, common peduncle rather more than an inch long. Corolla much longer than the calyx, hairy, pointed with a persistent style.

My specimens, though differing in a few minute particulars from the

description of Mr. Nuttall, appear to belong to this species.

Grows in dry sandy lands.

Flowers September.

### 3. VIOLACEA.

L. erecta, ramosa, pubescens; foliis ellipticis; racemis subumbellatis, foliis vix su- | what umbellate, scarce-

perantibus; lomentis ovatis, pilosis. E. ly longer than the leaves; pods ovate, hairy.

Sp. pl. 3. p. 1195. Walt. p. 185. Pursh 2. p. 481. Nutt. 2. p. 108.

Stem 3-4 feet high, much branched, furrowed. Leaves a little hairy on both surfaces, common petiole generally from half an inch to an inch long. Flowers on short racemes, and as is usual in this genus, 2 from each bud, but the buds are so pear together that the flowers are very much crowded, and as the racemes are just a little longer than the leaves, the apper extremities of the branches frequently resemble a compact cylinder of flowers. Corolla larger than the calyx, bright purple. Pod

Grows in dry rich soils. Flowers September.

The L. Divergens of Dr. Muhlenberg, I have never met with in this state, but the specimens which he sent me appear to differ very much from our common L. Violacea. It is distinguished by much larger leaves on much longer petioles, its stem is much more diffusely branched, the peduncles long with the flowers scattered and distinctly racemose, and the lomentum, or pod, reticulated and nearly glabrous.

## 4. FRUTESCENS.

L. foliis ternatis, ellipticis, obtusis, sericeis; stipulis subulatis; racemis axillaribus, ovatis, foliis brevioribus; lomentis pilosis, calvce brevioribus.

Leaves ternate, elliptic, obtuse, silken; stipules subulate; racemes axillary, ovate, shorter than pods leaves; shorter than the calyx.

Hedysarum frutescens. Sp. pl. 3. p. 1193.

H. Umbellatum? Walt. p. 184.

L. Capitata. Mich. 2. p. 71. Pursh 2. p. 480.

Root perennial. Stem really herbaceous, though like some other speeies of this genus, suffruticose in appearance, 4-6 feet high, pubescent, villous when young. Leaves ternate, covered with a silky pubescence on both surfaces, somewhat glaucous, common petioles 6-8 lines long. Flowers in crowded, axillary racemes, shorter than the leaves, common peduncles 6-8 lines long. Calyx 5-parted, the segments three times as long as the tube and longer than the corolla. Corolla white, the vexillum spotted with red near the base.

Grows in the upper districts of Carolina. Common near Columbia.

Flowers September.

### 5. A NGUSTIFOLIA.

bescentibus; racemis capitatis, foliis longioribus; corollis calvce longioribus.

L. foliis oblongo-el-lipticis lanceolatisque, subtus canescenti pu-liptic and lanceolate, hoary and pubescent underneath; racemes | capitate, longer than the leaves; corolla longer than the calyx.

L. capitata. var. angustifolia. Pursh 2. p. 480

Stem herbaceous, erect, 4-5 feet high, pubescent. Leaves long and very narrow, sprinkled with a few hairs on the upper surface, very villous and hoary on the under, common petioles 3-4 lines long. Racemes sometimes compound, compactly clustered, common peduncles 1-2 inches long. Segments of the calyx rather longer than the tube, not quite as long as the corolla. Corolla white, vexillum purple at base. Lomentum

in this and the preceding species, inclosed in the calyx.

I have separated this species from the frutescens, as it appears to differ permanently in the size and form of the leaf, and in the comparative length of the racemes and corolla, it differs also with us in its habitat. This is found very abundantly in the low country, where I have never seen the former unless when cultivated in my garden.

Grows in dry sandy soils.

Flowers September.

## 6. HIRTA.

L. erecta, ramosa, villosissima; foliis subsessilibus; foliolis rotundato-ovalibus; spicis axillaribus, longepedunculatis; corollis calyce subæqualibus; lomento calycem subæquante.

Erect, branching, very villous; leaves nearly sessile; leaflets oval, nearly round; spikes axillary, on long peduncles; corolla the length of the calyx; pod as long as the ca-

Mich. 2. p. 71. Pursh 2. p. 480. L. Polystachya. Hedvsarum hirtum. Sp. pl. 3. p. 1193. Walt. p. 185.

Root perennial, Stem erect, branching, 3-4 feet high, with the whole plant pubescent, and very hairy when young. Leaves ternate, nearly round, and as in all the species of this genus, very entire, slightly mucromate, covered on both sides with a silky pubescence, 3-5 lines long. Flowers crowded, in simple racemes, on peduncles longer than the leaves. Calyx very hairy, deeply 5-cleft, segments subulate, equal. Corolla near-Petals all equal, scarcely as long as the calyx, the vexillums spotted in the centre with red. Lomentum hairy, 1-seeded.

Grows in dry and moderately fertile soils,

Flowers September.

# 7. Procumbens.

L. procumbens, gracilis, pubescens; foliis | der, pubescent; leaves evalibus; pedunculis oval; peduncles very longissimis, setaceis, long, setaceous; flow-

Procumbent, slen-

spicifloris; lomentis or-biculatis, pubescentibus | ers in spikes; pods or-bicular, pubescent

Mich. 2. p. 70. Pursh 2. p. 481. Nutt. 2. p. 118.

Stem prostrate, branching, with the branches assurgent. Leaves ternate, leastets oval, nearly round, emarginate, mucronate, very pubescent and slightly glaucous underneath. Flowers few near the summit of long axillary peduncles. Corolla purple, longer than the calyx. Lomentum when mature nearly round, and very pubescent particularly along the margin.

Grows in dry soils.

Flowers August to October.

In the L. Polystachia and Frutescens, the calvx is deeply and equally 5-parted, in this and some other species it appears to be 4-parted, with the ' upper segment 2-cleft.

# 8. PROSTRATA.

L. prostrata, subglabra; foliis ellipti- glabrous; leaves elcis obovatisque; pe-dunculis foliis super-antibus, spicifloris; lo-mentis orbiculatis, spikes; pods orbicumentis parce pilosis.

Prostrate, nearly lar, a little hairy.

Sp. pl. 3. p. 1200. Pursh 2. p. 481. Nutt. 2. p. 108.

Plant in habit and appearance very similar to the preceding species. Stem very slender, woody and glabrous. Leaves on very short petioles, a little hairy on the under surface and sometimes distinctly obovate. Peduncles scarcely more than an inch long, very slender. Flowers very numerous and rather smaller than those of L. Procumbens. small, slightly sprinkled with hairs.

Grows in dry soils.

Flowers August to October.

# \*\* Legume many seeded, generally articulated.

# HEDYSARUM. GEN. PL. 1204.

Calyx 5-fidus. Co-|Calyx 5 cleft. Keel ollæ carina trans- of the Corolla trans-

verse obtusa. mentum pluri-articula- (Lomentum) catis, 1-spermis.

# . 1. Nudiflorum.

H. foliis ternatis, lato-ovalibus, acuminatis, subtus glauces. culato, glabro, caule triangularibus.

Lo- | versely obtuse. Pod tum. Articulis trun- | jointed. Joints truncate, 1-seeded.

Leaves ternate, oval. broad, acuminate, slightly glaucous uncentibus; scapo pani- derneath; scape paniculate, glabrous, taller foliifero altiore; lomen than the stem; joints ti articulis subrotundo- of the pod obtusely triangular.

Sp. pl. 3. p. 1198. Walt. 185. Mich. 2. p. 71. Pursh 2. p. 483.

Root perennial. Stem generally erect, 6-8 inches high, simple, pubescent, with the leaves crowded near the summit. Leaves ternate, leaflets ovate, slightly acuminate, pubescent, a little scabrous, particularly on the upper surface. Common Petioles 3-5 inches long. panicle 2-3 feet long, the common peduncles shooting from the base of the stem, partial peduncles generally in pairs, abo t an inch and a half long, pubescent. Calyx 4-cleft, the upper segment sometimes bifid, the lower longer than the rest. Corolla purple. Petals equal. Vexillum marked at base with two dark purple spots. Segments of the staminiferous tube unequal. Lomentum 3-4 jointed, pubescent.

Grows in dry rich shaded soils,

Flowers June—August.

#### Mich. 2. ACUMINATUM.

H. erectum, simplex, pubescens; fominatis, parce pilosis; acuminate, gissime pedunculata.

Erect, simple, pubescent; leaves terliis ternatis, rotunda- | nate, ovate, nearly to ovatis, longe acu- round, conspicuously ā little panicula terminali, lon- hairy; panicle terminal, on a very long peduncle.

Mich. 2. p. 72. Pursh 2. p. 483. YOL, II.

Root perennial. Stem erect or procumbent, scarcely a foot high, and with the whole plant sprinkled with soft hair. Leaves crowded near the summit of the stem, leaflets much dilated in the middle, abruptly acuminated, a little scabrous, common petiole 3-4 inches long. Flowers in a terminal paniele 1-2 feet long, partial peduncle 2-4 lines long. Calyx A-toothed, nearly equal in length. Corolla pale violet, nearly white. Petals equal in length. Lomentum 3—4 jointed. Joints rounded.

The stamens in this and the preceding species are nearly monadel-This species is generally considered as the H. Glutinosum of Dr. Muhlenberg and Willdenow, if, however, Willdenow is correct, in describing the panicle as arising from the base of the stem, which he has twice mentioned, the two species must be distinct. In a specimen of the H. Glutinosum, which was sent me by Dr. Muhlenberg, the leaves and panicle are unfortunately detached from the stem, as far, however, as they can be compared to this species, the resemblance is minutely exact.

· Grows in rich shaded soils. Flowers June—August.

#### 3. Strictum. Pursh.

Erect; leaves teraxillaribus cemes axillary and terminal; pods gene-

Pursh 2. p. 483. Nutt. 2. p. 109.

Stem erect, 3-4 feet high, covered, as is common in this genus, with an adhesive pubescence, branching towards the summit. Leaflets long, exactly linear, but elliptic at their terminations, bearing a few hairs sprinkled along the margin, common petiole 4-5 lines long, pubescent. Flowers in long, axillary and terminal panicles, pubescent. Calyx 4-cleft, segments a little unequal. Corolla small, purple, greenish at base. Lomentum generally 2-jointed. Joints nearly oval, hispid.

Grows in dry pine barrens. Flowers August—September.

# 4. PANICULATUM.

ternatis, lineari-lance- nate, linear lanceolate,

H. erectum; foliis | Erect; leaves terolatis, utrinque obtusis, obtuse at each end, a gularibus, hispidis.

subtus parce pilosis; | little hairy underneaths panicula terminali; lo- | panicle terminal; pods menti articulis trian- hispid, with the joints l triangular.

Walt. p. 185. Mich. 2. p. 74. Pursh 2. p. 488. Sp. pl. Lin. 8. p. 1056. Gron. Flor. Virg. 108.

Root, as in all of this genus, perennial. Stem erect and procumbent. furrowed, a little hairy towards the summit. Leaves very narrow, with the margins revolute, nearly glabrous, paler underneath, and a little hairy, sometimes 3-4 inches long, 3-4 lines wide, common petiole about an inch long. Calyx 4-cleft, the inferior segment nearly twice as long as the Corolla purple. Lomentum generally 5-jointed. Jointe nearly others. triangular.

Grows in damp soils.

Flowers August—September.

#### Mich 5. GLABELLUM.

H. erectum, glabri- | usculum; foliis terna- brous; leaves ternate. tis, ovatis, obtusis, sub- ovate, obtuse, slightly cula terminali; lomen- | panicle terminal; joints rhomboideis.

Erect, nearly glatus subglaucis; pani- | glaucous underneath; ti articulis triangulo- of the pod triangular approaching to rhomboidal.

Pursh 2. p. 482. Mich. 2. p. 73 H. Paniculatum. Willd. Sp. pl. 3. p. 1196.

Stem erect and procumbent, about 2 feet high, pubescent near the suitimit. Leaves ovate, very obtuse, pale green with the veins distinctly reticulate, sprinkled with hair on both surfaces, common petiole about half an inch long. Stipules dilated at base, acuminate and very acute. Flows ers in a somewhat leafy panicle. Calyx 4-cleft, the upper segment as usual a little broader than the others, the lower a little prolonged. Corolla purple. Lomentum 8-5 jointed, the joints nomewhat rhomboldal, hispid.

Grows in shady places.

Flowers August—September.

#### 6. OBTUSUM.

H. foliis ternatis, reticulatis, hispidis.

Leaves ternate, oovatis, obtusis, basi vate, obtuse, slightly subcordatis; stipulis | cordate at base; stisubulatis; panicula ter- | pules subulate; paniminali; articulis lo- cle terminal; joints of menti semiorbiculatis, the pod semiorbicular, reticulate, hispid.

Sp. pl. 3. p. 1190. Pursh 2. p. 482.

Stem erect, branching, a little hairy towards the summit. small, scarcely an inch long, ovate and obtuse, nearly glabrous but sprink-'led with a few hairs, particularly along the veins, the lateral leaves generally subcordate. Panicle terminal, erect. Corolla purple. Lomentum generally 3-jointed. Joints hispid, nearly round.

Grows in dry soils. Flowers September.

#### 7. CILIARE.

pidis.

H. foliis ternatis, | Leaves ternate, oovatis, subtus pubes- | vate, pubescent undercentibus, margine ci- neath, fringed along liatis; panicula termi-nali; lomenti articu-lis semiorbiculatis, hispid.

Sp. pl. 3. p. 1196. Pursh 2. p. 482. Nutt. 2. p. 109.

Stem erect, about 2 feet high, streaked, pubescent. Leaves ovate, sometimes a little rhomboidal, pubescent underneath, a little scabrous on the upper surface, on a common peduncle rarely half an inch long. Panicle terminal, composed of many simple racemes, nearly covered with small Howers. Corolla purple. Calyx 4-cleft. Lomentum 2-3 jointed. Joints nearly round, reticulate-

Var. Oblongifolium.

In the dry lands about Beaufort, I have always found this plant accompanied with a variety or perhaps species, resembling it entirely in habit, size, in the clustered panicle of small flowers, but differing in its leaves, which are larger and proportionally more long, more glabrous, slightly glaucous underneath, and growing on petioles an inch long.

Grows in dry sandy lands. Common about Beaufort.

Flowers September and October.

# 8. ROTUNDIFOLIUM.

H. prostratum, hirsutum; foliis ternatis, orbiculatis; stipulis i bus; lomenti articulis subrhomboideis.

Prostrate, hirsute; leaves ternate, orbicular; stipules cordate, cordatis, reflexis; ra- reflected; racemes ax-cemis axillaribus et illary, and paniculate illary, and paniculate paniculato-terminali- | at the summit; joints of the pod nearly rhomboidal.

Mich. 2. p. 72. Pursh 2. p. 484.

Stem 2-3 feet long, geniculate, branching. Leaves a little scabrous, and villous on both surfaces, paler underneath, common petiole from 1-1 1-2 inches long. Stipules cordate and acuminate, persistent. Flowers sparingly scattered on the racemes, common peduncle 6—18 inches Calyx 4-cleft. the lower segment prolonged. Corolla pale purple, nearly white. Lomentum 3-4 jointed. Joints nearly rhomboidal, reticulate, very pubescent along the margins. Varies sometimes with leaves ovate, slightly heart-shaped at base.

Grows in dry fertile soils. Flowers August—September.

#### Mich. 9. Bracteosum.

H. glabrum; foliis ternatis, ovatis, acuacutissimisminatis que; stipulis oblique ovatis; panicula ter-minali; bracteis majusculis, ovatis, longe acuminatis: lomenti | articulis subtriangularibus.

Glabrous; leaves ternate, ovate, acuminate and very acute; stipules obliquely ovate; panicle terminal: bracteas large, ovate, with a long acumination; joints of the pod nearly triangular.

Mich. 2. p. 73. Pursh 2. p. 482. H. Cuspidatum. Sp. pl. 3. p. 1198. Pursh 2 p. 483. Plukenet t. 308. f. 5.

Stem 3-5 feet-high, erect and decumbent, very glabrous below, a little scabrous near the summit. Leaves tapering to a very long and acute point, sometimes ciliate, and sprinkled with hairs along the veins, com-

mon petiole 2-5 inches long. Racemes axillary and terminal, forming a large loose panicle. Bracteas before the opening of the flowers imbricate and conspicuous, when in flower, from the elongation of the common peduncle, the flowers appear thinly scattered on the stem. Calyx 4-cleft, the upper segment bifid, the lower long. Corolla purple, rather larger than is common in this genus. Lomentum 3-6 jointed, often pendulous very scabrous. Joints long and triangular.

Grows in rich dry soils.

Flowers August-September.

#### 10. Canadense.

H. foliis ternatis, oblongo lanceolatis; latis, acuminatis, cili- | minate, ciliate; joints atis; articulis lomenti obtuse triangulis, hispidis.

Leaves ternate, oblong lanceolate; stistipulis filiformibus; pules filiform; flowers floribus racemosis; in racemes; bracteas bracteis ovato-lanceo- | ovate-lanceolate, acuof the pod obtusely triangular, hispid.

Sp. pl. 3. p. 1187. Pursh 2. p. 481.

Stem about 2 feet high, erect, very pubescent near the summit, furrowed. Leaves long, lanceolate and ovate-lanceolate, pubescent on both surfaces, particularly along the veins. Flowers in compact, axillary racemes. Bracteas large, closely imbricate and conspicuous before flowering as in H. Bracteosum. Corolla purple.

This species is said by Pursh to extend to Carolina. It very probably can be found in our mountainous districts. I have however, never seen

it in the low country. Grows in dry soils.

Flowers July—August. Pursh.

#### 11. MARILANDICUM.

H. foliis ternatis, Leaves ternate, ob-oblongis, subtus villo- long, slightly villous siusculis; stipulis sub-ulatis; racemis pani-culatis; lomentis tri-articulatis, articulis underneath; stipules subulate; racemes pan-iculate; pods 3-joint-ed, joints rhomboidal,

rhombeis reticulatis, | reticulate, a little hairy. pilosiusculis.

Sp. pl. 3. p. 1189. Pursh 2. p. 482.

Stem erect, pubescent towards the summit. Leaves ovate, hairy on the under surface, particularly along the veins, the lateral leaflets sessile and slightly cordate, common petiole 1-2 inches long. Panicle somewhat loose and slender. Corolla purple. Lomentum 2-3 jointed, somewhat rhomboidal.

Grows in dry soils. Flowers July—August.

### 12. RIGIDUM. E.

H. erectum, ramosissimum; foliis oblongo-ovatis, obtusis, reticulatis, pubescenceolatis, acuminatis.

Erect, much divided; leaves oblong-ovate, obtuse, reticulate, pubescent; panitibus; panicula ramo- | cle branching; bracsa; bracteis ovato-lan- teas ovate lanceolate. lacuminate.

Stem about 3 feet high, almost tomentose towards the summit. Leaves nearly 2 inches long, 5-7 lines wide, thick, strongly reticulate and very pubescent on the under surface, common petiole rarely half an inch long. Panicle composed of long erect racemes. Bracteas small. Lower segment of the calyx much longer than the upper. Corolla small, purple. Flowers at first crowded, scattered as the stalks extend.

Grows in dry soils.

Flowers August-September.

#### Nutt. 13. LÆVIGATUM.

erectum, glasubcoriaceis, subtus | what coriaceous, slight. bracteis parvulis; lo- pound, terminal; brac-

Erect, very gla. berrimum; foliis ter- | brous; leaves ternate. natis, ovatis, acutis, ovate, acute, some. subglancis; panicula ly glaucous under-composita, terminali; neath; panicle commenti articulis trian- teas small; joints of gularibus, pubescenti- the pod triangular, bus. pubescent.

Nutt. 2. p. 109.

Stem 3—4 feet high, sometimes decumbent, a little pubescent towards the summit. Leaves sometimes slightly acuminate, veiny, common petiole 1—3 inches long, partial petioles about 3 lines long. Flowers in a large compound panicle, (florets as is common in this genus,) 2 from each bud, on peduncles 5—8 lines long. Bracteas ovate, acuminate, ciliate; 2—3 lines long. Calyx 4-cleft, the upper segment emarginate, the lower one nearly twice as long as the rest. Corolla purple. Lomentum 3—5 jointeed. Joints triangular, pubescent.

This plant has, as remarked by Mr. Nuttall, some resemblance to the H. Bracteosum, it differs however, in its leaves, which are wider, thicker and not so acute, and by its small bracteas. It was sent by me many years ago, as a distinct species, to Dr. Muhlenberg under the name of H.

Coriaceum.

Grows in rich dry soils near Beaufort. Flowers August to October.

# 14. Rhombifolium. E.

H. pubescens; foliis ternatis, rhomboideis, obtusis, crassiusculis, reticulato-rugosis; panicula composita; bracteis parvulis; lomentis 1—3 articulatis, articulis suborbiculatis, venosis.

Pubescent; leaves ternate, rhomboidal, obtuse, thick, reticulate, rugose; panicle compound; bracteas small; pods 1-3 jointed, joints nearly round, veined.

Stem 2—3 feet high. Leaves somewhat thick and rugose, paler underneath, the lateral leaflets frequently obtuse, the terminal always rhomboidal, common petiole 6—10 lines long, the partial about 1 line. Stipules subulate, 3—4 lines long. Buds 2—3 flowered, proper peduncle 3—5 lines long. Bracteas ovate, lanceolate, acuminate, hairy. Calyx 4.eleft, the upper segment slightly emarginate, the lower one a little longer than the others. Corolla purple. Lomentum 1—3 jointed. Jointa nearly round, very pubescent.

Grows in dry soils about Beaufort. Flowers September—October.

# 15. VIRIDIFLORUM.

H. erectum; foliis ternatis, ovatis, obtusis, supra scabris, subtus mollissime villosis; panicula terminali, longissima, subnuda; lomenti articulis triangularibus.

Erect; leaves ternate, ovate, obtuse, scabrous on the upper surface, villous and very soft underneath; panicle terminal, very long, naked; joints of the pod triangular.

Clayton Flora Virgin. p. 109. no. 190. Linnæi. Sp. pl. 1055. Walt. p. 185.

Stem 3—4, feet high, pubescent, very scabrous towards the summit. Leaves ovate, sometimes acute, very scabrous on the upper surface, clothed with a velvet like tomentum on the under, 2—3 inches long, 1—1 1-2 wide, common petiole 1—2 inches long. Peduncles very scabrous and sometimes viscid. Calyx 4-cleft, the upper segment bifid, the lower one longer than the rest. Petals purple within, greenish without. Lomentum 3—4 jointed, joints oblong, triangular.

This plant as was remarked to me by Dr. Muhlenberg in his letters, is evidently the original H. Viridiflorum of Clayton and Gronovius, "foliis magnis superne asperrimis, subtus mollibus althea instar" and therefore of Linnæus. Walter, Michaux, Willdenow and Pursh have under this name described another species.

Grows in dry soils. Very common. Flowers from June to October.

# 16. Scaberrimum. E.

H. erectum, scaberrimum; foliis ternatis,
ovatis, superne attenuatis, acutis, canescenti-pubescentibus; stipulis ovatis, acuminatis, persistentibus; panicula majuscula, terminali; lomenti articulis majusculis, subtriangularibus, hispidissimis.

Erect, very scabrous; leaves ternate, ovate, tapering to the summit, acute, hairy, pubescent; stipules ovate, acuminate, persistent; panicle large, terminal; joints of the pod large, somewhat triangular, very hispid.

Stem 3-4 feet high, branching, and with most parts of this plant more scabrous than any other species we have described. Leaves of a pale green, beautifully veined, hairy, and scabrous particularly on the under surface, very obtuse at base, common peduncles 2-3 inches long. Stipules dilated at base, large, obliquely ovate, acuminate, hairy and persistent. Bracteas ovate, lanceolate, hairy. Calyx 4 cleft. Corolla 3 times as large as the calyx, purple. Lomentum larger than in any other of our

own species, 3—6 jointed, joints somewhat triangular.

This is one of the species which has been referred to the H. Canescens of Linnæus—The H. Canescens of Willdenow, is the H. Rotundifolium of Michaux, and our later botanists. I have among my specimens one sent me as the H. Canescens, according to Sir James Edward Smith, in which the leaves resemble this very much in shape, size, and colour, but are thinner in their texture, less hairy, less scabrous, not so distinctly articulate, and the flowers apparently forming much more compact racemes, with bracteas nearly thrice as long as in our plant.

Grows in dry soils. Very common.

Flowers June and August.

# 17. LINEATUM. Mich.

H. caule repente, viridi lineato; foliis sub- | streaked with green; sessilibus, trifoliatis, leaves nearly sessuborbiculatis; racemis sile, trifoliate, nearly elongatis, laxe parvi- | round; racemes long, floris; lomenti ar- with small scattered ticulis lenticularibus.

Stem creeping, flowers; joints of the pod lenticular.

Mich. 2. p. 72.

If the Stem of this plant had been rigidly erect, it would resemble very much the H. ciliare of this sketch. If no error has crept into the description of Michaux, his plant has not recently been seen by any of our botanists.

Grows in Carolina. Michaux.

#### ZORNIA.

tus, 2-labiatus. Vex- late, bilabiate. Vex-

### 1. Tetraphylla.

Z. foliis digitato-quadrifoliatis; folio-lis lanceolatis, glabris; spicis axillaribus, pe-dunculatis; floribus alternis bibracteatis, bracteis suborbiculatis.

Leaves digitate, leaflets 4, lanceolate, glabrous; spikes axil-lary, on peduncles; flowers alternate, pro-tected by two nearly round bracteas.

Mich. fl. Amer. 2. p. 76. Pursh. 2. p. 484. Anon. bracteat. Walt. p. 181.

Root somewhat cylindrically tuberous, perennial. Stem herbaceous, prostrate, branching in every direction, about 2 feet long, glabrous. Leaves digitate, generally by fours, leaflets lanceolate, very acute, the lower one sometimes obovate, all entire, glabrous and dotted; common petiole 1-2 inches long, partial petioles scarcely one line long. Stipules lanceolate, very acute, deciduous. Flowers in long (4—8 inches) simple, axillary spikes, somewhat distichous on the spike. Bracteus 2 at the base of each flower, covering the bud and nearly enclosing the expanded flower, lanceolate, ciliate, acuminate, attached to the stem near its summit. Calvx 4 cleft, the upper segment broad, emarginate, all fringed. Corolla yellow, the vexillum and keel longer than the wings. Stamens monadelphous, the stameniferous tube divided to the middle, the segments alternately longer. Anthers 5 round, 5 oblong. Lomentum 2—4 jointed, joints nearly round, rugose and hispid. In its artificial character this plant is very nearly allied to the genus Hedysarum, where it was formerly placed. In habit it is very distinct.

Grows in the driest sandy lands.

Flowers June to August.

# ÆSCHYNOMENE. GEN. Pt. 1202.

Calyx bilabiatus. | Calyx bilabiate.

mens divided into two equal phalanxes.

### 1. VISCIDULA.

Æ. caule prostrato, viscido-pugracili. bescente; foliolis 7—9, obovatis; pedunculis subbifloris; lomento pubescente, profunda incisura articulato.

Stem prostrate, slender, viscidly pubescent; leaflets 7-9 obovate; peduncles generally 2 flowered; pod pubescent, with the joints deeply notched.

Mich. 2 p. 74. Pursh. 2 p- 485. Nutt. 2 p. 111.

Root perennial. Stem about 3 feet long, branching. Leaves obovate. very obtuse, oblique, finely reticulate. Stipules small, ovate and acuminate. Racemes axillary, 2-3 flowered, longer than the leaves. Calyx almost equally 5 cleft, with 2 persistent bracteas at the base. Corolla yellow. Lomentum composed of two very distinct rounded joints, hispid. conspicuously mucronate.

Grows in sandy soils in the southern parts of Georgia.

· Flowers,

#### 2. HISPIDA.

Æ. caule erecto, petiolis-que tuberculatohispido; foliis multijugis; foliolis linearibus, obtusis; stipulis membranaceis, semisagittatis; racemis simplicibus, paucifloris; lomentis hispidis.

Stem erect and with the petioles hispid and tubercled; leaves in many pair, leaflets linear, obtuse; stipules membranaceous. misagittate; racemes simple, few flowered; pods hispid.

Willd. Sp. Pl. 3 p. 1163. Pursh. 2 p. 485. Nutt. 2 p. 111.

Annual. Stem 2-3 feet high, hispid. Leastets oval, very numerous. Racemes simple, few flowered, generally bearing a leaf. Calyx 2 lipped, deeply divided, the upper lip bifid, the lower trifid, with the intermediate segment very small. Corolla much larger than the Calyx, yellow, tinged with reddish purple. Lomentum composed of many (7-10) ve-

ry indistinct joints, very hispid.

I have had no opportunity of examining this plant in a living state; it is said by Pursh, on the authority of the herbarium of Gronovius to be the original Hedysarum Virginicum of Linnæus. It scarcely can be arranged with that genus, but I think also with M. Nuttall, that it cannot remain in the same genus with the preceding species.

Grows in damp and marshy soils.

Flowers July and August.

### SESBANIA POIRET.

Calyx dentibus sub-

Teeth of the calvx equalibus. Legumen long, nearly equal. Pod long, nearly cylindricum, 2-valve, dissepimentis tranversis. long, nearly cylindrical, 2 valved, with a transverse partition.

#### 1. MACROCARPA. Muhl.

S. foliis sine impari pinnatis, multijugis, (10—25 ;) foliolis ellipticis, glabris, subtus glaucescentibus; ra-cemis axillaribus, paucifloris; leguminibus pods nearly terete. subteretibus, elongatis.

Leaves equally pinnate; leaflets 10-25 pair, elliptic, glabrous, slightly glaucous underneath; racemes axillary, few flowered: long.

Annual. Stem 4-12 feet high, glabrous, with expanding branches. Leaslets entire, slightly mucronate, 5-12 lines long, 3 wide. Stipules subulate, a little hairy, caducous. Racemes shorter than the leaves. Calyx pubescent along the margin, teeth subulate, the two upper ones reflected Corolla yellowish, dotted with purple on the outer surface, vexillum larger than the other petals, reflected. Stamens diadelphous. Legume about a foot long, obscurely 4 angled, slender, compactly filled with cylindrical or reniform seeds.

Grows around ponds. Not common. Paris Island.

Flowers August to October.

# 2. Vesicaria. Jacq.

S? foliis sine impari pinnatis, multijugis, (10-20;) foliolis obracemis paucifloris, folio brevioribus; lomentis lanceolatis, longe stipitatis subdispermis.

Leaves evenly pinnated; leaflets 10-20 pair, oblong, obtuse, longis, obtusis, glabris; | glabrous; racemes few flowered, shorter than the leaves; pod lanceolate, stipitate, generally 2 seeded.

S. Platycarpa Persoon Synopsis 2. p. 316. Nutt. 2. p. 112.

S. Disperma. Pursh 2. p. 485.

Robinia vesicaria. Jacq. ic. rar. 1. t. 48.

Phaca floridana. Pers. Syn. 2. p. 331. Sp. pl. 3. p. 1252.

Æschynomene platycarpa. Mich. 2. p. 75.

Plant about 7 feet high, glabrous. Leaves equally pinnate, the common petiole ending in a bristle; leaflets sprinkled with a few hairs near the base. Racenes 4—8 flowered. Calyx 5 toothed. Petals equal, yellow. Lomentum conspicuously stipitate, rigidly mucronate, with both sutures thickened, the two tunics of the pod separate in an unusual manner when they are mature, so that the seeds appear to be inclosed in an interior integument. From this circumstance Jacquin's trivial name was derived, which I have retained, not only as prior in time, but perhaps as most appropriate. To the preceding species however, this plant is not allied, and after being so often removed, it has still to find an abiding

Grows in damp soils. Not very common, sometimes seen near Charles.

Flowers August-September.

# \*\*\* Legume many seeded. Stigma pubescent.

### LATHYRUS. GEN. PL. 1186.

Calycis laciniæ superiores 2, breviores.
Stylus planus, supra
villosus, superne latior.

Upper segments of
the calyx 2, short.
Style flat, villous on
the upper side, wider
towards the summit.

1. Pusillus. E.

L. pedunculis unifloris, elongatis; stipulis falcatis, cirrhis diphyllis, simplicibus; foliis lineari-lanceolatis.

Peduncles one flowered, long; stipules falcate; cirrhi 2 leaved, simple; leaves linear lanceolate.

A small slender vine, glabrous. Stem angled and winged. nearly half an inch long, very acute. Leaves about an inch and a quarter long, nerved, acute at each end, tendrils divided. Segments of the Calyx very acute. Corolla twice as long as the calyx, purple. long, slightly falcate, many seeded (about 14.)

This plant, which appears to have much affinity to the L. Angustifolia. of Europe, was found by the late Dr. Trescott on Cooper River in St.

John's parish, and is described from his specimens.

Flowers in May.

### VICIA. GEN. PL. 1187.

Calyx superne emarginatus, 2-dentatus, inferne dentibus 3, rectisologis. Vexillum emarginatum. Stigma latere inferiore transverse barbatum.

1. SATIVA.

V. floribus binis subsessilibus; stipulis dentatis, macula notatis: foliolis oblongo ovatis, retusis, mucronatis; leguminibus erectis, subtereti-linearibus, glabris. Sp. pl. **3.** p. 1104.

Walt. p. 183. Mich. 2. p. 69. Pursh 2. p. 471.

Upper lip of the calyx emarginate, slightly 2 toothed, the lower with 3 straight long Vexillum eteeth. marginate. Stigma transversely bearded on the lower side.

Flowers in pairs, nearly sessile; stipules toothed, spotted; leaflets oblong-ovate, retuse, mucronate; pods erect, slender, nearly terete, glabrous.

Stem 4-angled, pubescent, branching, 2-6 feet long. Leaves pinnate, terminating with a tendril; leaflets generally 6 pair, elliptic, but retuse and pointed at the summit, pubescent. Stipules 2-lobed, the lobes divaricate, notched, pubescent, with a black spot at the base. Flowers axillary, sessile, solitary or in pairs. Calyx 5-cleft, segments nearly equal, cylindrical. Seeds numerous, (about 10,) glabrous.

Grows about Charleston very abundantly.

Flowers March—June.

# 2. MITCHELLI. Rafinesque.

V. pedunculis axillaribus, solitariis, multifloris; stipulis parvulis; foliolis plurimis (10-14,) lineari-lanceolatis, retusis, mucronatis; leguminibus | dispermis, pilosis. E.

Peduncles axillary, solitary, many flowered; stipules small; leaflets numerous (10— 14,) linear lanceolate, retuse, mucronate; pods 2-seeded, hairy.

Annual? humble. Stem very much branched and diffused over the small herbage in its neighbourhood. Leaves alternate, terminating in divided tendrils; leaslets numerous, (8-14,) small, linear lanceolate, sometimes cuneate, obtuse and emarginate at the summit, pointed by the projecting midrib. Flowers 4-6 near the summit of the peduncles, rather more than an inch long, small, greyish white. Legumes small, very hairy, and I believe constantly 2 seeded.

This species, which was first noticed at New-York, by Mr. Rafinesque as distinct from the V. Pusilla, grows very abundantly on some farms in

the vicinity of Charleston. Flowers March—April.

# 3. CAROLINIANA. Walt.

V. pedunculis mullatis, pubescentibus.

**Peduncles** tifloris, folia æquanti-bus, vel superantibus; or longer than the stipulis lanceolatis, in-leaves; stipules lancetegerrimis; foliolis 8 olate, entire; leaflets -10, elliptico-lanceo- | 8-10, oblong lanceolate, pubescent.

Sp. pl. 3. p. 1094. Walt. p. 182. V. Parviflora? Mich. 2. p. 69. Pursh. 2. p. 472.

Perennial, much branched, running over shrubs 8-10 feet high. Leaves terminating with a 3-cleft tendril; leaflets 8-10, elliptic or ovate, generally obtuse. Flowers very numerous, on long peduncles. Calyx bairy, segments short and obtuse. Corolla white, the vexillum marked with a black spot. The Legume somewhat falcate, mucronate. Seeds numerous, small.

Grows in damp rich soils, frequent along the margins of swamps.

Flowers April.

### 4. Acutifolia. E.

V. pedunculis' paucifloris, folia superan-tibus; stipulis lanceo-latis, integris; foliolis olate, entire; leaflets paucis (6) linearibus, few (6) linear, acute utrinque acutis; caule at each end; stem glaglabro.

Peduncles few flow-

Perennial? Stem glabrous, somewhat angled, running over small shrubs 2-3 feet high. Leaves terminating in a tendril, generally undivided; leaflets 3 pair, sessile, glabrous, 10-15 lines long, very acute. Flowers few in my specimens, not exceeding 5 on the long peduncles. Upper lip of the Calyx nearly truncate. Corolla white. Legume glabrous, very slightly falcate, mucronate, many seeded. Seeds small.

Grows in Scriven county, Georgia.

Flowers April—May.

### - PHACA. GEN. PL. 1378.

A. caulescens, dif- | Caulescent, diffuse; mucronate.

Sp. Pl. 3. p. 1274. Walt. p. 183. Pursh 2. p. 472.

Stem prostrate terete. Root creeping. Leaves glabrous on both sides, somewhat glaucous underneath. Calyx smooth, green. Corolla yellow. Legume cylindrical, depressed, mucronate. Linnæus.

In my specimens the leaves are hairy underneath, and the plant bears a strong resemblance to the preceding species. It seems to differ by the

smaller number of its leaflets and flowers.

Grows in the mountains of Carolina. Flowers July, August, Pursh.

#### Mich. 3. GLABER.

A. caulescens, glaber; foliolis plurimis, parvulis, ovalibus, subtantibus, teretibus, incurvis.

Caulescent, glabrous; leaflets numerous, small, oval, slightciliatis; spicis longe | ly fringed; spikes few pedunculatis, pauciflo- flowered, on long peris; leguminibus dis- | duncles; pods distant, terete, incurved.

Mich. 2. p. 66. Pursh 2. p. 472.

Stem about 2 feet high, glabrous. Leaves very numerous, much small ler than in either of the preceding species, obtuse, sometimes emarginate, hairy along the edges, peduncles as long as the leaves, bearing a few flowers (3-6) near the summit. Calyx a little hairy, the teeth broad and short. Corolla white, much larger than the calyx.

Grows in the high pine barrens in Scriven County, Georgia.

Flowers April.

#### E. 4. OBCORDATUS.

A? glaber; foliolis | Glabrous; leaflets parvulis, plurimis (15) small, numerous (15) floribus albidis.

-19) obcordatis; pedunculis elongatis; duncles long; flowers

Plant small and apparently decumbent. Leaves unequally pinnate, leaflets 2-3 lines long, completely obcordate, on very short partial petioles. Peduncles robust, bearing at their summit 8-12 flowers. Bracteas subulate, scarcely longer than the partial peduncle. Calyx a little hairy, segments long, subulate. Corolla white.

This remarkable species was sent to me from St. Marys' by the late Dr. Baldwin as the A glaber of Michaux. From the specimen the corolla appears to have been white, the Legume I have not seen.

Grows in the Southern Districts of Georgia near St. Mary's.

Flowers.

\*\*\*\* Legume many seeded, 1-celled, not included in the preceding sections.

#### PHASEOLUS. GEN. PL. 1180.

Carina cum staminibus styloque spiraliter torta. Legumen compresum, falcatum. Semina compressa, reniformia.

1 Perennis. Walt.

P. caule volubili; racemis paniculatis, subgeminatis; foliolis ovatis, acuminatis, triplinervibus, pubescentibus; leguminibus pendulis.

Keel with the stamens and style spirally twisted. compressed, Seeds compressed, reniform.

Stem voluble; racemes paniculate, generally in pairs; leaflets ovate, acuminate. triplinerved, pubescent; pods pendulous.

Sp. pl. 3. p. 1031. Walt. 182. Pursh 2. 469. P. paniculatus. Mich. 2. p. 60.

Root perennial. Stem pubescent, climbing freely over small shrubs. Leaves ternate, the lateral leaves gibbous on one side, common petiole 2,-4 inches long. Stipules lanceolate, acuminate, small. Recemes or rather panicles, 1-3 in each axil but not of the same age, 4-8 inches long. Two small hairy bracteas at the base of each calyx Calyx 2 lipped? the upper lip nearly truncate and emarginate, the lower 3 cleft, the segments broad, short, acute. Corolla purple, vexillum large, reflected, the keel compressed, spiral. Legumen broad, falcate, mucronate. Seeds numerous, attached alternately to each valve.

Grows in damp rich land. Along the margins of swamps.

Flowers July-September.

# STROPHOSTYLES. E.

Carina cum staminibus styloque spiraliter torta. Legumen teres, subbiloculare. Semina cylindrico-reniformia.

Keel with the stamens and style spirally twisted. Legumen terete, somewhat bilocular. Seed reniform, nearly cylindrical

#### 1 Angulosa.

S. foliis ternatis, foliolis angulatis, bilobis trilobisque; peduncles longer dunculo foliis longiore; floribus capitatis.

Leaves ternate, leaflets angular 2—3 lobed; peduncles longer than the leaves; flowers in heads.

Glycine angulosa. Sp. pl. 3. p. 1056. Muhl. Cat. p. 64, Phaseolus trilobus. Mich. 2. p. 60. Pursh. 2. p. 470.

Annual. Stem prostrate, a little scabrous and hairy. Leaflets a little hairy particularly along the veins and margin, sometimes distinctly 3 lobed, sometimes only angled, with one lateral lobe entire and the other wanting. Common Petioles about 2 inches long. Flowers (8-14) clustered at the summit of peduncles 4 to 6 inches long. Stipules small, acute, membranaceous. Calyx 4-cleft, the upper segment oval, slightly 2-cleft. Corolla purple; the vexillum reflected; wings short, erect; keel acuminate, spirally twisted, depressing the vexillum. Stamens diadelphous, long, and with the style included in the carina and bending with it. Legume terete, slender, pubescent. Seeds many, reniform, somewhat cylindrical.

On the sea coast of Carolina the leaves of this plant vary as I have described them. Dr. Baldwin sent me, from the neighbourhood of St. Masy's, specimens much more distinctly 3-lobed and resembling very strongly the figure of Plakenet Alm. t. 120. f. 7. referred to by Linnaus under the Glycine triloba.

Grows on the sand hills along the margin of the ocean.

Flowers August to October.

#### 2. HELVOLA.

S. foliis ternatis, deltoidibus, oblongis; floribus capitatis; vexillum short; wings expanded, very large.

Leaves ternate, deltoid, oblong; flowers in heads; vexillum short; wings expanded, very large.

Phaseolus helvolus. Willd. Sp. pl. 3. p. 1032. Pursh 2. p. 470.

This plant is to me still obscure; among all the specimens I have seen belonging to this genus, I have met with none with large expanded wings. Grows in Carolina. Linnæus.

Flowers.

# 3. PEDUNCULARIS. Muhl.

minibus lanosis.

S. foliis ternatis, | Leaves ternate, oboblongo ovatis; flori-bus capitatis; vexillo majusculo, emargina-to; alis parvulis; se-long ovate; flowers in heads; vexillum large, emarginate; wings small; seeds woolly.

Phaseolus helvolus. Mich. 2. p. 60. Walt. p. 182. P. vexillatus. Pursh 2. p. 470.

Stem prostrate or climbing on small shrubs, and with the whole plant a little hairy. Leaves oblong, ovate, tapering a little irregularly towards the summit. Common petioles 10-15 lines long. Stipules lanceolate, acute. Flowers 5-7 at the summit of a common peduncle, 6-7 inches long. Calyx 4-parted; upper segment broad, obtuse. Corolla purple. Vexillum nearly round. Wings oval, small, angled, as usual in this class, near the base. Carina as long as the vexillum, spiral. Legumen terete, a little hairy.

Grows in dry and fertile soils. Flowers July to September.

The plants in this genus form a small but very natural group. They have been arranged by different Botanists as species of Phaseolus, Dolichos and Glycine: to the Glycine, as it now remains in this sketch, they have no affinity, but they certainly form an intermediate genus between

the Dolichos and the Phaseolus, resembling the former very much in its habit and in the legumen, the latter in the structure of the corolla, and they might be arranged with either of these genera with great propriety, if only one feature of its inflorescence is considered.

### DOLICHOS. GEN. PL. 1181.

Vexilli basis callis l mentibus.

Base of the vexil-2-parallelis oblongis, | lum furnished with 2 alas subtus compri- | parallel, oblong callosities, compressing the wings.

Pursh 2. p. 473. Nutt. 2. p. 113. Glycine apios. Sp. pl. 3. p. 1067. Walt. p. 186. Mich. 2. p. 83.

Root perennial, bearing small tubers. Stem frutescent, voluble, climbing over large shrubs, a little scabrous and hairy. Leaves unequally pinnate. Leaflets 5-7, ovate-lanceolate, acute, slightly scabrous and sprinkled with hair. Stipules linear, hairy, small. Flowers numerous, on axillary racemes, shorter than the leaves. Calyx with the upper lip truncated, the lower with one, sometimes with three small teeth. Corolla brown. Vexillum reflected. Wings smaller, erect. Keel as long as the vexillum, incur-Stamens and Style incurved with the keel. Legumen terete, glabrous. Seeds reniform.

This genus, in its artificial character, agrees very nearly with the preceeding, it differs however in its calyx, its germ, and very much in its ha-

bit, and may with propriety be kept distinct.

This plant was the original Glycine of Linnæus, and ought to have retained the name. The tubers formed an article of food to the Aborigines of this country.

Grows in damp rich soils, along the margins of swamps.

Flowers July—August.

# AMPHICARPA. E.

Calyx quadridentatus. Petala oblon- Petals oblong, equal. ga, æqualia. Vexil- | Vexillum with the lum lateribus appres- sides appressed. Stigsis. Stigma capita- ma capitate. Pod tum. Legumen com- compressed, stipitate, pressum, stipitatum, 2-4 spermum.

1. MONOICA.

Anon. Carolin. Walt. p. 188.

Root perennial, creeping. Stem voluble, climbing over shrubs, angular, retrorsely hairy. Leaves ternate, ovate lanceolate, thin, hairy, scabrous on the upper surface; common petiole 3-4 inches long. Stipules evate, subulate, hairy. Flowers in clustered pendulous racemes, generally sterile. Calyx tubular, a little gibbous at base, hairy, 4-toothed, teeth acuminate. Corolla white, tinged with violet, segments of the staminiferous tube alternately long and short. Anthers oblong. Germ sheathed at base. Legume smooth, 3-4 seeded.

Besides the flowers that we have described, this plant appears to produce near the surface of the earth racemes, of which the flowers are only furnished with a calyx, and the rudiments of a style. From these proceed a one seeded, ovate, torulose pod, which sinks into the earth and there ripens. I have known the plant cultivated for these subterraneous

pods, which were used as a vegetable for the table.

Grows in rich light lands. Flowers through the summer.

#### 2. Sarmentosa.

A. foliis ternatis o- 1 vatis, glabris; ra- vate, glabrous; racemis filiformibus, sub-trifloris; floribus ap-etalis; leguminibus oblongis, dispermis. vate, glabious, cemes filiform, gene-rally three flowered; flowers apetalous; pods oblong, two seed-

rugose; clusters axil-lary, few flowered, shorter than the peti-ole.

Sp. pl. 3. p. 1061. Mich. 2. p. 63: var volubilis. Pursh 2. p. 486.

Stem climbing over low shrubs, acutely angled, villous. Leaves generally rhomboidal, the intermediate one sometimes almost round, triply nerved, common petiole 1-2 inches long. Stipules ovate, lanceolate, acute, villous. Flowers rarely exceeding 6 in each duster; common peduncle about half an inch long. Calyx 4 parted, the segments very acute, somewhat falcate, as long as the corolla, the upper one 2-cleft. Corolla, small, yellow, vexillum reflected, the wing toothed only on the inner side. Legume falcate, villous. Seeds reniform, speckled, compressed.

Grows in dry soils. Flowers May and July,

#### 3. ERECTA. Walt.

Nutt. 2. p. 114. G. tomentosa var. erecta. Mich. 2. p. 63. Pursh 2. p. 486, Trifolium erectum. Walt. 184.

Root perennial. Stem erect, about 2 feet high, angled, tomentose, Leaves rugose, tomentose, triply nerved, the middle one sometimes rhomboidal; common petiole, about an inch and a half long. Stipules subulate, villous, raceme simple, many flowered; common peduncle, two or three inches long. Calyx four parted, the upper segment bifid, all acute. Corolla. scarcely longer than the calyx, yellow, sometimes tinged with fulvous. Wings toothed near the base on each side. Legume falcate, mucronate, villous. Seeds reniform.

Grows in dry soils. Flowers from June to August.

### 4. Mollissima.

G. caule erecto; fo. | Stem erect; leaves liis ternatis, foliolis ternate, leaslets oval, ovalibus, mollissime | tomentose, very soft; tomentosis; racemis racemes long, many longis, multifloris, ter- | flowered, terminal. minalibus.

Stem erect? angled, tomentose. Leaves ternate; leaflets oval, obtuse, rugose, cloathed with a velvet-like tomentum, the glandular dots less distinct on this than on the preceding species. Racemes 5-8 inches long. Calyx deeply cleft, segments subulate, acute, nearly as long as the corol-Wings toothed on each side near the base. The la. Corolla yellow. Legume I have not seen.

Grows near St. Mary's, Georgia. Dr. Baldwin.

Flowers.

### 5. Reflexa.

G? volubilis; foliis ternatis. rotundato rhombeis, pubescentibus; racemis axillaribus, erectis, foliis mul- | rect, much longer than to longioribus; flori- the leaves; flower bus ante anthesin le- | buds and pods reflectguminibusque reflexis, | ed,

Voluble; leaves ternate rhomboidal, nearly round, pubescent; racemes axillary, e-

Nutt. 2. p. 115.

Root perennial. Stem angled, branching, climbing over tall shrubs, pubescent particularly along the angles. Leaflets 3-nerved, covered with a soft pubescence, the lateral leaflets generally round, the middle one frequently rhomboidal. Common Petioles 1-2 inches long. bulate. Racemes 4-5 inches long, many flowered. Peduncles angled. Calyx 4-cleft, segments acute, the upper one 2-cleft, the lower longer than the rest. Corolla yellow, longer than the calyx, the petals all equal, the wings 1-toothed near the base. Legume falcate, pubescent, mucronate. Seeds reniform, glabrous.

The corolla, the seeds and the habit of this plant distinguish it from the other species of this genus, although in character it is very closely allied

to them.

Grows on Paris' Island, running over high shrubs, along the edge of the Island at Mr. Habersham's plantation. Found also near St. Mary's Georgia. by Dr. Baldwin.

Flowers August—October.

In the Journal of Natural Sciences published at Philadelphia, vol. i. P. . I offered some observations on the genus Glycine and some of its kindred genera. I there proposed to retain the name Glycine to the G. Apios the original type of the genus, and to this group I gave the name of Baldwinia as a tribute of respect to the late Dr. Baldwin, whose name occurs so often in this work. I still think this arrangement the most correct, but another has been extensively adopted, and I wish not unnecessasily to multiply synonymes.

# THYRSANTHUS.

Calyx 2-lipped, the upper lip truncate, emarginate, the lower three cleft. Vexillum callous at Wings cohering at the Tubulus denticulatus summit. A small den. ticulate tube sheathing the base of the ovarium. Pod torulose. nearly terete, many

#### 1. FRUTESCENS.

Journal of the Acad. of Nat. Sciences, Philad. 1. p. 371. Glycine Frutescens. Sp. pl. 3. p. 1067. Mich. 2. p. 63. Anon. Frutescens. Walt. p. 186. Pursh 2. p. 474. Apios Frutescens. Wisteria Speciosa. Nutt. 2. p. 116.

A twining shrub, climbing over bushes and small trees to some height, particularly along the margins of rivers; the young branches angular and pubescent. Leaves pinnate, generally 4 pair with an odd one; leaflets ovate lanceolate, slightly acuminate, pubescent. Flowers in clustered panicles (thyrsi,) axillary. Bracteas large, ovate lanceolate, acuminate, coloured, one at the base of each flower-bud. Flowers purple; vexillum broad, reflected at the summit, greenish near the base. Keel incurved at the summit, not deflecting the vexillum. Pod long, leathery, a little rue gose, many seeded. Seeds reniform, speckled.

This very ornamental plant grows in damp rich soils.

Flowers April-May.

#### GALACTIA. Brown.

Calyx 4-dentatus, bibracteatus. oblonga, omnia vexillo latiore incumbente. Stigma obtu-Germen basi sum. nudum. Legumen teres, polyspermum.

> Mich. 1. Mollis.

G. foliis ternatis, foliolis ellipticis, canescenti-villosis; racemis axillaribus, fofloribus pedicellatis.

Calyx 4-toothed, with 2 bracteas at base. Petals all oblong, the Vexillum broad, incumbent. Stigma obtuse. Germ naked at base. Pod terete. many seeded.

Leaves ternate, leaf. lets elliptic, villous, hoary; racemes axillary, much longer than his multo longioribus; the leaves; flowers pedicellate.

Mich. 2. p. 61. Pursh 2. p. 486. Nutt. 2. p. 117.

Root perennial. Stem prostrate or climbing over small plants, terete, villous. Leaflets conspicuously veined on the under surface; common petiole about 11 inches long. Stipules subulate. Common Peduncles 5 8 inches long, partial rarely exceeding 2 lines. Flowers commonly 3 from each bud. Calyx villous, 4-cleft, segments acute, the lower one a little longer than the rest. Bracteas 2, subulate, at the base of the calyx. Corolla small, purple; vexillum obovate, glaucous underneath. Stigma globose Legume straight, hispid, hooked at the point.

This appears to be the real G. Mollis of Michaux, but I have some

doubts whether it is not the G. Pilosa of Nuttall.

Grows in dry soils.

Flowers through the whole summer.

#### Nutt. 2. PILOSA?

G. parce pilosa; foliis ternatis, oblongo-

A little hairy; leaves ternate, oblong, ovatis, subacutis, sub- | ovate, somewhat atus pallidis; racemis cute, pale underneath; axillaribus, folio mul- racemes axillary much

short pedicels.

Nutt. 2. p. 116.

A vine climbing over small shrubs. Leaflets ovate and oval, mucrenate, nearly glabrous on the upper surface, hairy underneath. Racemes 6-12 inches long. Flowers scattered, 2-3 at each bud, on short pe-Calvx a little hairy. Bracteas small. Corolla pale purple. duncles. Legume villous.

This species has great resemblance to the G. Glabella. It differs however in its leaves which are smaller, more ovate, rather acute and mucronate, and in its racemes, which are much longer, with smallerflowers. I

feel by no means certain that this is the plant of Mr. Nuttall.

Grows in dry shady soils. Flowers through the summer.

# 3. GLABELLA.

G. foliis ovatis ellipticisque, utrinque emarginatis, supra glabris, subtus parce pilosis; racemis axillaribus, folia subæquantibus; calycibus glabris; leguminibus villosis.

Leaves ovate and elliptic, emarginate at each end, glabrous on the upper surface, a | little hairy underneath: racemes axillary as long as the leaves; calyx glabrous; villous.

Mich. 2. p. 62. Pursh 2. p. 487. Nutt. 2. p. 117. Ervum volubile. Walt. p. 187.

Root perennial. Stem climbing over shrubs, terete, a little hairy. Leaves ternate glabrous and nearly smooth on the upper surface, entire, a httle hairy underneath; common petiole about an inch long. Racemes about as long as the leaves, sometimes a little longer. partial peduncles about 2 lines long. Bracteas 2 small scales at the base of the calyx. Corolla larger than in the preceding species, reddish purple, vexillum externally glaucous. Style much longer than the stamens. Legume falcate. Seeds oval.

Grows in dry rich shaded soils. Flowers through the whole summer.

#### 4. Elliotti. Nutt.

G. foliis pinnatis, foliolis ellipticis, emarginatis, supra glabris, subtus pubescentibus; racemis elongatis, paueifloris.

Leaves pinnate. leaflets elliptic, emarginate, glabrous the upper surface, pubescent underneath; long, racemes

Nutt. 2. p. 117.

Root perennial. Stem voluble, climbing over small shrubs. Leaves unequally pinnate; leaflets about 7, lucid yet sometimes a little scabrous on the upper surface; common petiole 2-3 inches long. Flowers nearly sessile, somewhat clustered at the summit of the peduncle. Peduncles generally shorter than the leaves, sometimes longer. Bracteas subulate. Calyx a little hairy, 4-cleft, the lower segment the longest. Corolla twice as long as the calyx, white tinged with red when dry. Legume compressed, villous, falcate, hooked at the point. Seeds 3-5, reniform, smooth, speckled.

This plant was sent many years ago to Dr. Muhlenberg as the G. Pinnata, and was published under that name in his catalogue. Mr. Nuttal finding the name pre-occupied, has published it under the present.

Grows about three miles from Beaufort along the mail road.

Flowers May—July.

### CLITORIA. GEN. PL. 1183.

# 1. PSEUDACACIA.

R. foliis impari-pinnatis; stipulis spinescentibus; racemis pendulis; calycis dentibus muticis; leguminibus lævibus.

Leaves unequally pinnate; stipules spiny; racemes pendulous; teeth of the caunawned; pods

Sp. Pl. 3 p. 1131. Walt. p. 186. Mich. 2 p. 65. Pursh. 2 p. 487. Mich. arb. for. 3. p. 245.

A tree about 30 feet high, (sometimes 60-80. Mich.) Leaves unequally pinnate, with 4-7 pair of leaflets. leaflets frequently alternate. oval, emarginate, pubescent. Racemes axillary, simple. Calyx pubescent, spotted, 4 cleft, the upper segment broad, emarginate, the three lower Corolla white, vexillum large with the sides reflected. Legume acute. smooth.

This tree which is frequently cultivated for ornament on account of the beauty and fragrance of its flowers, is also much valued for the quality of its wood. It is supposed to make the most durable posts, when exposed to the weather, of any tree in this country, and is also preferred to any other wood for the trunnels of vessels.

Grows in the mountains in rich fertile soils. Not found in its native state on the sea coast of Carolina.

Flowers March and April.

### · 2. Viscosa.

R. foliis impari pin-

Leaves unequally ratis; racemis axillar- | pinnate; racemes axibus, erectis, conferti- | illary, erect, with the floris; calycibus acu-minatis; ramis, petio-lyxacuminate; branch lis, pedunculis, legy- es, petioles, peduncles

minibusque glandulo- | and pods viscid, glanso-viscosis. | dular.

Sp. pl. 3. 1131. Mich. 2. p. 65. Pursh 2. p. 488. Mich. arb. for. 3. p. 262.

A tree growing from 20—40 feet high. Leaves unequally pinnate, with 5—7 pair of leaflets. The Petioles, Peduncles, and young wood covered with a viscid pubescence. Corolla white, tinged with pink. Pod obliquely lanceolate, mucronate, when young pubescent, 3—5 seeded.

Grows in the mountains of Carolina and Georgia along the margins of

streams.

Flowers April and May.

#### 3. HISPIDA.

R. foliis impari-pinnatis; foliolis rotundato-ovalibus, mucronatis; racemis axillaribus; calycibus acuminatis; caule subinermi; ramis, pedunculis, calycibus, leguminibusque hispidis. Leaves unequally pinnate; leaflets oval, nearly round, mucronate; racemes axillary; calyx acuminate; stem unarmed; branches, peduncles, calyx and pods hispid.

A small shrub, 3—6 feet high extending very much with its creeping roots, and with all its branches, petioles, peduncles, and calyx very hispid. Leaflets oval and ovate, sometimes nearly round, pubescent underneath. Flowers in simple axillary racemes, generally pendulous. Calyx sometimes almost equally 5-cleft, with the segments acuminate. Corolla large of a bright rose colour, very ornamental.

Grows in the mountains of Carolina.

Flowers April.

I have two plants belonging to this genus, which require further examination. I have not the means at present necessary for an accurate description.

#### 1. Rosea.

A shrub about 3 feet high, not hispid. Stipules spiny. Young branches, petioles and under surface of the leaves pubescent. Leaflets elliptic. Flowers rose coloured.

Grows in the high pine barrens, between Waynesborough and Wrightsborough in Columbia County, Georgia. Scarcely a variety of R. hispida.

#### 2. NANA.

Whole plant scarcely a foot high. Flowers rose coloured. Grows in the pine barrens near Columbia, South-Carolina.—Mr. Herbersont.

### INDIGOFERA.

Walt. p. 187. Mich. 2. p. 68. Pursh. 2. p. 448. Nutt. 2 p. 119.

Root perennial. Stem erect 3-7 feet high, branching, striate, glabrous, the young branches sprinkled with hair. Leaves unequally pinnate. Leaflets about 6 pair, entire, mucronate, a little hairy, slightly glaucous underneath. Stipules 2 at the base of each petiole. Flowers subulate, very short, in simple axillary spikes or racemes twice as long as the leaves; common peduncle 5-6 inches long, partial peduncle 2 lines long, a small subulate bractea at the base of each partial peduncle. Calyx campanulate, pubescent, 5-toothed, teeth small. Corolla longer than the calyx, brown; vexillum a little hairy on the out side; keel longer than the vexillum, with a subulate spur on each side, near the base. Segments of the staminiferous tube very short, unequal. Anthers oblong. Stigma capitate. Pod short, a little turgid, mucronate, glabrous, seed reniform.

Grows in dry poor soils. Flowers July and September.

# TEPHROSIA.

bus. Stamina mona $oldsymbol{L}$ egumen compressum, subcoriaceum.

Calycis dentibus | Teeth of the calyx subulatis, subæquali- | subulate, nearly equal. Stamens monadel-| phous? Pod compressed, coriaceous.

#### 1. VIRGINIANA

T. erecta, pubescens; foliolis plurimis, | leaflets numerous, oboblongo-lanceolatis, a | long-lanceolate, acute; cutis; racemo terminali, subsessili; leguminibus falcatis.

Erect, pubescent: raceme terminal, nearly sessile; pods falcate.

Pursh 2. p. 489. Nutt. 2. p. 119. Galega Virginiana. Sp. pl. 3. p. 1244. Walt. p.

Root perennial, stoloniferous. Stems about a foot high, in dense clusters, somewhat angular, pubescent, hairy towards the summit. Leaves alternate, unequally pinnate; leaflets numerous from 11-25, oblong lanceolate. Flowers in compact, terminal racemes. Calyx hairy, deeply 5-cleft. Corolla dull yellow, tinged with purple, vexillum longer than the wings and keel. Pod compressed, falcate, very hairy. Seeds reniform.

Grows in dry pine barrens. Flowers May and July.

#### 2. HISPIDULA.

T. caule erecto, gracili, pubescente, dichotomo; foliis pinnatis, | mous; leaves pinnate, foliolis (11—15) ellip- | leaflets (11—15) ellipticis. subretusis. mucronatis, subtus pilosis; racemis folia æquantibus, paucifloris; leguminibus mucronatis, hispidulis.

Stem erect, slender, pubescent, dichototic, slightly retuse, mucronate, hairy underneath; racemes long as the leaves; few flowered; pods mucronate, slightly hispid.

Pursh 2 p., 489. T. gracilis. Nutt. 2. p. 119. Galega hispidula. Mich. 2. p. 68.

Root perennial. Stem about 2 feet high, slender, very much divided, finely pubescent. Leaflets oblong, obtuse, sometimes retuse, mucronate, nearly glabrous on the upper surface, very hairy and slightly coloured on the under, ribbed. Stipules 2, subulate, villous, at the base of each

petiole. Racemes opposite the leaves, 3-6 flowered. Calyx very villous, segments subulate, expanded. Corolla pale red; vexillum xternally pubescent. Pod about an inch and a half long, straight. mucronate, somewhat hispid. Seeds compressed, reniform, 4-7, spotted.

This plant as remarked by Mr. Nuttall, differs in some slight degree from the Galega hispidula of Michaux, but too slightly I think to consti-

tute a new species.

Grows in dry soils. Flowers May and August.

# 3. PAUCIFOLIA. Nutt.

T. caule decum- | foliis sparsis, pinnatis; foliolis cuneato ovalibus, subtus villosis; pedunculis foliis mulpedunculis foliis mulpeduncles much floris.

Stem decumbent. bente, villosissimo; very villous; leaves to longioribus, pauci- | longer than the leaves; few flowered.

Nutt. 2. p. 119. Galega villosa. Mich. 2. p. 67. - Spicata. Walt. p. 188.

Root perennial. Stem sometimes erect, generally decumbent and prestrate, very villous, the pubescence generally rufous. Leaves scattered, pinnate, leaflets 11-15, elliptic, obtuse, mucronate, generally cuneate at base, very hairy, almost hispid on the under surface, sometimes pubescent, sometimes nearly glabrous on the upper. Pctiole like the stem very villous. Peduncles opposite the leaves, very long, generally bearing 4 or 5 flowers, sometimes more, less villous than the stem. Bracteas lanceolate, villous. Calyx hispid, segments subulate. Corolla red, vexillum on the outer surface very hairy. Legume compressed, falcate, hispid.

I have little doubt that this plant is the real G. villosa of Michaux though not of Pursh. Sparsifolia would, I think have been a more appro-

priate name, than the one which has been imposed upon it.

Grows in dry soils. Very common.

Flowers through the summer.

# 4. Chrysophylla. Pursh.

T. prostrata, pubes-bescens; foliis pinna-tis, quinis, subsessili-by fives, nearly ses-

bus; foliolis cuneatoobovatis, obtusissimis, supra glabris, subtus sericeis; pedunculis oppositifoliis, elongatis, sub 3 floris; leguminibus rectiusculis.

sile; leaflets cuneate, obovate, very obtuse, glabrous on the upper surface, silken underneath; peduncles opposite the leaves, long, generally 3-flowered; pods nearly straight.

Pursh 2. p. 489.

T. Prostrata. Nutt. 2. p. 120.

Stem prostrate and pubescent. Leaves pinnate, subsessile, leaslets cuneate obovate, coriaceous, smooth above, sericeously villous underneath. Peduncles about 3 flowered, opposite to and longer than the leaves. Legume linear and nearly straight. Nutt.

Common around Savannah in dry and sandy soils. Nutt.

Flowers through the summer.

Spikes oval; pods

Willd. Sp. pl. 1406. Walt. p. 186. Mich. 2. p. 60. Pursh. 2. p. 490.

Stem diffuse, prostrate and assurgent, rarely exceeding a foot in height, angled, hairy. Leaves ternate, nearly sessile; leaflets obovate, emargimate, denticulate near the summit, hairy. Stipules obliquely lanceolate, acuminate, hairy, extended at base, longer than the petiole. Flowers in oval or globular axillary heads, common peduncles about an inch

and a half long. Bracteas small, ovate, acuminate, at the base of each partial peduncle. Calyx hairy, border 5-cleft, the lower segments longer than the rest. Corolla yellow, the vexillum twice as long as the wings, and keel. Pod coriaceous, spirally twisted, 1-seeded. Seed reniform glabrous.

Grows in dry sandy soils. An exotic now completely naturalized.

Flowers April and June.

### 2. Intertexta.

M. pedunculis subbifloris; leguminibus cochleatis, ovalibus; aculeis pubescentibus, setaceis, distichis, adpressis; stipulis ciliato-dentatis; foliolis obovatis, dentatis.

Pedunclessomewhat 2 flowered; pods spiral, oval; prickles pubescent, setaceous, distichous, appressed; stipules fringed, toothed; leaflets obovate toothed.

Sp. pl. 3. p. 1411. Walt. p. 186. Pursh. 2. p. 490.

This species with the M. Sativa, and M. Nigra—spring up occasionally in our enclosures, but neither of them appear to be naturalized in this country.

L. involucri squamis | exterioribus reflexis; the involucrum reflect-scapo unifloro; foliis ed; scape one-flowerruncinatis, glabris, la- ed; leaves runcinate, ciniis lanceolatis, dentatis.

Exterior glabrous, the segments lanceolate, toothed.

Sp. pl. 3. 2544. Mich. 2. p. 88. Pursh, 2. p. 497. Nutt. 2. p. 123.

Root perennial. Leaves all from the root, oblong, runcinate, glabrous, when young a little hairy. Scapes several from each root, terete, glabrous, shorter than the leaves, one-flowered. Leaves of the involucrum numerous; the interior series equal, appressed, frequently coloured, when old reflexed, the exterior lanceolate, imbricate, slightly fringed. Corolla ligulate, yellow. Seeds oblong, angled, compressed towards the summit, slightly muricate, crowned with a stipitate hairy pappus. Receptacle convex, dotted,

The leaves and stalk of this plant, like those of most of the semiflosculous plants, discharge when broken a milky acrid juice, which is generally narcotic and sometimes supposed to be poisonous.

Grows in damp soils. An exotic now naturalized.

Flowers from January to April.

### BORKHAUSIA. DE CANDOLLE.

Involucrum caliculabus laxis. Pappus pilose scales. Pappus hairy, stipitate. Receptaculum nudum.

foliis oblongis, | Leaves oblong, lancles long.

Nutt. 2. p. 126. Leontodon Carolinianum. Walt. p. 192. Scorzonera Pinnatifida. Mich. 2. p. 89. Pursh, 2. p. 497. Chondrilla Lævigata. Pursh, 2. p. 497.

Root perennial? Stem resembling a scape, about two feet high, slightly furrowed, pubescent towards the summit. Leaves alternate, narrow, when old pinnatifid, pubescent along the margins. Flowers very few, solitary on the summit of the long branches. Involucrum many leaved; the interior series equal, united, linear, with a dorsal tooth near the summit, the exterior slightly imbricate, subulate, short. Florets ligulate, very numerous, bright yellow. Seed oblong, compressed, striate, slightly rugose, crowned with a hairy stipitate pappus. The stipes remarkably long.

Grows in pastures and cultivated land-very common.

Flowers March—July.

# LACTUCA. GEN. PL. 1234.

Mich. 2. p. 85. Pursh, 2. p. 500. Nott. 2. p. 124.

Stem about three feet high, glabrous. Leaves sessile, long, tapering to an acute point, sometimes amplexicante; the lower frequently bearing a few segments, always acute, sometimes runcinate, somewhat glaucous underneath and fringed along the midrib. Flowers in a loose terminal panicle. Involucrum imbricate, the leaves subulate. Florets about twenty; corolla Seeds compressed, lanceolate, serrulate, crowned with a ligulate, purple. stipitate bairy pappus.

Grows in dry and moderately fertile soils.

Flowers April—September.

#### K. 8. SAGITTIFOLIA.

bro; foliis oblongo-lan- leaves oblong-lanceoceolatis, acutis, inte-late, acute, entire, glagerrimis, glabris, sub-tus pullidioribus, arcte sessilibus, basi sagitta-tate at base; flowers tis; floribus paniculatis.

L. caule erecto, gla- | Stem erect, glabrous; in panicles.

Stem four to six feet high, terete, glabrous. Leaves closely sessile, distinctly sagittate at base, tapering to a very acute, sometimes acuminate summit. The stem leaves very entire. Flowers in a loose terminal panicle. Involucrum cylindrical. Leaflets subulate, glabrous. Florets about twenty. Corolla yellow? Seed compressed, slightly margined. Pappus hairy, distinctly stipitate.

I collected this plant many years ago, along the margin of a creek, in the neighbourhood of Columbia. The Corolla in my specimens has been destroyed, but if my memory is accurate, it was yellow. I have preserved no root leaves, but I certainly saw none that were either runcinate or sinuate.

Flowers July—September.

# SONCHUS. GEN. Pl. 1233.

plexicaule. toothed and sinuate.

Sp. pl. 3. p. 1514. Pursh, 2. p. 501. Nutt. 2. p. 125.

Root annual. Stem two to five feet high, terete, glabrous, fistulous, branching, very tender and succulent. Leaves alternate, amplexicante, deeply sinuate and pinnatifid, segments acute and acutely toothed, the whole plant slightly glaucous. Flowers in axillary umbels. Peduacles one to two inches long, with tufts of a cotton-like tomentum, irregularly attacked to their surface. Scales of the involucrum subulate, appressed. Corolla yellow. Seed oblong, striate, glabrous. Pappus sessile.

Probably an exotic, now universally diffused in cultivated lands.

Flowers March—July.

#### 2. Macrophyllus. Willd.

S. pedunculis hirsutis, nudis; floribus pa-niculatis; foliis lyratis, cles; leaves lyrate, corbasi cordatis, subtus date at base, hirsute hirtis.

Peduncles underneath.

Sp. pl. 3. p. 1519. Pursh, 2. p. 501. Nutt. 2. p. 125.

Root tuberous, perennial. Stem erect, four to seven feet high. large, lyrate, very hairy and hispid on the under surface. Corolla blue.

This species I have not seen.

Grows in shaded low grounds, near Springs. Pennsylvania to Carolina. Pursh.

Flowers August-September.

### 3. FLORIDANUS. Lin.

S. pedunculis subsquamosis; floribus paniculatis; foliis lyratoruncinatis, denticulatis,
petiolatis.

Peduncles somewhat
scaly; flowers in panicles; leaves lyrate, runcinate, denticulate, petiolate.

Sp. pl. 3. p. 1520. Mich. 2. p. 85. Pursh, 2. p. 501. Nutt. 2. p. 125.

Stem erect, three to five feet high, glabrous. Leaves narrow, lanceolate, acuminate at each end, acutely denticulate, occasionally with one or two runcinate segments. Flowers in a long slender panicle. Corolla small, blue.

Grows in the upper districts of Carolina and Georgia.

Flowers July—September.

### 4. Carolinianus. Walt.

bro; foliis lanceolatis, leaves lanceolate, acute, acutis, undulatis, spi-nuloso dentatis, basi auriculatis, semiam-plexicaulibusque; flori-acute teeth, auriculate and semiamplexicaule at base; flowers somebus sub umbellatis. E. what umbellate.

### 1. ALTISSIMA.

P. caule ramoso; folucris sub 5-floris.

Stem branching; liis trilobis, petiolatis, leaves 3-lobed, petio-angulatis, denticulatis, late, angled, denticu-margine scabris; race- late, scabrous along mis axillaribus; flori- the margin; racemes bus nutantibus; invo- axillary, flowers nodding; involucrum generally 5-flowered.

Sp. pl. 3. p. 1537. Pursh, 2. p. 498.

Stem 4-6 and 8 feet high, branching, glabrous. Root perennial. Leaves alternate, deeply 3-lobed, almost hastate, the lateral segments angled near the base, the margin slightly and irregularly dentate, the under surface pale, if not slightly glaucous. Petioles 2—7 inches long. Flowers in axillary panicles. Involucrum cylindrical, composed of 5 strapshaped leaves, protected at base by small imbricate scales. Florets generally 5, ligulate, yellow. Seeds angular, striate. Pappus sessile, scabrous.

Grows in the mountains of Carolina. Dr. Macbride. Flowers September.

### 2. CORDATA.

6-8 floris.

P. foliis petiolatis, ovato lanceolatis, cordatis, dentatis ciliatis que; panicula laxa, racemiflora; floribus nutantibus; involucris | racemose; flowers nodding; involucrum 6-8 flowered.

Willd. hort. Berol. 25. Pursh 2. p. 498.

Root perennial. Stem 4—6 feet high, generally glabrous. evate-lanceolate, cordate and angled at base, irregularly angled toothed and fringed along the circumference; upper leaves simply lanceolate. Flowers in long loose panicles. Interior leaves of the involucrum generally 8, somewhat lanceolate, membranaceous along the margins, the exterior only minute, ovate scales. Florets ligulate, pale yellow. (Pursh.) Seeds striate, crowned with a scabrous pappus.

Grows in the mountains of Carolina.

Flowers August—October.

#### 3. Deltoidea. E

subglaucis; involucris 5-floris.

P. caule simplici, Stem simple, gla-glabro; foliis deltoi- brous; leaves deltoid, deis, acuminatis, acute | acuminate, acutely denticulatis, subtus | denticulate, slightly racemis | glaucous underneath; axillaribus, paucifloris; | racemes axillary, few flowered; involucrum 5-flowered.

Stem slender, about 2 feet high. Leaves on long petioles, the lower ones triangular, with an acuminated point, and the angles at base very acute, the upper ones ovate lanceolate, all denticulate, glabrous, and slightly glaucous underneath. Flowers in small axillary racemes, in my specimen not exceeding 3 heads in each raceme, which appear to have been nodding. Involucrum composed of 5 equal linear leaves, glabrous, membranaceous at the margins, and closely protected at base by small ovate Corolla purple? Seeds glabrous, slightly angled and imbricate scales. Pappus hairy.

Collected on the Saluda Mountains by Dr. Macbride.

Flowers September.

## 4. VIRGATA. Mich.

plicissimo; floribus nu- | nodding; involuerum generally 8 flowered.

Pursh 2. p. 498.

Stem about 2 feet high. Flowers purple. Pursh. Is this really a distinct species, or is it a young plant of the P. virgata? Collected in Georgia by Mr. Enslen. Flowers July—August?

# 6. CREPIDINEA.

P. foliis lato lanceolatis, in petiolum attenuatis, inæqualiter angulato dentatis; panicula fasciculis terminalibus, paucifloris, nutantibus; involucris hirsutis, 10—12 fidis, sub. 20-floris.

Leaves lanceolate. wide, attenuated base, unequally toothed and angled; panicle composed of small terminal nodding clusters; involucrum hairy, 10-12 cleft, generally 20 flowered.

Mich. 2. p. 84. Pursh 2. p. 499.

Among the Plants collected by Dr. Macbride on the Saluda mountains was one, which though destitute of its lower leaves, appeared in other re-

spects to agree very well with the P. Crepidinea of Mich.

Stem 4—6 feet high, branching towards the summit. Upper leaves sessile, lanceolate, denticulate, scabrous and somewhat pubescent. Flowers in terminal clusters, nodding. Involucrum 8-10 leaved, nearly glabrous, surrounded at base, as usual in this genus, with small imbricate scales. Florets numerous, Pappus sessile, scabrous.

Grows in the mountains of Carolina.

Flowers September.

### 7. ALBA.

Sp. pl. 3. p. 1536. Walt. p. 193. Mich. 2. p. 83. Pursh 2. p. 499.

Root perennial, somewhat tuberous. Stem herbaceous, 2 feet high, much divided, slightly angled and pubescent. Lower leaves hastate, lobed and irregularly sinuate and dentate. Lobes obtuse or acute; the upper leaves spathulate, obovate, toothed and angled. Flowers in loose panicles composed of small terminal clusters. Involucrum cylindrical, 8 leaved; leaves oblong, pubescent, fringed at the summit. Scales at the base lanceolate, acute. Florets 8-12, ligulate, of a pale yellowish white colour. Seeds cylindrical, striate, crowned with a scabrous pappus.

Grows in dry soils.

Flowers September—October.

The root is excessively bitter, from whence the plant has derived the popular name of the Gall of the earth.

#### 8. Rubicunda.

P. foliis ciliatis, radicalibus hastato-angulatis, subintegerrimis, inferioribus obo- the lower stem leaves vatis, basi attenuatis, obovate, tapering at subangulatis, summis lanceolatis, integerrimis; racemo simplici; floribus nutantibus.

Leaves ciliate, those of the root hastate, angled, nearly entire, base, slightly angled, the upper lanceolate, entire; racemes simple; flowers nodding.

Sp. pl. 3. p. 1537. Pursh 2. p. 499.

This species with which I am unacquainted, was considered by Linnæus as a variety of the P. Alba. Mr. Nuttall considers it as the same plant with the P. Virgata, and has excluded it from his list of species.

Grows in shady woods from Pennsylvania to Carolina.

Stem not above 18 inches high. Pursh.

Flowers August-October.

# 9. SERPENTARIA. Pursh.

P. foliis dentatis, radicalibus asperis, palmato sinuatis, caulinis longe petiolatis, sinuato pinnatifidis, subtrilobis, lacinia intermedia 3-partita, [ middle segment 3 partsummis lanceolatis; ra- | ed, upper leaves lanterminalibus. cemis subpaniculatis, brevibus, nutantibus; involucris 8-fidis, 12-floris. | lucrum 8-cleft, 12-

Leaves toothed. rough, those of the root palmate, of the stem on long petioles, sinuate, pinnatifid, somewhat 3-lobed, the ceolate; racemes terminal, paniculate, short, nodding; invominal, flowered.

Pursh 2. p. 499.

Plant 2—4 feet high, nearly glabrous. Leaves alternate, hastate, sinuate, angled and toothed, with a long attenuated base, resembling a winged petiole, lateral lobes so abruptly angled at their termination, as frequently to appear proemorse. Flowers in loose terminal panicles; florets purple,

This plant bears so striking a resemblance to the P. Alba, as to render it doubtful whether it ought to be separated from it. It appears from the specimens I possess, to be a taller plant, to have its leaves much more distinctly hastate, its angles and lobes more acute.

Grows in the mountains in Pendleton county, S. Carolina. Sent to me also from Salem, N. Carolina, by Dr. Schweinitz. Flowers August-October.

### 10. Aphylla. Nutt.

P. caule subsimplici; ramulis virgatis; foliis radicalibus linearibus, caulinis minimis, subulatis, sparsis; floribus solitariis; involucris 8-fidis, 10— 12 floris.

Stem nearly simple; twiggy; branches leaves of the root linear, of the stem small, subulate, scattered; flowers solitary; involucrum 8-cleft. 10-12 flowered.

N utt. 2. p. 123.

Root perennial? Stem about 2 feet high, glabrous, striate; sparingly branched towards the summit. Root leaves I have never seen. Stem leaves mere scales scattered along the stem. Flowers terminal, solitary.

Involucrum very long, cylindrical. Florets purple.

The specimen of this plant which Dr. Baldwin sent me from St. Mary's under the name of Prenanthes Pumila, is too imperfect to enable me to speak of it with much confidence. It appears to me questionable, however, whether it belongs to this genus.

It grows in the pine barrens round St. Mary's, Georgia.

Flowers.

# HIER-ACIUM. GEN. Pl. 1238.

Receptaculum nudiusculum. Pappus | simplex, sessilis. Involucrum imbricatum, ovatum.

Sp. pl. 3. p. 1572. Nutt. 2. p. 125. H. scabrum. Mich. 2. p. 86. Pursh 2. p. 504.

Root perennial. Stem 2-4 feet high, very hairy and scabrous. Leaves sessile, attenuate, oval-lanceolate, the lower ones denticulate, very hispid, particularly towards the base, upper leaves small. Flowers in a compact terminal panicle. Interior leaves of the involucrum somewhat lanceolate, hairy, but less tomentose than the peduncle; florets numerous, yellow, scarcely longer than the involucrum.

Grows in the upper and mountainous districts of Carolina.

Flowers August-September. Pursh.

#### 3. Gronovii.

H. caule folioso, Stem leafy, panicu-paniculato; involucris late; involucrum hishispidis; foliolis obo- pid; leaves obovate

vatis lanceolatisque, and lanceolate, fring-ciliatis, pubentissimis. ed, very pubescent.

Sp. pl. 3. p. 1570. Walt. p. 193. Mich. 2. p. 87. Pursh 2. p. 503.

Root perennial, somewhat præmorse. Stem simple, erect, 2-3 feet. high, nearly naked towards the summit, hairy and roughened with a gland ular pubescence. Leaves sew near the base of the stem, attenuate, sessile, sprinkled with long hairs, and at the same time covered with a short down, almost tomentose, the margins scarious and sometimes toothed. Flowers in a long,naked, terminal panicle. Involucrum cylindric, and with the peduncles covered with hairy and almost hispid glands, interior leaves about 12, linear, equal, exterior about the same number, imbricate; florets yellow. Seeds oblong, furrowed, crowned with a hairy pappus.

Grows in dry soils. Very common. Flowers through the whole summer.

### 4. PANICULATUM.

H. glabriusculum; caule erecto, folioso, paniculato, inferne al- | iculate, woolly bo-lanato, pedicellis capillaribus; foliis lantis, membranaceis.

Nearly glabrous; stem erect, leafy, panhoary below, pedicels capillary; leaves lanceolatis, nudis, denta- | ceolate, naked, toothed, membranaceous.

Sp. pl. 3. p. 1572. Mich. 2. p. 86. Pursh 2. p. 503.

Root perennial. Stem 2-4 feet high, branching, nearly glabrous towards the summit. Leaves lanceolate, thin, glabrous, sessile, sparingly but very regularly denticulate. Panicle large, compound. Flowers on long slender peduncles. Interior leaves of the involucrum very narrow, glabrous; florets yellow. Seed deeply furrowed. Receptacle naked.

Grows in the mountains of Carolina.

Flowers July—September.

# KRIGIA. GEN. PL. 1244.

Involucrum polyphyllum, simplex. Receptaculum nudum. Pappus duplex, extemembranaceus. interior capillaceus.

1. VIRGINICA.

K. pusilla, glauca; foliis primariis, subrotundis, integris, cæteris subglabris; Ivratis. scapis unifloris, glabris, demum foliis Iongioribus ; involucro glabro. Nutt. 2. p. **126.** 

Involucrum many leaved, simple. ceptacle naked. Pappus double, the exterior membranaceous, the interior hairy.

Small, glaucous; the leaves nearly first round, entire, the rest lyrate, nearly brous; scapes one flowered, glabrous, finally longer than the leaves; involucrum glabrous.

Sp. pl. 3. p. 1618. Pursh 2. p. 504. Hyoseris Virginica. Mich. 2. p. 88.

Plant often minute. Flowers bright orange colour. Leaves and Bristles of the pappus 5-8. Nutt.

Grows in dry sandy soils. Flowers in the spring.

#### 2. Caroliniana.

K. foliis runcinatis, subglabris; scapis prælongis, involucrique basi glanduloso-pilosis. Nutt.

Leaves runcinate, nearly glabrous; scapes very long, and with the base of the involucrum glandularly hairy.

Hyoseris Caroliniana. Walt. p. 194.

Root perennial, fibrous. Radical Leaves at first lanceolate, then pinnatifid and sometimes runcinate, the lateral lobes acute, the terminal one large, generally obtuse, all sometimes toothed, and sprinkled particularly on the upper surface, with jointed hair. Scapes numerous from each root, 6-12 inches high, a little hairy, particularly towards the base, one flowered. Involucrum 10-20 parted, segments equal, linear lanceolate. Corolla ligulate, longer than the involucrum, bright orange coloured, a little hairy at base. Seeds inversely conic, striate, muricate, crowned with a double pappus, the exterior composed of 5 short, nearly round, membranaceous leaves, the interior of 5 scabrous bristles, as long as the involucrum, and alternating with the leaves of the exterior pappus. Receptacle naked, convex, dotted.

Around the plants of this genus there is still some obscurity. The plant which I have minutely described above, is the common species of our country and is generally considered as the K. Virginica. The references to Willd. and Mich. would perhaps be more correct here than under the preceding species. If, as suggested by Mr. Nuttall, this is the H. Caroliniana of Walter, I have no doubt that his H. Virginica is the K. Dandelion of Nuttall. At the same time, I am persuaded that the plant I have described is not the Southern species known to Mr. Le Conte and Dr. Baldwin, which I have seen, but of which I have no description.

Grows in sandy soils. Very common.

Flowers February—April.

#### 3. DANDELION.

K. glabra, subglau-ca; foliis lineari lan-glaucous; leaves line-ceolatis, integris, lœvi-ar lanceolate, entire,

# bus; scapis unifloris. | smooth; scape 1-flow-| ered.

Tragopogon dandelion. Sp. pl. 3. p. 1495. Troximon dandelion. Persoon 2. p. 360.

Hvoseris major. Walt. p. 194.

Hyoseris angustifolia. Mich. 2. p. 87. Pursh, 2. p. 404.

Root perennial, somewhat tuberous. Primary Leaves oblong, narrow, slightly obovate, the other leaves linear-lanceolate, 8-14 inches long, acute, generally entire, sometimes very slightly denticulate, somewhat glaucous. Scape a little longer than the leaves, bearing a few glandular hairs near the base of the involucrum. Involucrum 10-12 parted; florets yellow, nearly three times as long as the involucrum. Scales of the exterior pappus not distinguishable in my specimens, bristles of the interior numerous.

Grows in the lime-stone soils in St. John's, Berkeley. Dr. Macbride.

This appears from the description to have been the original Tragopogon' Dandelion of Linnæus. Specimens sent to me from Salem, North-Carolina, as the K. Dandelion of Nuttall belong, I think, to a very different species.

# 4. AMPLEXICAULIS.

K. glauca; foliis radicalibus spathulato-lanceolatis ovalibus-que, dentatis; scapis parce foliosis ramosisque.

Nutt. 2. p. 127.

Hyoseris amplexicaulis. Mich. 2. p. 87.

Hyoseris biflora. Walt. p. 194.

Hyoseris prenanthoides. Willd. Sp. pl. 3. p. 1516.

Troximon virginicum. Pursh, 2. p. 505.

Root perennial. Stem 12-14 inches high, resembling a scape bearing a few sessile, semiamplexicaule, lanceolate or ovate leaves, and sparingly divided into long slender branches. Radical leaves all spathulate, generally lanceolate and irregularly toothed. Flowers solitary, on the extremities of the long branches. Involucrum about 12-parted, a little hairy at base. Florets yellow, twice as long as the involucrum. Exterior pappus 8-parted.

Grows in the middle and upper districts of Carolina.

Flowers.

Receptacle naked. Pappus 0. Involu-crum 8-leaved in a double series.

#### 1. Humilia.

Root annual? Stem 6-12 inches high; branching, glabrous. Root leaves oblong, narrow, slightly obovate, sessile. The stem leaves strapshaped, acute, entire, sessile and slightly glaucous. Flowers terminal and somewhat umbellate, with two or more leaves sheathing the base of each umbel; perhaps 1 small leaf for each peduncle. Peduncles 3-8, 1-2 inches long, sometimes though rarely compound. Involucrum generally 8-leaved; leaves ovate, acuminate, glaucous, a little hairy and closely united at base but seeming to form two rows. Florets ligulate, few, (8-10) small, yellow, a little longer than the involucrum. Receptacle naked, flat. Seeds somewhat lanceolate, furrowed, transversely striate and without even the vestige of a pappus, as far at least, as the limited opportunities which I have had for examining it, have enabled me to ascertain.

Grows, though very rare, in the low and middle country of Carolina. Found many years ago along the road between Jacksonborough and Ashepoo-Ferry. Sent to me recently from Augusta, Georgia, by Dr. Leavenworth.

Flowers April.

# STOKESIA. L'HERITIER.

regularibus.

Receptaculum nu-dum. Pappus 4-seto-sus. Involucrum foli-4 bristles. Involucrum Receptacle naked. aceum, subimbrica- leafy, somewhat im-tum. Corolla radia- bricate. Corolla rata; corollulis radii in- diating; florets of the fundibuliformibus, ir- ray funnel shaped, irregular.

# 1. CYANEA.

Root perennial. Stem leafy. Leaves lanceolate. Pedunoles axillary, 1-flowered. Flowers large, blue or purple, very handsome. Pursh. With this plant I am entirely unacquainted.

Grows in Carolina.

Flowers.

# CNICUS. GEN. PL. 1255.

Involucrum imbricatum, ventricosum, spinosis. squamis plumosus. villo-Receptaculum sum.

*Involucrum* imbricate. ventricose, with spinous scales. Pappus feathered. ceptacle villous.

### 1. ALTISSIMUS.

C. foliis sessilibus, oblongo lanceolatis, scabris, subtus tomentosis, dentatis, ciliatis, radicalibus pinnatifidis; involucris brac- root pinnatifid; invoteatis, ovatis; squamis ovato-lanceolatis, spinosis, appressis.

Leaves sessile, oblong lanceolate, scabrous, tomentose underneath, toothed. fringed, those of the lucrum ovate, bracteate; scales ovate lanceolate, spinous, appressed.

Sp. pl. 3. p. 1671. Pursh, 2. p. 506.

Root perennial. Stem erect, branching, sometimes on the borders of the Missouri, according to Mr. Nuttall, attaining the height of 15 or 18 Leaves tomentose and hoary underneath, the upper one sessile, lanceolate, irregularly spiny. Flowers terminal. Involucrum somewhat cylindrical, the scales ovate, acuminate, appressed, pale, with the terminating spine discoloured and appearing as if riveted to the scale. generally purple. Receptacle villous.

Grows in the upper districts of Carolina. Pursh. Willd. I have not myself seen this species in Carolina, my specimens are from Pennsylva-

nia.

Flowers July—September.

#### 2. Muticus.

pinnatifidis. spinulosis, sublanceo- | spinulous,

C. foliis omnibus | Leaves all pinnatisubtus | fid, lanuginous underlanuginous, laciniis neath, the segments somewhat latis, acutis; ramulis | lanceolate, nudiusculis unifloris; | branches naked, one

involucris globosis; flowered; involucrums squamis muticis. globose; scales unarmed.

Pursh, 2. p. 499. Cirsium muticum. Mich. 2. p. 89.

Stem tall, slender, branching. Leaves deeply sinuate, the segments sometimes 3-lobed; lobes acute and spiny, pale, hairy, and when young lanuginous underneath. Flowers in globose heads. Scales or leaves of the involucrum lanuginous, the lower ones armed with spines, the upper simple, acute. Corolla purple.

Grows in the mountains of Carolina and Georgia.

Flowers July—September.

#### Mich. 3. REPANDUS.

C. foliis amplexi-

Leaves amplexicaulibus, angusto-ob- | caule, narrow, oblong, longis, lævissime ob- slightly and obtusely tuseque sinuatis, spi- sinuate, with numenulis crebris, lanugi- | rous small spines, lannosis; ramis unifloris, | uginous; branches one foliosis; involucri | flowered, leafy; scales squamis lanceolatis, e. of the involucrum lanrectis, spinula arista- | ceolate, erect, armed with a spine.

Cirsium Repandum. Mich. 2. p. 89.

Stem erect, about 2 feet high, sometimes divided, but generally simple, and bearing one terminal flower, very lanuginous. Leaves oblong, narrow, slightly sinuate, repand, very closely fringed with spines, slightly discoloured and lanuginous underneath, 2-3 inches long and about half an inch wide, perhaps larger near the root. Involucrum somewhat cylindrical, scales ovate-lanceolate, very acute, terminating in a short spine, slightly lanuginous. Corolla tubular, much longer than the involucrum, deeply 5-cleft, bright purple. Receptacle bristly. Seed crowned with a beautifully feathered pappus.

Grows in dry pine barrens in the middle districts of Carolina and Geor-

gia. Flowers June-July.

## 4. VIRGINIANUS.

C. simpliciusculus; foliis sessilibus, lanceolatis, subtus cano-tomentosis, remote dentatis, dentibus spinosis; floribus solitariis; involucro globoso; squa
mis mucronatis.

Simple; leaves sessile, lanceolate, hoary and tomentose underneath, remotely toothed; teeth spinous; flowers solitary; involucrum globose; scales mucronate.

Pursh, 2. p. 506. Carduus Virginianus. Walt. p. 195? Nutt. 2. p. 129. Cirsium Virginianum. Mich. 2. p. 90.

Root perennial. Stem erect, 2—3 feet high, somewhat angled, covered with a white tomentum, particularly towards the summit, sometimes sparingly branched. Leaves narrow, lanceolate, acute, bearing spiny teeth, sometimes slightly sinuate and angled, green and a little hairy on the upper surface, hoary and tomentose underneath. Flowers solitary, terminal. Involucrum ventricose; scales oblong, ovate, acuminate, a little villous, terminated with a small reflected spine, glutinous along the midrib. Corolla nearly twice as long as the involucrum, deeply 5-cleft, purple. Fidments villous at base. Seeds oblong, slightly angled, crowned with a feathered pappus. Receptacle flat, bristly.

Grows in wet pine barrens in the middle districts of Carolina and

Georgia.

Flowers June-September.

### 5. GLABER? Nutt.

C. foliis pinnatifidis, glabriusculis, segmentis 3—5 lobis, acutissime spinosis; involucro ventricoso,
squamis pilosis, spinula sub reflexa mucronatis; caule ramosissimo. E.

Leaves pinnatifid, nearly glabrous, segments 3—5 lobed, acutely spinous; involucrum ventricose, scales hairy, mucronate with the point reflected; stem much divided.

Nutt. 2. p. 129.

Stem erect, 4-6 feet high, furrowed, unarmed, some-Root perennial. what glabrous but sprinkled with a few lanuginous hairs, branching more than in any other species with which I am acquainted. Leaves sessile, 1 -2 feet long, deeply pinnatifid, a little hairy along the veins and midrib, armed with very acute spines along the margins and angles. Flowers somewhat paniculate. Peduncles on small branches, nearly naked, slender and a little hairy. Involucrum campanulate, ventricose; scales lanceolate, closely appressed, a little hairy, viscid and armed with a short somewhat recurved spine. Corolla much longer than the involucrum, of a pale purple colour. Seeds oblong, glabrous, crowned with a beautifully feathered caducous pappus. Receptacle flat, bristly.

This species of Cnicus, by far the most common in the low country of Carolina and Georgia, appears to have been overlooked by both Walter and Michaux, at least the C. Glaber of Mr. Nuttall is the only species whose description accords with the character of our plant. I once considered it as the C. Repandum, of Michaux, but the plant I have described under that name agrees more accurately with his observations.

Grows in cultivated lands, very common about buildings. Flowers May-August.

#### Muhl. 6. Discolor.

C. foliis sessilibus,

Leaves sessile, pinpinnatifidis, supra par-ce pilosis, subtus cane-scenti-tomentosis, la-ciniis bilobis spinosis; involucris globosis, squamis ovatis spinos squamis ovatis, spino-sis; caule ramoso. involucrum globose, scales ovate, spinous; stem branching.

Sp. pl. 3. p. 1670. Nutt. 2. p. 130.

Stem erect, 3-6 feet high, in my specimens very hairy, and covered with cobweb-like tomentum. Leaves long, deeply pinnatifid, the segments very generally 2-lobed, the lobes ovate and spiny, woolly underneath, the margin very irregularly armed with spines. Flowers solitary, terminating the branches, which are generally leafy, up to the base of the involucrum; scales of the involucrum ovate, acute, crowned with a long spine. rolla bright purple. Seeds smooth, crowned, with a feathered pappus.

Grows in the upper districts of Carolina.

Flowers June—July.

### 7. Horridulus.

C. foliis sessilibus, pinnatifidis, acute inspinosissimis subtus lanuginosis; floribus confertis, bracteatis; bracteis geminatim spinosissimis; involucris inermibus.

Leaves sessile, pinnatifid, acutely notched, very spinous, lanuginous underneath: flowers crowded, bracteate; bracteas very spinous, the spines generally in pairs; involucrum unarmed.

Pursh, 2. p. 507. Nutt. 2. p. 130. Cirsium horridulum. Mich. 2. p. 90. Carduus spinosissimus. Walt. p. 194.

Root perennial, fusiform. Stem erect, simple, 2-3 feet high, lanugí-Leaves sessile, crowded near the base of the stem, pinnatifid, segments lobed, and toothed, and acutely spinous, hairy on the upper surface, lanuginous underneath. Flowers sometimes terminal, solitary, generally axillary, on very short peduncles, crowded near the summit of the stem. Bracteas 20-30 around the base of each flower, scarcely longer than the involucrum; the interior appear pectinately spinous, on the exterior the spines are distinctly arranged in pairs. Involucrum ventricose, scales numerous, lanceolate, very acute, but scarcely spiny, a little hairy. Coseeds oblong, shining, crowned with a feathered paprolla pale purple.

Very generally diffused over our country. Grows in dry poor soils.

Flowers March—April.

# LIATRIS. Gen. Pl. 1263.

Involucrum oblon- l gum, imbricatum. Re- imbricate. ceptaculum conica.

Involucrum oblong, Receptanudum. | cle naked. **Pappus** Pappus plumosus, sæpius coloratus. Semina pubescentia, obfeathered, generally
coloured. Seeds pubescent, inversely conic.

\* Floribus spicatis | \* Flowers in spikes vel racemosis, radici- or racemes; root tubebus tuberosis. | rous.

tusis.

L. foliis linearibus integerrimis, glabris, basi ciliatis, nervosis et punctatis; capitulis spicatis; squamis involucri linearibus, ob-

Sp. pl. 3. p. 1636. Muhl. Cat.? p. 70 Serratula Spicata. Lin. Gron.

Root tuberous, perennial. Stem two to four feet high, simple, glabrous. Leaves linear lanceolate, very narrow, acute, dotted, somewhat rigid, sparingly fringed at base. Flowers in a terminal spike, somewhat scattered, much longer than the bracteal leaves. Involucrum cylindrical, about 8-flow-ered, scales oblong, somewhat obtuse. Corolla bright purple, longer than the involucrum, and with the long style sprinkled with glandular dots. Seeds furrowed, very hairy, crowned with the feathered pappus.

Var. Macrostachya. Mich.

Mich. 2. p. 91. Pursh, 2. p. 507.

Stem 3 to 5 feet high. Leaves longer and narrower in proportion to their length than in the preceding variety, and more conspicuously fringed, flowers in a long terminal spike, on pedicels 1 to 2 lines long. To this species the figure of Dillenius Hort. Elth. t. 72. f. 83. appears to belong.

Grows in flat pine barrens. Flowers, August-October.

# 2. Pycnostachya.

L. caule simplici, hirsuto; foliis strictis, angusto-linearibus, pubescentibus; spica longa, floribus confertim sessilibus; involucris Stem simple, hairy; leaves straight, narrow linear, pubescent; spike long, flowers clustered, sessile; involucrum appressed, square

rose at the summit. appressis, squarrosis.

Mich. 2. p. 91. Pursh, 2. p. 507. Pluck, alm. t. 423, f. 6.?

Plant two to four feet high. Flowers small. This plant, which I have not seen in the low country, is said by Pursh to grow in our mountain meadows.

Flowers in September.

### 3. GRAMINIFOLIA. Walt.

L. caule simplici, glabro; foliis linearibus, longissimis, glabris, nervosis, margine scabriusculis. media interne subpilo- | brous, the midrib haisis; capitulis spicatis, ry on the upper sur-remotiusculis, subsessi-libus; involucri squa rather distant, nearly mis oblongis, obtusis, sessile; scales of the mucronatis, ciliatis, ap- | involucrum oblong, obpressis, interioribus coloratis.

Stem simple, glabrous: leaves linear, very long, glabrous, nerved, with the marcosta gins somewhat scatuse, mucronate, ciliate, appressed, the interior coloured.

Pursh, 2. p. 508. Nutt, 2. p. 131. Anon. Graminifolia. Walt. p. 197. Pluk. alm. t. 424. f. 6. ?

Stem two to four feet high, simple, a little hairy. Leaves very narrow, sometimes linear, sprinkled with hair all over their inner surface. Flowers in a terminal spike, not crowded. Bracteal leaves as long as the involvcrum, sometimes longer. Involucrum cylindrical, containing about six flowers, scales oblong, obtuse, mucronate, pubescent along the margia. Corolla purple, sprinkled, together with the style, with glandular dots. Seeds furrowed, very hairy. Pappus feathered, not coloured.

Grows in wet pine barrens. Flowers in September.

#### Nutt. 4. TRUITEGLIA.

L. caule gracili, glabro: foliis inferioribus basi parce pilosis, su-perioribus setaceis; per setaceous; raceme racemo longissimo; very long; pedicels pedicellis longis, mucronatis.

Stem slender, glabrous: lower leaves confertis, linearibus, crowded, linear, a little squamosis; leafy; scales of the ininvolucri squamis ob- volucrum oblong, mucronate.

· Nutt. 2. p. 181. L. Graminifolia. Willd. 3. p. 1636.?

Stem two to four feet high, simple, glabrous; lower leaves very narrow or linear; glabrous, though a little hairy near the base, crowded, and frequently, as has been remarked by Mr. Nuttall, resembling tufts of the leaves of the Pinus palustris, upper leaves very small, setaceous, scattered. Flowers crowded in a terminal raceme. Peduncle four to six lines long, furnished with two or three small scales. Involucrum oblong, containing about five flowers. Scales eval, membranaceous along the margin. Corolla bright purple, sprinkled with glandular dots. Seeds furrowed, very hairy. Pappus feathered, not coloured.

I have specimens from the western districts of Georgia, in which the lower scales of the involucrum are lanceolate, acute; the interior all emarginate and sometimes lacerate; in all other respects agreeing exactly with this species. I have always been accustomed to consider this plant as the L. Graminifolia, of Willdenow and Muhlenburg, though not of Walter and

Grows in dry pine barrens. Flowers, August-October.

## 5. CYLINDRACEA. Mich.

L. gracilis, tota hirsutula; foliis lineariinvolucris cronatis.

Slender, somewhat hairy; leaves linear; bus; spica rariflora; spike few flowered; insubsessili- volucrum nearly sesbus, cylindraceis, pau-sile, cylindrical, few cifloris; squamis apice flowered; the scales rotundatis, abrupte mu- round at the summit, abruptly mucronate.

Mich. 2. p. 93. Pursh, 2. p. 508.

On the somewhat questionable authority of Pursh, (I mean questionable as regards the habitat of his species,) I have introduced this plant, which he mentions as having been collected in Carolina by Mr. Fraser. Michaux discovered it in the prairies of the Illinois. The plant which under this name I shall describe, I received from my friend Dr. Torrey, of New-York. It was collected near the shores of Lake Michigan, and although by a many flowered involucrum, and the want of pubescence, it varies from the description of Michaux, it yet resembles his plant in too many respects to be hastily separated from it.

Root tuberous. Stem one to two feet high, slender, glabrous. Leaves linear and linear lanceolate, long, narrow, glabrous; the upper leaves pubescent along the margin, the lower ones attenuated very much at base. Flowers few, (five to eight) in a terminal spike. Involucrum long, cylindrical, containing fourteen to twenty florets. Scales oblong, rounded at the summit, and abruptly acuminate, pubescent along the margin. Corolla bright purple, sprinkled with glandular dots. Pappus conspicuously

feathered.

Grows in woods and meadows—Pursh. Flowers, August—September.

#### 6. ASPERA.

L. caule subramoso, scabro-pubescente; foliis lineari-lanceolatis, asperrimis; capitulis brevibus, spicatis, distincte alternis, solitariis, sessilibus; involucri squamis rotundato-obtusis, conniventibus.

Stem somewhat branching, scabrous, pubescent; leaves linear lanceolate, very rough; heads short, spiked, distinctly alternate, solitary, sessile; scales of the involucrum obtuse, nearly round, connivent.

Mich. p. 92. Pursh, 2. p. 508.

This species, which was discovered by Michaux in the prairies of Illinois, is mentioned by Pursh as growing also in Carolina. I have not seen it in this country, and the Anon. Ramos. of Walter, which Pursh has quoted as a synonyme, and which perhaps formed his authority for placing it among our plants, belongs, I think, to a very different species.

Flowers, August—October. Pursh.

### 7. HETEROPHYLLA.

L. caule simplici, glabro; foliis lanceola tis, glabris, lævibus; | late, glabrous, smooth, superioribus lineari-lanceolatis, multoties olate, much smaller; minoribus; involucris heads spiked, on short spicatis, brevissime pe- peduncles, dunculatis, subsquar- | squarrose; scales of rosis; squamis lanceo- the involucrum lanceolatis, acutis, nudis.

Stem simple, glabrous; leaves lanceosomewhat late, acute, naked.

Willd. enum. 503.

Flowers the size of the L. Graminifolia. Grows in South-Carolina and Georgia. Flowers, August—October.

#### 8. Pilosa.

bescente; foliis linear-ibus, pilosis, ciliatis; hairy, fringed; heads capitulis racemosis, racemose, loose; scales dicellis bracteolatis.

L. caule simplici pu- | Stem simple, pubessquamis of the involucrum oboblongis, obtusis; pellong, obtuse; pedicels bracteate.

Sp. pl. 3. p. 1636. Pursh, 2. p. 508. Nutt. 2. p. 131. A low species, flowers the size of L. Pycnostachya. Pursh.

Var. dubia. Barton?

Stem two to three feet high, streaked, not slender, a little hairy. Leaves long, linear, the lower linear lanceolate, dotted, acute, hairy and fringed near the base, nearly glabrous towards the summit. Racemes long, leafy; peduncles one-half to one inch long, the lower ones long, compound, furnished with small scales. Involucrum oblong, containing ten to fourteen flowers; scales rather obtuse, fringed, appressed. Corolla bright purple, scarcely longer than the involucrum. Seeds hairy. Pappus feathered, not coloured.

This variety is certainly not sufficiently hairy to have merited the trivial

name which belongs to this species; perhaps it is really distinct.

Grows in pine barrens-Georgia to New-Jersey.

Flowers, August-October.

#### 9. GRACILIS?

so; foliis linearibus, leaves linear, glabrous, glabris, basi ciliatis; fringed at base; heads capitulis racemosis, sub 7-floris; involucri flowered; scales of the squamis obovatis, ciliatis, appressis. E.

L. caule gracili, pilo- | Stem slender, hairy; fringed, appressed.

Pursh, 2. p. 508.

I know not whether the plant I am describing is the real L. Gracilis of Pursh. It agrees with his description in many respects, and it certainly it

very different from the preceding species.

Root tuberous, perennial. Stem two to three feet high, very slender, streaked, pubescent. Leaves linear, narrower than those of any other species excepting L. Tenuifolia, glabrous, slightly fringed at base, expanding, the lower about six inches long, the upper scarcely an inch. Raceme terminal. Peduncles nearly an inch long, hairy, furnished with a few small scales. Involucrum containing about seven flowers; scales obovate, obtuse, dotted, coloured at the summit, scarious and fringed along the margin. Corolla bright purple, much longer than the involucrum. Seeds furrowed, hairy, crowned with a coloured, feathered pappus.

Grows in dry pine barrens. Flowers September.

#### 10. SECUNDA. E.

L. caule reclinato, pubescente; foliis linearibus, glabris, basi parce ciliatis; racemis secundis; involucri squamis lanceolatis, acute, appressed.

Stem reclining, pubescent; leaves linear, glabrous, sparingly fringed at base; racemes secund; scales of the involucrum lanceolate, acute, appressed.

Root tuberous, perennial. Stems two to three feet high, pubescent, declining, generally curved. Leaves linear; the lower ones linear lanceolate, with a long attenuated base, dotted as in all of the species of this division. Flowers in a long terminal raceme, which, from the peculiar habit of the stems, is always turned to one side. Peduacles from half an inch to an inch long, furnished with one or two subulate leaves. Involucram about

10-leaved, containing four to five flowers. Leaves oblong lanceolate, acute, sometimes slightly acuminate, glabrous, pubescent along the margin. rolla pale purple. Seeds furrowed, hairy. Pappus slightly feathered.

In the scales of the involucrum this plant bears a striking resemblance to the L. Heterophylla; in other respects it appears sufficiently to differ.

Grows on the summits of the dry sand hills in the middle country; common near Columbia.

\* Flowers, August—September.

#### 11. Resinosa. Nutt.

L. glabra; foliis li-

Glabrous; leaves linearibus, confertis; ca- | near, crowded; heads pitulis spicatis, oblon- spiked, oblong, 4-5 gis, 4-5 floris; invo- flowered; scales of the lucri squamis obtusis, involucrum obtuse, apappressis, resinosis, pressed, resinous, final-demum canescentibus. ly hoary.

Nutt. 2. p. 131.

Stem about two feet high, very smooth. Radical leaves long, stem leaves Spike 6 to 12 inches long. Flowers bracteate, closely sessile. Scales of the involucrum resiniferous, at length appearing whitish. Corolla purple, internally smooth. Seed large, villous. Nutt.

Grows in the pine forests of North and South-Carolina.

Flowers.

#### 12. ELEGANS.

L. caule simplici, villoso: foliis lineari-lance olatis, subtus scabriusculis; racemo cylindra. cio, confertiflore; involucri squamis intimis ligulatis, coloratis.

Stem simple, villous; linear-lanceoleaves late, slightly scabrous underneath: raceme cylindrical, flowers crowded; interior scales of the involucrum ligulate, coloured.

Sp. pl. 3. 1635. Mich. 2. p. 11. Pursh, 2. p. 509. Nutt. 2. p. 132. Stæhelina Elegans. Walter, 202.

Root tuberous, perennial. Stem erect, three to five feet high, pubescent, almost tomentose. Leaves linear lanceolate, sometimes falcate, cartilaginous along the margins, dotted, the lower obscurely five-nerved. Flowers axillary, crowded, forming a long compact cylindrical raceme. Peduncle from two lines to an inch long, clothed with small leaves. Involucrum about 12-leaved, bearing five flowers, leaves imbricate, lanceolate, ovate, dotted, villous; the five interior very long, coloured. Corolla shorter than the involucrum. Style deeply two cleft. Seeds oblong, furrowed, very villous, crowned with a coloured, feathered pappus. Receptacle flat, dotted, sometimes a little hairy.

Grows in dry soils.

Flowers, August-September.

# 13. SCARIOSA.

L. caule erecto, pil Stem erect, hairy; loso; foliis lanceolatis, leaves lanceolate, pupubescentibus, margi- bescent, scabrous ane scabris; capitulis long the margin; heads racemosis, 14 floris; involucri squamis obovate, subglabris, margine scariosis, inferioribus patentibus. Ε.

glabrous, with the margin scarious, the lower ones expanding.

Sp. pl. 3. p. 1635. Pursh, 2. p. 509. Nutt. 2. p. 132. L. Squarrulosa. Mich. 2. p. 92. Anon. Ramos. Walt. p. 198.

Root tuberous, perennial. Leaves somewhat crowded, lanceolate, pubescent, particularly on the under surface, scarious along the margin, the lower nearly a foot long, including the long attenuated base, two inches wide, the upper two to three inches long. Flowers in a terminal raceme. Peduncles one to four lines long, pubescent. Involucrum somewhat squarrose at base, scales dilated and slightly coloured at the summit. Corolla glabrous, bright purple. Style nearly twice as long as the corolla. Seeds furrowed, hairy. Pappus feathered, pale purple. Receptacle naked, slightly convex, handsomely dotted.

This species is very much disposed to throw out branches whenever the slightest injury is sustained by the stem. When the stem is broken, it will frequently shoot out four or five long branches, and then from the size and brilliant colour of the flowers, it becomes the most ornamental species of the genus. In this state it is probably the Anon. Ramos. of Walter.

Of this plant there are many varieties or kindred species not yet discrim-

nated. In my Herbarium are the following:

- a. Lanceolata, the var. described above. Anon. Ramos. Walt. L. Squar-
- b. Intermedia. Stem leaves longer than in the preceding var. pubescent. Involucrum containing twenty-four to thirty flowers. Scales obovate, conspicuously fringed. Grows on Long Island. Dr. Torrey. An intermediate species between this and L. Spheroidea—perhaps belonging to the latter.

c. Diversifolia. Lower leaves large, glabrous. Stem leaves much smaller than in the two preceding varieties, slightly pubescent. Stem almost tomentose. Involucrum containing about twenty flowers. Scales obovate, pubescent along the margins.

d. Foliosa. Leaves of the stem long, linear lanceolate, nearly glabrous. Raceme long; through the greater part of its length the leaves at the base of each peduncle are longer than the peduncles and flowers. Involucrum

about fourteen flowered. Scales obovate, glabrous.

e. Confertiflora. Leaves lanceolate, the lower glabrous, very acute, the upper small, a little hairy; all somewhat crowded. Flowers in a compact spike. Involucrum containing fourteen to twenty flowers. Scales obovate. nearly glabrous. Grows along the western frontier of Georgia.

Grows in dry soils.

Flowers, August—October.

### 14. SPHEROIDEA. Mich.

L. foliis lævibus; in- | Leaves smooth, the ferioribus lato lanceo-latis; superioribus lan-ceolato linearibus; ra-cemo floribus majuscu-lis, solitariis, alternis; involucris subglobosis; scuamis evalibus, erec squamis ovalibus, erec- oval, erect. tis.

Mich. 2. p. 92. Pursh, 2. p. 509.

Root tuberous, perennial. Stem two to four feet high, a little pubescent. Leaves lanceolate, acute, dotted, glabrous, somewhat coriaceous. The lower ones large, attenuated into a petiole at base, four to five inches long. Flowers large, in a simple terminal raceme. Involucrum spheroidal, containing many florets; scales oval or obovate, very obtuse, coloured, slightly fringed, sometimes fimbriate, and sprinkled with glandular dots. Florets bright purple, longer than the involucrum. Seeds very hairy, crowned with a pappus not conspicuously feathered.

Grows in the upper districts of Carolina. Edgefield, Mr. Oemler.

Flowers, August—October.

## 15. SQUARROSA.

L. caule simplici pubescente; foliis longissime linearibus, nervosis, margine scabriusculis; racemis pauciflo- | racemes few flowered, ris, foliosis; involucri | leafy; upper scales of squamis superne folia- | the involucrum leafy, ceis, lanceolatis, rigi- lanceolate, dis, patentibus.

Stem simple, pubescent; leaves very long, linear, nerved, with the margins scabrous; rigid, ex-

Sp. pl. 3. p. 1634. Mich. 2. p. 92. Pursh, 2. p. 509. Nutt. 2. p. 182.

Root tuberous, perennial. Stem two to three feet high, pubescent, a little scabrous, leafy. Leaves linear, long; the lower ones sometimes exceeding a foot in length, glabrous, scarious along the margin; the upper ones sometimes ciliate. The nerves somewhat pellucid. Flowers generally four to five, in a terminal raceme. Involucrum cylindrical; scales ovate, lanceolate, ciliate, acuminate, with the points all expanding. Florets bright purple, deeply cleft, the segments hairy on the inner surface. striate, hairy, crowned with a coloured pappus, conspicuously feathered.

Grows in dry pine barrens. Flowers, September—October.

\*\* Floribus corym- | \*\* Flowers in co-bosis, radicibus fibro- | rymbs; roots fibrous. sis.

#### 16. PAUCIFLORA. Pursh.

L. caule simplici glabro; foliis linearibus, panicula virgata, panicle virgate, leafy, foliosa, ramis brevibus with paucifloris; involucris | short, subsessilibus secundis involucrum sessile, se-3-5 floris; squamis cund, 3-5 flowered; erectis, lanceolatis, a- the scales erect, lancecutis, glabris.

Stem simple, glabrous; leaves linear, the branches few olate, acute, glabrous.

Pursh, 2. p. 510.

A small species described by Pursh, from specimens collected in Georgia by Bartram, and now in the herbarium of the late Sir Joseph Banks.

#### 17. Paniculata. Walt.

L. caule simplici, piloso-viscoso; foliis lan- viscid; leaves lanceoceolatis, nervosis, gla-briusculis; panicula coarctata; involucris sub 5-floris, squamis late, nerved, nearly glabrous; panicle con-tracted; involucrum ge-nerally 5-flowered, lanceolatis.

Stem simple, hairy, scales lanceolate.

Willd. Sp. pl. 3. p. 1637. Mich. 2. p. 93. Pursh, 2. p. 510. Nutt. 2.

Anon. Paniculat. Walt. p. 198.

Root perennial, somewhat tuberous. Stem erect, one to two feet high, coloured and branching towards the summit, with the branches and involucrum viscid and very hairy. Leaves of the root spathulate, lanceolate, very finely denticulate, glabrous; leaves of the stem small, sessile, sometimes ovate-lanceolate, hairy. Flowers in a long terminal panicle, in clusters from four to six, on the small branches. Involucrum six to eight leaved, four to five flowered; scales appressed, imbricate. Corolla much longer than the involucrum, viscid, purple. Seeds furrowed, hairy, crowned with a pale purple feathered pappus. Receptacle, naked, flat, dotted. The involucrum is sometimes found with eight to ten leaves, containing eight to ten flowers, as if formed by the union, or soldering of two distinct heads of flowers. (Cephalanthia—Rich.)

Grows in flat pine barrens, very common.

Flowers, September—October.

#### Walt. 18. Odoratissima.

L. glaberrima; caule |

Very glabrous; simplici; foliis ovatis stem simple; leaves olanceolatisque, nervo- vate and lanceolate, sis, denticulatis, sub nerved, toothed, slightglaucis; panicula co- ly glaucous; panicle rymbosa; involucris 7 corymbose; involu-

-8 floris, squamis ob-ovatis, obtusis. | crum 7-8 flowered, the scales obovate, obtuse.

Sp. pl. 3. p. 1637. Mich. 2. p. 93. Pursh, 2. p. 510. Nutt. 2. p. 132.

Anon. Odoratiss. Walt. p. 198.

Root perennial, thick or tuberous. Stem erect, three to four feet high, striate, purple. Leaves of the root spathulate, lanceolate or ovate, obtusely toothed, nerved; of the stem amplexicable, generally five nerved, all a little glaucous, and when bruised, highly aromatic. Flowers in a large expanding corymbose panicle. Involucrum ten to twelve leaved, generally seven flowered, appressed, glabrous, coloured. Corolla a little longer than the involucrum, bright purple. Seeds furrowed, a little hairy, crowned with the coloured slightly feathered pappus.

Grows in flat pine barrens, in some situations very abundant; when trampled under the hoofs of horses, it persumes the air with its peculiar

fragrance.

Flowers, September—October.

## 19. Tomentosa? Mich.

L. caule simplici, foliisque cuneato-lanceolatis hirsutis; corymbo paucifloro, depresso, divaricato, ramis multifloris (4—8); involucris glabris, squamis ovalibus, obtusis.

Stem simple, and with the cuneate lance-olate leaves hairy; corymb few flowered, depressed, divaricate, the branches many flowered (4—8); involucrum glabrous, the scales oval, obtuse.

Mich. 2. p. 93. Pursh, 2. p. 510. L. Corymbosa. Nuttall, 2. p. 132.

Root perennial. Stem about two feet high, branching near the summit, with the branches and base of the leaves hirsute, and somewhat tomentose. Root leaves cuneate, lanceolate; stem leaves oblong, sessile; the lower ones narrowed at base. Flowers in terminal corymbs. Branches many Involucrum containing about twenty florets; scales oval, membranaceous along the margin, a little hairy at base. Corolla pale purple. Seeds inversely conic, crowned with the feathered slightly coloured pappus.

This plant differs in some respects, particularly in its many flowered branches, and in the smooth and obtuse scales of its involucrum, from the

L. Tomentosa of Michaux. It agrees, however, in so many other respects, that I think it may be adopted as that species, at least, until a better claimant for the name shall be discovered.

Grows in damp soils along the margins of swamps in Georgia.

Flowers, September—October.

## 20. Walteri.

L. caule simplici, superne piloso; foliis lanbris, punctatis, basi- brous, dotted, attenuatenuatis; floribus co- ate at base; flowers in rvmbosis. multifloris, squamis a- | many cutis, tomentosis. E.

Stem simple, hairy near the summit: leaves ceolatis, acutis, gla- lanceolate, acute, glainvolucris | corymbs, involucrum flowered, scales acute, tomentose.

Anon. Uniflor. Walter, p. 198.

Root perennial. Stem about two feet high, nearly glabrous at base, very hairy towards the summit. Root leaves narrow, lanceolate, glabrous, with the attenuated base three to five inches long; stem leaves diminishing in size, the upper ones very small, ovate, sessile and hairy. Corymb few flowered. Branches, one to five flowered. Scales of the involucrum ovate, acute, coloured, tomentose. Corolla deep purple. Seeds furrowed, a little hairy, crowned with the coloured slightly feathered pappus.

This plant appears to form an intermediate species between L. Bellidifolia

and Tomentosa.

Grows in St. John's, Berkeley. Flowers, September—October.

## VERNONIA. GEN. Pl. 1262.

Receptaculum nularis. Involucrum ov- Involucrum ovate, imatum, imbricatum.

Receptacle naked. dum. Pappus duplex: Pappus double, the exterior paleaceus, brevis; interior capil- the interior capillary.

#### Mich. 1. OLIGOPHYLLA.

V. caule simplici, superne ramoso; foliis radicalibus ovalibus, caulilanceolatis, acuminatis.

Stem simple, branching towards the summit; root leaves oval, stem nis lanceolatis, omnibus leaves lanceolate, all dentatis; corymbo pani- toothed; corymb panicuculato; involucri squamis | late; scales of the involucrum lanceolate, acuminate.

Mich. 2. p. 94. Pursh, 2. p. 511. Nutt. 2. p. 134. Chrysocoma Acaulis. Walt. p. 196.

Root perennial, stoloniferous. Stem about two feet high, furrowed, a little pubescent and scabrous. Root leaves large, oval, acute, coarsely but acutely toothed; stem leaves a little crowded at the base of the stem, scattered towards the summit, finely toothed, sometimes serrate; all scabrous on the upper surface, pubescent underneath, particularly along the veins. Petioles of the radical leaves about two inches long; of the stem leaves only an attenuated base. Flowers scattered in an irregular panicled corymb. Involucrum imbricate; scales ovate-lanceolate, pubescent, fringed, acuminate, the lower ones filiform at their summits. Corolla purple, deeply fivecleft, much longer than the involucrum. Seeds oblong, striate, hairy, crowned with a double pappus; the exterior composed of many short scales; the interior hairy, somewhat scabrous.

Grows in damp pine barrens, and along the margins of swamps.

Flowers June-July.

## 2. Scaberrima? Nutt.

longe niucronatis.

V. caule simplici; fo- | Stem simple; leaves liis lineari lanceolatis, denticulatis, scabris, pi-losis; corymbo subumbel- linear lanceolate, denti-culate, scabrous, hairy; corymb somewhat umlato; involucri squamis | belliform; scales of the involucrum conspicuously mucronate.

Nutt. 2. p. 134.

Root perennial. Stem about two feet high, slender, very hairy near the base, smooth and nearly naked towards the summit. Leaves somewhat crowded on the lower part of the stem, sessile, two to three inches long, hairy and scabrous on both surfaces, with the margins revolute and sparing-

ly denticulate. Flowers in a small, terminal, umbellate corymb, with a few scattered branches below the umbel. Scales of the involucrum ovate, lanceolate, fringed, terminating in a long, subulate, somewhat rigid point. Corolla bright purple. Seeds furrowed, hairy, crowned with a double pappus; the exterior composed of short, subulate scales; the interior long, hairy, slightly scabrous. Receptacle naked, dotted.

Grows in dry pine barrens.

Flowers June—August.

## 3. Angustifolia.

V. caule simplici; foliis crebris, longe angusteque subumbellato; squamis rigide mucronatis.

Stem simple; leaves numerous, long, linear, linearibus, | nearly entire; corymb subintegris; corymbo | somewhat umbelliform; involu- scales of the involucrum rigid, mucronate.

Mich. 2. p. 94. Pursh, 2. p. 511. Chrysocoma Graminifolia? Walt. p. 196.

Root perennial. Stem about three feet high, simple and somewhat scabrous. Leaves linear and linear lanceolate, sparingly denticulate, with the margins revolute, somewhat lucid, paler and a little hairy underneath, very scabrous, numerous but not crowded, expanding. Flowers in a large terminal corymb. Scales of the involucrum ovate-lanceolate, tapering to a long, subulate, expanding, somewhat rigid point. Florets numerous. rolla bright purple. Seed furrowed, hairy; interior pappus hairy, scabrous.

Grows in very dry soils. On the high sand hills in the middle country.

Common near Columbia. Flowers June—August.

4. Noveboracensis.

V. altissima; foliis crebris, serrulatis, scabris; co-!

filiformibus.

Very tall; leaves nulanceolatis, merous, lanceolate, serrulate, scabrous; corymbo fastigiato; in- | rymb fastigiate; scales volucri squamis apice of the involucrum filiform at the summit.

Willd. Sp. pl. 3. p. 1632. Mich. 2. p. 95. Pursh, 2. p. 511. Nutt. 2. p. 134.

Root perennial. Stem five to six feet high, pubescent and branching towards the summit. Leaves numerous, long, narrow, lanceolate, a little scabrous, nearly glabrous on the upper surface, finely pubescent, particularly along the veins, on the under. Flowers in a very large terminal corymb. Involucrum loosely hemispherical; scales ovate-lanceolate, terminating in a long, subulate point. Florets numerous. Corolla purple. Seed furrowed, a little hairy. Scales of the exterior pappus subulate, interior pappus long, hairy.

Grows in ditches and wet lands. Flowers July—September.

## 5. Tomentosa. E.

V. caule gracili, superne tomentoso; foliis longe angusteque lanceolatis, acutissime serratis, supra scabriusculis, subtus tomentosis, canescentibus; corymbo fastigiato; involucri squamis apice filiformibus.

Stem slender, tomentose towards the summit; leaves long, narrow, lanceolate, very acutely serrate, slightly scabrous on the upper surface, tomentose and hoary underneath; corymb fastigiate; scales of the involucrum filiform at the summit.

Chrysocoma Tomentosa? Walt. p. 196.

Stem three to five feet high, rather slender for its height, finely tomentose, the summit and branches of the corymb hoary. Leaves five to seven inches long, scarcely one wide; densely tomentose underneath. Flowers in a terminal corymb. Scales of the involucrum ovate lanceolate, hairy, terminating in a very long filiform point. Corolla purple.

This plant, of which however, my specimens are imperfect, containing only immature flowers, appears to differ from any of our described species, unless it be the C. Tomentosa of Walt. The filiform points of the involucrum are twice as long as those of any other species that I have seen.

Grows in wet soils, ditches. St. Thomas and St. Dennis, near Charles-

ton, Mr. Caradeux.

Flowers July-August.

## 6. PREALTA.

V. caule altissimo, anguloso, dense-pube-scente; foliis crebris, lanceolatis, acute ser-ratis, subtus pubescen tibus; corymbo fastigiato; involucri squamis ovatis, acutis, muticis.

Stem very tall, angled, densely pubescent; leaves numerous, lanceolate, acutely serate, pubescent underneath; corymb fastigiate; scales of the involucrum ovate, acute, unarmed.

Sp. pl. 3. p. 1633. Mich. 2. p. 95. Pursh, 2. p. 511. With this species I am unacquainted. Grows from New-England to Carolina. Pursh. Flowers August—October.

## 7. ALTISSIMA. Nutt.

V. caule glabro; foliis lanceolatis, serratis, scabriusculis; involucro parvo, hemispherico, squamis ovatis, acutis, ciliatis, muticis, arcte appressis.

Stem glabrous; leaves lanceolate, serrate, slightly scabrous; involucrum small, hemispherical, scales ovate, acute, fringed, unawned, closely appressed.

Nutt. 2. p. 134. Chrysocoma Gigantea? Walt. p. 296.

Stem six to ten feet high, nearly glabrous. Leaves very long, narrow, nearly smooth on both sides, slightly scabrous, serrulate. Flowers small, in an irregular terminal corymb. Involucrum hemispherical; scales ovate, acuminate, slightly mucronate, ciliate, closely appressed. Corolla purple. Seeds furrowed, ribs very slightly hairy. Pappus very short, the interior hairy.

This species, although the leaves are not rugose, is probably the C. Gigantea of Walter. It is readily distinguished by its small compact hemispheri-

cal involucrum, from any other species which I have seen.

Grows in ditches and damp soils. Flowers August—October.

## BRICKELLIA. E.

Involucrum poly- Involucrum many phyllum, imbricatum. leaved, imbricate. Seed Semina sub glabra, 10 striata. Pappus pilosus sive scaber. Receptaculum nudum, leaved, limbileated nearly glabrous, 10 streaked. Pappus hairy or scabrous. Receptaculum nudum, ceptacle naked, dotpunctatum.

## 1. Cordifolia. E.

Stem about three feet high, finely pubescent, almost tomentose near the summit. Lower leaves opposite, cordate, acuminate, dentate, triplinerved, finely pubescent, particularly on the under surface, on petioles about an inch long; upper leaves frequently alternate, obtuse at base. Flowers not nemerous, moderately large, in a terminal paniculate corymb. Involucran many leaved, many flowered, (forty to fifty); the interior leaves linear-lanceolate; the exterior linear, almost setaceous, loosely attached to the summit of the peduncle. Corolla tubular, five-cleft at the summit, pale purple. Stamens shorter than the corolla, attached to the tube. Style much longer than the corolla, two-cleft. Stigmas linear, obtuse. Seed long, angular, striate, a little hairy towards the summit. Receptacle slightly convex, naked, conspicuously dotted. Pappus hairy, pale purple, a little scabrous, as long as the corolla.

This plant which in its artificial characters is closely allied to the Eupane rium, differing principally in size and number, in its general aspect, bears more resemblance to the Vernonia. I have named it in commemoration of Dr. John Brickell, of Savannah, who at one period of his life paid much attention to the botany of this country, and made known to Dr. Muhlenberg,

Fraser and others, many of its undescribed plants.

Grows on the sides of hills in the western districts of Georgia.

Flowers August—September.

## KUHNIA. Gen. Pt. 322.

Involucrum cylindridraceum, imbricatum.
Pappus plumosus, sessilis. Semina pubessilis. Semina pubescentia, multistriata.
Involucrum cylindricate. Pappus
feathered, sessile.
Seeds pubescent, many
streaked.

## 1. CRITONIA.

K. foliis linearibus, Leaves linear, near-subintegerrimis, subtus ly entire, dotted under-punctatis; panicula neath; panicle long, longa, patente.

expanding.

Sp. pl. 5. p. 1773. Pursh, 2. p. 512. Nutt. 2. p. 135. Critonia Kuhnia. Mich. 2. p. 101.

Root thick, somewhat tuberous, perennial. Stem slender, about three feet high, striate, pubescent. Leaves alternate, sessile, linear, entire, with the margin revolute when young, pubescent. Flowers in a very long expanding panicle composed of small, somewhat corymbose clusters. Invofucrum cylindrical, imbricate, sixteen to twenty leaved, containing eight to ten flowers; the exterior leaves small, acute, reflected at the summit; the interior twice as long, linear, erect, pubescent. Corolla tubular, white, the border five-cleft, segments acute, with a glandular fringe. Filaments very short, anthers slightly united. Style deeply two-cless. Seed cylindrical, firmly striate, nearly glabrous, crowned with a white beautifully feathered pappus. Receptacle flat, naked, deeply dotted.

Grows in dry soils. Flowers September—October.

## 2. EUPATORIOIDES?

K. caule ramoso, Stem branching, pubescente; foliis lan- pubescent; leaves lan-

ceolatis, serratis, sub-tus pubescentibus, glanduloso punctatis; floribus paniculatis.

ceolate, serrate, pubes-cent underneath, sprin-kled with glandular dots; flowers in pani-

Sp. pl. 3. p. 1772. Pursh, 2. p. 512. Nutt. 2. p. 135.

Stem two to three feet high, branching, the young branches very pubescent. Leaves three inches long, lanceolate, irregularly serrate, slightly scabrous on the upper surface, pubescent underneath, thickly spotted with chindular granules. Involucrum cylindrical, containing about ten flowers; leaves linear, acute, pubescent, the exterior very small. Corolla white. Seeds finely striate, more pubescent than those of the proceding species: Pappus beautifully feathered.

Grows in the western districts of Georgia; very common in the prairies of the Alabama.

Flowers September—October.\*

## MIKANIA. Willd.

Receptaculum nu-dum. Pappus pilosus. Pappus hairy. Invo-Involucrum 4—6 phyl-lum, 4—6 florum. Sty-lus semibifidus, longus. long, deeply cleft.

A twining plant, running over small shrubs. Flowers white, tinged with

Grows along the margins of water courses from Canada to Carolina. Pursh. Not found in the low country.

Flowers July—September.

## 2. Pubescens. Muhl.

M. pubescens; caule volubili; foliis cordatis, climbing; leaves cor-

Pubescent; repando-dentatis, basi-angulatis, acuminatis; involucro quadrifloro. date, repand, toothed, angled at base, acumi-nate; involucrum fourflowered.

Muhl. Cat. p. 71. Nutt. 2. p. 136.

Root perennial. Stem voluble, striate, pubescent, climbing fifteen to twenty feet high. Leaves opposite, cordate, conspicuously acuminate, angled and somewhat hastate at base, pubescent, on petioles about an inch long. Flowers in paniculate corymbs, axillary and terminal. Involucrum composed of four equal leaves, and a fifth exterior and smaller, all linear-lanceolate, acuminate, hairy. Corolla tubular, a little longer than the calyx, pale purple, slightly fragrant. Stamens very short. Style almost twice as long as the corolla, two-cleft. Seed oblong, striate, slightly angled when young, glandular. Pappus hairy. Receptacle naked, dotted.

The Synonyme of Walter, quoted under the preceding species, probably belongs to this. The genus itself is scarcely distinct from Eupatorium.

Grows very abundantly in damp soils.

Flowers July-October.

## EUPATORIUM. GEN. Pl. 1272.

Involucrum imbrica- | Involucrum imbritum, oblongum. Stylus | cate, oblong. Style Semina glabra, (5) striata vel angulata. Pappus pilosus, plerumque scaber. Receptaculum nudum.

longus, semibifidus. | long, deeply cleft.

\* Involucris 3—5 floris.

\* Involucrum containing 3—5 flowers.

## 1. Fœniculaceum.

E. caule paniculato; | Stem bus filiformibus.

paniculate: foliis glabris, inferioribus pinnatis, superiorbus fasciculatis, omniper clustered, all filiform.

Sp. pl. 3. p. 1750. Pursh, 2. p. 512. Nutt. 2. p. 135. E. Fœniculoides. Walt. p. 199. Chrysocoma Capillacea. Mich. 2. p. 101.

Root perennial. Stem herbaceous, three to ten feet high, striate, clothed with a soft pubescence. Lower leaves compoundly pinnate or pinnatifid, the segments generally about an inch long, filiform, glabrous and furrowed along the upper surface; the upper setaceous in fasciculate clusters. Flowers very small and numerous, in compound nearly erect panicles. Involucrum ten-leaved, three to five flowered, the five interior leaves equal, the exterior small, all linear-lanceolate, pubescent. Corolla tubular, five-cleft, of a yellowish white colour, sometimes sprinkled with purple. Stamens very short. Germ oblong, glabrous. Style much longer than the corolla, deeply two-cleft, stigmas glandular, obtuse. Seeds cylindrical. Pappus slightly scabrous. Receptacle naked, dotted.

Grows in pastures very abundantly, preferring damp rich soils. Dog-

Fennel.

Flowers September-October.

## 2. Coronopifolium.

E. caule paniculato; foliis inferioribus pin-natifidis, laciniis lance-olato-linearibus, denti-

indivisis. fasciculatis, omnibus dotted, pubescent. punctatis, pubescentibus.

superioribus the upper undivided, linearibus, linear, clustered, all

Sp. pl. 3. p. 1750. Pursh, 2. p. 512. Nutt. 2. p. 135. E. Compositifolium. Walt. p. 199. Chrysocoma Coronopifolia. Mich. 2. p. 102.

Root perennial, creeping? Stem herbaceous, erect, three to four feet high, pubescent. Lower leaves pinnatifid, segments five to seven, linear, but acute at each end, slightly and sparingly denticulate. Panicle compound, with the branches expanding. Involucrum eight to ten-leaved, five-flowered, the five interior leaves equal, imbricated at base, with three to five smaller ones, all pubescent, linear-lanceolate, very acute. Corolla white, scarcely longer than the involucrum, slightly five-cleft. Stamens as long as the corolla. Germ oblong, angled. Style much longer than the stamens, two-cleft. Stigmas single. Seed glabrous, crowned with a scabrous pappus as long as the corolla.

This species is closely allied to the preceding, although agreeing in character, they differ in habit and appearance from all the other species of this

genus—under this name two species are now probably included.

Grows in dry poor soils.

Flowers September-October.

#### 8. Pinnatifidum. E.

E. foliis pinnatifidis, Leaves pinnatifid, inferioribus verticilla- the lower verticillate,

tis, superioribus alter- the upper alternate, the natis, laciniis lineari-bus, pubescentibus; flo-ribus corymbosis. E. segments linear, pube-scent; flowers in co-rymbs.

Root perennial. Stem erect, three to four feet high, striate, branching towards the summit, pubescent on the branches. Lower leaves verticillate by fours, two to three inches long, pinnatifid, the segments linear, one to one and a half inches long, the upper generally alternate. Flowers in a large fastigiate corymb. Involucrum eight to ten-leaved, five-flowered; leaves oblong, lanceolate, pubescent, sprinkled on the back with glandular dots. Corolla white, five-cleft. Style much longer than the corolla, deeply twoeleft. Stigmas glandular. Seed oblung, deeply striate or furrowed, crowned with a scabrous pappus rather longer than the corolla.

This plant appears to connect the two preceding species with the rest of

the genus. It has the pinnatifid leaves of the former, with the corymbose flowers that distinguish all of the subsequent species.

Grows in damp soils, in the middle districts of Carolina.

Flowers September—October.

## 4. Linearifolium. Walt.

E. caule subprocumbente, superne villoso; cumbent, villous towfoliis caulinis oppositis, ards the summit; stem lanceolato - linearibus, leaves opposite, lancerarissime dentatis, in- olate - linear, terdum fasciculatis; toothed, stylo corollam subæ- | clustered; style as long quante.

Stem somewhat prosometimes as the corolla.

Walt. p. 199. Mich. 2. p. 97. Pursh, 2. p. 513. Sp. pl. 3. p. 1750.

Stem generally procumbent, one to two feet high, almost viscidly pubescent, branches opposite and alternate. Stem leaves generally opposite, seesile, three-nerved, pubescent, slightly scabrous, having generally at their base verticillate clusters of smaller leaves. Flowers in an irregular corymb. Involucrum cylindrical, ten-leaved, five-flowered; leaves linear, very villous, sprinkled with glandular dots. Corolla white. Stamens very short. Germ angled. Style two-cleft, not longer than the corolla. Stigmas obtuse, glandular. Seed furrowed, crowned with a scabrous pappus.

Grows commonly in dry soils. Flowers August-October.

#### 5. Hyssopifolium. Linn.

E. caule erecto; foliis infimis oppositis, lanceoleaves opposite, lanceolato-linearibus, subden-late - linear, slightly tatis; corymbo subfas- toothed; corymb nearly tigiato; stylo corolla fastigiate; style much multo longiore.

longer than the corolla-

Sp. pl. 3. p. 1749.? Pursh, 2. p. 512.?

Stem straight, erect, about two feet high, pubescent, branches generally alternate. Leaves sessile, the lowest opposite, the upper alternate, linear lanceolate, slightly toothed, dotted, pubescent, bearing sometimes at base clusters of small leaves. Flowers in a terminal, somewhat fastigiate corymb.

Involucrum ten-leaved, five-flowered; leaves linear-lanceolate, pubescent, sprinkled with glandular dots, purplish at the summit. Corolla white. sprinkled with glandular dots. Stamens very short. Style much longer than the corolla, two-cleft. Stigmas obtuse. Seed furrowed, sprinkled with glandular dots; crowned with a scabrous almost feathered pappus.

This species has evidently been confounded with the preceding by Walter and Michaux, and I feel uncertain whether my references to Willdenow and Pursh are correct. This species, however, appears to me sufficiently

distinct.

Grows very common, preferring damp soils. Flowers September—October.

#### E. 6. GLAUCESCENS.

E. foliis subsessiliserratis, basi integerri- tusely serrate, entire mis, triplinervibus, sub at base, triplinerved, glaucis, pubescentibus; somewhat glaucous, pubescent; flowers in

Leaves nearly sesbus lanceolatis, obtuse sile, lanceolate, obcorymbs.

Stem about two feet high, pubescent. Leaves of the stem generally opposite, scarcely more than an inch long, but wide in proportion to their length, with three to four obtuse serratures from the middle to the summit, pubescent on both surfaces, acute at base, but scarcely petiolate, and generally bearing a pair of small lanceolate leaves in each axil; the leaves of the branches small and generally alternate, all of an olive green and somewhat glaucous hue. Flowers in corymbs. Involucrum eight to ten-leaved, fiveflowered; the leaves lanceolate, acute, sprinkled externally with glandular dots. Corolla white. Style much longer than the corolla, two-cleft. Pappus slightly scabrous.

Grows in rich shaded soils.

Flowers September.

## 7. Sessilifolium.

E. foliis sessilibus, disamplexicaulibus, displexicaule, distinct, otinctis, ovato-lanceolabasi rotundatis, at base, serrate, very serratis, glaberrimis; glabrous; stem nearly glabrous. Sp. pl. 3. p. 1251. Walt. p. 199. Mich. 2. p. 98. Pursh, 2. p. 515.

Stem obscurely four-angled, sprinkled with hairs which are scarcely visible without a lens. Leaves rounded at base, amplexicaule, opposite but not connate, sprinkled underneath with minute resinous dots. Peduncles pu-Willd. bescent.

Grows in the mountains. Pursh, Mich.

Flowers August—September.

#### 8. Truncatum. Muhl.

E. foliis sessilibus, amplexicaulibus, distinctis, lanceolatis, basi truncatis, serratis, glabriusculis; caule pubescente.

Leaves sessile, amplexicaule, distinct, lanceolate, truncate at base, serrate, nearly glabrous; stem pubescent.

Sp. pl. S. p. 1751. Pursh, 2. p. 513.

Stem covered, particularly towards the summit, with slender, jointed, white Leaves opposite, sessile, amplexicaule, distinct, rather broad, very glabrous on the upper surface, pubescent underneath along the veins, and sprinkled with resinous dots, obtusely serrate and truncate at base. Pedarcles and Involucrum pubescent. Very similar to E. Sessilifolium, yet sufficiently distinct by a stem pubescent, leaves truncate at base, the serratures larger and more obtuse, and the involucrum more pubescent. Willd.

I have taken the description of this and the preceding species from Willdenow. Specimens which have been sent me under these names from Pennsylvania, North-Carolina, and the mountains of South-Carolina, are not to

me sufficiently distinct; perhaps I have seen only one species.

Grows on the Saluda and Alleghany mountains.

Flowers August—September.

#### Linn. 9. Album.

E. foliis subsessilibus, oblongo lanceolatis, scabriusculis, serlanceolatis, scariosis, albis.

Leaves nearly sessile, oblong-lanceolate, somewhat scabrous. ratis; involucri squamis | serrate; the interior interioribus elongatis, | scales of the involucrum long, lanceolate, scarious, white.

Sp. pl. 3. p. 1752. Walt. p. 199. Pursh, 2. p. 513. E. Glandulosum. Mich. 2. p. 98.

Stem erect, about two feet high, striate, villous. Lower leaves opposite, the upper alternate, all sessile, lanceolate, coarsely toothed, dotted, pubescent and scabrous. Flowers in fastigiate corymbs. Involucrum ten-leaved, five-flowered; leaves linear-lanceolate, very acute, thickly sprinkled with glandular dots. Corolla white. Stamens short. Anthers purple. Style scarcely longer than the corolla, two-cleft. Seeds furrowed, crowned with a scabrous pappus.

Grows in dry poor soils. Flowers August—September.

#### 10. PARVIELORUM. E.

E. foliis sessilibus, angusto-lanceolatis, aplinervibus, seminibus angulatis.

Leaves sessile, narrow lanceolate, very cutissime serratis, tri- | acutely serrate, pubesplinervibus, utrinque cent on both surfaces; pubescentibus; floribus flowers in corymbs, small; seeds angled.

Stem about two feet high, pubescent. Leaves opposite and alternate, about two inches long, with numerous and acute serratures, entire at base, and tapering almost to a petiole. Flowers in terminal corymbs. Involucrum eight to ten-leaved; the interior leaves strap shaped, the exterior small, all very pubescent and sprinkled with glandular dots. Corolla white, with the pappus scarcely longer than the involucrum. Style much longer than Seeds angled not furrowed. Pappus very slightly scabrous.

The flowers of this plant are much smaller than those of any other of the

corymbose species which I have seen.

Collected in St. Thomas' by Mr. Caradeux.

Flowers in September.

#### E. 11. Scabridum.

E. foliis sessilibus, | Leaves sessile, ovateovato-lanceolatis, a-cute serratis, basi inte-gris, . pubescentibus, subscabris, subtus sub-lanceolate, acutely ser-rate, entire at base, pu-bescent, slightly sca-brous, somewhat glau-

glaucis; floribus corym- | cous underneath; flowbosis; involucri squa-mis acutissimis. E. ers in corymbs; scales of the involucrum very acute.

Stem two to three feet high, pubescent, the lower branches brachiate, the upper alternate. Leaves scarcely more than an inch long, opposite, ovate, acute at each end, with numerous serratures. Involucrum ten-leaved, fiveflowered. Leaves lanceolate, somewhat mucronate, hairy, sprinkled with glandular dots. Corolla white, longer than the involucrum. Stamens very short. Style longer than the corolla, two-cleft. Seed angled. Pappur scabrous.

Grows in dry soils.

Flowers from August to October.

## 12. Rotundifolium.

E. foliis sessilibus, distinctis, subrotundo-deltoidibus, obtuse serratis, venosis, sub

glaucis; involucri squa- cous; scales of the in-mis acutis. volucrum acute.

Sp. pl. 3. p. 1754. Mich. 2. p. 93. Pursh, 2. p. 514. Nutt. 2. p. 135. E. Marrubium? Walt. p. 199.

Stem two to three feet high, very pubescent. Leaves opposite, decussate, triplinerved, dotted, slightly scabrous, with a somewhat glaucous or perhaps more correctly hoary hue. Flowers in a fastigiate corymb. Invohcrum ten-leaved, five-flowered; leaves lanceolate, acute, very pubescent. Corolla white. Stamens very short. Style much longer than the corolla. Seeds angled. Pappus scabrous, longer than the corolla.

Decoctions of this as well as of the preceding species are used with much

success as a tonic febrifuge. -

I have always suspected this plant to be the E. Marrubium of Walter. It is commonly known through our low country as the wild horehound, and its leaves bear more affinity to the garden horehound, (marrubium vulgare) than those of any other of our species.

Grows in dry pine barrens.
Flowers from July to September.

## 18. VERRENÆFOLIUM.

ovato-lanceolatis, ob- lanceolate, rugosis, scabris; flori- rugose, scabrous; flowbus parvulis. E.

E. foliis sessilibus, Leaves sessile, ovatelongis, inciso-dentatis, notched and toothed,

Michaux, 2. p. 98.

E. Teucrifolium? Sp. pl. 3. p. 1753.

Stem herbaceous, erect, two to three feet high, pubescent. Leaves of the stem opposite, decussate, somewhat deltoid, tapering to an obtuse point, coarsely toothed, particularly towards the base, dotted, very hairy on the under surface. Flowers in a somewhat fastigiate corymb. Involucrum ten-leaved, five-flowered; leaves lanceolate, not very acute, very hairy. Corolla small, white. Style much longer than the corolla. Stigmas reflexed. Seed angled. Pappus very scabrous.

The E. Lanceolatum of Muhlenberg, which I have not seen in the Southern States, appears to be an intermediate species between this and the E.

Album, nearly allied to each, yet sufficiently distinct.

If the synonyme from Willdenow which I have quoted, belongs really to this species, I know not why Michaux's name should have been changed; it has the claim of priority, and it is equally perhaps more appropriate.

Grows in damp soils.

Flowers August-September.

#### 14. Pubescens. Muhl.

culato, pubescente, ramis fastigiatis.

pubescent,
fastigiate.

E. foliis sessilibus, Leaves sessile, disdistinctis, ovatis, sca- tinct, ovate, somewhat briusculis, venosis; in-ferioribus duplicato serratis, superioribus subserratis; caule pani-subserratis; caule panibranches

Sp. pl. 3. p. 1755. Pursh, 2. p. 514. Nutt. 2. p. 125.

Stem erect, pubescent; like the leaves the lower branches are opposite, the upper alternate. Leaves ovate, the lower sometimes oval, two to three inches long, obtuse at base, tapering to an acute summit, rather thin and slightly scabrous, corymb fastigiate. Involucrum ten-leaved, five-flowered; leaves linear-lanceolate, acute, hairy. Corolla white, and with the pappus nearly twice as long as the involucrum. Style longer than the corolla-Seed angled. Pappus scabrous.

Grows from New-Jersey to Carolina. Pursh. My specimens are from

Pennsylvania.

Flowers August-October.

#### Willd. 15. Cuneifolium.

E. foliis petiolatis, obovato - lanceolatis, apice subserratis, triplinervibus, utrinque pubescentibus.

Leaves on petioles, obovate - lanceolate, slightly serrate at the summit, triplinerved, pubescent on each sur-

Sp. pl. 3. p. 1753. Pursh, 2. p. 514.

Stem terete, pubescent. Leaves opposite, pubescent on both surfaces; the lower obovate, lanceolate, obtusely serrate, slightly petiolate; the upper petiolate, with a few serratures near the summit. Flowers white.

With this species I am unacquainted, it is however singular that both Willd. and Pursh should quote as a synonyme the E. Marrubium of Walt.

which is described as having sessile, deltoid leaves.

Grows in Carolina. Willd. Pursh. Not above a foot high. Pursh. Flowers.

\*\* Involucris multi- | \*\* Involucrum many floris (5—50.)

## 16. Perfoliatum.

E. foliis connato-perfoliatis, rugosis, subtus tomentosis; cau-Leaves connate-per-foliate, rugose, tomen-tose underneath; stem E. foliis le villoso.

villous.

Sp. pl. 3. p. 1761. Walt. p. 200. Pursh, 2. p. 516. E. Connatum. Mich. 2. p. 99.

Stem three to six feet high, striate, villous almost tomentose, and with the leaves and involucrum hoary and sprinkled with glandular dots. Lower leaves connate, the upper distinct, abruptly truncate at base, all tapering gradually to the summit, serrate, rugose, slightly pubescent on the upper surface, tomentose underneath. Involucrum many leaved, (fourteen to sixteen.) eight to ten flowered, leaves linear-lanceolate, acute, pubescent, imbricate. Corolla small, white, glabrous. Style nearly twice as long as the corolla, two-cleft, stigmas simple. Seed angular, pappus scabrous.

A decoction of this plant is much used and recommended in fevers; it acts as an emetic or sudorific, according to the constitution of the patient.

Grows in wet soils.

Flowers September—October.

#### 17. CEANOTHIFOLIUM. Muhl.

Foliis petiolatis, o- Leaves on petioles, vatis, acuminatis, den- ovate, acuminate, tootatis, triplinervibus, sub glabris; involucris 5—10 floris, squamis subæqualibus.

tatis, triplinervibus, thed, triplinerved, somewhat glabrous; involucrum 5—10 flowered, scales nearly equal.

Sp. pl. 3. p. 1755. Pursh, 2. p. 514.

Stem two to three feet high, sometimes slightly pubescent. Leaves opposite, on petioles about an inch long, ovate-lanceolate, slightly acuminate, dentate, triplinerved, strongly veined, slightly scabrous, and pubescent along the veins, very obtuse at base. Flowers in terminal corymbs. Involucrum ten-leaved, five to ten flowered; leaves nearly equal, one or two sometimes smaller than the rest, all linear-lanceolate, pubescent. Corolla white. Style longer than the corolla, two-cleft. Seeds angled. Pappus hairy, less scabrous than usual in the preceding species.

From my much valued friend Dr. Schweinitz, I received under the name of E. Melissoides, a plant nearly allied to this. It differs however by its leaves, more pubescent, more acuminate, less scabrous, and less obtuse at base, and its florets generally more numerous, eight to twelve in each capitulum. It may prove a distinct species, but it is scarcely the E. Melissoides described by Willdenow. It was collected around Salem, N. Carolina.

Grows in shaded rich soils. Paris Island, near Beaufort.

Flowers September.

## 18. AGERATOIDES.

E. foliis petiolatis, Leaves on petioles, ovato-lanceolatis, acu- ovate-lanceolate, acuminatis, triplinervibus, minate, triplinerved, grosse serratis, glabris; coarsely serrate, glacorymbo multifloro; brous; corymb many

involucri squamis sub flowered; scales of the æqualibus. E. flowered; scales of the involucrum nearly equal.

Sp. pl. 3. p. 1765. Pursh, 2. p. 516. E. Urticæfolium. Mich. 2. p. 100.

Stem 2 to 3 feet high, smooth, glabrous; leaves generally opposite, two to four inches long, glabrous, coarsely toothed, on petioles two inches long. Involucrum ten to twelve-leaved, twelve to sixteen-flowered; leaves linearlanceolate, finely pubescent, nearly equal in length. Corolla white: Style longer than the corolla. Seeds angled, glabrous. Pappus slightly scabrous.

I feel doubtful whether the plant I have described is the E. Ageratoides of Muhl.; it certainly is the E. Urticæfolium of Mich. and its leaves bear & striking resemblance to those of the Urtica, (now Boehmeria) cylindrica.

Grows in damp rich soils. Paris Island.

Flowers September.

## 19. Aromaticum?

cordato-ovatis, acutis, cordate-ovate, acute, triplinervibus, obtuse triplinerved, obtusely

E. foliis petiolatis, Leaves on petioles, serratis, sub scabris; serrate, somewhat scabrous; floribus corymbosis; brous; flowers in corymbs; scales of the aequalibus. E.

Sp. pl. 3. p. 1765. Mich. 2. p. 100. Pursh, 2. p. 516. E. Cordatum. Walt. p. 199.

Stem about two feet high, terete, very finely pubescent. Leaves opposite, on short peduncles, the lower very distinctly cordate, all acute not acuminate, tripli-nerved, coarsely and unequally toothed, somewhat scabrous on the upper surface, finely pubescent underneath. Flowers in a terminal corymb, the lower branches opposite, brachiate. Involucrum about ten-leaved, thirteen to twenty flowered; leaves lanceolate, pubescent, nearly equal. Corolla very white, nearly twice as long as the involucrum, fragrant. As-Style longer than the corolla. Seeds angled. Pappus dightthers white. ly scabrous.

This plant is certainly the E. Aromaticum of Michaux, and E. Cordains of Walter. Whether it is the E. Aromaticum of Linnæus and Gronovius is, I think, questionable; it does not resemble the figure referred to in Plukenet

t. 88. f. 3.

Grows in rich dry soils. Flowers August—October.

#### 20. SEROTINUM. Mich.

E. foliis petiolatis, ovato-lanceolatis, su-perne attenuatis, acu-tis, grosse et acute ser-vate-lanceolate, taper-ing towards the sum-mit, acute, coarsely pubescentibus; involutriplinerved, pubescent; cri squamis imbricatis. scales of the involu-E.

Leaves petiolate, otriplinervibus, and acutely serrate, crum imbricate.

Mich. 2. p. 100. Pursh, 2. p. 517.

Stem five to six feet high, pubescent, almost tomentose. Leaves large, five to six inches long, ovate, tapering gradually to the summit, which is sometimes acuminate; lower leaves opposite, the lowest slightly cordate. Petioles two to three inches long. Flowers in a fastigiate corymb, very numerous, rather small. Involucrum ten-leaved, twelve to fourteen flowered; leaves linear, very villous. Corolla white. Seeds angled. Pappus scabrous.

The expression of Michaux, "rariter serratis" is incorrect, and has, I suspect, given rise to some doubts about the species.

Grows in the vallies of the Sea-Islands.

Flowers September—October.

#### Walt. 21. Incarnatum.

E. foliis longe petiolatis, cordato-deltoidibus, acutis, obtuse dentatis, triplinervibus, subglabris; involucri squamis subæqualibus.

E. foliis longe petiolatis, cordato-deltoidibus, deltoid, cordate, acute, obtusely toothed, triplinerved, thin, nearly glabrous; scales of the involucrum nearly equal.

Walt. p. 200.

Stem about two feet high, covered with a fine scarcely visible pubescence, sparingly branched. Leaves opposite, on slender petioles one to two inches long, deltoid, very acute, very thin, cordate and thinly sprinkled with short hair. Flowers in terminal corymbs, more loosely aggregated than in the following species. Involucrum fifteen to twenty-leaved, bearing about twenty flowers; leaves linear-lanceolate, very acute, a little pubescent, nearly as long as the corolla, a few of the exterior ones a little shorter than the rest. Corolla purple. Style a little longer than the corolla, two-cleft.

Seed angled. Pappus hairy.

This plant appears to me to differ very much from the E. Cœlestinum with which it has usually been confounded; it is a more slender plant, its leaves are thinner and more glabrous, the corymbs less compact, the scales of the involucrum less numerous but larger, the style comparatively shorter. It is probably the plant of Petiver alluded to by Dillenius, Hort. Elth. p. 140.

Grows in loose rich soils.

Flowers October to November.

## 22. Cœlestinum.

E. foliis petiolatis, cordato-ovatis, obtuse dentatis, triplinervibus, subscabris; involucris polyphyllis, multifloris; receptaculis conicis.

Leaves petiolate, cordate-ovate, obtuse-lytoothed, triplinerved, slightly scabrous; involucrum many leaved, many flowered; receptacle conic.

Sp. pl. p. 1764. Walt. p. 200. Mich. 2. p. 100. Pursh, 2. p. 516.

Stem two to three feet high, pubescent. Leaves on petioles about half an inch long, opposite, deltoid, sometimes cordate, somewhat rugose, pubescent and slightly scabrous. Flowers in close fastigiate corymbs. Involucrum many leaved, (thirty) many flowered, (forty to sixty); leaves imbricate, linear, pubescent. Corolla small, of a beautiful light blue colour, sprinkled with red dots, very fragrant. Style twice as long as the corolla, Seed angled. Pappus scabrous. Receptacle conic, naked, dotted

Grows in rich shaded soils. Flowers September—October.

## 23. Ternifolium.

E. foliis petiolatis, ternis, quaternisve, o-vatis ovalibusque, acu-vate and oval, acumi-

minatis, dentatis, sub- | nate, toothed, pubestus pubescentibus, glan- cent underneath, dotted duloso punctatis. E. with glands.

E. Trifoliatum. Sp. pl. 3. p. 1756. Walt. p. 199. Pursh, 2. p. 516. Nutt. 2. p. 135.

Stem three to four feet high, striate, pubescent, solid. Leaves generally ternate, on petioles about an inch long, ovate or oval, but always acuminate, obtuse at base, thinly sprinkled with hairs on the upper surface, pubescent and almost covered with glandular dots on the under. Flowers in large ter-Involucrum about fifteen-leaved, imbricate, the interior minal corymbs. leaves linear-lanceolate, long, nerved, slightly pubescent, the exterior short, nearly ovate, more pubescent, all membranaceous or scarious, and adhering very slightly to the receptacle. Corolla tinged with purple. Style much longer than the corolla, deeply two-cleft, stigmas linear. Seed angled. Pappus filiform.

The species I have described above is certainly distinct, and is probably the real plant of Gronovius, "foliis ternis," Flor. Virg. p. but I have among my specimens one with ternate leaves, which most probably belongs to E. Verticillatum, and from such a specimen the phrase "utrinque attenuatis." which Willdenow and Pursh apply to this species, has possibly been

derived.

Grows in damp soils; rare in the low country of Carolina. Flowers September—October.

## 24. Purpureum.

E. foliis petiolatis, quaternis quinisve, oval lanceolatis, serratis, rugoso-venosis, scabriusculis; caule fis
Leaves on petioles, by fours or fives, oval lanceolate, serrate, rugose, veined, slightly scabrous; stem hollow. tuloso.

Sp. pl. 3. p. 1759. Mich. 2. p. 99. Pursh, 2. p. 515.

Stem four to seven feet high, nearly glabrous, tinged with purple, hollow. Leaves four to six, in a whorl, oval-lanceolate, serrate, nearly glabrous on the upper surface, underneath reticulately veined, somewhat pubescent and sprinkled with glandular dots, tapering at base to a petiole about an inch long, sometimes tinged with purple. Involucrum generally five-flowered, very similar to that of the preceding species, but less pubescent. Corolla Style, Stigma and Seed similar to those of the preceding pale purple. species.

Grows in wet soils. Flowers September.

## 25. MACHLATUM.

pubescentibus; caule derneath; stem solido, sulcato.

E. foliis petiolatis, Leaves on petioles, quaternis quinisve, o- by fours or fives, ovate vato lanceolatis, inæ- lanceolate, unequally qualiter serratis, subtus | serrate, pubescent unfurrowed.

Sp. pl. 3. p. 1760. Mich. 2. p. 99. Pursh, 2. p. 1760.

Stem four to five feet high, furrowed, not hollow, dotted with purple. Leaves verticillate, lanceolate and ovate, acute at each end, pubescent and slightly scabrous underneath. Involucrum five to eight flowered. Corolla tinged with purple. Style, Stigma, and Seed, very similar to those of the preceding species.

Grows in wet soils.

Flowers August-September.

## 26. Verticillatum.

E. foliis petiolatis, ternis quaternisve, ovato lanceolatis, utrinque acuminatis, inæqualiter serratis, glabriusculis; caule solido, lævi.

Leaves on petioles, by threes or fours, ovate lanceolate, acuminate at each end, unequally serrate, nearly glabrous; stem smooth.

Sp. pl. 3. p. 1760. Pursh, 2. p. 515. E. fusco-rubrum? Walt. p. 199.

Stem four to six feet high, smooth, pubescent near the summit, tinged with purple. Leaves verticillate, large, ovate-lanceolate, acuminate at each end, with very large serratures, glabrous, sprinkled with glandular dots on the under surface. Flowers in a terminal corymb, rather smaller than those of the preceding species. Involucrum ten to twelve leaved, five flowered, leaves oblong and ovate, obtuse, scarious, glabrous. Corolla purple. Seeds angled, pappus slightly scabrous.

Grows in damp soils, in the upper districts of South-Carolina and Geor-

ered.

Mich. 2. p. 101. Pursh, 2. p. 517. Nutt. 2. 137.

Root perennial. Stem erect, about two feet high, glabrous, branching near the summit. Root leaves obovate, lanceolate, narrow, acute, glabrous, entire, three-nerved, with a long attenuated base. Stem leaves scattered, the lower ones similar to the root leaves, but small, the upper ones linear, minute. Flowers in a terminal corymb. Involucrum oblong, eight to ten-leaved, containing three to four flowers, leaflets linear, rugose, appressed, glabrous, yellowish. Corolla tubular, glabrous, yellow, segments acute, reflected. Style scarcely as long as the stamens, two-cleft. Stigmas somewhat lanceolate, glandular, erect. Seed obovate, striate, hairy. Pappus hairy, scabrous, unequal. Receptacle flat, with a small membrane between the germs. .

Grows in flat pine barrens. Very common.

Flowers October—November.

## CACALIA. GEN. Pl. 1275.

Pappus pilosus.

Involucrum cylindri-cum, basi squamosum. | Involucrum cylindri-cal, scaly at base. Re-Receptaculum nudum. ceptacle naked. Pappus hairy.

## 1. ATRIPLICIFOLIA.

C. caule herbaceo; foliis petiolatis, glabris, subtus glaucis, radicalibus cordatis, dentatis, caulinis rhombeis utrinque subdentatis; floribus corymbosis, erectis: involucris 5-floris.

herbaceous: Stem leaves on petioles, glabrous, glaucous underneath, those of the root cordate, toothed, of the stem rhomboidal, slightly toothed on each side; flowers in corymbs, erect; involucrums 5-

Sp. pl. 3. 1737. Walt. p. 195. Mich. 2. p. 96. Pursh, 2. p. 518. Nutt. 2. p. 137.

Root perennial. Stem erect, three to eight feet high, branching, glabrous, somewhat glaucous. Leaves cordate, almost reniform, the upper ovate, rhomboidal, and lanceolate, all sinuate, with the summits of the lobes acute, sometimes dentated and glaucous underneath. Flowers in small termins. corymbs. Peduncles almost white, clothed with small subulate pale or colourless scales. Involucrum composed of five equal, linear, three-nerved, glabrous, colourless leaves, containing five flowers. Corolla tubular, whitish, tinged a little with purple. Styles bifid. Stigmas glandular. Seed oblong, glabrous, obovate. Pappus hairy, scabrous, very white. tacle naked, with an irregular angular somewhat glandular mass in the centre. This mass, composed perhaps of soldered scales, is generally threecleft at the summit, curved at base, as if embracing the stems of the florets, but of three more distinctly than the other two.

Variety Angulata.

I have specimens collected in St. Thomas' and in the middle districts of Carolina, in which the leaves are nearly round, deeply and acutely divided into seven or more lobes, the lobes sometimes dentate, in other respects agreeing with this species.

Grows generally in rich soils. Flowers July-September.

#### 2. Ovata. Walt.

C. caule herbaceo; foliis ovatis, obtusis, obtuse-dentatis, nervosis, subtus subglaucis, ed, slightly glaucous

inferioribus petiolatis, underneath, the lower involucris 5-phyllis, 5-lowered. underneath, the lower on petioles; involucrum 5-leaved, 5-flowered.

Walt. p. 196.

Stem three to four feet high. Leaves large, acute, very irregularly and obtusely toothed, seven-nerved, and slightly glaucous underneath. Flowers in a fastigiate corymb, pedicel clothed with small subulate scales, which sometimes surround the base of the involucrum. Involucrum oblong, composed of five equal, linear leaves. Corolla white. Seed smooth. Pappus hairy, white. Receptacle naked, with a glandular projection in the centre.

The root of this plant I did not observe; it appears to have been noticed by Walter, and to resemble very closely the C. Tuberosa of Nuttall; yet differing from both of their descriptions. My specimens, which are now

before me, are distinctly though slightly glaucous underneath.

Grows in the western parts of Georgia. Common in the highlands near the Alabama.

Flowers September-October.

# 3. LANCEOLATA?

C. caule herbaceo; foliis angusto-lanceolatis, utrinque acutis, remote dentatis, nervosis, subtus subglaucis; Stem herbaceous; leaves narrow lanceolate, acute at each end, remotely toothed, nerved, slightly glau-

involucris 5-phyllis, 5- cous underneath; invo-floris. cous underneath; invo-lucrum 5-leaved, 5-flowered.

Nutt. 2. p. 138.

Stem four to six feet high. Leaves long, narrow, lanceolate, remotely, but distinctly and acutely dentate, obscurely seven-nerved, slightly glaucous underneath. Flowers in a terminal corymb, pedicels more naked than in the preceding species. Involucrum composed of five equal, linear-lanceolate, acute scales, with membranaceous margins. Corolla nearly white, Seed smooth, glabrous, striate. Pappus hairy, white. Receptacle very small, with a glandulary projection in the centre.

Sent to me from Louisville, Georgia, by Mr. Jackson.

Flowers-

## SPARGANOPHORUS. Gært.

Involucrum someimbricatum; what globose, imbri-pice recurva- cate; scales recurved at the summit. Receptacle naked.

## 1. Verticillatus.

S. foliis linearibus, | Leaves linear, vertidentata.

verticillatis; capitulis cillate; heads few, terpaucis, terminalibus; minal; cup campanu-cupula campanulata, 5- late, 5-toothed.

Mich. 2. p. 95. Pursh, 2. p. 518. Nutt. 2. p. 139. Ethulia Uniflora. Walt. p. 195.

An aquatic plant, growing in shallow water.

Roots fibrous, creeping. Stem scarcely exceeding a foot in height, pube-scent towards the summit, simple. Leaves linear, about an inch long, glabrous, verticillate, generally six in each whorl. Heads terminal, sometimes solitary, frequently accompanied with other heads near the summit. Involucrum imbricate, containing many flowers, leaves lanceolate, acuminate, pubescent, the summits recurved, coloured. Corolla tubular, not much longer than the involucrum, pale purple. Seed glabrous, five angled, crowned with a membranaceous pappus, deeply five-cleft.

The pappus in this species appears to me to be composed of five distinct,

ovate, membranaceous, denticulate scales, forming a proper calyx. Grows in the flat pine barrens in the middle districts of Carolina.

Flowers-

Mich. 2. p. 104. Pursh, 2. p. 519. Nutt. 2. p. 139.

Root perennial. Stem two to three feet high, furrowed, angular, tomenbee. Leaves alternate, long, slender, irregularly pinnatifid, the segments remote, scarcely confluent, linear, sinuate-dentate, the upper ones more distinctly pinnatifid, with the segments entire, all tomentose and hairy underneath. Flowers in small terminal corymbs. Involucrum many leaved, containing many flowers, leaflets obovate, nearly round, tomentose on the back, membranaceous, white, the interior large and expanding, giving the flowers a radiated appearance. Florets tubular, whitish, externally pubescent, border five-cleft, with the segments revolute. Stamens extended, with their projecting summits very conspicuous. Style longer than the stamens. Stigmas two, revolute. Seed conical, a little hairy. Pappus composed of many short, obtuse, denticulate, membranaceous leaves.

Grows around ponds in the high pine barrens in the middle districts of Carolina and Georgia. I believe very rare. Scriven and Burke counties,

Georgia.

Flowers in April.

## POLYPTERIS. Nutt.

## 1. Integrifolia.

Nutt. 2. p. 139.

Root perennial. Stem erect, three to four feet high, a little scabrous, branching near the summit. Leaves alternate, linear lanceolate, entire, scabrous. Involucrum composed of eight to twelve leaves; leaves oblong, membranaceous. Floret: numerous, with a border deeply five-cleft; segments reflected. Stamens extended. Style longer than the stamens, twocleft. Stigmas linear, pubescent. Seed quadrangular, slightly scabrous, black, tapering at base, to a very acute point. Pappus nine-leaved, leaves subulate, with a midrib-prominent and rigid, pubescent on the back; the margin membranaceous, lacerate.

Discovered by Dr. Baldwin, near St. Mary's, Georgia.

Flowers.

#### MELANANTHERA. Mich.

M. foliis hastato-tri- | Leaves hastate three cuminate.

Mich. 2. p. 107. Pursh, 2. p. 519. Nutt. 2. p. 140. Bidens Nivea. Sp. pl. 3. p. 1721. Walt. p. 201.

Root perennial. Stem erect, four to six feet high, quadrangular, deeply furrowed, scabrous, spotted, branching. Leaves opposite, decussate on the angles of the stem, hastate, lanceolate, acute, toothed, scabrous, somewhat hispid, triplinerved, on petioles one to two inches long. Peduncles somewhat terminal, frequently by pairs, bearing each one head of flowers. Involucrum sixteen to twenty leaved, in two rows, leaflets equal, oblong-lanceolate, hispid, a little shorter than the corolla. Corolla tubular, pubescent, very white, border five-cleft. Stamens as long as the corolla, black, with their terminating summits white. Style as long as the stamens. Stigma reflected, acute, glandular. Seed turbinate, quadrangular, compressed, the two angles slightly winged. Pappus composed of two or three bristles, shorter than the corolla, scabrons, with small erect prickles. Receptacle convex, paleaceous; scales lanceolate, acuminate, scabrous, as long as the corolla.

Grows in dry rich soils. Flowers August-September.

ulato mucronatis, flos-culis brevioribus. lucrum subulate, mu-cronate, shorter than the florets.

Mich. 2. p. 126. Pursh, 2. p. 523. Nutt. 2. p. 145. Baccharis Fœtida. Walt. p. 202. Sp. pl. 3. p. 1918.

Root annual? Stem erect, three to five feet high, branching towards the summit, branches angled, somewhat viscid. Leaves alternate, sessile, large lanceolate, acute at each end, serrate, pubescent. Flowers in axillary and terminal corymbs, female florets in the circumference of each capitulura very numerous, hermaphrodite in the centre few, rarely exceeding five, all Involucrum many leaved, (sixteen to twenty,) imbricate; leaflets ovate, acute, pubescent, with the margins membranaceous. Female florets with the corolla slender, tubular, minutely five-toothed. Stamens none. Style longer than the corolla, two-cleft; germ oblong; seed oblong, cylindrical, pubescent. Pappus hairy. Hermaphrodite florets funnel shaped. with the border five-cleft, somewhat expanding. Stamens longer than the corolla, purple. Germ very short, thick. Style as long as the stamens, two-cleft. Seed probably abortive. Receptacle naked, slightly convex, dotted.

This species, and those that are strictly allied to it, are remarkable for the strong and to most persons disagreeable aroma, which is emitted from every part of the plant when bruised.

Grows very abundantly in ditches and damp places, both in brackish

and in fresh soils.

Flowers August-September.

### 2. Camphorata.

C. herbacea, subpubescens; foliis petiolatis, ovato-lanceolatis, a- | denticulatis; corymbis terminalibus et axillaribus, folio brevioribus; involucri squamis acutis, flosculos subæguantibus.

Herbaceous, slightly pubescent; leaves on petioles, ovate-lanceocutissimis, subrepando | late, very acute, denticulate; corymbs terminal and axillary, shorter than the leaves: scales of the involucrum acute, as long as the florets.

Pursh, 2. p. 523. Nutt. 2. p. 145. Erigeron Camphoratum. Sp. pl. 3. p. 1960.

Stem about three feet high, pubescent. Leaves nearly sessile, generally ovate-lanceolate, acutely denticulate, finely pubescent. Flowers in small axillary and terminal leafy corymbs. Involucrum many leaved, imbricate, leaves very pubescent, almost tomentose, rather longer than the florets. Florets in this species very similar in arrangement and structure to the preceding; female florets very slender, the hermaphrodite comparatively large, with a short pappus.

Grows along the margins of rivers and swamps in South-Carolina and Georgia. Pursh. I have not observed this species in the low country of Carolina, it grows probably in the middle or upper country. My specimens

are from Pennsylvania.

Flowers August-September.

### 8. Bifrons.

C. herbacea, sub Herbaceous, some-glutinosa; foliis ovali-lanceolatis, serratis, oval-lanceolate, serforis.

cordatis, amplexicauli- | rate, cordate, amplexibus; corymbis conferti- | caule; corymbs densely l flowered.

Sp. pl. 3. p. 1920. Pursh, 2. p. 524. Nutt. 2. p. 145. Conyza Amplexicaulis. Mich. 2. p. 126. Baccharis Viscosa. Walt. p. 202.

Root perennial. Stem erect, two to three feet high, branching towards the summit, very pubescent, slightly viscid. Leaves alternate, oblong, acute, amplexicaule, like the stem very pubescent, viscid, and sprinkled with glandular dots, sometimes ferruginous underneath. Flowers in compact, fastigiate corymbs. Female florets in the circumference of each capitulum, hermaphrodite florets few in the centre, all purple. Involucrum imbricate, leastlets subulate, somewhat villous externally, sprinkled with glands. Florets exactly similar to those of the preceding species.

This plant exhibits frequently a remarkable phenomenon. In every clear frosty morning, during the winter, crystalline fibres nearly an inch in length, shoot out in every direction from the base of the stem. It would appear as if the remnant of the sap or water, absorbed by the decayed stem, had congeoled, and had burst in this manner through the pores of the bark. Does this proceed from any essential quality of the plant, or from its structure?

Grows in wet soils, ditches and around ponds.

Flowers July-September.\*

\*The three preceding species are strictly congeners. They differ in several respects from the type of the genus Conysa, and with such species as shall be found truly allied to them, should form a sub-genus at least in this family; to which may be given with some slight variation the character I have inserted at the head of this genus.

Leptogyne. Involuctum imbricatum, squamis appressis. Corollulæ foem. plurimæ in ambitu, graciles, 5-dentatæ; herm. steriles? in centro, inpendibuliformes, 5-fidæ. Semina cylindrica, pubescentia. Pappus pilosus. Receptaculum nudum.

This however will be found to approach very near to the reformed character which R. Brown proposes for the Gnaphalium.

#### E. 4. SINUATA.

C. pilosa, scabriuseula; foliis inferioribus scabrous; lower leaves sinuatis, lobis ovalibus, acute, the lobes oval, acute, the upper linear, earibus, integerrimis; | entire; flowers in panifloribus paniculatis. E. cles.

Hairy, somewhat

Root annual? Stem about two feet high, branching. Lower leaves two to four inches long, oblong, lanceolate, deeply sinuate. Flowers in an oblong terminal panicle, female florets in the circumference, hermaphrodite in the centre, all white. Involucrum many leaved, imbricate; leaflets linear, haceolate or subulate, appressed; female florets a little longer than the involucrum, very slender, with the border slightly three-cleft. Stamens none. Style setaceous. Stigma simple. Hermaphrodite florets with the corolla. shorter than the female, border five-cleft. Anthers as long as the corolla. Style as long as the stamens, two-cleft. Stigmas glandular, obtuse, erect. Seeds all fertile, oblong, angled, hairy. Receptacle naked, convex, dotted.

This plant, which scarcely appears to be a native, has all the artificial and essential characters of the Conyza, with the habit and appearance of an

Grows around Charleston—very common.

Flowers April—July.

# PTEROCAULON. E.

#### 1. Pycnostachyum. Mich.

P. caule alato; foliis | lanceolatis, sub undula- | lanceolate, slightly untis, denticulatis, subtus | dulate, toothed, tomenalbo-tomentosis; spica cylindrica, densiflora.

Stem winged; leaves tose and white underneath; spike cylindrical, flowers clustered.

Conyza Pycnostachya. Mich. 2. p. 126. Pursh, 2. p. 524. Nutt. 2. p. 145. Gnaphalium Undulatum. Walt. p. 203.

Root tuberous, somewhat fusiform, perennial. Stem about two feet high, erect, simple, and with the under side of the leaves, and calyx densely tomentose and white. Leaves sessile, lanceolate, widely decurrent, so as to render the stem conspicuously winged. Flowers in a compact sometimes compound spike; female and hermaphrodite flowers promiscuously mingled in each capitulum, all white. Involucrum imbricate, leastets somewhat obovate, acute, appearing to be scarious on the inner surface, densely tomentose without; female florets slender, three-cleft; stamens none; style longer than the corolla, two-cleft, stigmas acute; hermaphrodite florets with the corolla deeply five-cleft; anthers very short; style shorter than the corolla, twocleft; stigmas glandular, white. Seed angled, pubescent. Receptacle naked, flat.

· This plant, as remarked by Michaux, should form an intermediate genus between Conyza and Gnaphalium, but it is in habit and appearance, much more nearly allied to the latter than the former; many species in the last section of Conyza in Wildenow, perhaps belong to this genus. The seeds of the hermaphrodite florets are probably sterile. They are certainly much shorter than the others. The root under the popular denomination of Black Root is much used in some parts of the country as an alterative and as a cleanser of old ulcers.

Grows in dry sandy soils. Flowers May—August.

# 1. POLYCEPHALUM.

G. herbaceum, erectum; foliis lineari-lance-olatis acutis, supra glabris, subtus pubescentibus; caule paniculato, tomentoso; corymbis terminalibus, coarctatis.

Herbaceous, erect; leaves linear-lanceolate, acute, glabrous on the upper surface, pubescent underneath; stem paniculate, tomentose; corymbs terminal, clustered.

Mich. 2. p. 127. Pursh, 2. p. 524. G. Obtusifolium. Sp. pl. 3. p. 1880. Walt. p. 203.

Root annual? Stem one to two feet high, branching near the summit, covered with a white tomentum. Leaves alternate, sessile, linear-lanceolate, nearly acute, entire, slightly undulate, nearly glabrous on the upper surface, tomentose, white underneath. Flowers in large terminal corymbs, composed of heads aggregated in small clusters. Involucrum imbricate, conical, leaflets oblong, white, tomentose at base; female florets slender, yellowish in the border, five toothed, stamens none, style longer than the corolla; hermaphrodite florets with the corolla funnel shaped, yellowish, the border five-cleft, stamens as long as the corolla. Seeds cylindrical, glabrous. Pappus hairy, as long as the corolla. Receptacle naked, flat, dotted.

Grows in dry pastures—very common.

Flowers September—October.

# 2. Purpureum.

G. herbaceum; foliis lineari-spathulatis, subtus tomentosis; caule erecto, simplicissimo; floribus sessilibus, glomeratis, terminalibus axillaribusque.

Herbaceous; leaves linear spathulate, to-mentose underneath; stem erect, simple; flowers sessile, clustered, axillary and terminal.

Sp. pl. 3. p. 1884. Mich. 2. p. 127. Pursh, 2. p. 525. Gnaphalium Hyemale. Walt. p. 203.

Root perennial, stoloniferous. Stem erect and assurgent, simple, tomentose and white, twelve to eighteen inches high. Leaves sessile, oblong, obovate, slightly mucronate, entire, undulate, obscurely triplinerved, tomentose, particularly on the lower surface, which, like the stem, is white. Flowers

in compact, axillary, sessile clusters. Involucrum imbricate, leaslets oblong, ovate, scarious, glabrous, appressed, the inner ones tinged with purple. Female florets numerous; corolla, if any, closely adhering to the style; stamens none; style two-cleft; stigma short, obtuse; hermaphrodite florets small, with the border five-cleft, purple. Style as long as the corolla. Stigma scarcely divided. Seed oblong, scabrous. Pappus hairy.

Grows in dry pastures—very common.

Flowers March—May.

sim angustatis, acutis; ing, acute; stem branchcaule superne ramoso, ing near the summit; corymbo fastigiato; flo- | corymb fastigiate, flowers on pedicels.

Willd. Sp. pl. 3. p. 1881. Walt. p. 203. Mich. 2. p. 127. Pursh, 2. p. 524.

Root perennial. Stem one to two feet high, branching towards the summit, clothed with a thick tomentum. Leaves linear-lanceolate, entire, tomentose, hoary underneath. Flowers in large terminal corymbs. Involvcrum many leaved, imbricate, scales ovate, obtuse, slightly plaited, of a snowy whiteness; male florets with the corolla five-cleft, yellowish, stamens nearly as long as the corolla, (Anthers with two bristles at base, Brown,) seed abortive, pappus scabrous, a little thickened at the summit; female florets with the corolla very slender, stamens none, style two-cleft, stigma simple. Seed oblong, a little scabrous, pappus pilose.

I give the habitat with some hesitation. But among my specimens I found one put away for examination in the manner I have usually put specimens received from some of my domestic correspondents; in this instance, however, without a note or label. On examination it proved to be a male plant of this species, justifying Mr. Brown's observations on its dioecious characters (Trans. Lin. Soc. vol. 12. p. 123.) The specimens in my herbarium from

the Northern States are female.

Grows in the mountains of Carolina and Georgia.

Flowers August—September.

# 4. PLANTAGINEUM.

sarmentis procumbentibus; caule simplici; foliis radicalibus ovatis, nervosis; coarctato; corvmbo floribus dioicis; involucri squamis interioribus esongatis, obtusis, coloratis.

Suckers procumbent: stem simple; leaves of the root ovate, nervose: corymb clustered, flowers dioecious; interior scales of the involucrum long, obtuse, coloured.

Sp. pl. 3. p. 1882. Walt. p. 203. Pursh, 2. p. 525. Nutt. 2. p. 146. G. Dioicum. var. Plantaginifolium. Mich. 2. p. 128.

Root perennial, stoloniferous. Stem scarcely a foot in height, simple, tomentose, white. Leaves of the root wide, spathulate, oval or acute, entire, three-nerved, tomentose, white on the under surface; of the stem spathulate, lanceolate, sometimes oval or obovate, frequently hoary on both surfaces. Flowers in small terminal corymbs. Involucrum imbricate, the interior scales long, very white, sometimes nearly acute. Female florets very slender; style two-cleft; pappus hairy, longer than the corolla.

Grows in woods and on sunny hills. Pursh.

Flowers May—July. Pursh.

Sp. pl. 3. p. 1974. Mich. 2. p. 119. Pursh, 2. p. 529. Nutt. 2. p. 165. Cineraria Canadensis. Walt. p. 207?

Stem four to eight feet high, a little hairy and scabrous, succulent, branching towards the summit. Leaves alternate, sessile, oblong, deeply notched, almost pinnatifid, the lobes all acute, pubescent, a little scabrous, hairy along the midrib; panicle compound, terminal, the branches strait, numerous. Involucrum ventricose; leaves equal, glabrous, acute; leaflets at base setaceous, irregularly disposed. Florets of the ray none; of the disk, tubular, numerous, white. Anthers a little longer than the corolla, purplish. Style longer than the stamens, two-cleft; stigmas reflected. Seeds cylindric, a little hairy. Pappus setaceous. Receptacle naked, dotted.

The involucrum in this species appears to be monophyllous, deeply divided.

Grows in rich damp soils. Flowers June—September.

### 2. Suaveolens.

S. caule herbaceo; corymbosis, Horibus tifloris.

Stem herbaceouse foliis petiolatis, hasta-to-sagittatis, serratis, glabris, concoloribus; leaves on petioles, has-tate, sagittate, serrate, glabrous, uniformly coloured; flowers in coerectis; involucris mul- | rymbs, erect; involucrum many flowered.

Cacalia Suaveolens. Sp. pl. 3. p. 1734. Walt. p. 195. Mich. 2. p. 96. Pursh, 2. p. 518. Nutt. 2. p. 138.

Root perennial. Stem three to five feet high, like the whole plant glabrous. Leaves hastate, ovate, acutely and irregularly serrate, mucronate, supported on winged petioles one to two inches long. Involucrum many leaved; leaves linear-lanceolate, acute, a little pubescent at the summit, surrounded at base, by small subulate or setaceous leaves, irregularly disposed. Florets of the disk very numerous, tubular, yellowish white, somewhat globular at base. Anthers longer than the corolla, with the terminal appendixes deeply separated, acute. Style two-cleft. Seed oblong, striate. Pappus simple, hairy under a lens, a little scabrous. Receptacle naked.

Grows in damp rich soils in the middle and upper districts of Carolina and Georgia.

Flowers August-October.

#### 3. Tomentosus. Mich.

incano-lanosus; bo subumbellato.

Hoary and woolly; caule simplici; foliis pe- | stem simple; leaves on tiolatis, ovali lanceola- | petioles, oval lanceotis, serrulatis; corym- late, serrulate; corymb somewhat umbelliform.

Mich. 2. p. 119.

Root perennial. Stem about two feet high, covered like the whole plant with a white cottony tomentum, which seems rather adhering to the surface of the plant, than growing out of it. Leaves of the root oblong, oval, generally obtuse, finely serrulate or crenulate, supported by petioles three to six inches long; leaves of the stem smaller, oblong, more or less dissected. Flowers in a small terminal umbel. Involucrum many leaved, the leaves equal, linear-lanceolate, very woolly at base. Florets of the ray, twelve to fifteen, the ligules lanceolate, nerved, slightly three toothed; of the disk numerous. Stamens as long as the tubular florets. Seed pubescent? Pappus simple, setaceous, similar on all the florets.

This plant has great resemblance, in size, and outlines, to the S. Balsamitæ; besides, however, its woolly surface, its leaves are much more slightly serrate, and the florets of the ray not distinctly three-notched as in that spe-

cies.

Grows near the Flat Rock not far from Camden. Mich. Found by Mr. Whitlow in the middle country of Carolina.

Flowers April—May.

### 4. OBOVATUS.

S. foliis radicalibus! briusculo.

Leaves of the root obovatis, crenato serra- | obovate, crenate or sertis, petiolatis, caulinis | rate, on petioles, of the pinnatifidis; floribus stem pinnatifid; flowsubumbellatis, longepe- ers somewhat umbeldunculatis; caule gla- | late, on long peduncles; stem nearly smooth.

Willd. Sp. pl. 3. p. 1999. Pursh, 2. p. 530. Nutt. 2. p. 165.

т 2

Root perennial. Stem twelve to eighteen inches high, simple, glabrous. Leaves of the root obovate, sometimes nearly round, crenate, glabrous, with an attenuated base about an inch long; leaves of the stem sessile, small, pinnatifid, a little woolly at the base. Flowers in small terminal panicles. Involucrum simple, many leaved; leaves linear-lanceolate, glabrous, with one or two small subulate leaves at base; florets of the ray ten to twelve, yellow; florets of the disk numerous. Stamens as long as the corolla-Seed oblong, striate. Pappus simple, hairy, white.
In the specimens which I have from this State, the leaves are more orbi-

cular, thicker, and the flowers larger than those from Pennsylvania; per-

haps they form distinct species.

Grows near Vance's ferry, on the Santee river.

Flowers.

### 5. Balsamitæ.

S. foliis radicalibus l subumbellatis; caule pedunculisque basi villosis.

Leaves of the root oblongis, serratis, petio- | oblong, serrate, on pelatis, caulinis inferiori- | tioles, of the stem, the bus lyrato-pinnatifidis, lower lyrate pinnatifid, serratis, summis pinna- serrate, the highest pin-tifidis, dentatis; floribus natifid, toothed; flowers somewhat umbellate; stem and peduncles villous at base.

Sp. pl. 3. p. 1999. Pursh, 2. p. 530.

Root perennial. Stem one to two feet high, glabrous except at the origin of the leaves, simple, slender. Leaves of the root oblong, oval or ovate, serrate and crenate, glabrous, supported on petioles four to six inches long, a little woolly at the base; leaves of the stem incised, pinnatifid, toothed. Flowers in small terminal umbels. Involucrum simple, many leaved; leaflets linear-lanceolate, membranaceous along the margin, with one or two small setaceous leaves at base; florets of the ray ten to twelve, linear-lanceolate, deeply three-cleft, differing in this respect from all the other species of this genus in my collection; florets of the disk numerous. Stamens about as long as the corolla. Seeds naked, striate. Pappus setaceous, white, similar on all the florets.

Grows in damp pine barrens. Dr. M'Bride.

Flowers April—May.

### 6. Aureus.

S. foliis radicalibus ovatis, cordatis, serratis, petiolatis, caulinis pinnatifidis dentatis, lacinia terminali lanceolata; pedunculis subumbellatis, incrassatis.

Leaves of the ovate, cordate, serrate, on petioles, of the stem pinnatifid, toothed, the terminal segment lanpeduncles ceolate; thickened; somewhat umbellate.

Sp. pl. 3. p. 1998. Mich. 2. p. 120. Pursh, 2. p. 530. Nutt. 2. p. 165.

Root perennial. Stem about two feet high, slender, glabrous, excepting near the root. Leaves of the root cordate, oval, sometimes nearly round, crenate, glabrous, supported on petioles about six inches long; lower leaves of the stem small, nearly round, on petioles scarcely an inch long, the upper sessile, amplexicaule, pinnatifid. Flowers in a simple, terminal umbel. Involucrum with only one or two small leaves at base. Florets of the ray vellow. Seed glabrous, striate. Pappus setaceous, similar in all the florets.

I have a specimen sent me from Pennsylvania by Dr. Muhlenburg, under the name of S. Aureus, which appears to agree exactly with the S. Cymba-

laria, of Pursh, excepting that its flowers are in a small umbel.

Grows in the mountains of Carolina. Mich.

Flowers June-July. Pursh.

#### Schweinitz. 7. Fastigiatus.

S. foliis radicalibus oblongis, cordato ova- oblong, cordate ovate, tis, crenato dentatis, crenately toothed, glaglabris, caulinis, pinna- | brous, of the stem pintifidis, pinnis dentatis, natifid, the segments incisisque; floribus sub-umbellatis, pedunculis involucroque glabris. the peduncles  $\mathbf{E}$ .

Leaves of the root and involucrum

Plant two to three feet high, and glabrous excepting sometimes the base of the stem, very similar in many respects to the preceding species, but generally larger. Root leaves oblong, ovate, and almost acute, deeply cordate, and supported by petioles six inches long; stem leaves two to four inches long, deeply pinnatifid, with the terminal segment ovate, and irregularly notched. Involucrum as in most of our species appearing to be one-leaved. deeply divided with one or two small scales at base, the segments or leaflets subulate, florets of the ray yellow, larger than those of S. Aureus. oblong, striate. Pappus setaceous, very white, and very abundant, so that the heads when the seeds are mature, resemble small balls of cotton.

Sent me under this name from Salem, North-Carolina. I have specimens from the middle country of South-Carolina, which, though wanting

root leaves, appear to belong to this species.

Flowers.

  - 1. ARGENTEA. Persoon.
- C. sericea; foliis l perne subnudo.

Silky; leaves lanceolanceolato - linearibus, erectis, acutis, integer-rimis; corymbo sub pa- late, linear, erect, acute, entire; corymb some-what paniculate; invoniculato; involucris pu- | lucrum pubescent; stem bescentibus; caule su- nearly naked towards the summit.

Inula Argentea. Pursh, 2. p. 532. Nutt. 2. p. 151.

Root perennial. Stem about two feet high, branching towards the summit. Leaves long, (those of the root ten to twelve inches,) nearly linear, somewhat rigid, entirely covered as well as the stem with long silken hairs, longitudinally appressed to their surface. Flowers in an irregular terminal corymb. Involucrum imbricate; leaves subulate, acute, pubescent, and in the specimen now before me, more covered with glands than those of the succeeding species. Florets of the ray ten to twelve; of the disk numerous, all yellow. Seeds oblong, villous or hispid. Pappus of both florets similar, the exterior subulate, resembling the interior in colour; interior very scabrous, light brown.

Grows in dry soils. Flowers July—October.

#### 2. Graminifolia. Mich.

tis, integerrimis, nervo-sis; corymbis composi-tis; caule superne fo-tire, nerved; corymbs compound; stem leafy towards the summit. liaceo.

Inula Graminifolia. Mich. 2. p. 122. Pursh, 2. p. 532. Nutt. 2. p. 151. Erigeron Nervosum. Sp. pl. 3. p. 1953.

Root perennial. Stem about two feet high. Leaves long, linear, entire, distinctly nerved, covered as well as the stem with a pubescence exactly similar to that of the preceding species; corymb compound, sometimes containing many heads. Florets of the ray, ten to twelve; of the disk numerous, all yellow. Stamens naked at base, as long as the corolla (of the disk,) at first

yellow, afterwards white. Stigmas nearly acute. Seed and Pappus exactly similar to those of the preceding species; the pappus, however, is less coloured.

These two species are probably distinct, yet they are so nearly allied that it is not easy to point out their specific distinction. I have never seen an individual of either species without glands on the leaves of the involucrum. The one which I have seen most nearly naked, belonged to this species. Judging from the specimens now before me, I should say that the leaves of the C. Argentea are narrower, thicker, and the nerves so close as not to be very distinct, that the flowers, and consequently the seed are much larger, and the stem nearly naked towards the summit. In the C. Graminifolia the leaves are conspicuously nerved, the corymbs generally more compact, and the heads more numerous.

Grows in dry sandy soils. Flowers July—October.

# 8. Pinifolia. E.

rigido; foliis linearibus, confertis, rigidis; co-rowded, rigid; corymb rymbo majusculo; involucri squamis apice volucrum woolly at the summit.

C. glaberrima; caule | Very glabrous; stem

Root perennial. Stem eighteen to twenty-four inches high. Leaves very numerous, crowded on the stem, four to six inches long, on the branches small, linear, with the midrib somewhat conspicuous, under a lens finely serrulate. Corymbe terminal. Flowers nearly as large as in any species of this genus. Involucrum imbricate, scales linear-lanceolate, a little woolly near the point. Florets of the ray about fifteen, of the disk very numerous, all bright yellow. Stamens of the disk longer than the corolla. Anthers white, with their projecting summits very conspicuous, lanceolate. Style longer than the stamens, two-cleft. Stigma glandular. Seeds all similar, long, hairy, hispid. The exterior pappus subulate, lacerate, whitish, the interior very scabrous, reddish brown. Receptacle naked.

Grows on the summits of the sand hills, between the Flint and Chatahoo-

chee rivers.

Flowers September-October.

### 4. MARIANA.

C. pilosa; foliis ob-longo lanceolatis, ser-ratis, superioribus ses-rate, the upper sessile,

cro viscido pubescente. bescent.

sillibus, acutis, inferio-ribus spathulatis ple-rumque obtusis; co-rymbo simplici; involu-tuse; corymb simple; involucrum viscidly pu-

Nutt. 2. p. 151.

Sp. pl. 3. p. 2099. Mich. 2. p. 122. Pursh, 2. p. 531. Inula Mariana.

Root perennial. Stem one to two feet high, simple, sparingly clothed with long lanuginous hair. Leaves clothed in a similar manner, particularly on the under surface. Corymb composed of a few heads. Peduncles and back of the leaves of the involucrum covered with viscid glands. Invobucrum many leaved, imbricate, leaves linear-lanceolate. Florets of the ray sixteen to twenty; of the disk very numerous, all yellow. Anthers slightly two-cleft at base, with the terminal appendix lanceolate, white. Stigmer glandular. Seeds oblong, villous. Pappus on all of the florets double, the exterior simple, short, the interior scabrous, not so much coloured as usual in this genus.

Grows in dry sandy soils. Flowers August-October.

The species which has been sent me from New-Jersey by my much esteemed friend Dr. Torrey, of New-York, as the Inula Falcata of Pursh, is certainly a very distinct species from this. It may be distinguished as C. falcata foliis lineari-lanceolatis, acutis, rigidis, sub falcatis; involucri squamis sub tomentosis. The flowers in my specimens too are smaller than those of the C. Mariana.

### 5. TRICHOPHYLLA. Nutt.

longis, obtusis, inter-gerrimis; corymbo sim-plici; involucri squamis the involucrum very angustissimis, glandu- narrow, glandular. losis.

C. pilosa; foliis ob- | Hairy; leaves oblong,

Nutt. 2. p. 150.

Root perennial. Stem twelve to eighteen inches high, sparingly lanuginous. Leaves somewhat lanuginous, sessile, generally entire, the lower one attenuated at base. Corymb simple, few flowered. Involucrum many leaved, imbricate; leaves very narrow, a little glandular, and sometimes hairy. Florets of the ray fourteen to sixteen, narrow, and perhaps longer than any other of our species; of the disk numerous, all yellow. Seeds oblong, villous, almost hispid. Pappus of both florets double, the exterior simple, the interior scabrous, brownish.

Grows in dry sails. Flowers August—September.

### 6. Gossypina.

C. lanuginoso-candi-cans; foliis sessilibus, oblongo – spathulatis, obtusis, integerrimis; Woolly,hoary;leaves sessile, oblong, spathu-late, obtuse, very en-tire; corymb fastigiate. corymbo subfastigiato.

Mich. 2. p. 122. Pursh, 2. p. 532. Nutt. 2. p. 1507

Root perennial. Stem one to two feet high, covered, like the whole plant, except the corolla, with a white lanuginous tomentum. Leaves oblong, obtuse, the lower ones obovate, all entire. Corymbe simple, few flowered. Involucrum many leaved, imbricate; leaves subulate, very woolly. Florets of the ray numerous, yellow. Anthers scarcely longer than the florets of the disk, white at the summit. Seed oblong, viscid, hispid. Pappus of all the florets double, the exterior white, finely lacerate, the interior scabrous,

Grows in high pine lands; common in the middle districts of Georgia: Flowers August—October.

### 7. DENTATA.

C. lanuginosa; foliis bo simplici. E.

Lanuginous; leaves cuneato obovatis, obtu-sis, sinuato dentatis, su-tuse, deeply toothed, perioribus oblongo ova- the upper oblong, oval, libus, integris; corym- entire; corymb simple.

Root perennial. Stem about two feet high, covered like the whole plant except the cerolla, with a white lanuginous tomentum. Lower leaves three to five inches long, with a long tapering entire base, towards the summit coarsely and obtusely toothed; upper leaves numerous, oblong, all sessile and semiamplexicaule. Flowers in a simple corymb, leaves subulate, very woolly; florets of the ray numerous, (twenty to twenty-five,) strongly nerved; florers of the disk also very numerous, all yellow. Stamens much longer than the florets of the disk, white, with the terminal appendices lanceolate. Style longer than the stamens, two-cleft. Seed small, oblong, hispid. Pappus double in all the florets, the exterior small, lacerate, white, the imterior scabrous, reddish brown.

This species has a very close affinity to the preceding, which it resembles entirely in habit and appearance, it differs only in its leaves, which are large and coarsely toothed, and in its seeds, which appear, at least, by my specimens, to be much smaller.

Sent me from Louisville, Georgia, by Mr. Jackson to whom I have been

indebted for so many rare species, from the same district of country.

Flowers August-October.

\* \* Floribus panicu-\* \* Flowers paniculatis.

#### Nutt. 8. DIVARICATA.

C. foliis lineari lan- l ceolatis, acutis, serra- | late, acute, acutely sertis, ciliatis, cauleque his- rate, ciliate, and with pidis; panicula divari- the stem hispid; panicata; pedunculis invo- cle divaricate; pedunlucrisque viscido pu- | cles and involucrum visbescentibus.

Leaves linear lanceocidly pubescent.

Nutt. 2. p. 152.

Root perennial. Nott. Stem about two feet high, slender, hispid and scabrous, irregularly branching towards the summit. Leaves very narrow, the lower ones with long tapering bases, very acutely serrate, hispid and scabrous. Flowers in a long scattered panicle. Involucrum many leaved, imbricate; scales linear-lanceolate, slightly acuminate, pubescent on the back. Florets of the ray not numerous, bright yellow, as in all the species of this genus; of the disk tubular, yellow. Style two-cleft. Seed oblong, hispid, the interior pappus reddish brown, scabrous, the exterior wanting.

In this species which has long been known to me and which I sent Dr. Muhlenberg many years ago, as the Inula hispida, I have been able to discover no trace of an exterior pappus unless the upper hairs of the seed can

be so called.

Srows near Savannah, whence it was first sent me by R. W. Habersham, Esq. I have found it also near the national establishment on the Chatshouchie River.

Flowers August—October.

### 9. SCABRA.

C. foliis inferioribus l ovalibus, dentatis, petiolatis, caulinis cordato-ovatis, omnibus scabris punctatisque; caule divari- | divaricate; flowers in cato; capitulis paniculatis. E.

Lower leaves oval, toothed, on petioles, stem leaves cordate. osessilibus, vate, sessile, all scabrous and dotted; stem panicles.

Pursh, 2. p. 531. Nutt. 2. p. 151. Inula Punctata. Muhl. Cat. p. 76.

Stem two to three feet high, branching from the base, Root perennial? clandularly hairy, and very scabrous. Leaves of the root distinctly petio-late, with the petioles dilated at base, coarsely toothed; of the stem somewhat amplexicaule, acute, the veins all pellucid. Flowers in a compound. terminal panicle. Involucrum many leaved, (nearly one hundred) imbricate, cylindrical; leaves linear, acute, viscid, pubescent, with the margins membranaceous. Florets of the ray about twenty, lanceolate, nerved; style scarcely longer than the tube; seeds oblong, and excepting at the base glabrous; exterior pappus a marginal cup, entire; the interior pappus wanting. Florets of the disk tubular, five-cleft, strongly nerved along the margins; stamens scarcely longer than the corolla. Seed hispid, exterior pappus composed of many membranaceous scales, the interior scabrous, reddish brown. Receptacle deeply celled.

Grows on the sand ridges near the ocean, and in dry pastures.

Flowers October.

The two preceding species differ in habit from this genus and the C. Scabra very much, in the structure of the seed and pappus. If the double or exterior pappus should be found to form permanent generic distinctions, and to unite those species which in habit, symmetry and character agree, this plant must be separated from this genus. It may be distinguished by the following character:

CALYCIUM. Antheræ basi Involucrum imbricatum, cylindricum. Semina radii glabra, cupula coronata; disci hirsuta, pappo duplici, exteriore membranaceo polyphyllo, interiore piloso scabro. Receptaculum favosum.

The first seven species of this genus, together with the C. falcata, form a very natural group, though the two first are marked with strong peculiarities. The two last differ in habit, and have also characteristic distinctions, which, with the increasing accuracy of the science, may cause them to be removed from this genus.

Pursh, 2. p. 547.

Stem twelve to eighteen inches high, pubescent near the summit. Leaves linear subulate, acute, very glabrous underneath, slightly scabrous on the upper surface, three to four inches long, two to three lines wide, when young, sometimes fringed. Flowers large, rarely exceeding four to five, on branches or peduncles nearly naked. Involucrum imbricate, leaves linear lanceolate, pubescent, reflexed, equal in length, the lowest sometimes longer and leaf-like. Florets of the ray about twenty-four, nearly an inch long, purple; of the disk numerous, yellow. Seed glabrous, angled. Pappur scabrous.

Grows in wet pine barrens. Flowers October—November.

# 7. Grandiflorus.

A. foliis subamplexicaulibus, lineari subu- amplexicaule, linear, latis, rigidis, reflexis, subulate, rigid, reflexmargine ciliato-hispi-dis; caule hirto, ramis unifloris; involucri hairy, the branches 1squamis lineari-lanceolatis.

Leaves somewhat flowered; involucrum squarrose, the scales linear-lanceolate.

Sp. pl. 3. p. 150. Mich. 2. p. 111. Pursh, 2. p. 550. Nutt. 2. p. 156.

Stem two to three feet high, very hairy, particularly towards the summit. Leaves two to four inches long, scabrous, sometimes almost hispid, linear, acute, the upper subulate. Flowers solitary on branches much more memerous than in the preceding species. Involucrum conspicuously squarrose, scales linear lanceolate, reflected. Florets of the ray numerous, large for this genus, linear-lanceolate, purple; of the disk numerous, yellow. Sees nearly glabrous. Dill. Hort. Elth.

Grows in dry sandy woods, Carolina, Pursh. In the mountains of North-Carolina and Virginia. Mich. I have not seen this species in the low

country.

Flowers October—November.

# 8. Exilis. E.

A. glaberrimus; cau-le gracili, elato, parce ramoso; foliis prælon-branched; leaves very gis, lineari subulatis; long, linear, subulate;

dio brevioribus. E. | as long as the ray.

capitulis racemosis; in- | heads in racemes; volucri squamis lineari | scales of the involucrum lanceolatis, radio dimi- | linear-lanceolate, half

Stem four to five feet high, erect, very slender, with a few scattering branches, which near the summit become corymbose. Lower leaves four to six inches long, scarcely exceeding a line in width, very slightly scabrous along the margin, the upper diminishing in size; those of the branches linearlanceolate. Flowers on the lower branches few, on the upper in racemes on peduncles two to four lines long. Scales of the involucrum linear-lan-ceolate, glabrous, loosely appressed. Florets of the ray about twenty, narrow, twice as long as the involucrum, pale purple; of the disk yellowish. Seed somewhat pubescent.

Grows in damp soils in the western districts of Georgia.

Flowers September-October.

#### Mich. 9. Subulatus.

liis lineari subulatis, linear-subulate, acute, acutis, erectis; ramis multifloris; involucris cylindraceis, squamis subulatis; ligulis radii erect; branches many flowered; involucrum cylindrical, the scales subulate; florets of the minutis.

A. glaberrimus; fo- | Very glabrous; leaves ray minute.

Mich. 2. p. 111. Parsh, 2. p. 545. Nutt. 2. p. 154.

Stem erect, two to three feet high, glabrous, with numerous expanding branches. Leaves one to four inches long, two to three lines wide, smooth, entire, somewhat appressed to the stem. Flowers very small, in a loose terminal panicle. Involucrum many leaved, imbricate, scales slightly re-Sected at the summit. Florets of the ray about thirty, scarcely longer than the involucrum, unequally three-cleft, pale purple; of the disk, six to ten, yellow. Seeds hairy.

Grows with A. Flexuosus in soils affected by salt water,

Flowers September—October.

# 10. Foliolosus.

A. caule ramosissi- | Stem bearing many mo, erecto; foliis lineari | branches, erect; leaves lanceolatis, integerri- | linear-lanceolate, enmis, margine scabris, tire with the margins rameis minutis creber- | scabrous, those of the rimis; ramis pauciflo- | branches minute and ris; involucri squamis numerous; acutis, appressis.

few flowered; scales of the involucrum acute, appressed.

Sp. pl. 3. p. 2025. Pursh, 2. p. 545. Nutt. 2. p. 155. A. Coridifolius. Mich. 2. p. 112.

Root perennial. Stem two to three feet high, glabrous, with the branches expanding. Leaves sessile, those of the stem about an inch and half long, acute at each end, those of the branches very small, appressed; all glabrous but scabrous along the margins. Panicle compound, the branches generally few flowered. Involucrum imbricate, scales acute, appressed, hairy or fringed at the summit. Florets of the ray twenty to twenty-four, linearlanceolate, pale purple; of the disk about thirty, yellow. Style scarcely as long as the stamens. Seed glabrous. Pappus somewhat scabrous.

The plant I have described is certainly the A. Coridifolius of Michaux. It appears to differ in some respects from the A. Foliolosus of Ait.

Grows in dry soils.

Flowers September—October.

#### 11. Sparsiflorus. Mich.

A. glabellus; foliis | linearibus, integris, re- | leaves linear, entire, flexis; caule tenui, ra-mosissimo; ramis ra-much branched; the mulisque patulis, seta- | branches expanding, ceis, unifloris; invo- setaceous, one-flowerlucri squamis appressis. | ed; scales of the invo-

Nearly glabrous; lucrum appressed.

Mich. 2. p. 112. Nutt. 2. p. 155.

This species I have not noticed and perhaps as suggested by Mr. Nuttally it is only a variety of the A. Foliolosus. The A. Flexuosus of Nuttall, A. Geniculatus, Hamilton, was considered by Dr. Muhlenberg, as well as Pursh, to be the A. Sparsiflorus of Michaux.

Grows in the low country of Carolina. Mich.

Flowers.

#### 12. Tenuifolius. Lin.

A. foliis lineari-lanceolatis utrinque atte nuatis, integerrimis, end, very entire, slight-margine scabriusculis; ly scabrous along the caule glabro, ramoso, margin; stem glabrous, erecto, ramulis uniflo- branching, erect, the ris; involucri squamis | branches one-flowered; acutis, laxis.

Leaves linear-lanceolate, tapering at each scales of the involucrum acute. loose.

Sp. pl. 3. p. 2026. Pursh, 2. p. 546? Nutt. 2. p. 155.

Stem two to three feet high, glabrous near the base, finely pubescent towards the summit. Leaves very numerous, linear, acute at each end, glabrous, slightly scabrous along the margins, those near the flowers, becoming suddenly very minute. Flowers numerous, in racemes along the main branches, on small branches or peduncles about an inch long. Scales of the involucrum linear, acute, imbricate, loosely appressed, much shorter than the disk. Florets of the ray numerous, very narrow, pale purple; of the disk numerous, yellowish. Seeds oblong, finely pubescent. Pappus hairy.

Grows in loose soils, particularly in the upper districts of Carolina.

Flowers October-November.

### 13. Dumosus? Lin.

A. foliis lineari-lanceolatis, integerrimis, glabris; caule paniculato; floribus terminalibus; involucri squamis lineari-lanceolatis, imbriantic apprendix E bricatis, appressis. E. | cate, appressed.

Leaves linear-lan-

Sp. pl. 3. p. 2026. Pursh, 2. p. 546.

Stem about two feet high, glabrous, somewhat sparingly branched. Leaves linear-lanceolate, acute, entire and slightly scabrous along the margin. Flowers at the summits of the branches, solitary, terminal. Scales of the involucrum linear-lanceolate, acute, loosely appressed, glabrous. Florets of the ray narrow, pale purple. Seeds nearly glabrous.

This species is by Mr. Nuttall considered as a variety of A. Tenuifolius, to which in its foliage it is closely allied. As I have specimens however. strongly resembling the original figure of Pluk. (t. 78. f. 6.) and bearing upon branches several inches long but one solitary terminal flower, I have concluded to retain it for the present and point it out as one of the many doubtful species in this prolific genus.

Grows in damp rich soils.

Flowers October.

### 14. Ericoides.

A. foliis linearibus, acutis; caule glabro.

Leaves linear. enintegerrimis, glaberri-mis, ramulorum subu-latis, approximatis, cau-linis elongatis; involu-tire, very glabrous, those of the branches subulate, approximate, of the stem long; scales cri squamis lanceolatis, of the involucrum lanceolate, acute; glabrous.

Sp. pl. 3. p. 2027. Pursh, 2. p. 546.

Stem two to three feet high, very glabrous, branches very numerous, slender, expanding. Leaves of the stem linear, acute at each end, glabrous; of the branches, subulate, gradually diminishing in size, very slender, so that although numerous they scarcely clothe the branches. Flowers as in the preceding species, on short peduncles of half an inch to an inch long, forming racemes along the large branches. Scales of the involucrum comparatively large, distinctly lanceolate, nearly as long as the disk. Florets of the ray, numerous, linear, pale purple. Seed a little pubescent. Pappus slightly scabrous.

This species appears to differ from the preceding by the very narrow subulate leaves on the branches, gradually diminishing in size and by the scales. of the involucrum which are much larger, lanceolate, and approaching more The A. Ericoides of Mich. probably benearly to the length of the disk.

longs to A. Multiflorus or A. Ciliatus.

Grows in barren soils from Canada to Carolina. Pursh. My specimens. are from Pennsylvania, marked by D. Muhlenberg, A. Ericoides verus Lin. secundum Smith.

Flowers October—November.

# 15. RACEMOSUS.

A. foliis lineari-lan- | Leaves bescentibus, margine escent underneath, sca-

scabris; ramis gracili- | brous along the marbus, elongatis; capitulis subsessilibus, confertis, juxta summitatem ramorum.

the summit of the bran-

Root perennial. Stem about two feet high, very diffuse, with slender branches eight to twelve inches long, slightly pubescent. Leaves linearlanceolate, pubescent underneath, along the margin and midrib; those of the stem one to two inches long, one to two lines wide, those of the branches very small, two to three lines long. Flowers very small, in simple racemes, occupying two to three inches at the summit of the branches, on peduncles one to two lines long. Scales of the involucrum imbricate, linearlanceolate, loosely appressed, nearly glabrous, as long as the disk. Florets of the ray numerous, linear, pale purple; of the disk yellow. Seeds slightly pubescent.

Grows in damp rich soils—Paris Island.

Flowers September—October.

# 16. Multiflorus.

culis, margine subcilia-tis; caule ramosissimo, diffuso, pubescente; in-volucris pedunculisque peduncles squarrose, oblongis, ciliatis. E. ed.

A. foliis linearibus, Leaves linear, entire, integerrimis, glabrius- nearly glabrous, slightsquarrosis, squamis the scales oblong, fring-

Sp. pl. 3, p. 2027. Pursh, 2, p. 546.

Stem two to three feet high, branching, very pubescent, almost hispid. Leaves linear, acute, small, pubescent and fringed along the margin. Flowers in crowded terminal raceines, on the horizontal branches somewhat se-Pedancles two to three lines long. Scales of the involucrum oblong and obovate, fringed, squarrose, and the small leaves on the short peduncles are commonly as squarrose as the involucrum, of which they then appear to be a continuation. Florets of the ray oblong, entire? nearly white; of the disk yellowish. Seed pubescent.

Grows in dry fields-Canada to Carolina. Pursh.

# 17. SQUARROSUS. Walt.

A. foliis creberrimis, arcte sessilibus, ovatis, acutis, reflexis, rigidis, margine hispidis; caule ramoso hirto; ramulis unifloris; involucri squamis lanceolatis, hirtis, laxe appressis.

Leaves very numerous, closely sessile, ovate, acute, reflexed, rigid, hispid along the margin; stem branching, hairy; branches one-flowered; scales of the involucrum lanceolate, hairy, loosely appressed.

Sp. pl. 3. p. 2028. Walt. p. 209. Mich. 2. p. 112. Pursh, 2. p. 547. Nutt. 2. p. 155.

Stem about two feet high, procumbent, branching, hispid, very rough. Leaves small, crowded, sessile, the young sometimes obovate, the old deltoid, acute, very scabrous, sprinkled with rigid hair. Flowers terminal, forming a loose panicle. Scales of the involucrum imbricate, (twenty-four to thirty,) mucronate, after flowering reflexed. Florets of the ray sixteen to twenty, linear-lanceolate, three-toothed at the summit, bright blue, handsome; of the disk yellow. Seed hairy. Pappus scabrous.

Grows in dry soils—common. Flowers September—November.

# 18. Concolor. Lin.

A. foliis oblongolanceolatis, integerrimis, utrinque cano-pubescentibus; caule simplicissimo, erecto, pubescente; racemo terminali; involucri squamis lanceolatis, sericeis, appressis.

Leaves oblong, lanceolate, entire, hoary and pubescent on both surfaces, stem simple, erect, pubescent; raceme terminal; scales of the involucrum lanceolate, silken, appressed.

Sp. pl. 3. p. 2029. Walt. p. 209. Mich. 2. p. 111. Pursh, 2. p. 548. Nutt. 2. p. 155.

Root perennial, sometimes tuberous, like the Liatris when in sandy soils. Stem erect, two to three feet high, virgate, pubescent, sparingly branched.

Leaves sessile, entire, slightly three-nerved, almost tomentose. Flowers in a long terminal raceme, on peduncles three to six lines long. Scales of the involucrum slightly appressed, villous. Florets of the ray, twelve to fifteen, linear-lanceolate, bright blue; of the disk blue also. Anthers and Stigmas Seed villous. Pappus slightly scabrous. purple.

Grows in dry soils-common.

Flowers September-October.

#### Pursh. 19. RETICULATUS.

A. foliis sessilibus, mis acutissimis.

Leaves sessile. oboblongo lanceolatis, long, lanceolate, acute utrinque acutis, cano tomentosis, triplinervi-bus, subtus reticulato venosis; floribus race-lately veined; flowers mosis; involucri squa- in racemes; scales of the involucrum very acute.

Pursh, 2. p. 548.

Stem about three feet high, tomentose, branching toward the summit. Leaves with the margins revolute, racemes somewhat fastigiate. Peduncles almost naked. Scales of the involucrum loosely imbricate. Flowers middle sized. Florets of the ray and disk white. Pursh.

With this species I am unacquainted.

Grows in dry swamps-Carolina and Georgia. Pursh.

Flowers August—October.

### 20. Nove Anglie. Lin.

A. foliis angusto-lanceolatis, pilosis, amco longioribus.

Leaves narrow, lanceolate, hairy, amplexplexicaulibus, basi au-riculatis; caule piloso; base; stem hairy; flow-floribus terminalibus, ers terminal, someinterdum confertis; in- | times crowded; scales volucri squamis lanceo- of the involucrum lanlatis, laxe appressis, dis- | ceolate, loosely appressed, longer than the disk.

Sp. pl. 3. p. 2032. Mich. 2. p. 113. Pursh, 2. p. 549. Nutt. 2. p. 156.

Stem three to four or six feet high, with diffuse spreading branches, hairy, almost hispid. Leaves long, narrow, lanceolate, very entire, hairy and scabrous along the margin, slightly auriculate at base. Flowers in a loose, terminal panicle on small branches half an inch to three inches long. Scales of the involucrum lanceolate, acute, somewhat hispid, scarcely longer than the disk, frequently coloured. Florets of the ray numerous, narrow, bright purple. Seeds hairy, almost villous.

The plant I have described and which I collected in the western districts of Georgia, belongs to the var. Spurius, A. Spurius. Willd.—but its branches are more diffuse, and its flowers more scattered than I believe are com-

mon in that variety.

Grows in rich soils, sometimes to the height of ten feet. Parsh. Flowers September—October.

#### 21. Cyaneus? Hoffman.

A. foliis lineari-lanlanceolatis, æquantibus.

linear-lan-Leaves ceolatis, amplexicauli- ceolate, amplexicaule, bus, lævigatis; caule smooth; stem branchramoso, glaberrimo, ra-mis patentibus; floribus racemoso - paniculatis, involucri squamis laxis, discum involucrum loose, lanceolate, as long as the disk.

Pursh, 2. p. 550? Nutt. 2. p. 156.

Stem two to three inches high, glabrous or slightly pubescent on the young branches. Leaves linear-lanceolate, those of the stem rather linearsubulate, somewhat scabrous, very acute, slightly amplexicaule. Flowers scattered along rigidly expanding paniculate branches, on small branches or peduncles half an inch to three inches long, not large. Scales of the involucrum linear-lanceolate, nearly glabrous, loosely appressed, nearly as longas the Florets of the ray numerous (twenty to twenty-four) narrow, purple? of the disk purple. Seed pubescent.

I have inserted this species with much hesitation. I have no opportunity of referring to the figure of Hoffman as the type of this species, and the plant I have described which was sent me under this name by Dr. Schweinitz is certainly not the plant of Pursh. It however differs from any species I have hitherto described, and until a good monograph of this genus with plates, shall be published, many of its species must continue obscure

and doubtful.

### 22. Virgatus. E.

A. foliis lineari-lanceolatis, amplexicaulibus, glaberrimis; caule sub ramoso, ramis virgatis, erectis; capitulis involucri racemosis; squamis acutissimis, sub squarrosis. E.

Leaves linear-lanceolate, amplexicaule, very glabrous; sparingly branched, branches virgate, erect; heads racemose; scales of the involucrum very acute, slightly rose.

Stem erect, three to four feet high, glabrous, branches few, erect, strictly virgate, slightly pubescent at the summit. Leaves of the stem three to four inches long, three to four lines wide, sessile, amplexicaule; glabrous, with the margins a little scabrous; those of the branches similar but smaller. Flowers in simple terminal racemes, on peduncles half an inch to two inches Scales of the involucrum linear-lanceolate, very acute, almost macronate, slightly squarrose. Florets of the ray, twenty to twenty-four, small, Seeds nearly glabrous. bluish purple.

From the A. Cyaneus this species differs by its larger leaves and long, erect, virgate branches; from A. Phlogifolius which it most resembles in the size of its leaves, it differs by its want of pubescence, smaller flowers and

simple racemes.

Grows in the western district of Georgia.

Flowers September—October.

#### 23. CAROLINIANUS. Walt.

A. caule fruticoso, flexuoso, ramosissimo, pubescente; foliis sessibentissimis, sub-squarrosis.

Stem shrubby, flexuous, much branched, pubescent; leaves seslibus, oblongo-lanceo-latis, utrinque attenua-tapering at each end; tis; involucri squamis | scales of the involucrum lineari-lanceolatis, pu- | linear-lanceolate, very pubescent, somewhat squarrose.

Sp. pl. 3. p. 2017. Walt. p. 208. Mich. 2. p. 111. Pursh, 2. p. 550. Nutt. 2. p. 156.

Stem pubescent, flexuous and decumbent, leaning upon surrounding plants VOL. II.

and growing to the height of ten or twelve feet, very pubescent when young. Leaves oblong-lanceolate, pubescent, very acute, attenuated near the base, then dilated and amplexicaule. Flowers very numerous, though generally solitary on short branches, large and handsome. Scales of the involucium very pubescent, almost villous. Florets of the ray numerous, bright purple; of the disk purplish. Seeds pubescent.

Grows in swamps. Flowers October.

\*\*\* Foliis lanceola-tis ovatisque, inferiori-bus serratis.

\*\*\* Leaves lanceo-late and ovate, the low-er serrate.

† Floribus corymbo- | † Flowers in corymbs-

#### 24. Surculosus? Mich.

A. caule simplici, superne pubescente; foliis obovato-lanceolatis, acutis, parce serratis, superioribus minoribus; floribus paucis, majusculis; lanceolate, acute, sparingly serrate, scabrous on the upper surface, the upper ones small; involucri squamis ob- flowers few, large; longo-ovatis, reflexis, scales of the involucrum pubentissimis. E.

Stem simple, pubescent towards the summit; leaves obovateoblong, ovate, reflexed, very pubescent.

Mich. 2. p. 112. Pursh, 2. p. 547. Nutt. 2. p. 157. A. Liatroides. Muhl. Cat.

Root creeping. Stem erect twelve to eighteen inches high, very pubescent towards the summit. Leaves sessile, somewhat three-nerved, slightly scabrous underneath, pubescent and very scabrous on the upper surface, ciliate when young; the lower leaves attenuate at base, three to four inches long, six to eight lines wide, the upper smaller. Flowers large, not numerous, (thirty-five) in a small terminal corymb, sometimes solitary. Involvcrum imbricate, cylindrical; the lower leaves ovate, nearly acute; the interior oblong, obtuse, reflected, all very pubescent. Florets of the ray about twenty, bright purple; of the disk, yellow. Seeds slightly angled, and a little hairy. Pappus scabrous.

Grows in Carolina, in the flat pine barrens near Purysburg.

Flowers October—November.

#### 25. Puniceus.

A. foliis amplexicaulibus, lanceolatis, ser- lanceolate, ratis, scabriusculis; ra- | slightly scabrous; branmis paniculatis, involu- ches paniculate; invocris laxis discum superantibus, lineari-lanceolatis, subæqualibus; caule pido.

Leaves amplexicaule, serrate, lucrum loose, longer squamis | than the disk; scales linear-lanceolate, nearhis- ly equal; stem hispid.

Sp. pl. 3. p. 2040. Mich. 2. p. 115. Pursh, 2. p. 554. Nutt. 2. p. 158.

The plant which in the low country of Carolina and Georgia has been considered as the A. Puniceus, differs so much from the Northern specimens which I possess, that it ought probably to constitute a new species.

The specific character above quoted is taken from Willdenow. I shall

now describe the plant as it appears to us.

Stem two to three feet high, robust, lucid, glabrous, the branches furrowed, pubescent. Leaves sessile, spathulate-lanceolate, dilated and semiamplexicaule, acutely serrate, smooth on the under surface, scabrous on the upper, six inches long and nearly two wide, when young pubescent. Flowers large, numerous, with a corymbose panicle. Scales of the involucrum numerous, imbricate, linear, acute, fringed, reflected. Florets of the ray twenty to thirty, linear-lanceolate, bright purple; of the disk numerous, yellow. Anthers exserted. Seed angled, a little hairy.

Grows along the margins of our rivers. Very common on the tide lands

of the Ogechee.

Flowers October-November.

### 26. Acuminatus.

A. foliis lato-lanceo- I

Leaves broad, lanlatis, inferne attenua- | ceolate, tapering totis, integris, superne wards the base, entire, inæqualiter serratis, unequally serrate near longissime acuminatis; the summit, conspicucaulesimplici, flexuoso, anguloso, panicula co-rymbosa, divaricato-dichotoma; involucri ously acuminate; stem simple, flexuous, angled; panicle corymbose, divaricate, dichodisco brevioribus.

foliolis laxis, linearibus, | tomous, leaves of the involucrum loose, line-ar, shorter than the

Mich. 2. p. 109. Pursh, 2. p. 555.

This species I have not seen in Carolina. Pursh says that a humble variety with a naked few-flowered corymb, scarcely longer than the leaves, grows on the summits of our highest mountains.

Flowers August-October.

### 27. Dracunculoides.

A. foliis linearibus, caule glabriusculo. | nearly glabrous.

#### Willdenow.

Leaves linear, acuacuminatis, integerri-mis, inferioribus linea-ri-lanceolatis, subserra-slightly serrate; brantis; ramis corymbosis; ches corymbose; invo-involucris imbricatis; lucrum imbricate; stem

Sp. pl. 82. p. 2050. Pursh. 2. p. 557.

Stem four feet high, erect, the branches corymbose, and marked with a decurrent hairy line; the lower leaves one to two inches long, linear-lanceolate, acuminate at each end, serrate in the middle, the upper linear, entire. Flowers small. Florets of the ray nearly white. Scales of the involucrum lanceolate, acute, somewhat expanding. Willd.

With this species I am unacquainted.

Grows in low grounds and along ditches: New-Jersey to Carolina. Pursh. Flowers September-November.

# latis.

†† Floribus panicu- | †† Flowers in panicis.

28. Junceus?

A. foliis lanceolato, | Leaves lanceolate, linearibus, sessilibus | linear, sessile, glabrous, glabris, infimis subser-ratis, ramulorum lan-ceolatis; caule pani- the lower slightly ser-rate, those of the bran-ches lanceolate; stem

culato, glabro, ramis paniculate, glabrous, virgatis; involucris imbricate; involucrum imbricate.

Sp. pl. 3. p. 2050. Pursh, 2. p. 557. Nutt. 2. p. 158.

Stem two to four feet high, with long slender branches, slightly pubescent. Leaves sessile, narrow, lanceolate, serrate, glabrous; those of the branches entire. Flowers small, in racemes at the end of the virgate branches, on peduncles two to four lines long. Scales of the involucrum linearlanceolate, acute, nearly glabrous. Florets of the ray (sixteen to twenty,) narrow, pale purple. Seeds somewhat pubescent.

I know not whether my reference of this plant is correct. I have of it apparently two varieties, one with leaves longer and more acutely serrate than the other and with flowers somewhat longer; but in habit similar.

Grows in damp soils, along ditches, swamps, &c.

Flowers September—October.

### 29. Divergens.

ceolatis, serratis, gla-bris, caulinis lineari-lanceolatis; ramis pa-tentibus; involucris imcente.

A. foliis elliptico-lan- | Leaves elliptic lanbricatis; caule pubes- | lucrum imbricate; stem pubescent.

Sp. pl. 3. p. 2052. Pursh, 2. p. 558. Nutt. 2. p. 159.

Stem two to four feet high, with the summit and numerous branches pubescent. Leaves lanceolate, very acute, finely serrate, glabrous; the small ones on the branches as usual entire. Flowers in somewhat crowded racemes on the expanding branches on peduncles one to three lines long. Scales of the involucrum linear-lanceolate, imbricate, nearly glabrous. Florets of the ray white, tinged with purple. Seeds somewhat pubescent.

Mr. Nuttall considers the A. Diffusus of Aiton, and the A. Pendulus, Ait. with long divaricate pendulous branches as only varieties of the present The last would appear from description to approach very nearly the A. Junceus of this sketch. If they should prove the same plant, they must I think be separated from A. Divergens.

Grows in woods in moderately fertile soils.

Flowers September—October.

#### Lin. 80. Tradescanti.

A. foliis lanceolatis. serratis, sessilibus, gla- | serrate, sessile, caule tereti, glabro.

Leaves lanceolate. bris; ramis virgatis; in-volucris imbricatis; gate; involucrum im-caule tereti, glabro. bricate; stem terete, glabrous.

Sp. pl. 3. p. 556. Mich. 2. p. 115. Pursh, 2. p. 556. Nutt. 2. p. 158.

Stem three to four feet high, glabrous, with numerous erect virgate branches. Leaves lanceolate, acute at each end, when large finely serrate, when small entire, a little scabrous on the upper surface. Flowers small, in simple or compound racemes, very numerous. Scales of the involucrum linear-lanceolate, acute, nearly glabrous. Florets of the ray, (about twenty) narrow, pale purple, of the disk, yellow. Seeds a little hairy.

The plant I have described agrees very exactly with the A. Vimineus, Willd: considered by Pursh, and I believe Mr. Nuttall, as a variety of A. Tradescanti. I must however remark that I have a specimen sent from Penn. by Dr. Muhlenberg, as the A. Tradescanti of Lin. which differs very widely from this, but differs, I think also, from the description of Ait. and

 $\mathbf{Willdenow.}$ 

Grows in the mountains of Carolina, Mich. Probably in all of the upper districts, as it is found in the same range of country in N. Carolina.

Flowers September-October.

### 31. Discoideus. E.

A? caule erecto sub l villoso; foliis spathula- | what ·losis, laxe appressis, subulate, villous, loosesub squarrosis; radii corollulæ 0.

Stem erect, somevillous: to ovatis, acutis, ser-ratis, pilosis, subtus pallidioribus; involucri spathulate, ovate, acute, serrate, hairy, pale on the under surface; squamis, subulatis, vil- | scales of the involucrum ly appressed, somewhat squarrose; florets of the ray none.

Stem two to three feet high, erect, generally hairy, sometimes very villous, branches not numerous, virgate, erect. Leaves all spathulate, distantly and coarsely serrate, very hairy on the under surface, three to four inches long, including the attenuated base, nearly two inches wide. Flowers

of a middling size, in a long virgate panicle. The lateral racemes axillary, Scales of the involucrum subulate, acute, villous, somewhat squarrose, scarcely longer than the mature seed. Florets of the ray wanting; of the disk twelve to fifteen, deeply five-cleft, pale purple. Seed ob-

long, very glabrous. Receptacle small, naked.

This plant, when I first discovered it, appeared to me likely to constitute a genus in Syngenesia Æqualis, somewhere between Vernonia and Eupatorium; but its involucrum and its babit so much resemble those of an Aster, that I have been induced for the present to arrange it here—varies with the lower stem leaves, nearly glabrous, and the leaves spathulate lanceolate.

Grows very abundantly in the rich high lands between the Alabama and

Chatahouchie rivers.

Flowers September-October.

#### 32. Versicolor. Willd.

A. foliis subamplexicaulibus, lato-lanceo- amplexicaule, broad, latis, serratis; caule ra-mosissimo, glabro; in-volucri squamis lanceo-latis, laxis, disco bre-latis, laxis, disco brevioribus.

somewhat Leaves loose, shorter than the disk.

Sp. pl. 3. p. 2045. Pursh, 2. p. 553. Nutt. 2. p. 158.

Upper leaves entire, the lower somewhat serrate, those of the root ob-. long, attenuate at each end, serrate in the middle, all glabrous. Flowers handsome, clustered towards the summits of the branches. Florets of the ray, first white, afterwards purple. Willd.

The specimens of plants that pass under this name with us, agree very accurately with the description of Willdenow, excepting that the flowers are

small, and the plant of course not as ornamental as he represents.

Grows in rich damp soils. Flowers September—October.

### 32. LEVIGATUS.

A: foliis subamplexi- | Leaves somewhat caulibus, lato-lanceo- | amplexicaule, broad, latis, subserratis, læ lanceolate, slightly servibus; caule ramosissi- rate, smooth; stem mo,glabro,ramulis mul- much divided, gla-

tisloris; involucri; squa- | brous, branches many mis, lanceolatis, laxis, flowered; scales of the discum subæquantibus. involucrum lanceolate, loose, as long as the

Sp. pl. 3. p. 2046. Pursh, 2. p. 553.

Stem two to five feet high, glabrous, branching profusely. Lower leaves two to three inches long, semiamplexicaule, glabrous, the upper narrow nearly entire. Flowers numerous, in racemose panicles. Scales of the involucrum linear-lanceolate, loosely imbricate. Florets of the ray about thirty, nearly linear, pale purple; of the disk yellow. Seeds pubescent.

Grows in damp rich soils. Flowers October-September.

#### 83. Amplexicaulis.

A. foliis ovato-oblongis, acutis, amplexicalibus, cordatis, sercaule, cordate, serrate; ratis; caule paniculato, stem paniculate, glamis lanceolatis, arcte volucrum lanceolate, imbricatis.

Leaves ovate, obglabro; involucri squa- | brous; scales of the inclosely imbricate.

Sp. pl. 3. p. 2046. Pursh, 2. p. 552. Nutt. 2. p. 153.

Stem erect, two to three feet high, glabrous, sparingly branched towards the summit. Leaves oblong lanceolate, the lower attenuate, semiamplexicaule, the upper more cordate, all glabrous and slightly serrate. Flowers middle sized, in a terminal panicle. Scales of the involucrum linear-lanceolate, thick, very acute, glabrous. Florets of the ray (sixteen to twenty) narrow, purple; of the disk yellow. Seed nearly glabrous.

Grows in dry soils moderately fertile.

Flowers September—October.

\*\*\*\* Foliis cordatis, serratis.

Leaves date, serrate.

### 35. Undulatus. Lin.

A. foliis caulinis oblongis, cordatis, amplexicaulibus, undulatis, scabris, summitate dentatis; paniculæ ramis patentibus, paucifloris; involucris squarrosis.

Stem leaves oblong. cordate, amplexicaule, undulate. scabrous. toothed near the summit; branches of the paricle expanding, fewsub- | flowered; involucrum slightly squarrose.

A. Undulatus. Linn. verus sec. Smith. Sp. pl. edit. 1. 1228.

A. Patens. Willd. Sp. pl. 3. p. 2034. Pursh, 2. p. 551.

A. Amplexicaulis. Mich. 2. p. 114.

Stem two to three feet high, scabrous, branching towards the summit. Leaves of the stem scabrous, and a little hairy, slightly undulate, sometimes entire, but frequently toothed near the summit; amplexicaule with the lobes surrounding the stem; of the branches oblong-lanceolate, sessile. Flowers large, not numerous, in a loose terminal panicle. Scales of the involucrum very numerous, linear-lanceolate, acute, pubescent, reflected at the summits. Florets of the ray about twenty, bright bluish purple; of the disk numerous, yellowish, sometimes changing to purple, as they decay. Seeds hairy.

Grows in dry soils—very common. Flowers September—November.

#### Mich. 36. Diversifolits.

A. foliis sub-integris, undulatis, sub-pubescentibus, scabris, inferioribus alato-petiola- brous, the lower tis, cordato-ovatis, su- cordate, ovate, perioribus oblongo-lanceolatis; panicula laxa, cemifloris.

Leaves nearly entire, undulate, pubescent, somewhat scawinged petioles, upper oblong-lanceoramulis gracilibus ra- late; panicle loose, the branches slender, racemose.

Mich. 2. p. 113.

A. Undulatus. Sp. pl. 3. p. 2035. Pursh, 2. p. 551. Nutt. 2. p. 156. A. Tardiflorus? Walt. p. 210.

Stem about three feet high, pubescent, scabrous, diffusely branched near the summit. Leaves generally entire, sometimes slightly toothed; the petiole of the lower ones winged, dilated at base, amplexicaule—those of the branches very small, all very pubescent underneath, slightly scabrous on the upper surface. Flowers of a middling size, in a long terminal panicle. Leaves of the involucrum numerous, lanceolate, pubescent, fringed. Florets of the ray from twelve to fifteen, pale purple; of the disk twentyfour, yellow, changing as they decay to purple. Seeds slightly angled, a little hairy.

Grows in dry soils, very common. Flowers September—November.

# 37. SAGITTÆFOLIUS. Wedemeyer.

A. foliis oblongolanceolatis, sessilibus, ceolate, sessile, serrate serratis, sub glabris, radicalibus ob- | glabrous, those of the longis, cordato-sagitta- | root oblong, cordate, tis, serratis, petiolatis; | sagittate, serrate, pecaule ramoso, glabro; tiolate; stem branchinvolucris laxis, imbricatis.

Leaves oblong-lanin the middle, rather ing, glabrous; involucrum loose, imbricate.

Sp. pl. 3. p. 2035. Pursh, 2. p. 551. Nutt. 2. p. 156.

Stem two to three feet high, erect, glabrous, bearing many branches. Leaves of the root oblong, unequally serrate, cordate and sagittate at base, glabrous, two inches long and upwards, on naked petioles; lower stem leaves oblong, ovate, acuminate, coarsely serrate, on winged petioles, the upper oblong-lanceolate, acuminate, sessile, serrate in the middle, the kighest entire. Flowers of a middling size, peduncles leafy. Scales of the involucrum lanceolate, loosely imbricate. Willd.

The plants which I have examined as belonging to this species have their leaves slightly scabrous and pubescent along the veins, and nearly entire, thinner however and more glabrous than those of A. Diversifolius to which

they are nearly allied.

Grows in the upper districts of North and South-Carolina.

Flowers September—October.

### 38. SCARER.

A. foliis inferioribus ! petiolatis, oblongo-cerdatis, acutis, integerrimis, caulinis sessilibus, amplexicaulibus, ovato lanceolatis, superne attenuatis, acutissimis. omnibus scabris, undulatis; panicula laxa elongata, ramulis ra-

Lower leaves petiolate, oblong, cordate, acute, entire, those of the stem sessile, amplexicaule, ovate lanceolate, tapering to a very acute point, all scabrous, undulate; panicle loose, long, the branches racemose.

Stem about three feet high, striate, a little hairy, very scabrous. Lower leaves on petioles, two to three inches long, cordate, with the sinus deep, and the lobes round; stem leaves rather narrow, lanceolate, and ovatelanceolate, rigid, very acute, all scabrous. Flonders rather small, in a long terminal panicle. Scales of the involucrum linear-lanceolate, acute, pubescent, appressed. Florets of the ray twelve to sixteen, oval, purple; of the disk yellow. Seed angled, hairy. Pappus scabrous.

This species differs from A. Diversitolius in its leaves which are narrower, much more acute, more rigid, more scabrous and less pubescent, and

perhaps also by a larger panicle.

Grows in soils rather dry. Flowers September-October.

## 39. Paniculatus?

A. foliis ovato-lanceolatis. subserratis, petiolatis, glabris, radicalibus, ovato-cordatis serratis, scabris, pepilosis; involucris laxis, subimbricatis.

Leaves ovate-lanceolate, slightly rate, petiolate, glabrous, those root ovate-cordate, sertiolis nudis; caule ra, rate, scabrous, with the mosissimo, glabro, ra- petioles naked; stem much divided, glabrous, branches hairy; involucrum loose, somewhat imbricate.

Sp. pl. 3. p. 3035. Pursh, 2. p. 551. Nuttall, 2. p. 156.

I insert this species with much hesitation; my specimens which were referred to it by Dr. Muhlenberg, differ in some respects from the description of Willdenow, and may really belong to another section of this genus.

Stem three to four feet high, striate, glabrous, branching very much towards the summit, the young branches a little hairy. Root leaves wanting: stem leaves spathulate-lanceolate, acute, or slightly acuminate, a little hairy, particularly along the margins and veins. Flowers small in compact clustered racemes, forming a large terminal panicle. Scales of the involucrum not very numerous, subulate, nearly glabrous. Florets of the ray about twelve, narrow, pale purple; of the disk yellow, changing as they decay to purple. Seeds very glabrous.

This plant, which is probably the A. Paniculatus of Muhlenberg and Pursh, differs very essentially from the A. Diversifolius. The A. Panicu-

latus of Nuttall, must certainly be a different plant.

Grows in damp rich soils in the low country of Carolina.

Flowers September—October.

#### Lin. 40. Cordifolius.

subimbricatis.

A. foliis cordatis, acutis, subtus pilosis, argute serratis, petiolatis, petiolis alatis; late, with the petioles caule paniculato, pilo-so; involucris laxis, late, hairy; involucrum loose, slightly imbri-

Sp. pl. 3. 2036. Mich. 2. p. 114. Pursh, 2. p. 552. Nutt. 2. p. 156.

Stem two to three feet high, branching, the branches pubescent. Leaves of the root and lower part of the stem cordate, tapering to an acute point, acutely serrate, slightly pubescent underneath, on petioles one to two inches long, very slightly winged. Flowers numerous, rather small, in panicles composed of crowded racemes. Scales of the involuerum linear-lanceolate, nearly glabrous, loosely appressed. Florets of the ray about twelve, narrow, white, tinged with purple. Seeds glabrous. Varies, with the lower leaves ovate-cordate, the upper spathulate-ovate, the serratures nearly obtuse, and the petioles more conspicuously winged.

Grows in the upper and mountainous districts of Carolina and Georgia.

Flowers September—November.

### 41. Corymbosus. Ait.

A. foliis ovatis, arsis.

Leaves ovate, acuteserratis, acumi- ly serrate, acuminate, natis, inferioribus cor- the lower cordate, pedatis, petiolis nudis; tioles naked; branches ramis pubescentibus, pubescent, somewhat sub fastigiatis; involucri squamis ovato lan- involucrum ovate-lan-ceolatis, arcte appres- ceolate, closely appres-

Sp. pl. 3. p. 2036. Pursh, 2. p. 552. Nutt. 2. p. 156.

Stem one to two feet high, glabrous, sparingly branched near the summit, the branches a little pubescent. Leaves somewhat large, the lower ovate, cordate, the upper spathulate-lanceolate, all glabrous, acuminate and very acutely serrate. Flowers not numerous, much larger than those of the preceding species, in a terminal somewhat fastigiate corymb. Scales of the involucrum ovate-lanceolate, pubescent, closely imbricate. Florets of the ray about twelve, narrow, white, tinged with purple, Seeds glabrous.

Grows in shady woods in the upper districts of Carolina and Georgia.

Flowers September—October.

\*\*\*\*\* Pappo du-plici, floribus plerum-que corymbosis, vix hu-rally in corymbs. jus generis.

#### 42. Linardifolius. Lin.

foliis crebris, Leaves superne ramoso, ramis | stem branching gitudine disci.

numerous, linearibus, mucronatis, | linear, mucronate, withenerviis, rigidis, paten- out nerves, rigid, ex-tibus, scabris; caule panding, scabrous; unifloris fastigiatis; in- the summit, branches volucris imbricatis, lon- | fastigiate, one-flowered; involucrum imbri-cate, as long as the Sp. pl. S. p. 2024. Walt. p. 209. Mich. 2. p. 110. Purph, 2. p. 545. Chrysopsis Linariifolia. Nutt. 2. p. 122.

Stem about two feet high, generally erect, when young pubescent. Leaves alternate, but crowded, expanding or reflected, with the midrib year prominent, very scabrous along the margins, about an inch and half long. Flowers in an umbellate corymb, the branches generally one-flowered and clustered at the summit of the stem. Segles of the involucrum very numerous, imbricate, linear-lanceolate, fringed. Florets of the ray ten to twelve, linear-lanceolate, three-cleft at the summit, pale purple; of the disk namerous, yellow. Seeds oblong, villous. Pappys double or composed of short hairs intermingled with the long.

Between the A. Rigidus of Fursh, and this species, I can perceive no dis-

tinction.

Grows in dry soils, very common. Flowers September—November?

# 43. DICHOTOMUS.

silibus, ovalibus, obtu- sile, oval, obtuse, pusis, pubescentibus; co- bescent; corymb somerymbo subdichotomo, what dichotomous. ramulis nudis, elonga- branches naked, long. tis.

A. foliis arcte ses- | Leaves closely ses-

Stem about two feet high, very pubescent, dichotomously divided towards the summit. Leaves oblong, oyal, closely sessile and semetimes slightly cordate. Corymb few flowered, pedupcles long, naked. Scales of the involucrum linear-lanceolate, very pubescent, scarcely longer than the mature Florets of the ray, ten to sixteen, white, tinged with purples of the disk numerous, yellowish. Seeds very hairy. Pappus double.

Grows in damp rich soils-Paris Island.

Flowers October.

### 44. Humilis.

A. foliis subrhom-

Leaves semewhat boideis, ovato-lanceo- rhomboidel, oval-lanlatis, utrinque acumina-tis, subpetiolatis, gla-bris, margine hispidis; ceolate, acuminate at each end, slightly pe-tiolate, glabrous, his, corymbodivergenti-di- | pid along the margin; chotomo, n idiusculo, corymb diverging, di8-floris.

paucifloro: involucris | chotomous, rather nalaxis imbricatis; radiis | ked, few-flowered; involucrum loose, imbri-cate, florets of the ray

Sp. pl. 3. p. 2038. Pursh, 2. p. 548. A. Cornifolius. Sp. pl. 3. p. 2039. A. Infirmus. Mich. 2. p. 109.

Stem one to two feet high, pubescent. Leaves lancéolate, acuminate at each end, reticulately veined, very conspicuously hairy along the margins and veins. Flowers in small terminal corymbs. Scales of the involucrum lanceolate, a little hairy. Florets of the ray about eight, lanceolate, white. Seed glabrous.

This species appears to me to differ from the A. Amygdalinus in its léaves, which are larger, thinner, more rédiculate, and more hairy, by its

larger radial florets, and by its large glabrous seed.

Grows in the mountains of Carolina. Pursh. Mich.

Flowers September—October.

### 45. Amygdalinus. Lam.

A. foliis lanceolatis, F acuminatis. basi tenuatis, glabris, mar-gine scabris; caule sim-plici, apice corymboso; gin; stem simple, co-

Leaves lanceolate. at- acuminate, tapering at involucris laxis imbricatis, squamis lanceo-latis, sub acutis.

rymbose at the sum-mit; involucrum loosely imbricate, the scales lanceolate, generally acute.

Mich. 2. p. 109. Pursh, 2. p. 549. A. Umbellatus. Ait. 3. p. 199. Chrysopsis Amygdalina. Nutt. 2. p. 158.

Stem about two feet high, striate, a little angled, finely pubescent near the summit. Leaves lanceolate, acuminate at each end, a little pubescent, the margin reticulately veined, but the veins not as prominent as in the preceding species, slightly scabrous on the upper surface. Flowers in a numerous and terminal corymb. Scales of the involucrum pubescent, scarcely longer than the mature seed, lanceolate, rather acute than obtuse, pubescent, particularly along the margins. Florets of the ray about twelve, oblong, narrow, white. Seeds pubescent along the angles. Pappus double.

If this plant should be made the type of a new genus, the species will probably multiply. I have by me varieties, with the leaves simply acute, not acuminate, the lowest rather obtuse, the corymbs small; and with leaves acuminate; with leaves green on both sides and slightly glaucous underneath.

Grows on the edges of swamps, in the middle and upper districts of Ca-

rolina.

Flowers August—September.

#### Nutt. 46. OBOVATUS.

A? foliis sessilibus, catis, appressis. E.

Leaves sessile, oval, ovalibus, obtusis, inter- obtuse, sometimes obodum obovatis, subrugo- vate, somewhat rugose, sis, pubentissimis; co- very pubescent; corymbis paniculatis; in- rymb paniculate; scales volucri squamis imbri- of the involucrum im-| bricate, appressed.

Chrysopsis Obovata. Nutt. 2. p. 152.

> Stem about three feet high, branching towards the summit, very pubescent, when young somewhat viscid. Leaves alternate, oval, obtuse, sometimes toothed, mucronate, almost tomentose underneath, three to four inches long, one and an half inches wide. Flowers in a loose paniculate corymb, sometimes pyramidal. Involucrum many leaved, imbricate, leaves scarcely longer than the mature seed. Florets of the ray ten to thirteen, three toothed at the summit, white, twice as long as the involucrum; of the disk numerous, (thirty) yellow. Style scarcely longer than the stamens, two-cleft, stigmas thick. Seed angular, hispid. Pappus double.

Grows in damp soils. Flowers May-June.

# SOLIDAGO. GEN. Pl. 1292.

liis lanceolatis, serratis, lanceolate, serrate, tritriplinervibus, scabris; plinerved, scabrous; racemis paniculatis, racemes paniculate, sessecundis, recurvis; ligulis abbreviatis.

S. caule villoso; fo- | Stem villous; leaves of the ray short.

Sp. pl. 3. p. 2055. Walt. p. 206, Pyrsh, 2. p. 585. Nutt. 2. p. 159.

Stem two to five feet high, erect, very villous. Leaves lanceolate, the apper generally entire, always scabrous on the upper surface, sometimes pubescent underneath, numerous. Flowers in secund racemes, on long branches recurved at the summit. Scales of the involucrum twelve to sixteen, oblong, rather obtuse, imbricate, small, appressed. Florets of the ray yellow as in all of this genus, so short as to seem wanting. Seeds pubescent?

Grows in the mountains of Carolina. . Flowers September-October.

#### 2. PROCERA? Ait.

S. caule villoso, erecto, foliis lanceolatis, leaves lanceolate, serserratis, triplinervibus, | rate, triplinerved, scascabris, subtus villosis; brous, villous under-racemis spiciformibus, erectis, innuptis nutan-spiciform, before flowtibus; ligulis abbrevia- ering nodding; florets tis.

Stem villous, erect: of the ray short.

Sp. pl. 8. p. 2025. Parsh, 2. p. 585.

In the western districts of Georgia, I met with a species agreeing very nearly with the T. Process of Aiton. Stem three to five feet high, very pubescent. Leaves lanceolate, very acute at each end but not acuminate. finely serrate; scabrous on the upper surface, covered with a fine pubescence on the under, conspicuously triplinerved. Flowers in a pyramidal panicle, the lower branches, perhaps all, recurved before flowering. Scales of the

involucium not numerous, linear, nearly glabrous. Florets of the ray rather small. Seed finely pubescent.

Flowers September -- October.

### 3. Reflexa.

bus, scabris, reflexis; scabrous, ramis paniculatis, subsecundis.

S. caule erecto, vil. | Stem erect, villous; loso; foliis lanceolatis, leaveslanceolate, slightsubserratis, triplinervi- | ly serrate, triplinerved, branches paniculate. secund.

Sp. pl. 3. p. 2056. Pursh, 2. p. 536.

Leaves narrow lanceolate, acuminate, with about three serratures in the middle, scabrous, reflected. Racemes of the panicle secund, reflected, short. Willd.

Grows in pine woods and old fields. New-Jersey to Carolina. Flowers September.

#### Lin. 4. LATERIFLORA.

S. caule erecto, pilosiusculo; foliis lanceolatis, subtriplinervibus, glabris, margine scabris, inferioribus subculatis, subrecurvis, secundis.

Stem erect, a little hairy; leaves lanceolate, somewhat triplinerved, glabrous, scabrous along the marserratis; racemis pani- gins, the lower slightly serrate; racemes paniculate, secund, recurved.

: Sp. pl. 3. p. 2057. Pursh, 2. p. 536.

Plant about half the size of S. Canadensis. Leaves only occasionally marked with one or two teeth. Besides the terminal panicle the lower part of the stem has flowering branches. Lin. The flowers are larger, and the leaves broader than those of the preceding species. Willd.

Grows in dry soils, in woods and old fields. Pursh.

Flowers September—October.

### 5. ASPERA. Ait.

S. caule erecto, te- | reti, piloso; foliis ovatis, subellipticis, scaberrimis, rugosis, serratis, enervibus; racemis paniculatis, secundis.

Stem erect, terete, hairy; leaves ovate, somewhat elliptic, very scabrous, rugose, serrate, without nerves; paniculate, racemes secund.

Sp. pl. 3. 2057. Mich. 2. p. 117. Pursh, 2. p. 536.

Stem erect, three to five feet high, very hairy and somewhat scabrous. Leaves sessile, oval-lanceolate, very scabrous on the upper surface, somewhat scabrous and hairy on the under, acutely serrate. Flowers in a long terminal panicle. Racemes secund, recurved. Scales of the involucrum not numerous, linear-lanceolate, nearly glabrous. Florets of the ray small, yellow, seeds pubescent.

Grows in Carolina. Pursh.

I have not seen this species in the low country; it probably extends along the range of our mountains.

Flowers in September.

#### 6. ALTISSIMA. Lin.

These two species are considered by our Botanists now as mere varieties.

I have, therefore, placed them together.

Stem very variable in size, three to seven feet high, robust, very hairy, branching very profusely towards the summit. Lower leaves sessile, lancrolate, acute, very rugose, very scabrous on the upper surface, scabrous and hairy underneath, more or less coarsely servate; upper leaves generally ovate, with a few serratures. Flowers in large almost corymbose panicles, composed of small recurved branches. Scales of the involucrum linearlanceolate, nearly glabrout. Florets of the ray rather small. Seed pubes-

There are certainly some remarkable varieties included under this species

a few I shall enumerate.

c. Rugosa. Muhl. Stem about three feet high, villous. Lettres finely serrate, less rugose than those of the other varieties. Flowers in a pyramidal panicle.

b. Stem hairy, rough. Leaves very rugose. Lateral branches of the pani-

cle long, slender, slightly recurved.

c. Stem and leaves similar to the last. Branches more robust, producing numerous recurved racemes; each branch forming a long cylindrical mass of flowers.

d. Stem softly pubescent. Branches scattered, divaricate, recurved, nearly

simple.

Grows in damp rich soils.

Flowers September—October.

#### 8. Villosa. Pursh.

S. caule erecto, vilsubpilosis, enervibus, hairy, nerveless, inferioribus serrulatis; | lower racemis secundis.

Stein erect, villous: loso: foliis sessilibus, | leaves sessile, oblongoblongo - lanceolatis, lanceolate, somewhat serrulate: paniculatis, cemes paniculate, cund.

Pursh, 2. p. 558. Nutt. 2. p. 159.

Stem three to five feet high, robust, villous, with many recurved expanding branches near the summit. Lower leaves oblong-lanceolate, serrulate, with a few long scattered hairs along the veins, slightly scabrous, particularly along the margins and midrib; the upper oval or evate-lanceolate, very entire, with the axils generally crowded with simil leaves. Plosers namerous, in a terminal panicle, suther small. Racemes secund and recurved. Scales of the involucium linear, nearly glabrous. Florets of the ray seven

to ten, small; of the disk about five. Seed hairy.

This species, which appears to agree with the Villosa of Pursh, excepting that the leaves do not merit the epithet of soft, grows very abundantly in damp tich soils, and is very nearly allied to the S. Altissima.

Flowers September-October.

### 9. Nemoralis. Ait.

S. caule erecto, tomentoso; foliis caulinis lanceolatis, hispidis, integerrimis, radicalibus subcuneiformibus serratis; racemis paniculatis, secundis.

Stem erect, tomentose; leaves of the stem lanceolate, hispid, very entire, of the root somewhat cuneate, serrate; racemes paniculate, secund.

Sp. pl. 3. p. 2059. Pursh, 2. p. 5\$7. Nutt. 2. p. 156.

Stem two to three feet high, sparingly branched, covered with a fine tomentum. Leaves lanceolate, tapering to the base, the larger serrate, not strongly veined, alightly hispid, sessile, with small axillary clusters at their base. Flowers in a terminal sourcewhat torymbose panicle. Scales of the involucrum linear-lanceolate, only pubescent along the margins. Seed pubescent.

The whole plant, as remarked by Pursh, has a cinereous hue.

Grows in dry soils, not uncommon in old fields.

Flowers September-October.

# 10. Unimpolia. Muhl.

S. caule erecto, villoso, striato; foliis oblongo-lanceolatis, serratis, acutis, subtus pilosis; supra subscabris; racemis paniculatis, secundis; pedunculis villosis; ligulis abbreviatis. E.

Stem erect, villous, striate; leaves oblong-lanceolate, serrate, acute, hairy underneath; slightly scabrous above; racemes paniculate, secund; peduncles villous; florets of the ray short.

Sp. pl. 3. p. 2060. Pursh, 2. p. 538. Nutt. 2. p. 159.

Stem three to four feet high, villous, when young almost tomentose, bearing towards the summit many recurved branches. Leaves (of the root obovate, Pursh,) of the stem oblong-lanceolate, acute, rarely acuminate, acutely serrate, veiny, slightly scabrous on the upper surface, hairy underneath, particularly along the veins. Flowers in an oblong terminal panicle, the racemes secund and recurved. Scales of the involucrum oblong, narrow, rather obtuse. Florets of the ray about seven, scarcely longer than the involucrum. Seeds pubescent, almost villous.

In changing in some respects the character of this species given by Willdenow, I have been guided by specimens sent me by Dr. Muhlenberg himself, with which plants collected in the western districts of Georgia exactly

Grows in rich shaded soils. Flowers September—October.

### 11. ARGUTA. Ait.

S. caule erecto, glabro; foliis glabris, ar- leaves glabrous, acutegute inæqualiter serra- ly and unequally sertis, caulinis ellipticis, rate, those of the stem radicalibus spathulatoovatis; racemis paniculatis secundis; ligulis elongatis.

Stem erect, glabrous; elliptic, of the root spathulate-ovate; racemes paniculate, secund; florets of the ray long.

Sp. pl. 3. p. 2060. Pursh, 2. p. 538. Nutt. 2. p. 159.

Stem two to three feet high, very glabrous, though sometimes a little pubescent on the young branches, striate, frequently coloured, the branches long, virgate. Leaves of the root spathulate ovate, very acutely serrate, the attenuated base two to four inches long; of the stem oblong-lanceolate, serrate, of the branches lanceolate, entire, all glabrous, and somewhat tripli-Flowers on recurved racemes forming long terminal panicles. Scales of the involucrum, as in most of the species, linear-lanceolate, nearly glabrous. Florets of the ray of a middling size. Seeds minutely pubes-

Grows in moderately rich, shaded soils.

Flowers in September.

# 12. Cinerascens. Schweinitz.

cili, pubescente; foliis pubescent; leaves long, elongatis, lineari-lanceolatis, basi attenua-tis, serratis, utrinque subscabris, pubescenti-bus; racemis recurvis; nuate at base, serrate, slightly scabrous on both surfaces, pubes-cent; racemes recurvpedunculis ligulisque ed; peduncles and floelongatis. E.

S. caule erecto, gra- | Stem erect, slender, linear-lanceolate, atterets of the ray long.

Stem about three feet high, pubescent, slightly scabrous, slender, bearing towards the summit branches which are slender, rather scattered, almost horizontally expanding and recurved. Lower leaves three to five inches long, six to eight lines wide, with a long tapering base, somewhat scabrous on both surfaces, slightly serrate, the upper distant and small. Flowers of a middling size in a loose terminal panicle. Racemes secund, the peduncles frequently three-flowered, and longer than the involucrum. Scales of the involucrum linear, glabrous. Florets of the ray about five. Seeds pubes-

The plant I have described agrees in most respects with specimens sent me under this name from Salem, North-Carolina, by Dr. Schweinitz.

Grows in the western districts of Georgia.

Flowers September—October.

## 13. Juncea?

bro, foliis lanceolatis, glabris, margine sca-bris, inferioribus serra-gins scabrous; the lowtis. secundis.

S. caule erecto, gla- | Stemerect, glabrous, tis: racemis panicula- er serrate; racemes paniculate secund.

Sp. pl. 3. p. 2060. Pursh, 2. p. 538.

Stem about three feet high, slender, virgate, glabrous, with the branches near the summit, rather scattered, when young pubescent. Leaves long lanceolate, slightly acuminate, finely and acutely serrulate, and scabrous along the margins, glabrous, obscurely triplinerved. Racemes secund, recurved, forming a sparse terminal panicle. Scales of the involucrum oval

or ovate, the exterior generally obtuse, and slightly pubescent. Florets of the ray few, small. Seed thinly sprinkled with hairs.

Grows in the upper districts of Carolina. In sandy fields and woods.

Pursh.

Flowers September-October.

### 14. ELLIPTICA?

S. caule erecto, gla- | Stem erect, bus.

bro; foliis ellipticis, brous; leaves elliptic, lævibus, serratis; race- | smooth, serrate; ramis paniculatis, secun-dis; ligulis mediocri-cund; florets of the ray middle sized.

Sp. pl. S. 2060. Pursh, 2. p. 538. Nutt. 2. p. 159.

- I feel doubtful whether the plant I am about to describe really belongs to the S. Elliptica of Aiton. It agrees with it in many respects, but I have

seen no leaves that would merit Miller's epithet of Latissimifolia.

Stem three to four feet high, glabrous, branches towards the summit numerous, obliquely expanding, recurved. Leaves oval-lanceolate, slightly acuminate, serrate, glabrous, scabrous along the margins, with the veins moderately conspicuous, stem leaves three to four inches long, one and a half wide. Flowers numerous in a crowded terminal panicle, racemes secund, expanding and more leafy than usual in this genus. Scales of the involucrum linear, acute, glabrous. Florets of the ray about seven, slender. Seed pubescent.

Grows in damp rich soils. Paris Island.

Flowers September—October.

### 15. ODORA. Ait.

lanceolatis, integerri-mis, glabris, margine scabris; racemis pani-lanceolate, entire, gla-brous, scabrous along the margins. culatis.

S. caule erecto, pu- | Stem erect, pubesbescente; foliis lineari- | cent; leaves linear-

Sp. pl. 3, p. 2061. Pursh, 2. p. 539. Nutt. 2. p. 159. .

Stem about three feet high, branching and pubescent near the summit. Leaves sessile, linear-lanceolate, entire, thin, glabrous, but slightly scabrous along the margins. Racemes recurred forming a pyramidal panicle. Scales of the involucrum linear-lanceolate, nearly glabrous. Seed a little hairy.

Grows in rich dry soils, principally along the mountains, Canada to

Carolina. Pursh.

Flowers September-October.

sessilibus, linearibus,
superne attenuatis, glabris, pellucido punctatis, reflexis, margine
asperis; paniculæ ramis recurvatis. E.

Stem erect, terete, glabrous; leaves closely sessile, linear, tapering to the summit, glabrous, pellucidly dotted, reflexed, rough along the margin; branches of the panicle recurved.

Mich. 2. p. 117. Pursh, 2. p. 539. Nutt. 2. p. 159.

Stem three to four feet high, pubescent towards the summit. Leaves sessile, somewhat amplexicable, narrow, about two inches long, tapering almost from the base to the summit, slightly mucronate. Panicle composed of recurved racemes. Scales of the involucrum linear-lanceolate, slightly fringed, the interior much longer than the exterior. Florets of the ray three in each head, longer than the involucrum; of the disk three to four, yellow. Seeds a little hairy.

Grows in dry soils very common. Flowers August—October.

# 17. TORTIFOLIA. E.

S. caule erecto, pubescente; foliis linearilanceolatis, subserratis, patulis, tortuosis, supra nervoque scabris, subtus subglabris; panicula pyramidata, racemis recurvis. E.

Stem erect, pubescent; leaves linear-lanceolate, slightly serate, expanding, twisted, the upper surface and midrib scabrous, the under nearly glabrous; panicle pyramidal, racemes recurved.

S. Odora. Mich. 2. p. 118.

Stem about three feet high, very pubescent towards the summit. numerous, linear-lanceolate, with a few distinct serratures, sometimes pubescent underneath, obscurely triplinerved, generally twisted. Flowers in a very compact panicle, the racemes handsomely recurved, bearing near the base, a number of small buds that never mature. Scales of the involucrum linear-lanceolate, rather obtuse, nearly glabrous. Florets of the ray three to five; of the disk about the same number. Seeds pubescent.

Grows in dry pastures with the preceding, from which, however, it is very

distinct.

Flowers August-October.

# 18. Pyramidata. Pursh.

'S. caule erecto, tereti, hirto; foliis oblonis, pedunculis glabris.

Stem erect, terete, hispid; leaves oblong. gis, acutis, subamplexi- acute, somewhat amcaulibus, sessilibus, gla-bris, margine scabris, brous, scabrous along rariter obsolete denta- | the margins, rarely and tis; panicula nuda, py-ramidata, ramis reflex-nicle naked, secund, pyramidal, branches reflected; peduncles glabrous.

Pursh, 2. p. 537. Nuttall, 2. p. 159.

Stem four to six feet high. Leaves oblong, subovate, acute, margia remotely serrulate, scabrous, nearly smooth, midrib on the under side pubescent, stem roughly pilose, summit virgate; branches small, leafy, paniculate, recurved, racemes filiform, secund, pubescent. Peduncles squamose. Flowers small, ligulate, minute. Seed smooth. Nearly allied to S. Retrorsa. Nuttall.

· Grows in the pine barrens of Georgia. . Flowers August-September. Pursh.

### 19. Corymbosa.

E.

of the ray long.

Stem four to six feet high, robust and virgately erect, branching near the summit, the young branches hirsute. Leaves closely sessile; the lower four to six inches long with fine indentations along the margins; the upper ovate and generally entire, all very rigid. Flowers large for this genus, in a terminal corymb; the lower branches recurved and secund. Scales of the involucrum oval, fringed or pubescent along the margins. Florets of the ray about ten; of the disk rather more numerous, all yellow. Seed gla-

This species is probably allied to S. Lævigata and Mexicana, but appears to be sufficiently distinct.

Grows in the middle districts of Georgia. Louisville, Mr. Jackson.

Flowers September—October.

#### 20. Sempervirens.

S. caule erecto, glalævibus, integerrimis, smooth, entire,

Stem erect, glabrous; bro; foliis lineari-lan- leaves linear-lanceoceolatis, subcarnosis, late, somewhat carnose, margine scabris; race- | brous along the marmis paniculatis, secun- gin; racemes panicudis, pedunculis pilosis. late, secund, peduncles hairy.

Sp. pl. 3. p. 2060. Pursh, 2. p. 538. Nutt. 2. p. 160.

Stem three to six feet high, erect, smooth, with axillary, recurved, somewhat expanding branches towards the summit. Leaves long, linear-lanceolate, acute, somewhat carnose, very smooth but scabrous along the margin. Racemes axillary, very slender, pubescent, with a small leaf at the base of each peduncle; partial peduncle longer than the involucrum. Flowers small. Scales of the involucrum linear-lanceolate. Florets of the ray about five. Seeds slightly pubescent.

Grows in damp rich soils. Flowers September—October.

#### \*\* Racemis erectis. \*\* Racemes erect.

#### 21. Limonifolia. Persoon.

caule obliquo. glabro: foliis lanceolatis, subcarnosis, integerrimis, undique lævibus; racemis panicu- | both surfaces; racemes latis, erectis; peduncu- panicled, erect; pedunlis squamosis, glabris; cles scaly, glabrous; ligulis elongatis.

Stem oblique, glabrous; leaves lanceolate, somewhat nose, entire, smooth on florets of the ray long.

Persoon. Syn. 2. p. Nutt. 2. p. 159. S. Mexicana. Sp. pl. 3. 2063. Pursh, 2. p. 541.

Racemes paniculate, not virgate, secund, nearly naked. Pedancles mostly one-flowered, generally pubescent. Flowers large, rays about ten. Receptacle punctate, margins of the alveoli pubescent. Nutt. This, I think, belongs decidedly to the last division of this genus, (racemis erectis,) Schweinitz.

Stem three to five feet high, glabrous, generally purple. Leaves semile, somewhat amplexicaule, linear-lanceolate, acute, very glabrous, succulent, nerved, scabrous along the margins; the lower ones a foot in length. Recemes paniculate, generally erect, sometimes, though rarely, recurved. Flowers large. Scales of the involucrum linear, acute. Florets of the ray seven to ten. Seed pubescent.

I am uncertain whether the plant I have described really belongs to this species, about which I think there exists some uncertainty. The S. Sempervirens of Michaux evidently belongs to this species or to the S. Lævigata. In the S. Sempervirens I have followed the authority of Mr. Nuttall.

As the name of Mexicana was inaccurately applied to this species, I have concurred with Mr. Nuttall in restoring to it, at the suggestion of Person, the original name of Plukenet t. 235. f. 2.

Grows in the neighbourhood of salt water very abundantly.

Flowers August-October.

### 22. Speciosa. Nutt.

ramis virgatis; foliis branches lanceolatis, subcoria- leaves lanceolate, someceis, margine scabris, what coriaceous, sca-

ligulis | erect, compound; rets of the ray 5, long, seed glabrous.

Nutt. 2. p. 160.

Stem three to six feet high, smooth, slightly furrowed, the young branches pubescent. Leaves lanceolate, broad, coriaceous with pellucid veins, the upper leaves very entire, but scabrous along the margins, the lower remotely and slightly serrate. Racemes numerous, erect, compound, with the flowers somewhat crowded towards the summit. Scales of the involucrum oblong. Florets of the ray 5, nearly twice as long as the involucrum. rather obtuse. Seed glabrous.

This plant, which appears to agree with the S. Speciosa of Nuttall, grows abundantly in dry rich soils, in the western districts of Georgia, and near the

Alabama.

Flowers September—October,

### 23. Pubescens.

S. caule erecto, ramoso, pubescente; foliis basi attenuatis, pubescentibus, inferioribus the lower serrate; raserratis; racemis erectis, paniculatis; ligulis |

Stem erect. branching, pubescent; leaves longo-lanceolatis, long-lanceolate, tapering at base, pubescent, cemes erect, paniculate; florets of the ray middle sized.

Stem erect, three to four feet high, pubescent, slightly scabrous, generally coloured, with numerous rigidly erect branches towards the summit. Leaves long-lanceolate; the upper softly pubescent and generally entire, the lower almost spathulate, slightly scabrous and serrated towards the summit. Plowers numerous in a compound terminal panicle. Scales of the involucram subulate, pubescent. Florets of the ray seven to ten, slender. Seeds minutely pubescent.

This species in habit bears much resemblance to the S. Speciosa; it differs by its pubescence, by its leaves, which are thinner, narrower, more tapering at base, by smaller flowers; it appears also to be allied to the S.

Viminea, with which I am unacquainted, but differs by its uniform pubes

· Grows in damp soils near Louisville, Georgia.

Flowers October.

### 24. PAUCIFLOSCULOSA.

florets of the ray long.

Sp. pl. 3. p. 2062. Pursh, 2. p. 589. Nutt. 2. p. 160.

Stem two to three feet high, erect, striate, almost furrowed near the summit, very villous. Leaves large, oval-lanceolate, nearly acute, hairy and slightly scabrous on the upper surface, almost villous underneath; the upper ones nearly sessile, the lower attenuated into a sheath-like petiole, four to six inches long, serrate. Flowers in a long, terminal, somewhat crowded raceme, composed of small erect branches. Scales of the involucrum oblong, slightly pubescent. Florets of the ray six to eight, yellow. Seed glabrous.

Specimens of this plant collected by Dr. M'Bride are marked as I have described them. In specimens sent from Pennsylvania by Dr. Muhlenberg, the leaves are nearly glabrous, only scabrous along the margins, and more

entire.

Grows in the mountains of Carolina.

Flowers August-September.

#### 27. STRICTA. Ait.

S. caule erecto, gla- | Stem erect, bro; foliis caulinis lan- | brous; leaves of the ceolatis, integerrimis, stem lanceolate, entire, glabris, margine sca-bris, radicalibus serra-long the margins, of tis; racemis panicula- the root serrate; ratis, erectis; pedunculis cemes paniculate, eglabris.

rect; peduncles glabrous.

Sp. pl. 3. p. 2062. Pursh, 2. p. 540. Nutt. 2. p. 160.

About two feet high, very smooth. Pursh.

This species I have never seen. Dr. Schweinitz remarks that with him it never branches.

Grows in sandy woods, New-Jersey to Carolina. Pursh.

### 28. VIRGATA. Mich.

S. caule simplici, lævi; foliis glabris, oblongo-lanceolatis, subobtusis, erectis, punctatis, margine scabris, inferioribus parce serratis; racemis erectis, virgatis.

Stem simple, smooth; leaves glabrous, oblong-lanceolate, rather obtuse, erect, dotted, scabrous along the margin, the lower sparingly serrate; racemes erect, virgate.

Mich. 2. p. 117. Pursh, 2. p. 538. Nutt. 2. p. 160.

Root perennial. Stem very erect, two to four feet high, attenuated towards the summit, striate, nearly glabrous. Lower leaves nearly a foot long, spathulate-lanceolate, the upper diminishing, sessile, appressed, oblong-lanceolate, all nerved, somewhat carnose, scabrous and serrulate along the margins, sometimes acute, dotted, veins pellucid. Flowers rather large, in erect, appressed racemes. Scales of the involucrum linear-lanceolate, acute, pubescence appressed. Florets of the ray five to seven, with a scale sometimes attached to the tube of the corolla, of the disk about eight. Seed striate, hairy. Pappus hairy, somewhat scabrous.

Grows in damp soils, along the margins of swamps.

Flowers June—October.

### 29. Pulverulenta. Nutt.

S. caule simplici, foliisque pulverulentopubescente; foliis sessilibus, inferioribus ellipticis, serratis, superioribus obovatis, integerrimis, margine scabris; racemis erectis, spiciformibus; ligulis (10) elongatis. Stem simple and with the leaves covered with a pulverulent pubescence; leaves sessile, the lower elliptic, serrate, the upper obovate, entire, scabrous along the margin; racemes erect, spiciform; florets of the ray long.

Nutt. 2. p. 161.

A species which might be confounded with the preceding, though quite distinct. Nutt.

Stem three to four feet high, attenuated, sometimes reddish. The lower leaves acute, and somewhat resembling those of the Spiræa Salicifolia.

Grows in Georgia and Florida, where it was first detected by Dr. Bald-

Flowers-

### 30. Erecta? Pursh.

S. caule simplici pedunculisque pubescente; foliis lanceolatis, utrinque acutis, gla- acute at each end, glascabris; racemis brevi- | along the margins; rabus, erectis, axillari- cemes short, erect, axbus terminalibusque.

Stem simple and with the peduncles pubescent; leaves lanceolate. bris, venosis, margine | brous, veiny, scabrous lillary and terminal.

Pursh, 2. p. 542. Nutt. 2. p. 161.

Stem about two feet high, erect, simple in my specimens, glabrous, excepting towards the summits. Leaves lanceolate, somewhat coriaceous, veined, glabrous, excepting the margins, which under a lens are fringed with short rigid hairs, acute at base, the lower appearing slightly petiolate, more uniform in their size than usual in this genus. Racemes axillary, one to three inches long, erect, rigid, flowers rather large. Scales of the involucrum linear, rather obtuse. Florets of the ray seven to ten, pale. glabrous.

There is great uncertainty still about this species. The plants described by Pursh, Nuttall, and myself, differ at least in pubescence. The racemes are collected more towards the summit than in S. Flexicaulis, from which it

is in other respects sufficiently distinct.

Grows in damp soils.

Flowers September—October.

#### 31. Cœsia. Aiton?

S. caule erecto, lævi; minatis, glabris, serratis: racemis erectis: ligulis mediocribus.

Stem erect, smooth; foliis lanceolatis, acu- leaves lanceolate, acu-| minate, glabrous, serrate; racemes florets of the ray middle sized.

Sp. pl. 3. 2062. Purch, 2. p. 540. Nutt. 2. p. 161.

Stem two to three feet high, smooth, tinged with purple and having a glaucous hue, bearing many slender, obliquely expanding branches. Leaves sessile, lanceolate, acuminate, finely and acutely serrate, pale underneath, slightly scabrous along the margins. Racemes generally erect, sometimes slightly recurved, not very compact. Scales of the involucrum linear, rather obtuse, slightly pubescent along the margins. Florets of the ray about five, rather small. Seed nearly glabrous.

Grows in the upper districts of Carolina and Georgia.

Flowers September.

### 82. LITHOSPERMIFOLIA. Willd.

S. caule ramoso, pubescente; foliis lanceolatis, utrinque scabris, attenuatis, 3-nervibus, integerrimis; racemis erectis, ligulis elongatis.

scabris, ervibus, racemis elonga
Stem branching, pubescent; leaves lanceolate, scabrous on both surfaces, tapering, 3-nerved, entire; racemes erect; florets of the ray long.

Willd. enum. 891. Pursh, 2. p. 541. Nutt. 2. p. 161.

This species I have never seen. Dr. Schweinitz, in some valuable MS. notes on this genus which I have received from him, remarks that its leaves and their habit determine this species well; rare about Salem, North-Carolina.

Grows in sandy barren soils New-Jersey to Carolina. Pursh. Flowers August—October.

### 33. FLEXICAULIS. L.

S. caule flexuoso, glabro, angulato; foliis ovatis, acuminatis, serratis, glabris; racemis erectis, axillaribus; ligulis mediocribus.

Stem flexuous, glabrous, angled; leaves ovate, acuminate, serrate, glabrous; racemes erect, axillary; florets of the ray middle sized.

Sp. pl. 8. p. 2064. Mich. 2. p. 118. Pursh, 2. p. 542. Natt. 2. p. 161.

Stem two to three feet high, slender, slightly flexuous, glabrous. Leuves ovate-lanceolate, acuminate, acutely serrate, glabrous, reticulately veined, acute at base. Racemes scattered along the stem, small, axillary, erect. Scales of the involucrum linear, rather obtuse. Florets of the ray about

five; of the disk seven to eight. Seeds hairy.

Under this name I received a specimen from Dr. Muhlenberg which evidently belongs to the S. Axillaris of Pursh. It is distinguished by leaves narrow-lanceolate, remotely serrulate, acute or very slightly acuminate, and by compact, somewhat globular racemes clustered along the stem. It appears to me a very distinct species and was so considered by Dr. Muhlenberg, who arranged our common S. Flexicaulis as the S. Latifolia. I have been induced to add this note because the S. Axillaris has been omitted by Mr. Nuttall in his enumeration of our species; and Dr. Schweinitz remarks, "what I call by this name is very doubtful; it may belong to S. Flexicaulis, but differs in habit."

Grows in the upper districts of Carolina and Georgia—not common in the low country.

Flowers September—October.

#### 34. GLOMERATA.

S. caule humili, simplicissimo; foliis gla- | ple; leaves glabrous, bris, oblongo-lanceola- oblong-lanceolate, sersimplici. involucris multifloris.

Stem humble, simtis, serratis; racemo | rate; raceme simple, glomerulis composed of axillary axillaribus; superiori- heads, the upper ones bus capitato-congestis; clustered; involucrum turgidis, | turgid, many-flowered.

Mich. 2. p. 117. Pursh, 2. p. 542.

Lower leaves broad, oval, acuminate, serrate, nearly allied to Aster. Nuttall. Distinguished among the rest by its deep and close serratures, and the capitate form of the axillary racemes. Schweinitz.

This species I have not seen.

Grows in the mountains of Carolina. Michaux. Near Salem, North-Carolina. Schweinitz.

Flowers-

#### Mnhl. 65. SQUARROSA.

S. caule erecto, ramoso, pubescente; foliis lanceolatis, acutis, serratis, subtus molliter pubescentibus, inferio- pubescent, the lower ribus basi attenuatis; tapering at base; raracemis compositis, e. | cemes compound, erect; rectis, floribus majus- | flowers large; involuculis; involucris squarrosis.

Stem erect, branching, pubescent; leaves lanceolate, acute, serrate, underneath softly crum squarrose.

Nutt. 2. p. 161.

Stem erect, robust, three to five feet high, striate, pubescent. Leaves, except the lowest, sessile, lanceolate, serrate towards the summit; slightly pubescent on the upper surface, very pubescent underneath. Flowers large, in compound erect racemes. Involucrum imbricate, the scales linear, re-flexed like those of the Aster. Florets of the ray about ten, scarcely longer than the involucrum; of the disk sixteen to twenty. Seeds glabrous. Pappus hairy, scabrous.

I have described the southern species, on which this name was first imposed by Dr. Muhlenberg. It appears to differ in some though not very important characters, from the northern plant described by Mr. Nuttall. It is one of our most ornamental species; it has the structure of an

Aster, with the appearance and peculiar fragrance of a Solidago.

Grows in dry sandy soils. Flowers in September.

#### 86. Angustifolia. E.

S. caule erecto, glabro; foliis subulato-lin brous; leaves subulate, earibus, integerrimis, nearly linear, entire, glabris; racemis erec- glabrous, racemes e-

Stem erect, tis, paniculatis; ligulis rect, paniculate; florets mediocribus. E. of the ray middle sized. of the ray middle sized.

Stem two to three feet high, very glabrous, generally coloured, with many slender, erect branches near the summit. Leaves sessile, subulate, sometimes lanceolate-linear, acute, those of the stem very entire, very glabrous, though slightly scabrous along the margins, the upper axils frequently bear-

ing the sudiment of a small branch, producing numerous small almost setaceous leaves. Flowers in a compound terminal panicle. Branches slender but generally erect. Scales of the involucrum linear-lanceolate, glabrous. Florets of the ray seven to ten, slender. Seed slightly pubescent. Allied to S. Viminea.

Grows in rich soils. Found on Paris Island, near Beaufort.

Flowers September-October.

#### E. 37. SALICINA.

S. caule elato, gracili, superne pubescente scabriusculo; ramis mis subsecundis, ramulis brevibus, rariter | recurvis. E.

Stem tall, slender. pubescent towards the summit, somewhat scavirgatis, elongatis, e- | brous; branches virrectis; foliis lanceola-tis, supra scaberrimis, subtus glabris, inferi-oribus serratis; race-pate, long, erect; leaves lanceolate, above very scabrous, gla-brous underneath, the lower serrate; racemes somewhat secund. branches short, sometimes recurved.

Stem four to five feet high, when old nearly glabrous, when young pubescent and slightly scabrous, generally coloured and bearing towards the summit a few slender erect branches one to two feet long. Leaves sessile, the lower three to four inches long, scarcely one wide, regularly lanceolate, very scabrous on the upper surface, very glabrous and paler on the under surface; the upper ones diminishing in size. Flowers in long slender racemes, in which the small branches are sometimes recurved. Scales of the involucrum oblong, rather acute. Florets of the ray about five, very slander. Seed nearly glabrous.

This plant, which I can refer to none of our described species, and of which the location appears somewhat questionable, is very common in the

eak land in the western districts of Georgia.

Flowers September—October.

#### 38. ELATA? Pursh.

so, superne tomentoso; tomentose towards the foliis ovali-lanceolatis, summit; leaves oval-

S. caule tereti, pilo- | Stem terete, hairy,

acutis, subintegerrimis, venosis, subtus tomentoso-pubescentibus; racemis erectis, paniculatis; ligulis elongatis. late; florets of the ray

Pursh, 2. p. 543. Nutt. 2. p. 162.

I know not whether the species which in unison with Dr. Schweinitz I am describing as the S. Elata, be the real plant of Pursh, whose description is very brief. It accords, however, with it in its leading characters.

Stem two to three feet high, terete, pubescent, when young tomentoes, branches erect, not numerous. Leaves sessile, rather small, nearly entire, with elevated veins, pubescent, underneath almost tomentose. Scales of the involucrum linear-lanceolate, acute, pubescent. Florets of the ray seven to ten, nearly twice as long as the involucrum; of the disk ten to twelve. Seed glabrous.

Grows in pine barrens near Louisville, Georgia. Mr. Jackson. Selem,

North-Carolina. Dr. Schweinitz.

Flowers September.

## 89. Rigida. L.

S. caule foliisque pilosis, scabris; foliis ovato-oblongis, cauli- ovate, oblong, those of nis integerrimis, infi- the stem entire, the mis serratis; ramis lowest serrate; flower floriferis paniculatis; bearing branches paniculate; racemes comfastigiatis, ligulis elon- pound, nearly fastigigatis.

Stem and leaves hairy, scabrous; leaves ate; florets of the ray

Sp. pl. 3. p. 2067. Mich. 2. p. 118. Pursh, 2. p. 543. Nutt. 2. p. 162.

Stem three to four feet high, slightly angled, very pubescent, when young tomentose, branches very numerous, forming a somewhat fastigiate corymb. Leaves sessile, approximate, very pubescent and scabrous, the upper very entire. Flowers large for this genus, somewhat clustered near the summits of the branches. Scales of the involucrum oblong, obtuse, pubescent. Florets of the ray seven to ten; of the disk numerous. Seeds glabrous.

Grows in the mountains of Carolina. Mich.

Flowers September-October.

### 40. GRAMINIFOLIA.

S. caule angulato, ramosissimo; foliis lanceolato-linearibus, integerrimis, erectiusculis, 3—5 nervibus, scabriusculis, nervis subtus pilosis, axillis nudis; corymbis terminalibus, fastigiatis, ramulis capitatis, ligulis altitudine disci.

Stem angled, branching; leaves lanceolate - linear, entire, nearly erect, 3—5 nerved, a little scabrous, the nerves hairy underneath, axils naked; corymbs terminal, fastigiate, with the heads clustered; florets of the ray as long as the disk.

Chrysocoma Graminifolia. Sp. pl. 1178. Euthamia Graminifolia. Nutt. 2. p. 162.

Solidago Lanceolata. Willd. Sp. pl. 3. 2060. Michaux var. Major. 2. p. 116. Pursh, 2. p. 540.

Stem two to three feet high, slightly furrowed, the angles pubescent, branches very numerous, obliquely expanding. Leaves numerous, lanceolate-linear, never wide enough to deserve the appellation of lanceolate, obscurely three to five nerved, the nerves underneath pubescent. Flowers numerous, clustered, in a terminal corymb. Scales of the involucrum numerous, linear-lanceolate, slightly viscid. Florets of the ray about ten, short; of the disk not numerous, rarely exceeding six. Seeds villous. Receptacle setose. Nuttall.

Specimens of this plant from Connecticut agree exactly with ours, excepting that in our southern species the heads are, I think, smaller, and the

forets of the ray more distinctly exserted.

Grows in damp rich soils; not so common as the succeeding species. Flowers September—October.

## 41. Tenuifolia.

S. caule scabro, angulato, corymboso-ramoso; foliis angustissime linearibus, patulis, 3-nervibus, obsolete scabris, axillis foliosis; corymbis terminalibus fastigiatis, ramulis ca- nal, fastigiate, heads pitatis, ligulis disco vix altioribus.

Stem angled, scabrous, with fastigiate branches; leaves very narrow, linear, expanding, obscurely 3-nerved, scabrous, the axils leafy; corymbs termiclustered; florets of the ray scarcely as long as the disk.

Pursh, 2. p. 540. Euthamia Tenvifolia. Nutt. 2. p. 162.

Very similar to the preceding species, but every way smaller.

Stem about two feet high. Leaves linear, scabrous along the margins, obscurely three-nerved, covered with glandular dots. Scales of the involucrum viscid. Florets of the ray about ten, not much longer than the involucrum. Seeds villous.

Grows very common in dry pastures. Flowers September—October.

## ERIGERON. GEN. Pl. 1287.

Involucrum imbricatum. Corollulæ radii lineares, plurimæ. Pappus duplex, exterior minimus, interior pilosus. Receptaculum | interior hairy. Recepnudum.

Involucrum imbricate. Florets ray linear, numerous. Pappus double, the exterior very small, the tacle naked.

## 1. NUDICAULE.

E. glabrum; foliis |

Glabrous; leaves of radicalibus spathulato- | the root spathulate-lanlanceolatis, acutis, sub- | ceolate, acute, slightly

dentatis, caule simpli-cissimo, subaphyllo, elongato; corymbis ter-terminal corymb fewminalibus paucifloris; flowered, rays as long radiis longitudine invo- as the involucrum. lucri.

Mich. 2. p. 224. Pursh, 2. p. 533. Nutt. 2. p. 147. Doronicum Lævifolium. Walt. p. 205?

Root perennial, sparingly stoloniferous. Stem erect, about two feet high, a little pubescent and scabrous near the summit. Leaves of the root spathulate-lanceolate, irregularly toothed, glabrous, somewhat succulent; of the stem similar, but small and scattered, and sometimes slightly fringed near the base. Flowers few, sometimes only three or four, in a small terminal corymb. Involucrum imbricate, the leaves subulate, acute, a little hairy at base. Florets of the ray numerous, (about thirty) linear, obscurely threetoothed, white, twice as long as the involucrum; of the disk very numerous, tubular, five-toothed at the summit, greenish yellow. Stamens of the ray none; of the disk, short. Style short, two-cleft. Stigmas obtuse, appressed. Seeds hispid. Pappus hairy. Receptacle flat, naked, dotted.

Grows in flat and damp pine barrens.

Flowers May—June; sometimes again in the autumn.

### 2. Bellidifolium.

tis; caule 3-5 floro; radiis involucro subduplo longioribus.

E. hirsutum, inca- | Hirsute, hoary; leaves num; foliis radicalibus of the root obovate, obovatis, subserratis, slightly serrate, of the caulinis sessilibus, spar- stem, sessile, scattered; sis, oblongo-lanceola- oblong - lanceolate; stem 3-5 flowered; rays twice as long as the involucrum.

Sp. pl. 3. p. 1958. Pursh, 2. p. 502. Nutt. 2. p. 148. E. Pulchellum. Mich. 2. p. 124.

Root perennial, stoloniserous. Stem twelve to eighteen inches high, and with the Leaves and Involucrum very hairy. Leaves of the root spathulate, obovate, dentate, the lower stem leaves similar, the upper small, lanceolate. Flowers few, terminal, large for this genus, the one on the central stem, generally larger than those on the lateral branches. Involucium somewhat imbricate, but nearly equal in a double series; leaves linear-lanceolate,

very acute. Florete of the ray linear, ligulate, two-toothed? at the summit, pale blue, nearly twice as long as the disk; stamens none; style much longer than the tube, two-cleft; stigma simple, expanding. Florets of the disk small, tubular, yellowish, five-toothed at the summit. Stamens as long Style longer than the stamens. Stigma thickened, erect. as the corolla. Seed oblong, compressed, slightly winged, nearly glabrous. Pappus sca-Receptacle slightly convex, naked, dotted.

Grows in dry shaded soils, near Beaufort, near Ashley Ferry, Colum-

bia, Mr. Herbemont.

Flowers March—April.

### 8. STRIGOSUM?

E. pubescens, scabriusculum; foliis line- scabrous; leaves linear, aribus, elongatis, infe- long, the lower linearrioribus lineari-lanceolatis, denticulatis; caule laxe paniculato; floribus terminalibus.

Pubescent, slightly lanceolate, denticulate; stem loosely paniculate; flowers terminal.

Sp. pl. 3. p. 1953. Doronicum Ramosum. Walt. p. 205?

Root perennial. Stem about two feet high, slightly furrowed, a little scabrous, with the leaves and involucrum clothed with white, appressed hair, giving the plant a somewhat hoary aspect. Leaves of the root long, narrow, lanceolate, denticulate; of the stem long, linear, entire. Flowers in a loose terminal panicle. Involucrum imbricate, with the leaves subulate, appressed. Florets of the ray linear, twice as long as the involucrum, two to three cleft at the summit, white. Style twice as long as the tube, slightly two-cleft; stigmas obtuse; seeds oblong, hispid; pappus, the exterior composed of minute scales, the interior wanting. Florets of the disk very numerous, tubular, yellow, with the border five-cleft. Stamens very Style scarcely longer than the stamens. Seeds hispid. Pappus double, the exterior composed of minute scales, the interior of a few hairy rays as long as the corolla. Receptacle slightly convex.

Under the name of E. Strigosum, I received from Dr. Muhlenberg, and under that of E. Nervosum, I received from Dr. Schweinitz, (Salem, North-Carolina,) specimens apparently of the same plant. They both differ from the one I have described in being less hairy, and having the florets of the ray much wider, in both the interior pappus of the ray was wanting. Perhaps these are distinct, and may be the E. Nervosum of Pursh, but not of

Willdenow.

Grows in dry sandy pastures. Flowers May-August.

### 4. LONGIPOLIUM. La Marck.

E. glaberrimum; caule virgatim paniculato, ramis strictis; foliis longissime-linearibus, strictis; involucfis ovatis; radiis flavis, vix involucro longioribus.

Very glabrous; stem virgately paniculate, branches strait; leaves very long, linear, straight; involucrum ovate; florets of the ray yellow, scarcely longer than the involucrum.

Pursh, 2. p. 534.

Grows in Carolina. La Marck. Flowers August—September. Does it belong to this genus?

### 5. Ambiguum. Nutt.

E. pubescens, scabriusculum; foliis linearibus, inferioribus subserrulatis; floribus parvulis, subbinis, axillaribus terminalibusque; involucro hemisphærico.

Pubescent, somewhat scabrous; leaves linear, the lower slightly serrulate; flowers small, generally in pairs, axillary and terminal; involucrum hemispherical.

Nutt. 2. p. 147.

Stem simple, terete, leafy, eighteen inches high. Leaves two to four inches long, two to four lines wide, attenuated at base. Flowers about eight

to ten, small and pale yellow. Pappus double? Nutt.

This species I have not noticed. The E. Carolinianum of Linnæus to which I was accustomed to refer the E. Strigosum of this sketch, and to which Mr. Nuttall alludes under this species, if established on the figure of Dillenius, (Hort. Elth. t. 806. f. 394.) belongs, I think, unquestionably to another genus.

Grows in Georgia.

Flowers.

### 6. Philadelphicum?

E. pubescens; foliis inferioribus cuneatoobovatis, sinuato-dentatis, caulinis oblongolanceolatis. caulibus; floribus subcorymbosis; radiis capillaceis, involucro duplo-longioribus.

Pubescent; lower leaves cuneate. obovate, sinuate, toothed, oblongstem leaves amplexi- | lanceolate, amplexicaule; flowers what corymbose; florets of the ray capillary, twice as long as the involucrum.

Sp. pl. 3. p. 1957? Mich. 2. p. 223. Pursh, 2. p. 533. Nutt. 2. p. 148.

Root perennial. Stem one to two feet high, slightly furrowed, pubescest, with the hairs expanding. Leaves of the root sometimes deeply sinuste, the upper leaves becoming gradually entire, all amplexicaule. Flowers in a loose corymb. Involucrum many leaved; leaves subulate, nearly equal, arranged nearly in two series. Florets of the ray very numerous, fone to two hundred) pale purple, slightly two-cleft at the summit; stamens none; style longer than the tube, two-cleft: of the disk very numerous, yellow, five-cleft at the summit; stamens and style about as long as the corolla-Seed oblong, hispid; pappus pilose, under a lens scabrous.

The exterior pappus is very inconspicuous if not entirely wanting in this species; the florets of the ray have the interior pappus. This is scarcely

the E. Philadelphicum of Linnæus.

Grows very common in pastures and fields.

Flowers February—June,

#### La Marck. 7. Quercifolium.

-E. tenue pubescens; foliis lanceolatis, acutis, inferioribus sublyratis, grosse-dentatis, supremis integerrimis; caule leaves lanceolate, acute, the lower somewhat lyrate, and coarsely toothed, the upper ensubsimplici, summitate | tire; stem nearly sim-

pubescent Finely

3-floro; radiis involu- | ple, few-flowered (3) at cro duplo longioribus. the summit; florets of the ray twice as long as the involucrum.

La Marck encyc. 8. p. 491. Pursh, 2. p. 533.

Not above a span high; flowers pale blue or white. Pursh.

I have not been able to refer to the figure of Lam. (illust. t. 681. f. 4.) for this plant, but it appears to me probable that it is only the preceding species which he has described under this name, perceiving that it did not correspond with the original description of the E. Philadelphicum,

Grows in Carolina.

Flowers July and August. Pursh.

## \*\* Pappo simplici Canotus. Nuttall.

Pappus simple.

### 8. CANADENSE.

E. caule hispido, paniculatim ramosissimo; late, profusely branch-foliis lineari-lanceola- ed; leaves linear-lantis, ciliatis; involucris | ceolate, fringed; involongioribus.

Stem hispid, panicucylindricis; radiis con- | lucrum cylindrical; flofertis, involucro vix rets of the ray crowded, scarcely longer than the involucrum.

Sp. pl. 3. p. 1954. Mich. 2. p. 123. Pursh, 2. p. 534. Nutt. 2. p.

Senecio Ciliatus. Walt. p. 208?

Root annual. Stem two to eight feet high, hairy, diffusely branched. Leaves long, very narrow, slightly scabrous on the upper surface, the lower ones sparingly toothed. Flowers racemose on the branches, forming an oblong panicle. Involucrum imbricate, leaves very narrow, acute, membranaceous at the margins. Florets of the ray capillary, very numerous, scarcely longer than the involucrum; of the disk four-cleft, yellowish. Seeds oblong, sprinkled with short hairs. Pappus simple, hairy. Receptucle

Grows in pastures and fields, very common, preferring dry soils. Flowers June—September.

#### 9. Pusillum. Nutt

E. gracile; caule glabro; foliis lineari-lanceolatis, integris, marginibus scabris; panieula subsimpliei, ramulis divaricatis.

Slender; stem glabrous; leaves linearlanceolate, entire, scabrous along the margins; panicle nearly simple, the branches divaricate.

Nutt. 2. p. 148.

Plant small. Stem four to six inches high; panicle simple, somewhat fastigiate, branches naked, or merely furnished with small scales, each pes-

jecting two or three flowers. Nutt.

This small and perhaps doubtful species is also found in Carolina, and if this section should be established as a genus, new species may be detected. We have a very large variety six to eight or ten feet high, which I think will also be found sufficiently distinct from the common E. Canadense.

Grows with the preceding. Flowers through the summer.

## BOLTONIA. GEN. PL.

Receptaculum favosum, hemisphæricum. | hemispherical. Pappus dentato-aris- pus awned, 2 generally tatus subbicornis. Co- conspicuous. Florets *rollulæ* radii plurimæ. Involucrum imbricatum.

Receptacle favose. of the ray numerous. Involucrum imbricate.

### 1. Asteroides.

B. foliis integerrimis; floribus longe peduncu- ers on long peduncles; latis; seminibus ovalibus, glabris, submuti- | scarcely awned. cis.

Leaves entire; flowseed oval, glabrous,

Sp. pl. 3. p. 2162. Mich. 2. p. 132. Pursh, 2. p. 561. Nutt. 2. p. 168.

Chrysanthemum Carolinianum. Walt. p. 204.

Root perennial. Stem erect, about two feet high, smooth, somewhat striate. Leaves alternate, sessile, lanceolate, smooth, with the margins scabrous. Panicle composed of a few rigid, one-flowered branches. Involvecrum imbricate, with the scales subulate, nearly equal. Florets of the ray linear, entire, white, tinged with pink; of the disk yellow. Seeds compressed, crowned with a five-toothed margin. Receptacle naked, hemispherical. Sp. pl. l. c.

Grows along the banks of swamps and ponds in Carolina, Pursh. Walter appears to have seen this plant. I have not met with it in the low

country of Carolina.

Flowers August-September.

### 2. GLASTIFOLIA?

B. foliis inferioribus l serratis: floribus breviter pedunculatis; semi- | peduncles; seed obcornibus obcordatis, con- date, spicue alatis, pubescen- | winged, tibus; aristis pappi 2— 4. elongatis, scabris.

Lower leaves serrate; flowers on short conspicuously pubescent: awns of the pappus 2 -4, long, scabrous.

Sp. pl. 3. p. 2161. Mich. 2. p. 192. Pursh, 2. p. 561. Nutt. 2. p.

Root perennial. Stem erect, branching, three to four feet high, slightly angled, very smooth. Leaves long-lanceolate, acute, somewhat glaucous with the margins cartileginous, the lower ones remotely toothed, the upper ones obscurely five-nerved. Flowers solitary, on long scattered branches. Involucrum imbricate, leaves subulate, glabrous, with the margins slightly serrulate. Florets of the ray about thirty-six, white, with their summits slightly three-toothed; of the disk numerous, yellow. Stamens a little longer than the florets. Style as long as the stamens, two-cleft. Seeds pubescent, compressed, obovate, of the ray three-winged; of the disk two-winged; the wings fringed. Pappus of ten or more scabrous bristles, of which two, three, or four are sometimes long, the rest very short.

Grows in the river swamps, common on the Ogeechee.

Flowers August—November.

#### · 3. DIFFUSA. E.

B. glaberrima; foliis | diffusa, multiflora; seminibus obovatis, e- | longioribus. E.

Leaves linear-lancelineari-lanceolatis,mar- olate, scabrous along gine scabris; panicula the margin; panicle diffuse, many flowered; seed obovate, emargimarginatis, vix alatis; | nate, slightly winged; aristis pappi duabus awns of the pappus 2 long.

Root perennial? Stem two to three feet long, striate, glabrous, branching diffusely almost from the root, branches slender, expanding. Leaves two to three inches long, glabrous, entire? scabrous along the margins. Flowers small, numerous, in a loose spreading panicle. Peduncles one to two inches long, one-flowered. Scales of the involucrum linear, imbricate, glabrous. Florets of the ray numerous, linear, nearly white; of the disk numerous, yellow. Seed obovate, compressed, emarginate, scarcely winged the crown fimbriate, or fringed with small bristles, of which two are much longer than the rest and are about one third of the length of the seed.

Grows in damp rich soils between the Chatahouchie and Alabama.

Flowers September—October.

## CHRYSANTHEMUM. GEN. PL. 1307.

## 1. AUTUMNALE.

VOL. IL

H. foliis lanceolatis, Leaves lanceolate, serratis, decurrentibus; serrate, decurrent; floribus corymbosis; flowers in corymbs; corollulis disci 5-fidis; | florets of the disk 5radii planis, reflexis. | cleft; of the ray flat, reflexed.

Sp. pl. 3. p. 1120. Mich. 2. p. 133. Pursh, 2. p. 560. Nutt. 2. p. 173.

Root perennial. Stem two to three feet high, branching towards the summit, glabrous and winged by the decurrent leaves. Leaves alternate, sessile, doubly serrate, glabrous. Flowers in small corymbs, the peduncles pubescent near the summit. Involucrum eight-parted, the segments subulate, entire, twice as long as the disk. Florets of the ray about ten, obovate,

three-toothed at the summit, strongly nerved, yellow; of the disk numerous, vellow, tubular, five-cleft at the summit. Anthers a little longer than the florets. Seeds somewhat angular, increasing towards the summit. Pappus composed of five to six membranaceous scales, ovate, acuminate, mucronate, lacerate, shorter than the florets of the disk. Receptacle nearly globular, naked, excepting that between the florets of the ray are interposed subulate, entire scales as long as the florets of the disk.

Grows in wet soils, along the margins of fresh water rivers—very com-

mon.

Flowers October-November.

#### Mich. 2. Quadridentatum.

lanceolatis, integris, ceolate, entire, widely dentatis.

H. foliis angusto- | Leaves narrow lanlatius decurrentibus; decurrent; florets of flosculis disci quadri- the disk 4-toothed.

Mich. 2. p. 132. Pursh, 2. p. 560. Nutt. 2. p. 173.

Michaux describes this plant as growing in Carolina. Nuttall mentions it as seen by him in Louisiana. Pursh speaks of it also as a Mississippi plant, and says that its flowers are smaller than those of the preceding species. I have a specimen which I was once disposed to consider as belonging to this species, it differs, however, in several respects, but as it is imperfect I shall briefly notice it in this place.

Stem about three feet high, winged, the wings less conspicuous than those of the H. Autumnale, pubescent. Upper leaves remote, linear-lanceolate, pubescent, entire; the lower ones in my specimen wanting. Flowers solitary, terminating the small branches. Involucrum about twelve-parted? Flores of the ray obovate, with the summit three or four toothed, yellow, larger than those of the H. Autumnale; of the disk very numerous, four or five parted. Seeds hispid, covered with scales rather than with hair. Papper composed of six ovate acuminate, mucronate scales. Receptacle oblong. resembling that of the Rudbeckia.

Grows in the swamps of Carolina. Flowers September—October.

## ECLIPTA. GEN. PL. 1316.

Involucrum poly- Involucrum many phyllum, foliis subæqua- leaved, the leaves Corollulæ disci nearly equal.

### 1. ERECTA.

E. erecta, dichoto-1 strigosa; foliis lanceolatis, basi attenuatis, rariter serratis: Pursh.

Erect, dichotomous, strigose; leaves lanceolate, attenuate base, rarely serrate: pedunculis geminis, e- | peduncles by pairs, longatis; involucri foli | long; leaves of the inolis ovatis, acuminatis. | volucrum ovate, acuminate.

Sp. pl. 3. p. 2217. Pursh, 2. p. 561. Nutt. 2. p. 169.

Plant annual. Leaves opposite, sessile, lanceolate, serrate, triplinerved, remote. Peduncles by pairs, long. Flowers small, white. Lin. Grows in dry gravelly soils, Virginia to Florida. Pursh, Flowers June—July.

#### Mich. 2. Procumbens.

E. procumbens as- | Procumbent or assurgensve; foliis longo lanceolatis, inferne angustatis, rariter serratis; involucri foliolis acute lanceolatis; flosculis quadrifidis. Mich. drifid.

Mich. 2. p. 129. Pursh, 2. p. 562. Nutt. 2. p. 169.

Root annual? Stem procumbent, one to two and a half feet long, terete. sometimes turgid below the joints, branches numerous, opposite, radicant, and with the whole plant sprinkled with rigid appressed hairs. Leaves sessile, triplinerved, opposite. Peduncles about an inch long, generally in pairs, but never, I believe, opposite. Involucrum eight to ten leaved; leaves lanceolate, serrate, fringed, arranged in one series but unequal in size, longer than the florets of the ray. Florets of the ray numerous, (twentyfour to thirty,) short, linear, white, two-toothed; of the disk tubular, white, four-cleft. Stamens four, as long as the florets of the disk; style as long as the stamens. Seed four-angled, roughened with tubercles, with a thick margin around the summit, crowned with a pappus composed of short, white, setaceous, deciduous bristles irregularly arranged. Receptacle bristly, the bristles almost setaceous, fringed, as long as the seed.

Grows in damp soils—very common.

Flowers June—October.

## 3. Brachypoda. Mich.

E. divaricato prostrata: foliis lanceolatis, rarissime serratis; pedunculis solitariis ge- serrulate; peduncles minisque, brevibus; in solitary and in pairs, lanceolatis: quinquefidis. Mich.

Divaricate, trate; leaves lanceolate, very sparingly foliolis ovali short; leaves of the inflosculis | volucrum oval-lanceolate: florets 5-cleft.

Mich. 2. p. 130. Pursh, 2. p. 562. Nutt. 2. p. 169. Amellus Carolinianus. Walt. p. 213.

This species, probably by its close resemblance to the preceding, has eluded my notice. Of many plants of this genus which I have examined, I have never found one with the florets of the disk five-cleft; yet Walter and Michaux both mention this character.

Grows in low sandy fields, Pursh; in Carolina, Mich.

Flowers July—September.

#### ANTHEMIS. Gen. Pl. 1312.

A. foliis bipinnatifi- | Leaves bipinnatifid,

Sp. pl. 3. p. 2208. Pursh, 2. p. 563. Nutt. 2. p. 171.

Root perennial. Stem about two feet high, pubescent. Leaves doubly pinnate, the segments linear, acute, dissected and toothed, all glabrous. Flowers with terminal corymbs. Involucrum many leaved, imbricate, scales ovate and lanceolate, hairy. Florets of the ray about five, white; of the disk more but not very numerous, white, tubular. Pappus none. Receptacle chaffy. Scales ovate, lanceolate, acute.

An exotic like the preceding, not so generally naturalized, but found very

frequently around buildings.

Flowers June-August.

## ACMELLA. Rich.

Involucrum paucifo-lium, foliis duplici se-rie. Semina tetragona, apice truncata, nuda.

Involucrum few lea-ved, leaves in a double series. Seeds 4-angled, truncate at the summit, um, paleaceum.

Receptaculum oblong- | naked. Receptacle oblong, chaffy.

### 1. Repens.

liis ovato lanceolatis, ovate-lanceolate, toothdenticulatis, tripliner- ed, triplinerved, a little vibus, parce pubescen- pubescent; peduncles tibus; pedunculis axil- axillary and terminal, laribus, terminalibusque, longissimis, uni-

A. caule repente; fo- | Stem creeping; leaves very long, one-flowered.

Pers. Syn. 2. p. 473. Nutt. 2. p. 171. Anthemis Repens. Walt. p. 211. Pursh, 2. p. 562. Spilanthus Repens. Mich. 2. p. 131.

Root perennial. Stem one to two feet long, recumbent, pubescent, taking root at the lower joints. Leaves opposite, ovate-lanceolate, acute, & base attenuated into a semiamplexicable petiole about an inch long. Flowers solitary, near the summit of the stem, peduncles three to four inches long. Involucrum composed of about twelve leaves arranged in a double series, leaves ovate-lanceolate, very acute, equal, pubescent. Plorets of the ray about twelve, yellow, unequally three-toothed, twice as long as the involucrum; of the disk numerous, tubular, with the border five-cleft. 🌆 there short, yellow. Style longer than the florets of the disk, two-cleft. Seeds oblong, obovate, compressed, naked. Receptacle chaffy. Scales obovate, acuminate, yellow.

Grows in wet soils.

Flowers September—October.

Root perennial. Stem two to four feet high, glabrous, dichotomously branching. Leaves opposite, ovate-lanceolate, triplinerved, coarsely serrate, nearly smooth, and glabrous. Flowers solitary, terminal, and in the divisions of the stem, on long peduncles. Involucrum many leaved, imbri-, cate, leaves oblong, rather obtuse. Florets of the ray oblong, yellow, about ten? of the disk numerous. Seeds four-angled, naked. Receptacle convex, scaly, the scales longer than the seeds.

Grows in dry sandy soils—not common in the low country of Carolina.

Flowers May-June.

## TETRAGONOTHECA. L'Heritier.

Involucrum

mono- | Involucrum one-leaphyllum, 4-gonum, 4- ved, 4-angled, 4-partpartitum, latissimum. ed, very broad. PapPappus nullus. Receptaculum paleaceum. chaffy.

## 1. Helianthoides.

Willd. Sp. pl. 3. p. 2116. Pursh, 2. p. 563. Nutt. 2. p. Polymnia Tetragonotheca. Walt. p. 216. Mich. 2. p. 147.

Root perennial. Stem herbaceous, erect, two to three feet, high, branching, somewhat hispid, and with the whole plant scabrous. Leaver opposite, sessile, spathulate-lanceolate, dentate, bairy, sprinkled with glandular atoms. Flowers solitary, axillary and terminal. Involucrum one-leaved, deeply four-parted, the segments ovate-lanceolate, acute, hairy on the outer surface, glabrous within, the margins reflected and united render the involucion four-angled, and in some measure four-winged. Florets of the ray six to eight, large lanceolate, unequally three-toothed, yellow; of the disk numerous, (about fifty,) tubular, yellowish, with the margin five-cleft. Anthers longer than the florets of the disk. Styles longer than the stamens, twocleft. Stigmas reflexed. Seeds obovate, slightly angled, pubescent at the summit. Pappus 0. Receptacle conic, chaffy, the scales lanceolate, acuminate, nerved, sprinkled with glandular dots.

Grows in dry sandy soils.

Flowers May-June, and frequently again in the autumn.

Sp. pl. 3. p. 2064. Walt. p. 212. Mich. 2. p. 130. Pursh, 2. p. 563. Nutt. 2. p. 172.

A small shrubby plant with stoloniferous roots. Stem one to two feet high, glabrous, pubescent at the summits, branching. Leaves opposite, sessile, semiamplexicaule, entire, obscurely three-nerved, glaucous, the attempt ated base two to five toothed, sometimes on the branches one or none. Flowers solitary, terminal. Involucrum many leaved, imbricate; leaves lanceolate, acuminate, mucronate, expanding. Florets of the ray ten to twelve, yellow, lanceolate, nearly acute at the summit; of the disk numerous,

longer than the involucrum, yellowish, five-cleft. Styles and stamens about as long as the florets of the disk. Seeds of the ray three; of the disk four angled, crowned with a four-toothed membrane, the angles very acute. Receptacle flat, impressed, chaffy; chaff obovate, acuminate, with a rigid point, pubescent.

Grows along the margin of salt water.

Flowers June-October.

#### 2. Angustifolium. Pursh.

B. foliis alternis, linearibus, superne latio- linear, broader

Leaves alternate. integerrimis, the summit, entire, glaglabris; involucri folio- brous; leaves of the lis acute lanceolatis. involucrum acutely lanceolate.

Pursh, 2. p. 564. Nutt. 2. p. 172.

With this species, which was described by Pursh from specimens in the Herbarium of Sir Joseph Banks, I am unacquainted. It was found probebly in Florida by Bartram.

Grows in Georgia and Florida. Pursh.

Flowers—

## SIEGESBECKIA. Gen. Pl. 1320.

Sp. pl. 3. 2222. Walt. p. 213. Mich. 2. p. 134. Pursh, 2. p. 564. Nutt. 2. p. 170.

Root perennial. Stem herbaceous, erect, three to six feet high, furrowed pubescent, towards the base irregularly winged by the decurrent leaves. Leaves alternate, spathulate, ovate-lanceolate, acute, toothed, hairy, and scabrous on the upper surface, almost tomentose underneath. Flowers numerous in a terminal corymb. Involucrum many leaved, imbricate; leaves oblong, pubescent, shorter than the disk. Florets of the ray about three, white, oval, two to three toothed; of the disk about fifteen, tubular, nearly white, with the border five-cleft. Seeds four-angled, compressed, heavy,

enounced with two scalarous bristles. Receptacle flat, chaffy. Scales oblong, obovate, somewhat acute, hairy, a little shorter than the florets.

Grows in the middle country of Carolina and Georgia.

Flowers August and September.

### 2. SINUATA.

V. foliis alternis, sessilibus, sinuatis, basi- sessile, sinuate, attenuattenuatis; floribus co- ate at base; flowers in

Leaves alternate. rymbosis, albis; invo-lucris imbricatis. | corymbs, white; invo-lucrum imbricate.

### V. Laciniata. Nutt. 2. p. 170.

Root perennial. Stem herbaceous, erect, four to six feet high, pubescent, striate, and towards the base irregularly winged. The upper and lowest leaves frequently spathulate, ovate, acute and acuminate, the intermediate deeply sinuate, with the sinuses obtuse and the lobes generally acute, all scabrous on the upper surface, pubescent underneath. Involucrum about ten-leaved, leaves pubescent, slightly obovate, scarcely half as long as the disk. Florets of the ray three to five, white, oval, twice as long as the disk; of the disk twelve to twenty, tubular, with the border five-cleft. Anthere as long as the corolla, like those of the preceding species nearly black. Seeds cuneate, obovate, compressed, winged, crowned with two awns, the awns and wings hairy. Receptacle small, chaffy. Scales lanceolate, concave, compressed, acute, pubescent, a little longer than the seeds.

I sent specimens of this plant to Dr. Muhlenberg many years ago, under the name of V. Sinuata; as it still appears to me the most appropriate name

I have retained it.

Grows on the sea islands in sandy soils, Eddings' Island, Hilton Head. Flowers October and November.

#### Mich. 3. Siegesbeckia.

V. caule alato; foliis oppositis, ovato-lancegulariter multifloris.

Stem winged; leaves opposite, ovate-lanceoolatis, utrinque acumi-natis, acute serratis; co-rymbo brachiato; ra-late, acuminate at each end, acutely serrate; corymb brachiate; mulis summitate irre- branches irregularly many flowered at the summit.

Willd. Sp. pl. 3. p. 2224. Mich. 2. p. 134. Purch, 2. p. 565. Nutt. 2. p. 170.

V. Occidentalis. Walt. p. 213.

Siegesbeckia Occidentalis. Lin. Gron.

Root creeping, perennial. Stem herbaceous, erect, four to six feet high, pubescent, four-winged, branches opposite, brachiate. Leaves large ovate, acuminate, acutely and irregularly toothed, triplinerved, pubescent, somewhat scabrous, abruptly attenuated at base into a petiole one to two inches long. Plowers in large somewhat fastigiate corymbs, the small branches of peduncles alternate. Involucrum eight to ten leaved, loosely imbricate, the leaves oblong, obtuse, pubescent, the interior resembling scales. Florets of the ray one to three, yellow, lanceolate, three-toothed at the summit, nearly an inch long; of the disk twenty to twenty-four, tubular, yellow, fivecleft at the summit. Seeds obovate, compressed, hispid, crowned with two hairy awns. Receptacle Mat, chaffy; scales lanceolate, acuminate, pubescent, as long as the florets of the disk.

Grows in dry sandy soils. Flowers June—August.

## 1. Helianthoides? Nutt.

A. foliis lanceolatis,

Leaves lanceolate. acutis, serratis, subtus acute, serrate, villous villosis, scabris; caule underneath, scabrous; alato, panicula pauci- stem winged; panicle flora, radiis elongatis. few flowered; florets of the ray long.

. Natt. 2. p. 181.

Stem three to four feet high, nearly terete but conspicuously winged, slightly scabrous. Leaves lanceolate, acute, serrate, slightly scabrous, villoas underneath, very slightly canescent, three to five inches long, two to three wide. Flowers in a small terminal corymb. Scales of the involutrum ovate and oval lanceolate, hearly equal, hispid, arranged in two series. Florets of the ray ten to twelve, narrow lanceolate, one and a half to two inches long, bright yellow; of the disk numerous, yellowish. Seeds compressed, very slightly winged, hairy, crowned with two persistent awas about one third of their own length. 'Receptacle rather convex, chaffy, the chaff lanceolate, concave, rather longer than the body of the seeds.

Grows near Louisville, Georgia. Mr. Jackson.

Flowers

## 2. SQUARROSA.

A? caule erecto, alato, superne pubescente; | pubescent towards the folis lanceolatis, ser-ratis, scabris; panicula laxa, foliosa; involucro patente; receptaculo summit; leaves lanceo-late, serrate, scabrous; panicle loose, leafy; involucrum expanding; subgloboso.

Stem erect, winged, receptacle nearly globose.

Nutt. 2. p. 181. Coreopsis Alternifolia, Sp. pl. 3. p. 2257. Verbesina Coreopsis, Mich. 2. p. 194. Pursh, 2. p. 565.

### a FLAVA.

Plant three to seven feet high, erect, winged, glabrous when old. Leaves broad lancacista, acute, serrate, scabreus, tapering at base to a short petiole. Flowers in a terminal panicle. Scales of the involucrum linear-lanceolate. expanding, finally reflexed, arranged in one? series. Florets of the ray about four, nearly an inch long, linear-lanceolate, expanding or reflexed, yellow; of the disk numerous. Seed compressed, slightly winged, a little hairy, crowned with two persistent awas. Chaff of the receptacle ovatelanceolate, rather longer than the seeds.

#### B ALBA.

Stem, leaves and panicle very similar to those of the preceding variety. Leaves narrow lanceolate, very scabrous and dotted on the upper surface. Scales of the involucrum about eight, linear-lanceolate, shorter than the disk, expanding or reflexed, arranged in a single series. Florets of the ray hone; of the disk numerous, white, glabrous. Seeds obovate, compressed, pubescent. Receptacle globose, chaff ovate-lanceolate, slightly acuminate, fringed.

Grows, variety a in the upper country of Carolina and Georgia; & in the

low country of Carolina.

Flowers August-October.

## HELIANTHUS. GEN. PL. 1322.

### 1. ATRORUBENS.

H. hispidus; caule superne nudiusculo laxe paniculato; foliis spa-thulatis, oblongo-ovatis, crenatis, triplinervibus, supra scabris; involucri long ovate, crenate, triplinerved, scabrous squamis ovato-lanceo- on the upper surface; latis, longitudine disci. scales of the involucrum

Hispid; stem naked towards the summit. ovate-lanceolate. as long as the disk.

Sp. pl. 3. p. 2254. Walt. p. 216. Mich. 2. p. 140. Pursh, 2. p. 570. Nutt. 2. p. 177.

Root perennial. Stem herbaceous, three to four feet high, muricate, with a few long branches. Leaves opposite, spathulate, but tapering at base, ovate, acute, toothed, scabrous on the upper surface, hairy and rather soft underneath, triplinerved, paler underneath; those near the base crowded and nearly a foot long, the upper ones small, sessile, and almost connate. Flowers in a loose terminal panicle. Involucrum many leaved, (twenty to twenty-four,) imbricate, leaves slightly obovate, ciliate, erect. Florets of the ray (fourteen) lanceolate, nerved, yellow, about an inch long; of the disk numerous, tubular, dark purple. Seeds oblong, four-angled, compressed, a little hairy on the summit, crowned with two long, fringed, deciduous awlos. Receptacle convex, chaffy, the chaff nearly as long as the corolla, concave, keeled, three-cleft at the summit, the middle segment long and with the keel fringed.

Grows generally in dry soils. Flowers September-October.

### 2. Sparsifolius.

mulis subglabris; foliis ovatis, acutis, grosse dentatis, hispidis, utrinque scaberrimis, abrutte in petiolum angustatis; involucri squamis ovali-lanceolatis, ciliatis; disco atro rubente.

H. caule scabro, ra- | Stem scabrous, the branches nearly glabrous; leaves ovate. acute, coarsely toothed, hispid, very scabrous on both surfaces, abruptly contracted into a petiole; scales of the involucrum oval-lanceolate, ciliate; disk dark

To the H. Atrorubens this plant bears a strong affinity. It is larger, however, and its leaves instead of tapering to the base with a slight acumination, abruptly terminate on hispid petioles two to three inches long; they are broader also, much more rough, particularly on the under surface, and are coarsely and irregularly toothed.

Stem four to five feet high, with long slender generally smooth branches. Leaves opposite, distant, the upper nearly sessile. Flowers in a loose scattered panicle. Florets of the ray about fourteen, bright yellow; of the disk numerous, dark purple. Leaves of the involucrum about as long as the disk, finely fringed. Pappus subulate. Chaff of the receptacle lanceolate, nearly entire.

Grows in the western districts of Georgia.

Flowers August—October.

## 3. Angustifolius.

Sp. pl. 3. p. 2244. Walt. p. 216. Mich. 2. p. 141. Pursh, 2. p. 572. Nutt. 2. p. 178.

Root perennial. Stem two to three feet high, pubescent, sparingly branched. Leaves opposite below, alternate near the summit of the stem, scabrous on the upper surface, pubescent and somewhat rough underneath. Flowers small, terminal. Leaves of the involucrum very acute, as long as the calc Florets of the ray about twelve, about an inch long, yellow; of the disk at purple at the summit. Seeds compressed. Pappus setaceous, fridad, about half as long as the seed. Receptacle convex, chaff concave, slightly three-cleft at the summit.

Grows in damp soils, most common in wet pine barrens. Flowers August-October; sometimes in April.

- Havescentibus.
- Floribus disci \*\* Florets of the ntibus. disk yellowish.
- † Foliis omnibus op- | † Leaves all oppopositis.
  - Schweinitz. 4. TRUNCATUS.

H. caule gracili, glafoliis oppositis bro; ovatis, superne attenuscabris, arcte sessilibus; involucri squamis ovato-lanceolatis, ciliatis; paleis lanceolatis, que. E.

Stem slender, brous; leaves opposite, ovate, tapering towards atis, serratis, pilosis, the summit, serrate, hairy, scabrous, closely sessile; scales of the involucrum ovate-lanceolate, ciliate; chaff ciliatis pubescentibus- lanceolate, ciliate, pubescent.

Root perennial. Stem about two feet high, slender, simple, sometimes divided at the base, glabrous. Leaves all opposite, abruptly rounded at base, triplinerved, paler undermath. Flowers few, small, terminal. Pedencles or small branches generally apposite. Leaves of the involucrum about as long as the disk, somewhat hispid on the inner surface. Florets of the ray ten to twelve, narrow, scarcely an inch long; of the disk not numerous, yellowish. Pappus subulate. Chaff of the receptacle undivided, pubescent, and fringed along the summit.

Sent to me under this name by Dr. Schweinitz from Salem, North-Carolina. Found abundantly in the western districts of Georgia. The latter rather more hispid and rough than my specimens from North-Carolina; in-

all other respects exactly similar. Flowers August-October.

#### Pursh. 5. Longifolius.

H. glaberrimus; cau-🕏 paniculato, ramis summitate paucifloris: ricatis.

Very glabrous; stem paniculate, the branches bearing a few flowfoliis subsessilibus lon-lers at the summit; gissime-lanceolatis, tri- leaves nearly sessile, plinervibus, integerri-mis, inferioribus serra-triplinerved, entire, the tis; involucri squamis lower serrate; scales ovatis, acutis, exteri- of the involucrum ooribus linearibus, diva- vate, acute, the exterior linear, divaricate.

Parsh, 2. p. 571.

Perennial. Stem three to four feet high, (four to seven, Pursh,) yery glabrous, tinged with purple. Leaves six to eight inches long, four to six lines wide, glabrous, obscurely triplinerved, generally entire, tapering towards the base, yet finally connate, forming a short sheath; near the root munarous, along the stem very distant. Flowers in a small terminal corymb, the branches alternate. Scales of the involucrum ovate-lanceolate, nearly glabrous. Florets of the ray about ten, small for this genus. Pappue subulate, caducous. Scales of the receptacle lanceolate, concave, conspicuously three-toothed.

This species, which agrees in habitat and character with the H. Longifolius of Pursh, is certainly remarkable. It has all the artificial, and I believe, essential characters of Helianthus, with the aspect of an aquatic Corcopsis.

Grows in damp rich soils in the western districts of Georgia.

Flowers September—October.

### 6. Pubescens.

H. cano-pubescens; caule villoso, foliis sessilibus, cordato-ovatis, amplexicaulibus, tripli nervibus, crenulatis, mollissimis; involucri squamis lanceolatis, villosis.

Pubescent, hoary; stem villous; leaves sessile, cordate-ovate, amplexicaule, triplinerved, crenulate, very soft; scales of the involucrum lanceolate, villous.

Sp. pl. 3. p. 2244. Pursh, 2. p. 570. Nutt. 2. p. 177. H. Canescens, Mich. 2. p. 140.

Root perennial. Stem two to three feet high, erect, nearly simple, villous, hoary. Leaves all opposite, cordate, ovate, acute, sessile, pubescent, soft excepting the margins which are very scabrous, the nerves and very prominent, and apparently bordering the young leaves. Flowers few, railly exceeding two to three, terminating the small branches. Involucrum imbricate, scales somewhat subulate, acute, very villous. Florets of the ray (fourteen to sixteen) lanceolate, nearly entire, yellow or rather tawny; of the disk numerous, tubular, yellowish, five-cleft, pubescent at the summits. Stamens and styles as long as the florets. Seeds compressed, a little hairy. Pappus composed of two membranaceous, concave, subulate scales, fringed, and about half the length of the seed. Receptacle convex, chaffy; the chaff lanceolate, concave, acute, entire, hairy towards the summit.

Grows around ponds near the Flint River, Georgia. Along the "Federal

Road" from Milledgeville to the Alabama.

Flowers August-September.

### 7. Mollis. Willd.

H. caule inferne lævi, superne scabriusculo; foliis ovato-lanceolatis, acutis, serratis, supra scabris, subtus pubescentibus, albo tomentosis; floribus paucis, terminalibus.

Stem smooth below, scabrous near the summit; leaves ovate-lanceolate, acute, serrate, scabrous on the upper surface, pubescent and haory underneath; flowers few, terminal.

Sp. pl. 3. p. 2240. Pursh, 2. p. 572. Nutt. 2. p. 178.

Root perennial, creeping. Stem herbaceous, three to six feet high, purple, smooth, slightly scabrous near the summit. Lower leaves opposite, the upper alternate, all ovate-lanceolate, very acute, with glandular serratures, pubescent and somewhat glaucous underneath. Petioles short, fringed. Flowers few, in a terminal panicle. Involucrum imbricate, leaves (twentythree to twenty-seven) oblong, lanceolate, hairy, fringed. Florets of the ray about ten, lanceolate, hairy, yellow, about an inch long; of the disk numerous, yellowish. Stamens and styles scarcely as long as the florets of the disk. Seeds compressed. Pappus acuminate, hairy. Chaff of the receptacle concave, three-cleft at the summit, hairy near the summit and along the keel.

This plant agrees in many respects with the H. Mollis as described by Pursh, but it certainly is not the H. Tomentosus of Michaux. A variety in the low country with the leaves pubescent and only slightly glaucous, I have always considered as the H. Lævis of Walter, but Walter's name could scarcely be retained to a plant which in reality has nothing smooth

about it but the lower part of the stem.

Grows in dry, moderately fertile soils. Flowers July—August.

### 8. Hispidulus.

H. caule scabro; foliis oppositis, sessilibus, ovato-lanceolatis, superne attenuatis, sersubtus pallidioribus, his- upper surface, paler pidulis; involucri squa- underneath and slightmis ovato-lanceolatis.! ciliatis: paleis tridentatis. E.

Stem scabrous; leaves opposite, sessile, ovatelanceolate, tapering towards the summit. serrulatis, supra scabris, rulate, scabrous on the ly hispid; scales of the involucrum ovate-lanceolate, ciliate; chaff 3-toothed.

Root perennial. Stem erect, scabrous, three to four feet high. Leaves long, narrow, tapering to their summits, triplinerved, very obscurely serru-Flowers few, terminal. Peduncles opposite, the upper pair generally longer than the stem. Leaves of the involucrum ovate-lanceolate, as long as the disk scabrous, ciliate. Florets of the ray eight to ten, about an inch long, yellow; of the disk numerous. Pappus subulate, pubescent. Chaff of the receptacle nearly as long as the florets of the disk, three-toothed, hairy along the back and summits.

Grows in the pine barrens near Louisville, Georgia. Mr. Jackson.

Flowers September—October.

## 9. STRUMOSUS.

plinervibus. Willd. basi ciliatis.

H. foliis ovatis, acu | Leaves ovate, acuminatis, serratis, tri- minate, serrate, triplisubtus nerved, scabrous unscabris; involucri squa- derneath; scales of the mis lineari-lanceolatis, involucrum linear-lanceolate; ciliate at base.

Sp. pl. 3. p. 2242. Pursh, 2. p. 571. Nutt. 2. p. 178.

My friend Dr. Schweinitz sent me under this name a plant of which the following is a brief description. The short and defective account of this species in Willdenow and Pursh, does not enable me to ascertain whether

we have all described the same plant.

Root perennial. Stem tall, slender, sparingly branched, glabrous. Leaves lanceolate, sometimes ovate-lanceolate, acuminate, conspicuously serrate, thin, slightly scabrous on both surfaces, paler and sprinkled with hairs derneath, on short petioles, the lower opposite, the upper alternate. ers small, few, terminal. Leaves of the involucrum linear-lanceolate, about as long as the disk, ciliate, with the hairs nearly obliterated towards the summit. Florets of the ray eight to ten, yellow, about an inch long; of the disk not numerous. Pappus nearly setaceous. Chaff of the involucrum nearly as long as the florets, pubescent near the summit, with two lateral teeth not opposite.

Collected near Salem, North-Carolina, and to be found most probably

along the base of the Alleghany mountains in Carolina and Georgia.

#### Var. a. PALLIDUS.

From Louisville, Georgia, I have received a specimen which at present I can only arrange as a variety of the preceding. Stem very slender. Leaves all opposite, narrow, lanceolate, long, tapering to the summit but scarcely acuminate, very thin, nerves prominent, slightly scabrous, light green, but paler and pubescent underneath. Flowers few, small, terminal. Leaves of the involucium fewer than in the preceding variety, shorter than the disk, fringed. Florets of the my eight? small; of the disk not numerous. Stamens longer than the florets of the disk. Pappus setaceous. Chaff of the receptacle pubescent, entire or three-toothed at the summit. The chaff, the involucrum, and the opposite narrow leaves seem to mark this as a distinct species. Sent by Mr. Jackson.

que scabriusculis, longe | brous on both surfaces, petiolatis, membrana-ceis; involucri squamis lanceolatis, ciliatis; flo-the involucrum lanceoribus parvis. E.

grosse serratis, utrin- | ly serrate, a little scalate, ciliate; flowers

Root perennial. Stem about four feet high, terete, glabrous. Leaves large, opposite, on petioles two to three inches long, spathulate ovate, thinner than those of any other species with which I am acquainted, excepting. those of H. Strumosus, slightly scabrous, not hairy on the upper surface, paler and a little pubescent on the under. Flowers few, small, terminal. Leaves of the involucrum lanceolate, fringed, appressed, as long as the disk. Florets of the ray about ten? yellow, about an inch long; of the disk not numerous. Seed obovate, compressed. Pappus subulate, pubescent. Clayof the receptacle slightly tridentate, fringed at the summit and along the tok.

In structure and habit very similar to H. Spathulatus, but with thinner leaves, longer petioles, and smaller flowers.

Grows in the western districts of Georgia.

Flowers August—October.

### 11. Spathulatus.

H. caule superne scabro; foliis oppositis, spathulato-ovatis, paulo acuminatis, serratis; supra scabris subtus pubescentibus; ramulis on the upper surface, lanceolatis, squamis hispidis; paleis acuminatis, integris. E.

Stem scabrous near the summit; leaves opposite, spathulate-ovate, slightly acuminate, serrate, scabrous oppositis; involucri pubescent underneath; branches opposite; scales of the involucrum lanceolate, hispid; chaff acuminate, entire.

Root perennial. Stem four to six feet high, terete, striate, scabrous towards the summit, branches few, and in my specimens with the leaves always opposite. Leaves ovate, with long, tapering, slightly acuminated summits, as in almost every species triplinerved, abruptly attenuated at base into a petiole about half an inch long, pubescent and soft underneath. Flowers

terminating the branches. Leaves of the involucrum lancoolate, with tapering subulate summits, about as long as the disk. Florets of the ray ten to twelve? yellow, about an inch long, pubescent, slightly emarginate; of the disk numerous. Seed four-angled, rather long. Pappus subulate, pubescent. Chaff of the receptacle not as long as the florets of the disk, acuminate, very hispid just below the summit.

I have a variety of this plant differing with narrower, oval-lanceolate

leaves, and very prominent serratures.

To the H. Macrophyllus of Willd. this plant appears to bear a strong resemblance. But Pursh places that species, with which I am unacquainted, among those with alternate leaves, while in this plant they are uniformly The size of the leaves would hardly justify Willdenow's specific name.

Grows in the western districts of Georgia.

Flowers August to October.

#### 12. Tricuspis. E.

H. foliis oppositis, oblongis, ovato-lanceceptaculi paleis tricuspidatis.

Leaves opposite long, ovate-lanceolate, olatis, utrinque scabris; scabrous on both surinvolucri squamis lato-subulatis, ciliatis; re-volucrum broad subulate, ciliate; chaff of the receptacle 3-cuspi-

Root perennial. Stem three to four feet high, and with the whole plant very scabrous, branches and leaves very regularly opposite. Leaves much whitened on the upper surface by the blistered epidermis; of a dull uniform brown colour, though very scabrous underneath, triplinerved, with the margins revolute, nearly entire. Flowers few, terminating the branches. Lavolucrum many leaved, leaves subulate, wide at base, the interior rather longer. Florets of the ray fourteen to sixteen, about one and a half inches long, yellow. Stamens longer than the florets of the disk. Seed compressed. Pappus nearly as long as the seed, subulate, lacerate. Chaff of the receptacle tricuspidate, the middle segment the largest and somewhat acuminate.

This plant in its artificial character resembles much the H. Decapetalus, but it is a much harsher and coarser plant, and its opposite leaves and branches also distinguish it. The chaff of the receptacle is more deeply three-cleft than in any other species which I have examined. To the H. Scaberrimus it is much more nearly allied.

Grows in the western districts of Georgia.

Flowers September-October.

#### 18. Diversiroling. E.

H. caule scabro; foliis oppositis, inferioribus ovato-lanceolatis. acuminatis, superioribus cordato-ovatis, mucronatis, omnibus su- all scabrous on the upcri squamis lanceolatis, dentatis. E.

Stem scabrous; leaves opposite, the lower ovate lanceolate, minate, the upper cordate ovate, mucronate, pra scaberrimis, subtus per surface, pubescent pubescentibus; involu- underneath; scales of the involucrum lanceociliatis; paleis sub tri- | late, ciliate; the chaff slightly 3-toothed.

Root perennial. Stem three to five feet high, very scabrous, with branches and leaves opposite. Lower leaves ovate-lanceolate, serrulate, with a tapering base, the upper abruptly contracted, nearly entire, all on hispid peticles two to three lines long. Leaves of the involucrum imbricate, scarcely as long as the disk. Florets of the ray ten to twelve, yellow, scarcely an inch long; of the disk numerous. Pappus subulate, concave, pubescent, longer than the seed. Chaff of the receptacle hairy at the summit, with two small but very distinct lateral teeth.

Grows in the western districts of Georgia. Somewhat resembling the H.

Tricuspis but very distinct.

Flowers August—October.

### 14. Scaberrimus.

H. foliis oppositis, lanceolatis. scaberrimis. gerrimis; taculi paleis integris, dorso ciliatis.

Leaves opposite, utrinque lanceolate, very scasubinte- brous on both surfaces, involucri | nearly entire; scales of squamis ovatis; recep- the involucrum ovate; chaff of the receptacle entire, fringed on the

Root perennial. Stem four to six feet high, very scabrous and very sparingly divided. Leaves lanceolate, with a long tapering base, whitened and blistered on both surfaces, opposite. Flowers very few. Involucrum many leaved, leaves ovate, finely tringed, appressed, imbricate, the interior the longest. Florets of the ray sixteen to twenty, about an inch long; of the disk numerous. Pappus nearly as long as the seed, subulate, pubescent. Chaff of the receptacle concave, entire at the summit.

Grows in the western districts of Georgia.

Flowers September-October.

# †† Foliis superiori- | \* Upper leaves albus alternis.

## 15. TRACHELIFOLIUS.

H. foliis ovato-lanceolatis, acuminatis, ser- olate, acuminate, serratis, triplinervibus, rate, triplinerved, very utrinque scaberrimis; scabrous on both sur-involucri squamis line-ari-lanceolatis, ciliatis, exterioribus longiori-olate, ciliate, the extebus.

Leaves ovate-lancerior the longest.

Sp. pl. 3. p. 2241. Pursh, 2. p. 570. Nutt. 2. p. 177. H. Gigas, Mich. 2. p. 141.

Root perennial. Stem erect, three to four feet high, branching towards. the summit, very scabrous. Leaves narrow, ovate-lanceolate, dightly acuminate, with glandular serratures, attenuated at base into a short petiole, tomentose and rough underneath, the upper surface whitened by the blistered and scabrous epidermis. Flowers in a loose terminal paniele. Issebucrum many leaved, leaves subulate, fringed. Florets of the ray ten to twelve, yellow, of the disk very numerous. Seed obovate, compressed, glabrous. Pappus subulate, very acute, a little pubescent. receptacle concave, three-toothed and hairy at the summit.

Grows near the mountains of Carolina. Dr. Macbride.

Flowers in September.

## 16. Tomentosus.

H. caule aspero; fo-liis ovato-lanceolatis, ovate-lanceolate, taper-superne attenuatis, a-ing to the summit, acutis, serrulatis, supra cute, serrulate;

scabris, subtus tomen- brous on the upper

tosis, plerumque alter- | surface, tomentose unnis; involucri squamis derneath, generally alfoliaceis, squarrosis, ternate; scales of the lanceolatis; paleis trifi- involucrum leaf-like,

squarrose, lanceolate; chaff 3-cleft.

Stem four to six feet high, pubescent and scabrous, sparingly branched. Upper leaves alternate, very long, ovate and oval-lanceolate, sometimes slightly acuminate, with fine and distant serratures. Flowers terminal, rather large, on short and robust peduncles. Leaves of the involucrum longer than the disk, ciliate with long tapering hispid summits. Florets of the ray twelve to fourteen, yellow; of the disk numerous, five-cleft, with the Seeds four-angled, slightly compressed. Pappus subulate. summits hairy. Chaff of the receptacle three-cleft, hairy towards the summit, the middle segment much larger than the lateral.

This plant appears to me to approach very near to the H. Tomentosus of Michaux; it is not the H. Mollis of Willd.; perhaps these plants, hitherto

united, are really distinct.

Grows in the western districts of Georgia, and between the Chatahouchio and Alabama rivers.

Flowers August—October.

## 17. DECAPETALUS.

H. foliis ovatis, acuminatis, remote serratis, triplinervibus, concoloribus, supra scabris, subtus pubescentibus, scabriusculis; involucri squamis ovatolanceolatis, subæqualibus, ciliatis.

Leaves ovate, acuminate, remotely serrate, triplinerved, uniformly coloured, scabrous on the upper surface, pubescent underneath, slightly brous; scales of the involucrum ovate-lanceolate, nearly equal,

Sp. pl. 3. p. 2241. Pursh, 2. p. 571. Nutt. 2. p. 178.

Root perennial. Stem three to four feet high, pubescent, scabrous, branching. Leaves towards the summit alternate, somewhat spathulate, the petioles fringed at base. Flowers in terminal panicles, large. Leaves of the involucrum long, equal, almost subulate but wide at base, beautifully fringed. Florets of the ray ten to twelve, lanceolate, yellow, nearly two inches long; of the disk numerous. Anthers longer than the florets of the disk. Seed long, compressed. Pappus subulate, much shorter than the seed, a little hairy. Chaff of the receptacle shorter than the florets of the disk, fringed near the summit.

Grows in dry soils, Pursh. Louisville, Georgia, Mr. Jackson.

Flowers August-October.

### 18. Multiflorus.

H. foliis triplinervibus, scabris, inferioribus cordatis, superioribus ovatis; radio multifloro; involucri squamis lanceolatis.

Leaves triplinerved, scabrous, the lower cordate, the upper ovate; florets of the ray numerous; scales of the involucrum lanceolate.

Sp. pl. 3. p. 2239. Pursh, 2. p. 572. Nutt. 2. p. 178.

Root perennial. The lower leaves cordate, triplinerved. Stem and peduncle scabrous. Leaves of the involucrum forty to fifty, loosely imbricate, not squarrose. Florets of the ray very numerous.

Grows in dry mountain woods from Pennsylvania to Carolina. Pursh,

Flowers July—September.

### 19. GIGANTEUS.

H. foliis alternis, lanceolatis, serratis, scabris, obsolete triplinervibus, utrinque attenuatis, subsessilibus, basi ciliatis; involucri squamis lanceolatis ciliatis.

Leaves alternate, lanceolate, serrate, scabrous, obscurely triplinerved, tapering at each end, nearly sessile, ciliate at base; scales of the involucrum lanceolate, fringed.

Sp. pl. 3. p. 2242. Pursh, 2. p. 571. Nutt. 2. p. 177.

Root perennial. Stem very tall, branching, a little rough, particularly near the summit. Leaves generally attenuate, oblong, scabrous on the upper surface, paler and nearly smooth underneath. Flowers in a loose terminal

panicle. Involucram many leaved; leaves linear-lanceolate, hairy, fringed, rather longer than the disk. Florets of the ray twelve to fourteen, (twenty, Willd.) lanceolate, yellow, not large; of the disk very numerous. longer than the florets of the disk. Seed compressed, glabrous. Pappus subulate, longer than the seed. Chaff of the receptacle hairy at the summit, with two slight lateral teeth.

Grows in the mountains of Carolina.

Flowers August—October.

### 20. ALTISSIMUS.

H. foliis alternis, ovato-lanceolatis, ser- | ratis, scabris, triplinervibus, apice attenuatis, atis; involucri squamis | lanceolatis, ciliatis.

Leaves alternate, ovate-lanceolate, rate, scabrous, triplinerved, tapering topetiolatis; petiolis cili- wards the summit, on petioles; petioles fringed; scales of the invo-lucrum lanceolate, fringed.

Sp. pl. 3. p. 2273. Nutt. 2. p. 178. Pursh, 2. p. 571.

Resembles the preceding; but the stem is smooth and purple. Leaves petiolate, broader and almost ovate-lanceolate. Leaves of the involucrum Florets of the ray about sixteen. Willd.

With this species I am unacquainted.

Grows in mountain meadows from Pennsylvania to Carolina. Pursh. Flowers July to September.

### 21. DIVARICATUS.

H. caule glabro, ramosissimo; foliis ovatolanceolatis, triplinervibus, supra scabris, subtus glabriusculis; panicula multiflora, floribus minimis.

Stem glabrous, branching; leaves ovatelanceolate, triplinerved, scabrous on the upper surface, glabrous derneath; panicle many flowered, flowers very small

Sp. pl. 3. p. 570. Walt. p. 215? Mich. 2. p. 141. Pursh, 2. p. 570 Nutt. 2. p. 177.

Root perennial. Stem five to six feet high, glabrous, di and tri-chotomously divided, the branches much more numerous than usual in this genus. Leaves ovate-lanceolate, serrulate, with a long, tapering, somewhat acuminate point, scabrous on the upper surface, pubescent and sprinkled with glandular dots underneath, the lower ones opposite, the upper generally alternate, on petioles three to six inches long. Flowers very small, numerous, in terminal panicles. Involucrum imbricate, the leaves ovate-lanceolate, very acute, fringed. Florets of the ray five to ten? yellow, slightly three-toothed; of the disk tubular, yellowish, not very numerous. Anthers longer than the florets. Seed compressed. Pappus two very slender awns, hairy. Chaff of the receptacle concave, as long as the florets of the disk, hairy and slightly angled near the summit.

Grows in the mountains of Carolina and Georgia.

Var. a. Ferrugineus.

I place under this name a plant I received from Louisville, Georgia, which agrees with the preceding in size, habit, and conformation of the leaves and panicle; it differs in having its flower larger, its chaff more conspicuously three-cleft, the leaves more strongly serrate, all with the under surface ferruginous, almost tomentose, and covered with glandular dots.

### 22. Aristatus.

H? caule erecto, scabro; foliis inferioribus oppositis, arcte sessili-bus, ovali-lanceolatis, oval-lanceolate, acute, bris, subtus pilosis; ry underneath; flowers corymbo seminibus compressis, | compressed, awns 2, aristis (2) persistenti- persistent. bus.

Stem erect, brous; lower leaves opacutis, dentatis, sca- toothed, scabrous, haipaucifloro; few, corymbose; seeds

Stem two to three feet high, scabrous, branches rather slender, not numerous, the lower opposite, the upper sometimes alternate. Leaves pale green, veiny, not nerved, oval-lanceolate, irregularly toothed, sessile, the upper sometimes alternate, not decurrent. Flowers in a small terminal corymb. Peduncles slender, rather long. Scales of the involucrum ovate-lanceolate, imbricate, pubescent. Florets of the ray narrow, about one and a half inches long, yellow. Scales of the receptacle ovate, oblong, rather longer

than the seed, which they almost envelope. Seed compressed, obovate,

with two persistent rather unequal awns.

I insert this species with some hesitation. Its seed and receptacle are those of an Actinomeris, while its involucrum and habit approach nearly to the Helianthus. It belongs perhaps to an intermediate genus.

Grows in dry sessile soils in the western districts of Georgia.

Flowers September—October.

With the arrangement of the species in this genus I am not satisfied, but it may serve to facilitate examination. The division into opposite and alternate leaved species is, I suspect, not to be strictly relied upon. I have still some specimens which I have not described. The western districts of Georgia, and more particularly the state of Alabama, abound with plants of this genus, and many remain yet to be distinguished. But the want of Botanic Gardens in our country retards the progress, and impedes even the accuracy of investigation, for specimens frequently present not only inadequate but even erroneous impressions of the real structure and habit of a plant.

#### 1. CHRYSANTHEMOIDES. Mich.

B. floribus radiatis, cernuis; radiis involu- | ding; florets of the ray cro subæquali triplo thrice as long as the longioribus; foliis oblongis, utrinque attenuatis, dentatis, basi tapering at each end, connatis. Pursh.

Flowers radiate, nodtoothed, connate base.

Sp. pl. 3. p. 1717. Mich. 2. p. 136. Pursh, 2. p. 566. Nutt. 2. p.

Coreopsis Bidens, Walt. p. 215.

I have transcribed the specific character with only a verbal alteration from Pursh, because the plant I shall describe differs from it in several particulars and leads to a suspicion I have long entertained, that several species are now covered under this name.

Root annual? Stem erect and declining, about two feet high, smooth below, a little hairy towards the summit, with opposite branches and peduncles. Leaves opposite, sessile, somewhat connate, oblong lanceolate, serrate, glabrous. Peduncles sometimes opposite, sometimes from the division of the stem, three to six inches long, generally erect, one-flowered. crum double, the exterior about eight-leaved, the leaves unequal, foliaceous, lanceolate, the largest as long as the florets of the ray, the interior eightleaved, the leaves equal, lanceolate, membranaceous, about as long as the florets of the disk. Florets of the ray eight, lanceolate, bright yellow, bearing only the rudiments of a germ; of the disk numerous, small, tubular, yellowish. Seeds compressed, oblong, the pappus composed of two awas which together with the edges of the seed are retrorsely aculeate, and sometimes may be discovered one or two smaller awns on the flattened angles. Receptacle convex, chaffy; chaff concave, membranaceous, as long as the florets of the disk.

Grows in shallow pools, very abundant, enlivening and almost covering ponds and old rice fields at the close of autumn with its brilliant flowers.

Flowers October—November.

### 2. Connata.

B. floribus discoideis; involucro exteriore | terior involucrumthrice flore triplo longiore; as long as the flower; foliis caulinis ternatis, stem leaves ternate, foliolis lateralibus con- lateral leaves connate, natis, floralibus oblon- | floral leaves oblonggo-lanceolatis.

Flowers discoid, exlanceolate.

Sp. pl. 3. p. 1718. Pursh, 2. p. 566. Nutt. 2. p. 179.

Root perennial. Stem about two feet high, glabrous, branches opposite, Leaves opposite, lanceolate, dentate, glabrous, very much attenuated at base, paler or slightly glaucous (I describe from specimens) underneath, the lower ternate, the upper simple all somewhat connate at base. Peduncles opposite, one-flowered. Involucrum double, the exterior foliaceous, much longer than the disk, the interior membranaceous, resembling the chaff of the receptacle. Florets of the ray 0; of the disk numerous, yellowish. Seed compressed; awns of the pappus subulate, retrorsely aculeate. Chaff of the receptacle nearly as long as the florets of the disk.

Grows in fields and woods, Canada to Carolina, Pursh. I have not seen it in the low country of Carolina. Flowers July-October.

### 8. PILOSA.

B. floribus discoideis; involucro exteriore longitudine interioris; long as the interior; foliis inferioribus pin- lower leaves pinnate, natis, superioribus ter- the upper ternate, leafnatis, foliolis oblongis, lets oblong, the termiterminali lanceolato, | nal one reliquis duplo longiore. | twice as long as the

Flowers discoid: exterior involucrum lanceolate. rest.

Sp. pl. 3. p. 1720. Pursh, 2. p. 566. Nutt. 2. p. 179.

Root annual. Stem two to three feet high, branching, hairy. Leaves ovate-lanceolate, oblong, dentate, somewhat hairy, the lower sometimes doubly pinnate. Flowers opposite and terminal on long peduncles. Exterior involucrum leafy, the interior resembling scales. Florets of the ray 0; of the disk rather numerous, yellowish. Seeds oblong, narrow, terminating in two or three awns retrorsely aculeate.

The specimens I have seen under this name do not accord exactly with

the figure of Dillenius. Hort. Elth. t. 53. f. 51. Grows a common weed in old fields. Pursh.

Flowers July—October.

### 4. Frondosa.

B. floribus discoideis; involucro exteriore terior involucrum much flore foliolis basi ciliatis; leassets fringed at base; foliis inferioribus pin- lower leaves pinnate, natis, superioribus ter- | the upper ternate, lannatis, lanceolatis, ser- ceolate, serrate. ratis.

Flowers discoid: exmulto longiore, longer than the flower,

Sp. pl. 3. p. 1718. Walt. p. 201. Mich. 2. p. 136. Pursh, 2. p. 566. Nutt. 2. p. 179.

Stem erect, three to four feet high, branching, sprinkled Root annual. with a few hairs. Leaves lanceolate, very acute, serrate, somewhat ribbed, sprinkled like the stem with a few short hairs, the lower pinnate, the upper ternate and simple. Pedancles one-flowered, long, opposite and terminal. Exterior involucrum eight-leaved, the leaves linear-lanceolate, ciliate, unequal, much longer than the disk; the interior eight-leaved, leaves membranaceous, scarcely as long as the disk. Florets of the ray 0; of the disk tubular, yellowish. Seeds compressed, rugose; awns two, retrorsely acaleate. Receptacle flat, chaffy; chaff linear-lanceolate, falling with the seeds.

Grows in damp soils. Flowers June—September.

### 5. BIPINNATA.

B. floribus subradia- I tis; involucro exteriore | radiate, exterior invodisco longiore; foliis lucrum longer than the bipinnatis, foliolis lan- disk; leaves bipinnate, ceolatis, pinnatifidis.

Flowers irregularly leaflets lanceolate, pinnatifid.

Sp. pl. 8. p. 1721. Mich. 2. p. 135. Pursh, 2. p. 567. Natt. 2. p. 179.

Root annual. Stem two to four feet high, glabrous, obtusely four-angled, branching, the branches opposite. Leaves decussate, glabrous, often doubly pinnatifid, the segments somewhat lanceolate, a little hairy along the margins. Péduncles long, generally terminal. Exterior involucrum eight-leaved, leaves linear-lanceolate, acute, nearly glabrous, unequal, longer than the disk, at first erect, afterwards expanding; interior eight-leaved, scarcelf as long as the disk, fringed near the summit. Florets of the ray generally three, obovate, yellow, scarcely as long as the disk; of the disk about twenty, yellow, tubular. Seed oblong, slightly angled, nearly twice as long as the interior involucrum, crowned by three, sometimes four unequal, short There is a striking difference in habit between this species and the B. Chrysanthemoides; there is also much difference in the seed, but as far as the seed is concerned, B. Frondosa and B. Pilosa, appear to connect intimately the two extremes.

Grows in dry soils—common. Flowers July—October,

### COREOPSIS. GEN. PL.

Involucrum duplex, polyphyllum, exterius æquale. Flores radia-! terior ti. Semina compressa, | Flowers radiate. Seeds emarginata, bidentata, compressed, emargin-vel bisetosa, setis nec ate, two toothed or two retrorsum Receptaculum paleace- | trorsely aculeate. Reum.

Involucrum double. many leaved, the exegual. one aculeatis. awned: awns not receptacle chaffy.

- \* Foliis oppositis,
- \* Leaves opposite, undivided.

#### 1. Lanceolata. Lin.

C. foliis sessilibus, lanceolato - linearibus, ceolate-linear, entire, integerrimis, ciliatis; ciliate; peduncles long, pedunculis elongatis, naked; seed orbicular, nudis; seminibus orbi- scabrous, winged, two culatis, scabris, alatis, toothed at the summit, apice bidentatis, emar- | emarginate. ginatis.

Leaves sessile, lan-

Sp. pl. 3. p. 2256. Walt. p. 215. Mich. 2. p. 137. Pursh, 2. p. 567. Nutt. 2. p. 179.

Root perennial, (bi-triennial, Dill.) Stem very short, divided at the base, procumbent, sprinkled with a few long hairs, the summits naked. Leaves opposite, sessile, linear-lanceolate, acute, entire, sometimes slightly undulate, fringed toward the base. Flowers solitary, on naked branches about a foot long. Involucrum, each about eight-leaved, all nearly of the same length, lanceolate, glabrous, membranaceous and coloured, (particularly the interior) along the margin. *Florets* of the ray about eight, bright yellow, dilated and toothed at the summit; of the disk somewhat numerous, yellowish. compressed, nearly black, winged and crowned with two small, subulate, hairy, deciduous awns. Chaff of the receptacle very narrow.

This species appears to differ much in size, and somewhat in habit, and may require further comparison. The plant which I have described above I collected around ponds a few miles from Darien, along the road to Fort Barrington. The pappus, as in the Helianthus, appears to be an appendage slightly attached to the seed, and differing from the pericarp in substance and colour.

In the C. Lanceolata as figured by Dillenius, (Hort. Elth. t. 48. f. 56.) the plant is altogether larger, and the lowest leaves have long attenuated

Grows in damp soils.

Flowers April-May; perhaps through the summer. (August-October, Pursh.)

### 2. Crassifolia. Aiton.

C. foliis obovatooblongis, integerrimis,
basi attenuatis, hirsutis; pedunculis elongatis, basi hirsutis.

Leaves obovate-oblong, entire, tapering
at base, hirsute; peduncles long, hirsute at
base.

Sp. pl. 3. p. 2256. Nutt. 2. p. 179. C. Lanceolata, var. b. Mich. 2. p. 137. Pursh, 2. p. 567.

Root perennial. Stem about two feet high, sparingly divided at base, striate, hairy below the upper pair of leaves. Leaves few, opposite, oblong, narrow, the lower attenuated at base, forming a petiole one to two inches long, very hairy. Flowers solitary, terminal. Involucrum nearly equal, glabrous. Florets of the ray about eight, bright yellow, dilated and toothed at the summit.

The leaves of this species though thicker than those of C. Lanceolata, scarcely merit the character of crassifolia; hirsuta would have been a more appropriate appellation.

Grows in pine barrens, in soils rather dry.

Flowers June—

### 3. Arguta. Pursh.

C. glabra; foliis petiolatis, lanceolato-ovatis, sensim acuminatis, argute serratis; pedunculis axillaribus termi-

# minalibusque, dichoto- | terminal, dichotomously me corymbosis.

Pursh, 2. p. 567.

Flowers of a middle size. Described by Pursh from specimens in the Herbarium of Sir Joseph Banks; supposed by Nuttall to be a variety of C. Latifolia.

Grows in Carolina, Pursh.

Flowers-

### 4. LATIFOLIA. Mich.

C. foliis ovatis, acuminatis, crenato dentatis, dentibus mucronatis; petiolis brevibus, radiis integris; seminibus cuneato oblongis, apteris, apice nudis.

Leaves of minate, creating thed with mucronate; short; floret entire; see oblong, with

Leaves ovate, acuminate, crenately toothed with the teeth mucronate; petioles short; florets of the ray entire; seed cuneate oblong, without wings, naked at the summit.

Mich. 2. p. 137. Sp. pl. 3. p. 2257. Pursh, 2. p. 567. Nutt. 2. p. 179. A tall plant with the habit of Silphium, flowers rather small. Mich. Pursh.

Grows on the highest mountains of Carolina, Mich.

Flowers July to September. Pursh.

### 5. OEMLERI. E.

C. foliis lato lanceolatis, sessilibus, utrinque acutis, integerrimis; pedunculis axillaribus terminalibusque, sub dichotome corymbosis. E. Leaves broad lanceolate, sessile, acute at each end, entire; peduncles axillary and terminal, dichotomously corymbose.

Connected with the two preceding species, which I have not had an epportunity of comparing, is the one I shall now describe; further examination must determine whether they are really distinct.

Stem two to three feet high, angular, glabrous. Leaves broad, entire, sessile, and connate by a small membrane, very glabrous, acute at each end but not acuminate. Flowers small, the lower opposite, axillary, the upper forming a dichotomous corymb. Exterior involucrum smaller than the interior, leaves lanceolate, glabrous. Florets of the ray about eight, entire, yellow; of the disk not very numerous. Seed compressed, cuneate, slightly bidentate and margined.

Collected near the junction of the Broad and Saluda rivers by Mr. Ocm-

Flowers July—August.

### 6. Rosea. Nutt.

rimis; capitulis axilla-ribus terminalibusque, longe pedunculatis; seeds entire, naked. seminibus integris, nudis.

C. parva, glaberri- | Small, very glabrous; ma; caule simplici; fo- | stem simple; leaves liis linearibus, integer- linear, entire; heads

Nutt. 2. p. 179.

Root perennial. Stem about twelve inches high, smooth, sometimes branching. Leaves about two inches long, opposite, connate, and sparingly ciliate at base, the axils producing small leaves or abortive branchlets. Flowers few, small, on peduncles about three inches long. Exterior insobucrum very small, interior eight-leaved. Florets of the ray about eight, pale red, obsoletely three-toothed; of the disk not numerous, somewhat saffron coloured. Seeds entire, not emarginated, naked. Nutt.

Grows in damp pine barrens and grassy swamps, New-Jersey to Georgia.

Nutt.

Flowers in August.

\*\* Foliis oppositis, \*\* Leaves opposite, divided. divisis.

### 7. AURICULATA.

C. pubescens; foliis | Pubescent; subsessilibus, ovali-lan- nearly sessile, ceolatis, integerrimis, | lanceolate, entire, the

involucro profunde partito; radiis vided; florets of the 4-dentatis; seminibus ray 4-toothed; seeds subrotundo - obovatis, obovate, nearly round, apice bidentatis.

inferioribus ternatis; | lower ternate; exterior exteriore involucrum deeply di-2-toothed at the sum-

Sp. pl. 3. p. 2256. Walt. p. 215. Mich. 2. p. 138. Pursh, 2. p. 568.

Root perennial. Stem three to four feet high, pubescent, sometimes mearly glabrous. Leaves oblong-lanceolate, entire, finely pubescent, the upper sessile, the lower divided, having two lateral small leaflets near the base, which are also lanceolate, and a common petiole near an inch long. Flowers axillary and terminal. Exterior involucrum divided to the stem. as long as the interior. Florets of the ray about eight, dilated and toothed at the summit, bright yellow.

Grows on the high mountains of Carolina and Virginia.

Flowers August-October. Pursh.

### Var. Diversifolia.

C. foliis infimis trifoliatis, foliolis rotundatis, caulinis foliolis obovatis, supremis simplicibus, spathulato-lanceolatis, omnibus integerrimis, cauleque pilosis; seminibus subrotundis. denticulatis, apice bidentatis. E.

Lowest leaves trifoliate with the leaflets round, those of the stem with the leaflets obovate; the uppermost simple, spathulate-lanceblate, all entire and with the stem hairy; seed nearly round, denticulate, twotoothed at the summit.

This species differs in many respects from the preceding; the stem is short, dichotomously divided at the summit. The lowest leaves small, trifoliate, the folioles all orbicular; the next larger with the folioles sometimes obovate, sometimes nearly round; the upper spathulate-lanceolate; the whole plant instead of being covered with a fine pubescence, is sprinkled with long white glandular hairs. Flowers naked, on peduncles, nearly a foot long, proceeding from the division of the stem. Calyx and corolla as in the preceding variety. Seed nearly round, slightly bidentate, and finely toothed along the margins. Chaff of the receptacle very narrow, longer than the florets of the disk.

Collected in the middle country of Carolina by Mr. Whitlow.

Flowers May-

#### 8. Senifolia. Mich.

C. pubescens; foliis foliolis lanceolatis, integerrimis; radiis integris; seminibus cunea- | entire; seed cuneate. tis.

Pubescent; leaves sessilibus; trifoliolatis, sessile, trifoliate, the leaflets lanceolate, entire; florets of the ray

Mich. 2. p. 138. Sp. pl. 3. p. 2254. Pursh, 2. p. 568. Nutt. 2. p. 180.

C. Major, Walt. 214.

Root perennial. Stem two to three feet high, generally branching near the summit, pubescent, angled. Leaves opposite, closely sessile, trifoliate, forming apparently a six-leaved verticill, leaflets lanceolate, slightly acaminate, pubescent. Peduncles opposite, brachiate, forming a terminal corymb. Exterior involucrum as long as the interior, both very pubescent. Florets of the ray about eight, narrow lanceolate, yellow, externally pubescent, slightly toothed near the summit. (Seeds oblong, cuneate, Mich.)

The whole plant sometimes nearly glabrous, Mich. In a specimen which I possess that appears to belong to the glabrous variety of Mich. the middle leaf of the verticill is sometimes three-parted, which I have never observed in the common plant, and the exterior involucrum is much smaller than the

interior; these characters seem to indicate a distinct species.

Grows in dry pine lands. Flowers June-August.

### 9. VERTICILLATA.

C. subglabra; foliis oppositis, sessilibus, trifoliolatis, interdum quinato-pinnatis, foliolineari-lanceolatis. integerrimis; radiis acutis; seminibus obovatis, lævissime bidentatis.

Nearly glabrous; leaves opposite, sessile; trifoliate, sometimes quinate; leaflets linearlanceolate, entire; florets of the ray acute, seed obovate, slightly 2-toothed.

Sp. pl. 3. p. 2151. Walt. p. 214. Mich. 2. p. 139. Pursh, 2. p. 569. Nutt. 2. p. 180.

Roof perennial. Stem erect, two to three feet high, angled, striate, glabrous, branching near the summit. Leaves sessile, forming a six-leaved verticill. The middle leastet of each leaf frequently three-parted, the leastets all narrow, apparently smooth, yet frequently covered with a fine pubescence. Flowers corymbose, peduncles opposite and terminal. Exterior involucrum generally ten-leaved, leaflets small, linear obtuse, irregularly arranged at base; interior eight-leaved, leaflets lanceolate, yellowish, and reflected at the summit. Florets of the ray eight, lanceolate, acute, yellow; of the disk numerous, yellowish. Anthers dark purple. Seeds compressed, winged, slightly bidentate. Chaff of the receptacle filiform, dilated at the summit.

Grows in dry soils. Flowers June—August.

### 10. Tenuifolia. Willd.

positis, sessilibus, tri- opposite, sessile, trifofoliolatis, foliolis com-posite multipartitis, dly many parted, seg-segmentis linearibus, ments linear, entire. integerrimis.

C. glabra; foliis op- | Glabrous; leaves

Sp. pl. 3. p. 2252. Pursh, 2. p. 569. Nutt. 2. p. 180. C. Verticillata, var. Tenuifolia, Mich. 2. p. 139.

Root perennial. Stem two to three feet high, glabrous, branching towards the summit, slightly angled. Leaves sometimes deeply three-parted. sometimes seeming to form a verticill of six distinct leaves, the divisions or leaves all many parted, sometimes compoundly, the segments all linear and entire. Flowers corymbose. Peduncles opposite and terminal. Exterior involucrum nearly as large as the interior, leaflets about eight, narrow and lanceolate. Florets of the ray eight, yellow, acute. The seed of this species I have not had an opportunity of examining.

Grows in the upper districts of Carolina. Dr. Macbride.

Flowers July and August.

### 11. TRICHOSPERMA. Mich.

C. glabella; foliis subquinato - pinnatis, lineari-lanceolatis, seriatis; floribus corymbosis; involucri exteri-

oris foliolis ciliato ser- | exterior

involucrum ratis; radiis integris; ciliate, serrate, florets seminibus cuneatis, 2 of the ray entire; seeds cuneate, 2—4 toothed.

Mich. 2. p. 199. Willd. 2. p. 2252. Pursh, 2. p. 568. Nutt. 2. p.

Root perennial, (biennial, Pursh.) Stem two to three feet high, glabrous, branching towards the summit. Leaves opposite, somewhat pinnate, the leaslets or segments five to seven, generally more or less notched, thin, gla-Flowers on peduncles, opposite and terminal, the upper divisions sometimes dichotomous. Exterior involucrum eight-leaved, leaves oblong, obtuse, sometimes obovate, ciliate; the interior eight-leaved, leaves lanceolate, striate, coloured, particularly along the margin. Florets of the ray eight, lanceolate, yellow, entire; of the disk yellowish. Seeds oblong, compressed, two to four toothed. Chaff of the receptacle linear-lanceolate.

This species appears to vary much, perhaps more than one is now co-

vered under this name.

In specimens sent me from Boston by Dr. Bigelow, the stem is square, the leaslets generally seven, very narrow, (linear,) deeply notched, almost pinnatifid, the flowers large. In specimens sent me from New-York by Dr. Torrey, the stem is nearly round or very obtusely angled, the leaslets ave, thin, narrow lanceolate, strongly toothed, the flowers smaller.

Grows in wet soils, in the upper districts of Carolina. Mich.

Flowers August-October.

#### 12. Mitis. Mich.

C. glaberrima; foliis | Very glabrous; bipinnatifidis, pinnis | leaves bipinnatifid, the linearibus, serrulatis; segments linear, serru-involucri exterioris fo-liolis linearibus serru-terior involucrum linelatis; seminibus ob- ar, serrulate; seeds longis biaristatis.

oblong, 2-awned.

C. Coronata, Walt. 2. p. 15.

(Root biennial, Pursh.) Stem three to four feet high, obtusely four angled, with very numerous brachiate branches. Leaves decussate, bipinnatifid, the segments slightly scabrous on the upper surface, the uppermost sometimes simply three-parted. Flowers in a loose terminal panicle-

Leaves of the exterior involucrum eight, linear, acute, as long as those of the interior; of the interior lanceolate, pubescent at base, dotted. Florets of the ray eight, obovate, obscurely three-toothed; of the disk numerous, yel-Anthers dark purple. Seed compressed, with the margin serrulate, nearly as long as the florets of the disk. Chaff of the receptacle linear, obtuse, longer than the florets of the disk, spotted near the summit with purple.

Grows in wet grounds.

Flowers August and September.

#### Mich. 13. Aristata.

C. pubescens; foliis | quinato pinnatis, folio- quinate, pinnate, the lis serratis; radiis inte-gris, lato ovalibus; of the ray entire, seminibus cuneato-ob- broad, oval; seed cuovatis, biaristatis; aris- | neate-obovate, 2-awntis longissimis, divari- ed; awns very long, catis. Mich.

Pubescent; leaves divaricate.

Mich. 2. p. 140. Sp. pl. 3. p. 2250. Pursh, 2. p. 568. Nutt. 2. p. 180.

Flowers large, rays very broad, Pursh. With this species I am unac**q**uainted.

Grows in Carolina, Pursh. In Illinois, Mich.

Flowers August—September.

### 14. Pubescens. E.

C. pubescens; foliis ' lis lanceolatis, obtusis, integerrimis, lateraliexterioris foliolis ova- exterior to-lanceolatis: radiis | undulatis? pappo ditis, pubescentibus. E. subulate, pubescent.

Pubescent; leaves quinato-pinnatis, folio- | quinate, pinnate, leaflets lanceolate, obtuse, entire, the lateral ones bus parvulis; involucri | small; leaves of the involucrum ovate-lanceolate: rets of the ray unduphyllo, foliolis subula- | late? pappus 2-leaved,

Root perennial. Stem about two feet high, obtusely angled, producing a few opposite branches and with the whole plant very pubescent, almost tomentose. First leaves simple, lanceolate, the mature leaf unfolding two pair of small, lateral leaflets. Flowers terminal, on the long, almost naked branches. Leaves of the exterior involucrum eight, ovate-lanceolate, slightly acuminate, as long as the interior, nearly glabrous. Florets of the ray eight, yellow, dilated at the summit, and from specimens appearing to be undu-Seed nearly round, slightly winged, emarginate and crowned with a short pappus more resembling a leaf than an awn. Chaff of the receptacle linear, acute, longer than the florets of the disk.

Grows in the western districts of Georgia.

Flowers August—September.

#### 15. Tripteris. Lin.

C. glabra; foliis peti- | olatis, lanceolatis, inte- tiolate, lanceolate, engerrimis, pinnatis, caulinis trifo-liolatis; radiis integris; trifoliate; florets of the seminibus obovatis, apice nudis.

Glabrous; leaves peradicalibus tire, those of the root ray entire; seed obovate, naked summit.

Sp. pl. 3. p. 2253. Mich. 2. p. 138. Pursh, 2. p. 568. Nutt. 2. p. 180.

Root perennial. Stem four to six feet high, terete, fistulous, glabrous, branching near the summit. Leaves opposite, the upper trifoliate; leases lanceolate, acute, entire, glabrous, slightly ribbed, scabrous along the margins. Flowers rather small, in a loose terminal corymb. Leaves of the exterior involucrum linear, shorter than the interior; of the interior lanceolate, coloured, particularly along the margin. Florets of the ray eight, yellow, narrow lanceolate, entire; of the disk numerous, yellowish. Chaff of the receptacle linear, longer than the florets of the disk. Seeds obovate, slightly winged, emarginate at the summit.

Grows in the upper districts of Carolina and Georgia; very abundant in

the western districts of Georgia.

Flowers August-October.

#### 16. NUDATA. Nutt.

C. caule subsimplici, superne dichotomo; foliis subulato linearibus, remotis, glabris, supre- | ulate, linear, remote, mis parvulis; radiis roseis; seminibus nudis. Nutt.

Stem nearly simple, dichotomous towards the summit; leaves subglabrous, the uppermost small; florets of the ray rose coloured; seeds naked.

Nutt. 2. p. 179.

Stem two to three feet high, round, smooth, striate. Leaves few, rarely more than two which are conspicuous, the lower five to six inches long, the upper about an inch, both linear, those near the summit very minute. Flowers four to six on the summit of the dichotomous stem, the peduncles or branches four to five inches long. Exterior involucrum minute. Florets of the ray red. Nutt.

Grows near St. Mary's, Georgia.

Flowers—

\*\*\* Foliis alternis. Leaves alter-

### 17. Angustifolia. Aiton.

C. foliis lineari-lanceolatis, integerrimis, olate, entire, smooth; lævibus; radiis oblon- florets of the ray ob-gis, trifidis, lacinia me- long, 3-cleft, the middia majore.

Leaves linear-lancede segment larger.

Sp. pl. 3. p. 2257. Pursh, 2. p. 569. Nutt. 2. p. 180. With this species I am not acquainted. Grows in Carolina and Florida. Bartram.

#### Walt. 18. GLADIATA.

C. caule glabro, superne dichotomo; foliis angusto-lanceolatis, integerrimis, crassis, in attenuatis; petiolum seminibus obovatis, alatis, alis serrulatis; pappo bisetoso.

Stem glabrous, dichotomous towards the summit: leaves narrow lanceolate, entire, thick, tapering to a petiole; seeds obovate, winged, the wings serrulate; pappus 2-awned, brist-

Walt. p. 215. Nutt. 2. p. 180. C. Dichotoma, Mich. 2. p. 137. Pursh, 2. p. 569.

Root perennial. Stem two to three feet high, slightly furrowed, dichotomously divided towards the summit. Leaves acute, somewhat succedent, those of the root tapering to a petiole three to six inches long. Flowers terminal. Exterior involucrum six to ten leaved, smaller than the interior, leaves lanceolate, irregularly inserted, expanding; interior eight-leaved, leaves lanceolate, coloured. Florets of the ray eight, yellow, dilated and three-lobed at the summit; of the disk numerous, dark purple. Seeds oblong, obovate, compressed. Pappus hairy, about half as long as the florets of the disk. Chaff of the receptacle linear-lanceolate, dark purple, as long as the florets of the disk.

Grows generally in damp pine barrens.

Flowers August—September.

### 19. Acuta. Pursh.

ceolatis, acutis, denti- olate, acute, toothed, culatis, subhirtis; flori- somewhat hairy; flowbus corymboso-panicu- | ers in corymbose panilatis.

Pursh, 2. p. 569. Nutt. 2. p. 180.

With this species, which was described by Pursh from specimens in the Herbarium of Sir Joseph Banks, I am unacquainted.

Grows in Georgia. Bartram.

Flowers—

### LEPTOPODA. Nuttall.

Involucrum polyphyllum, foliis duplici serie. Flosculi radii apice dilatati, 3-fidi. the ray dilated at the Semina cylindracea. summit, 3-cleft. Seeds Pappo membranaceo, cylindrical, crowned sub 8-phyllo, coronata. Receptaculum convexum, nudum.

Involucrum leaved, leaves in a double series. Florets of with a membranaceous pappus, generally 8leaved. Receptacle convex. naked.

### 1. Puberula. Macbride.

L. caule viscido-pubescente, stricto; foliis alternis, lineari-lanceolatis, semi amplexi- olate, semi amplexicaulibus, glabris, punc | caule, glabrous, dotted, tatis, caulinis inciso dentatis; paleis pappi fimbriatis.

Stem viscidly pubescent, striate; leaves alternate, linear-lancethose of the notched and toothed; chaff of the pappus fimbriate.

Galardia Fimbriata, Mich. 2. p. 142. Pursh, 2. p. 573. Helenium Vernale, Walt. p. 210.

Root perennial. Stem about two feet high, simple, very pubescent towards the summit, fistulous. Leaves alternate, those of the root sometimes a little obovate, generally linear-lanceolate, slightly repand, with an occa sional serrature, generally decaying before the expansion of the flower; those of the stem linear-lanceolate, with a few deep indentations. Flower solitary, terminal. Involucrum many leaved, with the leaves arranged in two series, the exterior eighteen to twenty, equal, subulate, pubescent, nearly twice as long as the interior, the interior somewhat lanceolate, pubescent. Florets of the ray numerous, (nearly thirty,) yellow, dilated towards the summit, three to four-cleft; of the disk very numerous, tubular, five-cleft. Stamens rather longer than the florets of the disk. Seed somewhat clavate,

hairy. Pappus eight to twelve-leaved, with the leaves membranaceous, fimbriate towards the summit. Receptacle convex, dotted.

Grows near the Santee River in damp soils. St. John's, Berkeley. St.

James, Santee.

Flowers in April.

#### Macbride. 2. Decurrens.

paleis pappi fimbriatis. | pappus fimbriate.

L. Helenium, Nutt. 2. p. 174.

Root perennial. Stem about twelve to eighteen inches high, simple, glabrous, furrowed, not fistulous. Leaves much longer than those of the preceding species, similar but distinctly decurrent, more slightly denticulate. Flower solitary, terminal. Involucrum many leaved, in two series, the exterior (eighteen) subulate, a little hairy at the summit, expanding, finally erect, (are these to be considered as scales belonging to the florets of the ray?) Florets of the ray eighteen to twenty, cuneate, yellow, pubescent on the outer surface, three-cleft at the summit; of the disk very numerous, with the border five-cleft. Stamens a little longer than the corolla. Style twoclest; stigma somewhat capitate. Seeds cylindric, glabrous. Pappus about eight-leaved, leaves membranaceous, awned, fimbriate. Receptacle convex, glabrous, dotted.

Grows in damp soils—along the head branches of Cooper River. Dr. Macbride. In wet pine barrens, Chatham and Bryan counties, Georgia.

Flowers March—April.

As fimbriata, the name applied to one of these plants by Michaux is derived from a generic character applicable to both, and helenium not appropriate, I have taken the liberty of distinguishing these two species by the names given to them by Dr. Macbride, when many years ago he first pointed them out to me as distinct, though hitherto confounded.

#### BALDUINA. Nuttall.

lulosum. Semina in in the cells. Chaff of cellulis. Pappus pale the pappus 10, erect, acute.

#### 1. Uniflora. Nutt.

integerrimis; semen æquante.

B. caule unifloro, Stem one-flowered, simplici, pubescente; foliis anguste obovatis, leaves narrow, obopappo vate, entire; pappus as long as the seed.

Nutt. 2. p. 175.

Root perennial. Stem about two feet high, slightly angled. Leaves obovate, with an oblong tapering base, dotted, somewhat succulent when young, pubescent. Involucrum many leaved, leaflets ovate, acuminate, the interior mucronate, squarrose. Florets of the ray numerous, (nearly thirty,) yellow, three-toothed at the summit, externally pubescent; of the disk very numerous, tubular, yellow, covered near the summit with a glandular pubescence. Stamens about as long as the florets of the disk. Style scarcely longer than the stamens. Seed nearly cylindrical, a little enlarged towards the summit, hairy. Pappus as long as the seed, if not longer. Scales membranaceous, erect, generally acute, (surrounded at base by a white, fimbriate, exterior pappus?) Receptacle convex, deeply honey-comb, the cells somewhat hexangular, with a denticulate summit, and sufficiently deep to enclose the seed and its pappus.

Grows in damp soils and along the margins of swamps in the middle

country of Carolina and Georgia. Flowers July—September.

2. Multiflora.

caule ramoso, |

Stem branching, multifloro, glaberrimo; foliis linearibus; involucri foliolis acuminatis; pappo brevi, cupulato.

many flowered, glabrous; leaves linear; leaves of the involucrum acuminate; pappus short, cup-shaped.

Root perennial? Stem two to three feet high, terete, glabrous, with very numerous branches. Leaves linear, almost setaceous, glabrous, alternate. sessile. Flowers terminal, somewhat fastigiate. Involucrum many leaved, imbricate, the leaves narrow ovate, acuminate, equal, covered with glandslar atoms and arranged nearly in two series. Florets of the ray small, yellow; of the disk numerous, yellowish. (Anthers bisetose at base, Nutt.) Seed inversely conic, very acute at base, clothed with a glossy silken pubescence, radiated on the summit. Pappus short, expanding, obtuse, almost truncate, the scales fourteen? generally equal to the rays on the summit of the seed. Receptacle nearly globular, cellular, the cells much deeper than the included seed and pappus, somewhat hexagonal, with six acuminate teeth, each of which from its structure is necessarily common to three cells.

Grows in the sand hills along the Altamaha, near Fort Barrington. Flowers in the autumn.

As it is considered incorrect to change names once publicly given, I have continued the name imposed upon this genus, however reluctant the gentleman to whom it is dedicated was to have it preserved. The two species, however, are scarcely congeners; they differ in habit, in their involucrum, and still more essentially in their seed and pappus. Indeed the bisetose anthers and deep cellular receptacle seem alone to unite them. To the former I had originally given the name of Favosa. The second, as far as imperfect specimens will permit me to describe it, offers the following characters.

ACTINOSPERMUM. Involucrum polyphyllum, foliis equalibus, duplici serie imbricatis. Receptaculum sub globosum, profunde favosum, cellulis hexagonis, 6-dentatis. Semina obconica, summitate radiata. Pappus polyphyllus, (12-14) cupulatim patens.

When a mature head of this plant is first examined, the seed are seen nestling in the bottom of the cells, exhibiting nothing but their radiated summits, and resembling in a striking manner some of the starry madre-

pores.

## GALARDIA. Fougeroux.

Involucrum poly-8-10 aristatis. Re-1ceptaculum convexum, convex, bristly. setosum.

### 1. Bicolor.

Sp. pl. 3. p. 2245. Pursh, 2. p. 572. Nutt. 2. p. 175. G. Lanceolata, Mich. 2. p. 142.

Root perennial. Stem herbaceous, about two feet high, pubescent, sparingly branched, with the branches twiggy and naked. Leaves alternate, sessile, linear-lanceolate, acute, pubescent, with a few serratures, fringed, the hairs of the fringe hooked. Flowers solitary, terminal. Involucrum many leaved, leaves arranged in two series, the exterior (9) reflexed, the interior (12—13) erect, all lanceolate, acute, pubescent. Florets of the ray about eight, dilated at the summit, three-cleft, with the segments unequal, yellow; of the disk numerous, tubular, deeply five-cleft, the segments linear, glandular, at first yellowish, afterwards dark purple. Stamene shorter than the corolla. Anthers yellow. Style of the ray 0; of the disk longer than the stamens, two-cleft. Seeds slightly turbinate, clothed with white hair. Pappus eight or nine leaved, leaves membranaceous, terminating in a long awn, with the awn as long as the corolla. Receptacle conic, glabrous? dotted.

The plant which I have described is certainly the G. Lanceolata of Mi-

I have doubts whether it is the G. Bicolor of Willdenow.

Grows in the dry pine barrens in the middle country of Georgia. Flowers May—August.

### RUDBECKIA. GEN. PL. 1324.

Involucrum subæ- | Involucrum nearly quale, duplici ordine squamarum. Pappus ble series. Pappus with a 4-toothed margin. Receptaculum conicum, paleaceum.

Receptaculum conicum, paleaceum.

### 1. PURPUREA.

R. aspera; foliis in-ferioribus lato ovatis, wide, ovate, tapering

basi attenuatis, remote at base, remotely too-

dentatis, caulinis lan- | thed, those of the stem ceolato-ovatis, subinte- lanceolate, ovate, neargerrimis, utrinque acu- ly entire, acuminate at minatis; radiis longis- each end; florets of the simis, deflexis, bifidis. | ray very long, deflected. two-cleft.

Sp. pl. 3. p. 2249. Walt. p. 214. Mich. 2. p. 143. Pursh, 2. p. 57. Nutt. 2. p. 178.

Root perennial. Stem four to five feet high, sparingly branched, sometimes a little roughened, often smooth. Leaves ovate-lanceolate, slightly acuminate, triplinerved, scabrous on both surfaces, tapering at base to a petiole and varying much in the length of the petiole and the coarseness of the serratures. Flowers large, terminal. Leaves of the involucrum numerous, linear-lanceolate, fringed, imbricate, at least in four or five series, squarrose. Florets of the ray about twelve, purple, two inches long, narrow, two-cleft at the summit, reflected; of the disk numerous, small. four-angled, inversely pyramidal, the summit concave and crenulated. Receptacle convex, chaffy, the chaff narrow, acuminate, nerved, glabrous, longer than the seeds and florets, and with their acute, rigid points forming a hispid capitulum.

This species appears at present to exhibit many varieties. It differs so much in its generic characters, in involucrum, seed, and chaff of the receptacle, from most if not all of the other species of the genus, that it will probably be separated and its distinct varieties established as species.

Grows in the upper and mountainous districts of Carolina and Georgia-

in the western districts of Georgia common.

Flowers August—October.

\*\* Involucro subæquali; paleis inermibus. | ly equal; chaff unarm-

\*\* Involucrum near-

Mich. 2. p. 144. Pursh, 2. p. 576. Nutt. 2. p. 179.

Flowers very showy; florets of the ray long, bright yellow, hanging downwards; disk ovate, purple. Pursh.

Grows in the western parts of Carolina and Georgia. Pursh.

Flowers July-October.

### 3. DIGITATA.

R. foliis inferioribus pinnatis, pinnis pinnatis, the segments pinnatifidis, superioribus pinnatis, pinnate, the highsummis 3-fidis; pappo | est 3-cleft; pappus crecrenato: caule lævi.

nate: stem smooth.

Sp. pl. 3. p. 2247. Pursh, 2. p. 575. Nutt. 2. p. 179.

Root perennial. Stem five to eight feet high, branching, glabrous. Leaves thin, slightly scabrous, the segments more or less toothed, generally lanceolate, acute. Flowers terminating the branches. Leaves of the involucrum not numerous, ovate-lanceolate, a little hairy, shorter than the disk. Florets of the ray yellow; of the disk numerous. Seeds oblong, four-angled, crowned with a short crenate or rather four-toothed margin. Chaff of the receptacle nearly truncate, almost tomentose at the summit, shorter than the seed.

Grows in the mountains of Carolina and Georgia.

Flowers August-October.

### 4. LACINIATA.

crenato; caule glabro.

R. foliis inferioribus | Lower leaves pin-pinnatis, pinnis 3-lobis, | nate, the segments 3-summis ovatis; pappo | lobed, the upper ovate; pappus crenate; stem glabrous.

Sp. pl. 3. p. 2246. Mich. 2. p. 144. Pursh, 2. p. 575. Nutt. 2. p.

Root perennial. Stem five to eight feet high, branching, glabrous. Leaves of the root and lower stem strictly trifoliate, with the upper foliole three-parted, all lanceolate, acuminate, coarsely toothed, sometimes laciniate, scabrous on the upper surface and along the margins, nearly smooth underneath; upper leaves ovate, nearly sessile, sometimes toothed. Flowers in a loose, terminal, somewhat corymbose panicle. Leaves of the inset crum ovate-lanceolate, small, much shorter than the receptacle. Florets of the ray about six, yellow, obovate, three-toothed; of the disk numerous, yel-Seed four-angled, crowned with a crenate margin. Chaff of the

receptacle obtuse, tomentose at the summit.

This species such as I have described it, grows abundantly in the western districts of Georgia. In a specimen of this plant sent me by Dr. Mulleaberg from Pennsylvania, the segments of the lower leaves are all entire, smaller and but slightly acuminate. Do they belong really to the same species?

Flowers August—October.

### 5. TRILOBA.

hispido-pilosa; liis lanceolatis, utrin- | lanceolate, que acuminatis, serra- at each end, serrate, tis, inferioribus trilo- the lower three-lobed; bis; involucri squamis | scales of the involulinearibus, deflexis.

Hairy, hispid; stem caule paniculato, ramis | paniculate, branches divaricatis foliosis; fo- divaricate, leafy; leaves acuminate crum linear, deflected.

Sp. pl. 3. p. 2247. Mich. 2. p. 144. Pursh, 2. p. 575. Nutt. 2. p. 178.

Root perennial. Stem four to five feet high, branching, somewhat scabrous, and hairy. Lower leaves deeply three-parted, the middle segment large, lanceolate, serrate, a little hairy; the lateral segments nearly entire; the base attenuated and very hairy; upper leaves lanceolate, serrate, sessile. Flowers numerous, on the summits of the branches. Leaves of the involvcrum linear-lanceolate, reflected, about half as long as the rays. Florets of the ray about eight, lanceolate, deflexed, yellow, the base and exterior surface becoming deep orange when dry; of the disk numerous, dark purple. Seed four-angled, crowned with a four-toothed margin. Receptacle conic, chaff lanceolate, acuminate, longer than the seeds.

Grows in the mountains of Carolina and Georgia. Saluda mountains,

Dr. Macbride.

Flowers August—October.

### 6. TOMENTOSA.

R. brevi pubescentia | subtomentosa: caule ramoso, ramis erectis virgatis; foliis lanceo- erect, virgate; leaves latis, acutis, inciso- lanceolate, acute, deep-dentatis integrisve, ly toothed and entire, scabris. trifoliolatis; involucri trifoliate; scales of the squamis lineari-lanceo-latis, deflexis, radiis lanceolate, deflected, multo brevioribus.

Plant covered with a short tomentum: stem branching, branches inferioribus scabrous, the E. much shorter than the florets of the ray.

- R. Subtomentosa, Pursh, 2. p. 575?
- . R. Triloba, var. Subtomentosa, Mich. 2. p. 144?

Root perennial. Stem three to four feet high, slightly furrowed, pubescent, bearing very many virgate branches. Leaves alternate, sessile, threenerved, scabrous and covered with a fine somewhat tomentose pubescence: the lower nearly trifoliate, having two small lateral leaves at the base; the middle leastet lanceolate, sometimes deeply notched, sometimes entire; the upper leaves lanceolate, entire. Leaves of the involucrum linear-lanceolate, or subulate, tomentose and deflected. Florets of the ray about eight, vellow, two-cleft at the summit, three times as long as the involucrum. Florets of the disk very numerous, of a brownish yellow. Seed four-angled; pappus obsolete, the summit of the seed slightly toothed. Receptacle oblong, oval, chaff truncated, longer than the seed, tomentose at the summit.

I am uncertain whether this is the R. Subtomentosa of Mich. and Pursh. It is a very distinct species from the R. Triloba, to which in fact it has no

resemblance but in its tripartite leaves.

Grows in the western districts of Georgia. Flowers August-September.

#### 7. Mollis. E.

R. caule hispido-vil-loso, ramoso; foliis ses-silibus, ovali-lanceola-tis, dentatis, mollissime

Stem hispid, villous, branching; leaves ses-sile, oval-lanceolate, dentate; soft, tomen-

tomentosis; radio mul- | tose; florets of the ray

### tifloro, involucro triplo | numerous, thrice as longiore. E. | long as the involucrum. longiore. E.

Root perennial. Plant two to three feet high, very much divided, a little scabrous and clothed with long and somewhat hispid hair. Leaves alternate, sessile, semiamplexicaule and slightly cordate, villous near the base, tomentose on both surfaces, the lowest probably spathulate. Flowers terminal. Scales of the involucrum lanceolate, expanding, or deflected, very hairy. Florets of the ray twelve to twenty, lanceolate, two-cleft at the summit, yellow; of the disk very numerous, dark purple. Seeds four-angled, the margin obsolete or slightly four-toothed. Receptacle convex, chaff concave, linear-lanceolate, as long as the florets of the disk, externally tomentose near the summit; among the exterior rows of the chaff setaceous bristles longer than the seed are also interposed.

Grows in the western districts of Georgia.

Flowers August—October.

#### Pursh. 8. Lævigata.

R. undique glaberrima; foliis ovato-lan- leaves ovate-lanceoceolatis, utrinque acu- late, acuminate at each minatis, triplinervibus, end, triplinerved, spaparce dentatis; involu- | ringly toothed; scales cri squamis lanceolatis, of the involucrum lanlongitudine radii.

Everywhere smooth; ceolate, as long as the rav.

Pursh, 2. p. 574. Nutt. 2. p. 178.

Leaves sub-coriaceous, very smooth and lucid, those of the root spathulate ovate, obtuse, those of the stem not acuminate. Peduncles few, long, naked. Flowers fastigiate, disk oblong. Nutt. Florets of the ray pale yellow, short. Pursh.

Grows in the pine barrens of Georgia.

Flowers-

### 9. Discolor.

R. ramis corymbo-

Branches sis, unifloris, peduncu- ose, 1-flowered, pedunlis nudis, elongatis; fo- cles naked, long; leaves so-pilosis, subintegerrimis, involucri foliolis
ovatis, acutis, petalis
lanceolatis, integerrilanceolate, entire, twocoloris discolaribus lan mis, discoloribus, lon- coloured, as long as the gitudine involucri. gitudine involucri.

liis lanceolatis, strigo- | lanceolate, hairy, stri-

Pursh, 2. p. 574.

I know not whether the plant I am about to describe be the real R. Dis-

color of Pursh; it has many points of resemblance.

Plant about two feet high, a little hairy, with a few long, slender naked branches. Leaves alternate, sessile, spathulate-lanceolate, triplinerved, finely and sparingly denticulate, sprinkled like the stem with very short hair, sometimes slightly cordate at base. Flowers few, small, terminal. The leaves of the involucrum oval, rather obtuse, a little hairy. Florete of the ray twelve to fourteen, lanceolate, two-cleft at the summit, externally hairy, scarcely longer than the involucrum; of the disk very numerous, dark purple. Seeds four-angled; the pappus a slight margin. Receptacle convex, chaff oblong, keeled, dark purple and fringed at the summit. The florets of the ray in this plant are trilobed and have, at least when dry, their bright yellow, the base or under surface dark orange.

To the preceding species this has great affinity, but it is altogether less hairy, its leaves are fewer, smaller, and more finely denticulate, its branches

summits fewer, more slender, and naked.

Grows in the western districts of Georgia. Flowers August and September.

#### 10. Spathulata. Mich.

R. gracilis, pubescens; caulibus unifloris, stem one-flowered; foliis obovato-spathulatis, integerrimis, in- late, entire; involucrum volucro patulo, imbri-cato; radiis tridenta-tis. expanding, imbricate; florets of the ray three-toothed.

Slender, pubescent;

Sp. pl. 3. p. 2249. Mich. 2. p. 144. Pursh, 2. p. 574. Nutt. 2. p. 178. A very small slender plant minutely pubescent. Mich.

Grows in the mountains of Carolina, Mich. Florida, Bartram.

Flowers July-September.

### 11. RADULA. Pursh.

R. caule inferne hispido, superne glabro, nudiusculo; pedunculis longissimis unifloris: foliis ovatis, attenuatis, tuberculatis, imbricatis, involucris squamis ovatis, acuminatis. ciliatis.

Stem hispid near the base, towards the summit glabrous, nearly naked; peduncles very one-flowered: long, hispidis; | leaves ovate, attenuate. tuberculate, hispid; inimbricate. volucrum scales ovate. acuminate, ciliate.

Pursh, 2. p. 575. Nutt.

Described by Pursh from specimens in the Herbatium of Sir Joseph Collected in Georgia by Bartram.

### 12. FULGIDA.

R. caule hispido, ramis virgatim elongatis, go-lanceolatis, denticulatis, hispidis, basi angustatis, subcordatis; involucri squamis radium subæquantibus; paleis lanceolatis.

Stem hispid, the branches long, virgate, unifloris; foliis oblon- | 1-flowered; leaves oblong lanceolate, denticulate, hispid, narrowed and slightly cordate at base; scales of the involucrum as long as the ray; chaff lanceolate.

Sp. pl. 3. p. 2248. Pursh, 2. p. 574. Nutt. 2. p. 178. R. Chrysomela, Mich. 2. p. 143.

Root perennial. Stem two to three feet high, bearing many branches, hispid. Leaves numerous, alternate, sessile, somewhat amplexicaule, triplinerved, hispid. Leaves of the involucrum lanceolate, hispid, somewhat soliaceous, the exterior the largest. Florets of the ray twelve to sourteen, lanceolate, two-cleft at the summit, externally hairy, scarcely longer than

the involucrum; of the disk very numerous, dark purple. Seed four-angled. Pappus a slight margin. Receptacle convex, chaff lanceolate, glabrous, with purple summits, nearly as long as the florets of the disk.

Grows in mountain meadows from Pennsylvania to Carolina, Pursh. In

the western districts of Georgia.

Flowers August-October.

### 18. HIRTA.

R. hirsutissima; caulibus virgatis, subra- | virgate, mosis, unifloris; foliis | branched, 1-flowered; spathulato-lanceolatis, leaves spathulate, lan-triplinervibus, serratis, ceolate, triplinerved, hirtis; involucri squa- serrate, hirsute; scales catis, radio breviori- bricate in a triple se-bus; paleis obovatis, ries, shorter than the acutis.

Very hirsute; stem sparingly mis triplici serie imbri- of the involucrum imray; chaff obovate, acute.

Walt. 214. Sp. pl. 3. p. Mich. 2. p. 143. Pursh, 2. p. 574. Nutt. 2. p. 178.

Root perennial. Stem two to three feet high, generally undivided, seabrous, hairy. Leaves alternate, sessile, semiamplexicaule, the lower spathulate-lanceolate, the upper lanceolate and ovate, all very hirsute. Flowers solitary, terminal. Involucrum many leaved, the leaves narrow lanceolate, hairy, the interior the smallest. Florets of the ray about fourteen, yellow, obliquely two-cleft at the summit, hairy, twice as long as the involucrum; of the disk very numerous, dark purple. Seed four-angled. Pappus obsolete. Receptacle conic, chaffy; chaff oblong, fringed and purple at the summit, hairy, as long as the florets of the disk.

Grows im dry sandy soils. Flowers June—September.

### 14. Aristata. Pursh.

R? caule hispido, ra-mis elongatis, corym-bosis, unifloris; foliis 1-flowered; leaves lan-VOL. II.

Pursh, 2. p. 574. Nutt. 2. p. 178.

Flowers small, deep yellow. Pursh.

Described by Pursh from specimens in the Herbarium of Sir Joseph Banks.

Collected in Carolina by Bartram. Can it really belong to this genus?

### CENTAUREA. GEN. PL. 1331.

Involucrum varium. Involucrum various. Radii corollulæ infundibuliformes, irregula- nel-shaped, irregular. res. Pappus pilosus. | Pappus hairy. Recep-Receptaculum setosum. | tacle bristly.

### 1. Benedicta.

C. involucri squamis duplicato-spinosis, lanatis, bracteatis; foliis semi - decurrentibus, with bracteal leaves at denticulato spinosis.

Scales of the involucrum doubly armed spines, woolly. with base; leaves somewhat decurrent, toothed and spiny.

Sp. pl. 3. p. 2315. Nutt. 2. p. 183.

Annual? Stems prostrate, six to twelve inches long, sparingly branched, very villous or woolly. Leaves sessile, pinnatifid, rugose, villous, segments acute, the lower sometimes runcinate. Flowers solitary, terminal, surrounded by the terminal leaves. Involucrum ovate, imbricate, the scales lanceolate, glabrous, terminating in a compound pectinate spine. Flurete all tubular, those of the ray slender, three-cleft, those of the disk five-cleft, one incision very deep. Styles of the fertile florets longer than the corolla, twoeleft; of the sterile shorter, undivided. Seed of the ray abortive; of the disk oblong, slightly curved, finely striate, crowned apparently with a triple pappus, the exterior a ten-toothed margin, the intermediate composed of ten or twelve awns as long as the seed, rigid, serrate, the interior of an equal number of short hairy awns. Bristles of the receptacle longer than the seeds.

Are exotic now naturalized; not uncommon in dry sandy pastures along the sea-coast; around Beaufort.

Flowers in April.

### SYNGENESIA NECESSARIA.

### CHAPTALIA. Ventenat.

Receptaculum nudum. Pappus capil-laris. Flosculi radii in duplici serie difformes, foeminei, fertiles; disci, masculi, bilabiati. Involucrum subimbricatum.

Receptacle naked. Pappus capillary. Florets of the ray dissimilar, in a double series, female, fertile; of the disk masculine, twolipped. Involucrum somewhat imbricate.

#### 1. Integrifolia. Mich.

C. foliis oblongolanceolatis obovatisque, retrorse denticulatis, subtus argenteonutantibus.

Leaves oblong lan- · ceolate and obovate, retrorsely denticulate, tomentose and silvery tomentosis; scapo nu- underneath; scape nado, unifloro, floribus ked, 1-flowered, flowers nodding.

Nutt. 2. p. 162. Tussilago Integrifolia, Mich. 2. p. 121. Willd, Sp. pl. 3. p. 1964. Perdicium Semiflosculare, Walt. p. 204.

Root somewhat tuberose, perennial. Leaves oblong, lanceolate, sometimes obovate, with fine retrorse denticulations, which, in the mature less are nearly obsolete, green and glabrous on the upper surface, covered with a white very dense cottony tomentum underneath. Scapes several from each root, six to ten inches long, tomentose, one-flowered; the flowers at first nodding, becoming erect as the seed matures. Calyx imbricate. Scales linear-lanceolate, appressed, clothed with a ferruginous tomentum, except the midrib which is glabrous. Exterior florets of the ray 16 to 20, glabrous, white on the interior surface, purple on the outer; just within these is a second series of female florets with long styles and only the rudiment of the corolla. Florets of the disk sterile, bilabiate, one lip broad, reflexed, slightly three-cleft, the other lip deeply two-cleft, with the segments revo-Seed of the fertile florets oblong, striate, glabrous.

Grows in damp pine barrens. Flowers March—April.

### \* GUMMIPBRUM. E.

S. caule erecto, hispido, gummifero; foliis sinuato pinnatifidis, subtus subhispidis; floribus majusculis, axillaribus subsessilibus; involucri squamis ovatis, acuminatis, margine hispidis. E.

Stem erect, hispid, bearing gam; leaves sinuate, pinnatifid, underneath somewhat hispid; flowers large, axillary, nearly sessile; scales of the involucrum ovate, acuminate, I hispid along the margin.

Root perennial? Stem two to three feet high, robust, very hispid and rough, exuding whenever wounded a terebinthine gum, so abundant that it sometimes I am told almost encrusts the plant. Leaves sinuate, pinnatifid, hispid on the under surface, particularly along the veins, the segments very acute, and generally more remote and incised than in the other pinnatifid species. Flowers larger than those of any other species in this genus that I have seen, axillary, on short squarrose peduncles. Scales of the involucrum

### 1. Laciniatum.

S. caule superne his-pido; foliis radicalibus the summit; leaves of caulinisque pinnatifidis, the root and stem pinlaciniis dentato sinuatis; floribus paniculatis; involucri foliolis
subcordatis acuminatis.

tis loot and stem plus
natifid, the segments
toothed and sinuate;
flowers in panicles;
scales of the involucrum somewhat cordate, acuminate.

Sp. pl. 3. p. 2330. Mich. 2. p. 145. Pursh, 2. p. 577. Nutt. 2. p.

Root perennial. Stew eight to twelve feet high, simple, smooth near the base, towards the summit rough and hispid. Leaves alternate, petiolate, about two feet long and one wide, amplexicaule at base, pinnatifid, segments distant, toothed and sinuate, scabrous. Scales of the involucrum ten, terminating in a subulate point. Florets of the ray about thirty, as long as the involucrum, yellow as in all the species of this genus. Florets of the disk numerous. Seeds emarginate, with two small awns.

This plant belongs to the Mississippi and a few of its tributary streams.

It has been reported to me as growing in the western districts of Georgia and among the Alleghany mountains. No plant, however, that I have seen belongs properly to the species as described by Linnæus, unless the follow-

ing should be considered as one of its varieties.

Flowers August to October. Pursh. More probably from June to August.

ovate acuminate, the outer ones fringed or hispid along the margins. Florets of the ray sixteen to twenty, perhaps twenty-four; of the disk numerous. Seed compressed, dilated, slightly winged, crowned with two subulate, very acute teeth.

Grows in the prairies of the Alabama.

Flowers from June to August.

I have introduced this remarkable species in a note, because I know not whether it has ever been found within the limits assigned to this work. The prairies of the Alabama in which this plant is found, commence within a few miles of the western frontier of Georgia, and this appears to be almost exclusively a prairie plant.

#### 2. PINNATIFIDUM. Е.

S. caule glabriuscu- Stem somewhat gla-lo; foliis sinuato-pinna- brous; leaves sinuate, tifidis, subscabris, sub- pinnatifid, somewhat tus parce pilosis; invo-lucri squamis ovalibus, exterioribus rotunda-the involucrum oval, tis. E.

the exterior round.

Stem four to six feet high, smooth and glabrous even among the branches. Leaves large, sinuate, pinnatifid, the summits of the segments generally acute, the upper surface nearly glabrous, the under surface slightly scabrous, sprinkled with a few short hispid hairs. Flowers large, not numerous, scattered in a loosely branching panicle. Scales of the involucrum imbricate, glabrous, the exterior circular, the interior oval, obtuse. Florets of the ray about as long as the involucrum. Seeds winged, obovate, emarge nate.

Grows in the western districts of Georgia, and particularly in and around the prairies of the Alabama.

Flowers July to August.

#### 8. Compositum. Mich.

S. caule lævi; foliis | Stem smooth; leaves caulinis sinuato-pinna- of the stem sinuate, tifidis, radicalibus ter- | pinnatifid, of the root natis, sinuato-multifi- ternate, sinuate, many dis; floribus parvis, pa- | cleft; flowers small, niculatis.

paniculate.

Sp. pl. 3. p. 2331. Mich. 2. p. 145. Pursh, 2. p. 577. Nutt. 2. p. 182.

S. Laciniatum, Walt. p. 217.

Root perennial. Stem two to four feet high, simple, nearly glabrous. Leaves much smaller than those of the preceding species, irregularly sinuate and lobed, sometimes pinnatifid, glabrous on the upper surface, sprinkled with hairs on the under surface and along the margin. Flowers small, in a terminal, somewhat corymbiform panicle. Scales of the involucrum ovate, rather obtuse, slightly fringed. Florets of the ray scarcely exceeding twelve, . nearly an inch long.

I suspect that some genuine species among the sinuate-leaved Silphiums

are yet undefined.

Grows in dry pine barrens. Flowers May—August.

#### Lin. 4. TERBINTHINACEUM.

S. caule lævi; foliis | radicalibus amplis, rotundato vel reniformi- or reniform, cordate, cordatis, sublobatis, slightly lobed and dentatisque, caulinis al- toothed, of the stem ternis, ovatis, serratis, alternate, ovate, scabris; panicula composita, multiflora.

Stem smooth; leaves of the root large round rate, scabrous; panicle compound, many flowered.

Sp. pl. 3. p. 2331. Mich. 2. p. 145. Pursh, 2. p. 577. Nutt. 2. p.

Stem erect, four to five feet high, glabrous. Root leaves deeply cordate, oblong or round, toothed, when luxuriant slightly lobed along the margin. Flowers more numerous than usual in this genus, in large scattered corymbose panicles. Scales of the involucrum nearly ovate, the exterior rather acute, the interior generally obtuse. Florets of the ray ten to twelve, about an inch long.

This species appears subject to some variations. In specimens sent me by Dr. Schweinitz from Salem, North-Carolina, the root leaves were nearly reniform, simply toothed and very scabrous underneath. In specimens collected in the western districts of Georgia and Alabama, where it appears to be more luxuriant, the leaves were lobed and angled, and nearly glabrous

underneath. In the flowers I can perceive no difference.

Grows along the mountains. Flowers July—August.

#### 5. Perfoliatum. Lin.

S. caule tetragono, Stem four-angled, lævi; foliis oppositis, smooth; leaves opposite, connate, ovate, connatis, ovatis, serratis.

Sp. pl. 3. p. 2331. Pursh, 2. p. 577. Nutt. 2. p. 188.

Stem about six feet high, four-angled, smooth. Leaves opposite, ovate or deltoid, serrate, opposite and perfoliate with decurrent petioles, the upper sessile, very broad, perfoliate. Pedancle terminal and from the axil of the highest leaves. Involucrum squarrose, scales obtuse. Florets of the ray twenty-four. Lin.

Grows in the mountains, Pennsylvania to Carolina. Pursh.

Flowers July to October.

### 6. Connatum. Lin.

S. caule tereti, his- | Stem terete, hispid; pido; foliis oppositis, leaves opposite, conconnatis, remote serra- | nate, remotely serrate, tis, scabris.

Sp. pl. 3. p. 2332. Mich. 2. p. 146. Pursh, 2. p. 578. Nutt. 2. p. 183.

Stem about six feet high, erect, simple, terete, (obscurely angled near the base,) scabrous with deflected hairs. Leaves opposite, connate perfoliste, ovate oblong, sessile, (not united by perfoliate perioles as the S. Perfolia-tum) scabrous, rather acute, servate. Panicle terminal, dickotomous. Isvolucrum squarrose, the scale ovate, obtuse, smooth, reflected at the summit-Florets of the ray twelve. Lin.

I have used the description given by Linneus of this and the preceding species, because I had no specimens on which I could depend, or rather

which agreed with the Linnsean plant.

Grows on the high mountains of Carolina, Pursh.

Flowers August—September.

#### 7. INTEGRIFOLIUM. Mich.

S. caule tetragono, aspero; foliis oppositis, sessilibus, oblongis, integerrimis, scabris; floribus paucis, breviter pedunculatis.

Stem four-angled, rough; leaves opposite, sessile, oblong, entire, scabrous; flowers few, on short peduncles.

Mich. 2. p. 146. Spl. pl. 3. p. 2333. Pursh, 2. p. 578. Nutt. 2. p. 183.

Stem square, rough. Leaves all uniform, opposite, sessile, erect, oblong, oval, very scabrous on the upper surface. Flowers few, on short peduncles. Mich. From the mountains of Carolina Dr. Macbride brought specimens nearly allied to this species, differing in a few particulars. Stem nearly terete, glabrous, the peduncles slightly angled. Leaves oblong, ovate or oval, acute, entire, scabrous on both surfaces, on short somewhat connate Flowers not numerous. Scales of the involucrum oblong, ovate, petioles. glabrous, slightly fringed, all nearly of one length. Florets of the ray fourteen, rather more than an inch long, of a very brilliant yellow.

The original S. Integrifolium of Mich. was collected in the state of Illi-

nois and may be distinct.

Flowers August—September.

#### Parsh. 8. LEVIGATUM.

S. caule simplici, tetragono, sulcato, gla- gled, furrowed, glabro: foliis oppositis | sessilibus, ovatis, acu- sessile, ovate, acumiratis, basi subcordatis, ciliatis.

Stem simple, 4-anbrous; leaves opposite, minatis, tenuissime ser- | nate, very slightly serrate, somewhat corutrinque glabris; in- date at base, glabrous; volucri squamis ovatis, scales of the involucrum ovate. ciliate.

Pursh, 2. p. 578. Nutt. 2. p. 183.

Stem about two feet high. Flowers in a compact corymb. Pursh.

The plant I am about to describe agrees in so many respects with this species, that it probably belongs to it. For the differences it will perhaps be easy to account.

Stem about two feet high, slightly angled, glabrous. Root leaves obling lanceolate, on petioles one to two inches long. Lower stem leaves oval lanceolate, on short petioles which are connate at base; the upper closely sessile, ovate, the highest almost cordate, all glabrous, slightly acuminate, finely fringed and all but the uppermost serrate. Flowers rather small, in a somewhat compact corymb. Scales of the involucrum ovate, ciliate, the exterior much smaller than the interior, rather acute. The leaves of this species are intensely bitter.

Pursh's description was made from plants collected by Mr. Enslen in Georgia between Savannah and Louisville. My specimens were collected

in the western districts of Georgia.

Flowers August—September.

## 9. Scaberrimum.

S. caule subangulato, angulis superne scabris; foliis ovatis, subacuminatis, serratis, rigidis, utrinque sca- acuminate, serrate, riberrimis, breviter petiolatis; floribus subcorymbosis; involucri squamis ovatis, ciliatis. E.

Stem somewhat angled, the angle rough towards the summit: leaves ovate, slightly gid, scabrous on both surfaces, on short petioles; flowers corymbose; scales of the involucrum ovate, ciliate.

Stem three to four feet high, very robust, angled when young, becoming terete and glabrous when old. Leaves on short petioles which as usual in this genus, are somewhat connate, three to four inches long, rather more than two wide, acutely serrate, resembling those of a rough leaved Helianthus. Flowers in a somewhat compact corymb. The exterior scales of the involucrum comparatively small, rather acute, scarcely scabrous. rets of the ray twelve to fourteen, about an inch long. Seed nearly circular, winged, deeply emarginate.

Grows in the western districts of Georgia.

Flowers August—September.

## 10. TRIFOLIATUM.

S. caule 6-angulato, | Stem six-angled, lævi; foliis terno verti- | smooth; leaves verticillatis, ovato-lanceo- cillate by threes, ovatelatis, inæqualiter den-tato serratis, supra scabris, superioribus sessilibus; panicula tri-lanceolate, unequally toothed and serrate, scabrous on the upper surface, the upper ones chotoma.

sessile; panicle tricho-

Sp. pl. 2. p. 2333. Pursh, 2. p. 578. Nutt. 2. p. 183. S. Ternifolium, Mich. 2. p. 146.

Stem four to six feet high, slightly angled, glabrous, generally purple. The upper leaves generally sessile, the middle and lower ternate, on short petioles, all ovate-lanceolate, serrulate, tapering to an acute point, slightly scabrous and sprinkled with hair on the upper surface, glabrous and reticulately veined on the under. Flowers in a terminal corymb. Scales of the involucrum ovate, rather acute, ciliate, loosely appressed. Florets of the ray about fourteen, about an inch and a half long, bright yellow.

Grows in the mountainous districts of Carolina and Georgia.

Flowers August—October.

### 11. TERNATUM.

S. caule tereti, lævi; foliis terno-verticillatis, leaves verticillate petiolatis, lanceolatis, threes, petiolate, lancesubdenticulatis, scabri- olate, slightly toothed, usculis, basi ciliatis, su- ciliate at base, someperioribus sparsis, ses- | what scabrous, the upsilibus; panícula dicho- per ones toma; calycibus ciliatis.

Stem terete, smooth; scattered. sessile; panicle dichotomous; the calyx frin-

Sp. pl. 3. p. 2833. Pursh, 2. p. 578. Nutt. 2. p. 183.

Stem four to six feet high, slightly angled, glabrous. Leaves nearly sessile, all narrow lanscolate, very acute, denticulately or sometimes acutely serrate, a little hairy and scabrous on the upper surface, the under reticulately veined and hairy along the midrib and larger veins. Flowers in a loose terminal corymb. Scales of the involucrum ovate, rather acute, ciliate, loosely appressed. Florets of the ray twelve to fourteen, about an inch and a half long.

I am not satisfied that I have accurately understood these two last species, nor as far as my specimens are concerned that they are sufficiently distinct:

but the leaves of the former are ovate, while in the latter they are marrow lanceolate, more pubescent underneath, and the corymb more diffuse.

Grows in the mountainous districts of Carolina and Georgia.

Flowers August-October.

#### Retz. 12. ATROPURPUREUM.

S. caule tereti, lævi; foliis subquaterno-ver- leaves verticillate by ticillatis, lanceolatis, fours, lanceolate, scasubintegerri- | brous, scabris. mis, subsessilibus, basi and sessile, ciliate ciliatis. sparsis; panicula dicho- scattered; panicle ditoma.

Stem terete, smooth; nearly entire superioribus base, the upper ones chotomous.

Sp. pl. S. p. 2334. Pursh, 2. p. 579.

Stem about four feet high, dark purple, somewhat densely clothed with leaves; the lowest leaves alternate, the next ternate, then quaternate or rather in approximating pairs; the uppermost scattered, all lanceolate, denticulate, scabrous, with the midrib dark purple, on short fringed petioles. Florets of the ray very narrow.

This species I have not seen; it is considered by Mr. Nuttall as a variety

of the preceding.

Grows in Carolina and Georgia, Pursh.

Flowers August—September.

## 18. DENTATUM.

S. caule erectum, subglabro; foliis inferioribus oppositis, superioribus alternis, omnibus lanceolatis, sinuato-dentatis, pilosis, scabris; floribus corymbosis; involucri squamis lato-ovatis, ciliatis.

Stem erect, somewhat glabrous; opposite, leaves alternate, lanceolate. sinuate. toothed, hairy, brous; flowers in corymbs; scales of the involucrum broad, vate, ciliate.

: Stem two to three feet high, slightly furrowed, generally glabrous. Upper leaves sessile, the lower on short petioles, irregularly and coarsely toothed, sometimes slightly sinuate and veined along the margin, hairy and scabrous on both surfaces. Flowers in a small terminal corymb. Scales of the involucrum ovate, broad, handsomely fringed. Florets of the ray about ten, nearly elliptic, scarcely an inch long.

This is nearly allied to S. Astericus, but it seems sufficiently distinct by its glabrous stem and its corymbose and smaller flowers; its leaves too ap-

pear to be more rigid and perhaps less scabrous on the under surface.

Grows in the western districts of Georgia.

Flowers August—September.

#### Lin. 14. ASTERISCUS.

S. caule simplici, te-reti, hispido; foliis op-positis alternisve, ob-longis, acutis, serratis, acute, serrate, scascabris; floribus paucis, | brous; flowers plerumque solitariis.

generally solitary.

Sp. pl. 3. p. 2332. Mich. 2. p. 146. Pursh, 2. p. 578.

Stem two to three feet high, terete, very hispid. Leaves all lanceolate, acute, serrate, sometimes coarsely dentate, scabrous, and somewhat hispid on both surfaces; the lower on short petioles, generally opposite; the upper alternate, sessile, sometimes all alternate. Flowers never numerous, frequently solitary, terminal. Scales of the involucrum ovate ciliate, the exterior acute. Florets of the ray eight to ten.

Grows in dry sandy soils. Flowers June—August.

#### 15. Pumilum. Mich.

S. caule petiolisque nibus muticis.

Stem and petioles tomentosis; ramis uni- tomentose; branches floris; foliis alternis, one-flowered; leaves cordato-ovatis, serra- | alternate, cordate, otis, petiolatis, subtus vate, serrate, petiolate, albo tomentosis; semi- white and tomentose underneath; seeds unawned.

Mich. 2. p. 146. Sp. pl. 3. p. 2382. Pursh, 2. p. 578. Nutt. 2. p.

S. Tomentosum, Pursh, 2. p. 579.

Stem two to three feet high, erect and procumbent, terete, covered like the underside of the leaves with a white tomentum. Leaves oblong, acate, irregularly toothed, conspicuously veined, the upper surface green, pubescent, the uppermost simply ovate. Flowers few, in an irregular corymb. Scales of the involucrum eight to ten, ovate, tomentose, imbricate. Florets of the ray eight to ten, rarely exceeding an inch in length, pubescent on the outer surface; of the disk numerous, dark purple. Seed obovate, crowned when young with two deciduous setaceous awns.

Grows in the high dry pine barrens in the middle country.

Flowers July—August.

## 16. ELATUM. Pursh.

alternis, | Leaves ovato-lanceolatis, cor- ovate-lanceolate, cordatis, serratis, obtusi- date, serrate, rather

Pursh, 2. p. 579.

These two species with which I am unacquainted, and which are very imperfectly distinguished, were described by Pursh from specimens in the Herbarium of Sir Joseph Banks. They were probably collected by Bertram (to whom the Botanists of the last century were indebted for a knowledge of many of our plants) on the confines of Georgia, Florida, and Alabams, the country of the Helianthus, the Silphium, the Rudbeckia, and perhaps I may add of the Solidago.

summit, awned with the persistent style.

## 1. STOLONIFERA?

G. herbacea, pro-cumbens, repens, gla-bra; foliis pinnatifidis, floribus ad radicem sessilibus.

Herbaceous, pro-cumbent, creeping, glabrous; leaves pin-natifid; flowers sessile at the root.

Nestt. 2. p. 134.

Hippia Stolonifera? Sp. pl. S. p. 2383. Persoon, 2. p. 497.

Root perhaps perennial, shooting out short runners (stolones) on all sides just under the surface of the ground, which produce new plants; each plant bearing five to six radical leaves and one sessile capitulum in the centre of the leaves. Leaves small, pinnatifid, with the segments linear and sometimes toothed, somewhat succulent and sprinkled with soft cottony hairs, the petiole-like base of the leaves four to eight lines long. Involucrum twelve to sixteen leaved, in a simple series; leaflets oblong, rather obtuse, hairy. Sterile florets in the centre of the capitulum, corolla funnel shaped, very slender, anthers closely united. Female florets in the circumference, corolla and stamens 0, germ dilated and woolly at the summit, margined. Style long, incurved, slightly two-cleft. Receptacle naked. Seed inversely wedge-shaped, crowned with the persistent style, winged, margin corrugate.

R. Brown is disposed to consider Gymnostyles as only a section of the genus Soliva. The character of that genus, however, as given in Persoon,

must be reformed before it can include this plant.

Grows in damp sandy soils. On Harleston's Green, Charleston. Mr. Middleton's, Ashley River. Mr. Pinckney's, Ashepoo.

Flowers February—May.

A shrub three to eight feet high, with very numerous opposite branches and leaves. Stem slightly furrowed, when young somewhat scabrous and pubescent. Leaves three-nerved, slightly scabrous with a somewhat dotted and uneven surface, of a greyish hue, attenuated at base into a short petiole. Flowers axillary, frequently in pairs, deflected, in simple axillary racemes forming together a large terminal panicle. Involucrum five-leaved, the leaves nearly round, viscidly pubescent. Fertile florets five in the circumference. Corolla very small, tubular, generally two? cleft. Style two-cleft, longer than the corolla. Stigmas obtuse. Male florets in the centre of the disk six to seven. Corolla longer than the involucrum, five-cleft, tinged with purple, stamens five, growing from the base of the corolla. Germ and Style very small, abortive. Seed abortive, naked. Bristles of the receptacle as many as the florets, as long as the corolla.

Grows along the seacoast in the vicinity of salt water—very common.

Flowers July—September.

Leaves bipinnatifid, giate.

Sp. pl. 4. p. 376. Pursh, 2. p. 581. Nutt. 2. p. A. Absynthifolia, Mich. 2. p. 183.

Stem four to six feet high, branching and with the leaves a little pubescent. Leaves sometimes opposite at base, alternate towards the summit, generally bipinnatifid, the segments larger and more distant than in the preceding species, nearly glabrous on the upper surface, pubescent and hoary underneath; racemes scattered, loosely paniculate. Heads of male florets small, globular; female florets remote, axillary, sessile. Spines of the fruit very short, acute.

Grows in the mountains of Carolina, Mich.

Flowers August—September.

# 4. PANICULATA. Mich.

A. caule ramosissimo, superne paniculato, petiolisque villosis; foliis utrinque viridibus bipinnatifidis, laciniis lanceolatis; fructibus aggregatis, pusillis, globoso-obovatis, subinermibus.

Stem branching, paniculate at the summit, and with the petioles villous; leaves green on each surface, bipinnatifid, the segments lanceolate; fruit somewhat clustered, small, obovate, slightly armed.

Mich. 2. p. 183. Sp. pl. 4. p. 376. Pursh, 2. p. 581. Nutt. 2. p. 186. Iva Monophylla, Walt. p. 232.

Root annual. Stem two to four feet high, branching, pubescent and hairy, somewhat scabrous. Leaves alternate, the lower compoundly, the upper simply pinnatifid, the segments all acute, somewhat hairy and scabrous. Flowers in simple racemes, terminal and axillary, the lower fertile, the upper sterile. Calyx of the sterile florets turbinate, ten-flowered, irregularly ten-toothed. Corolla globose. Stamens five, united on a pedical Fruit slightly muricate near the summit.

Grows in cultivated ground-very common.

Flowers July—September.

# XANTHIUM. GEN. PL. 1426.

Monoicum. Floris masculi—receptaculum paleaceum; antheræ approximatæ non coalitæ; involucrum polyimbricatum, phyllum, multiflorum. involucrumphyllum, 2-florum; codrupa sicca, rolla 0; muricata, 2-fida. Nux 2-locularis.

Monoecious. Mak florets—receptacle chaffy; anthers approximate, not united; involucrum many leaved, imbricate, many flowered. Female florets involucrum 2-leaved, 2-flowered; corolla 0; drupe dry, muricate, 2cleft; nut 2-celled.

# 1. STRUMARIUM.

Sp. pl. 4. p. 373. Mich. 2. p. 182. Pursh, 2. p. 581. Nutt. 2. p. 186. X. Americanum, Walt. p. 231.

Plant annual. Stem three to six feet high, branching, angled, pubescent, and very scabrous. Leaves alternate, generally three-lobed, the lobes coarsely toothed, pubescent and very scabrous on both surfaces, six to eight inches long, nearly of the same width, on petioles three to four inches long. Heads of male florets arranged on axillary racemes. Leaves of the involucrum subulate. Stamens united at base. Anthers distinct. Chaff of the receptacle subulate. Fertile florets one or two at the base of each raceme. Involucrum ten-leaved, two-flowered, the leaflets subulate, equal. Proper calyx an arillus? oblong, armed with hooked prickles of which the two at the summit become much larger than the others. Seed oblong, inclosed in the persistent calyx.

The germs in this plant which when young appear to be distinct, unite as

they mature and form a two-celled bipartible? fruit.

Grows in fields and about buildings-very common but not indigenous. Flowers July—October.

### 2. Spinosum.

#### Spines ternate; leaves X. spinis ternatis; foliis trilobis. three-lobed.

Sp. pl. 4. p. 374. Nutt. 2. p. 186.

Annual. Stem three to five feet high, terete, pubescent. Leaves alternate, ovate-lanceolate, acute, when young entire, when old, three-lobed, pale green, pubescent on the upper surface, almost tomentose underneath. Petioles two to three lines long, a spine three-forked, rigid, about an inch long, grows on one side of each petiole. Heads of male florets solitary, axillary at the base of each spine. Involucrum many leaved; leaves ovate. Filaments longer than the corolla, united at base. Anthers distinct. Fertile florets solitary, axillary, opposite the spine. Proper calyx armed with short hooked prickles. Styles two. Fruit two-celled.

An exotic now very common along the seacoast of Carolina and Georgia.

Flowers July—October.

Leaves of the root

Sp. pl. 3. p. 2390. Pursh, 2. p. 582. Nutt. 2. p. 187. E. Scaber, Walt, p. 217. Mich. 2. p. 148.

Root perennial. Stem about two feet high, terete, villous, particularly near the base, branching towards the summit. Leaves numerous on the stem, oblong lanceolate, serrate, thin, slightly scabrous and hairy on both surfaces, tapering to an attenuated base near two inches long. Flowers sessile, in terminal clusters. Bracteas three unequal leaves, cordate, villous, sessile at the base of each capitulum. Heads generally composed of four clusters each four-flowered. Involucrum of the clusters nine to ten leaved, leaves linear lanceolate, hairy on the outside, the interior the longest Florets all fertile. Corolla purple, tubular, five-cleft, deeply divided on one side so that the border becomes flat and ligulate, like the first division of the Syn. Æqualis to which this genus is closely allied. Seeds obleng, slightly angled. Pappus setaceous, awns five?

Grows in dry, moderately fertile soils.

Flowers July—September.

#### 2. Nudicaulis. E.

E. foliis radicalibus l ovali-lanceolatis, crenato-serratis, scabrius- | nately serrate, someculis, subtus villosis; what scabrous, hairy caule sub hirto, scabro, sub nudo.

Leaves of the root oval lanceolate, creunderneath; stem hairy, rough, nearly nak-

E. Tomentosus? Pursh, 2. p. 582.

E. Carolinianus, var. Simplex, Nutt. 2. p. 187.

Stem one to two feet high, scabrous, and somewhat hispid, branching towards the summit, generally purple. Root leaves large, scabrous on the upper surface, very villous on the under. Stem leaves 0, excepting a small one at each division of the branches. Bracteas tomentose. Scales of the involucrum rigid.

This species which has always been confounded with the preceding though marked as a variety by Mr. Nuttall, is probably distinct. Its leaves are larger, more rigid, more villous, and confined to the base of the stem. The bracteal leaves are much more tomentose, and the scales of the involucrum more rigid and comparatively longer. It appears also to commence flowering later.

Grows in dry moderately fertile soils.

Flowers August-September.

O. labello oblongolanceolato, pinnatim late, pinately ciliate, ciliato, petalis duplo twice as long as the longiore; cornu ger- petals; horn longer mine longiore.

Lip oblong-lanceothan the germ.

Sp. pl. 4. p. 8. Walt. p. 280. Mich. 2. p. 156. Pursh, 2. p. 585. Nutt. 2. p. 188.

Root perennial, composed of two small tubers. Stem one to two feet high, leafy, glabrous. Leaves lanceolate, acute, entire, nerved, sheathing at base, six to eight inches long, one to two wide. Flowers in a terminal mike, yellow, each protected by a leaf at base. Perianth 6-parted, 3 segments exterior, the upper erect, concave, the two lower obovate, deflected; three interior, the two lateral very small, incised at the summit; the inferior segment or labellum narrow lanceolate, longer than the lateral segments, beautifully laciniate or fringed. Horn at the base of the labellum filiform, longer than the germ. Capsule triquetrous, six furrowed, one celled, three valved. Seeds very numerous, very small.

Grows in wet soils—common along the margin of swamps.

Flowers July—August.

## 2. Blephariclottis.

O. labello lanceolato, ciliato, longitudine pe- ate, as long as the upmine longiore.

Lip lanceolate, cilitali supremi; cornu ger- per petal; horn longer mine longiore. per petal; horn longer than the germ.

Sp. pl. 4. p. 9. Pursh, 2. p. 585. Nutt. 2. p. 188.

This plant at least as understood by many of our botanists, though readily distinguished by its white corolla or perianth, is a very doubtful species. It grows intermingled with the O. Ciliaris, and excepting by colour is not easily discriminated. In the plants I have examined neither labellum nor horn furnished any permanent distinctions.

Grows with the preceding species in wet soils.

Flowers July—August.

Mich. 2. p. 156. Sp. pl. 4. p. 9. Pursh, 2. p. 585. Nutt. 2. p. 188.

Root tuberous. Stem erect, one to two feet high, slightly angled, leafy, glabrous. Leaves four to six inches long, one wide, lanceolate, nerved, sheathing at base. Flowers somewhat crowded, in a terminal spike. Perianth six-parted, yellow, the three exterior segments oval, entire, equal; of the interior the two lateral are smaller than the exterior, obovate, obtuse, incised or sharply toothed, the lower or labellum a little longer than the exterior segments, lanceolate, fringed. Harn about half as long as the germ. Filament (Caudicula, Richard) short, thick, bifid, forming the back and apper part of the genitaliferous column. (Gynostemium, R.) Pollinia incurved, ovate, alternate at the summit, with a white gland on one side, opening at the summit and discharging elastically the pollen, which appears to be attached originally to a viscous pedicel. Germ inferior, somewhat spiral, attenuated toward the summit. Style short, thick, forming the lower part of Stigma depressed, glandular. Seeds very numerous, the gynostemium.

Grows in damp soils along the margin of swamps, commonly intermingled with the two preceding species. It is readily distinguished by its smaller and more densely clustered flowers.

Flowers July—August.

#### Mich. 4. LACERA.

petalis | labello duplo longiore, tripar- the petals, three-parttito, laciniis multifidis; ed, with the segments petalis exterioribus many cleft; exterior ovato-lanceolatis, inte- petals ovate lanceolate, cornu germine brevi-

Lip twice as long as linearibus: the interior horn shorter than the

Mich. 2. p. 156. Pursh, 2. p. 586.

Stem twelve to eighteen inches high, slender, glabrous. Leaves narrow lanceolate, nerved, sheathing at base. Flowers rather scattered along a terminal spike. Bracteal leaf shorter than the germs. Exterior segments of the perianth equal, ovate lanceolate, rather acute, of the interior the two lateral are very narrow, strap-shaped, rather obtuse, as long as the exterior, the labellum twice as long, three parted from the middle, so that the undivided base is nearly as long as the segments.

From the O. Psycodes (judging from specimens sent me by Muhlenberg) this plant differs cosentially. It is distinguished by a more scattered spike, and by every portion of the flower, germ, segments, and labellum, longer and proportionally narrower.

Grows in the middle districts of Carolina. St. Stephen's, Dr. Macbride.

Flowers-

### 5. Flava? Lin.

O. labello ovato, dentato cornu attenuato germi-nis longitudine; spica germ; spike crowded; conferta; bracteis lon-bracteas as long as the gitudine florum.

Lip ovate, toothed crenatoque; and crenate; horn tal flowers.

Sp. pl. 4. p. 33. Pursh, 2. p. 586. Nutt. 2. p. 188.

Stem about two feet high, Leaves narrow lanceolate, sheathing, the upper one small. Flowers in a short crowded spike, yellow. Bracteal leaves sometimes not longer than the germ. Exterior segments of the perianth larger than the interior; labellum lanceolate, the sides toothed or crenate, almost fimbriate. Horn subulate, generally shorter than the germ, nearly acute at the point.

This is the O. Flava of Nuttall; it appears however, to differ much from the original O. Flava of Clayton, ("floribus in spica longa congestis; labio inferiore nectarii trifido; lacinia intermedia majore; calcare germine longi-

ore." Gron. Fl. Vir. p. 137.

Grows in the middle and upper districts of Carolina and Georgia.

Flowers in the summer.

#### 6. NIVEA. Nutt.

O. labello lineari-oblongo, integro; petalis | entire; petals expandpatentibus; cornu fili- ing; horn filiform, lonformi, germine longi-ore; foliis inferioribus lower leaves linear, linearibus prælongis, very long, the upper superioribus subulatis. subulate. Nutt.

Lip linear, oblong,

Lower leaves narrow, a span long, the upper very small. Spike rather dense, two to three inches long, bractcal leaves shorter than the germ. Flowers white, lip longer than the interior segments of the perianth. Genitaliferous column comparatively small, the pollinia consequently nearly ses-

Grows near St. Mary's, Georgia. Described by Mr. Nuttail from specimens collected by Dr. Baldwin. I have specimens which appear to agree with this species in which the horn is generally twice as long as the germ.

Flowers-

#### 7. CLAVELLATA. Mich.

O. labello ovato, inminis; caule unifoliato.

Lip ovate, entire; tegerrimo; petalis con-niventibus; cornu cla-clavate, as long as the vato, longitudine ger- | germ; stem one-leafed.

Mich. 2. p. 155. Pursh, 2. p. 586. Nutt. 2. p. 189. O. Tridentata, Sp. pl. 4. p. 41.

Stem about twelve inches high, glabrous, slender. Leaves lanceolate, nerved, sheathing, one large leaf near the base, and a few small ones towards the spike; sometimes though rarely two large leaves are found upon the stem. Flowers in a short, rather compact spike, small. Petals nearly equal, ovate, obtuse. Labellum longer than the petals, slightly three-toothed at the summit. Horn longer than the germ, conspicuously thickened at the end. (Corolla white, Pursh.)

Grows in the middle and upper districts of Georgia and Carolina.

Flowers-

### 8. Viridis.

O. labello lineari, bracteis flore longioribus.

Lip linear, three apice tridentato; peta-lis conniventibus; cor-nu obtuso, scrotiformi; toothed at the summit; petals connivent; horn obtuse, scrotiform; sesqui- bracteas longer than the flower.

Sp. pl. 4. p. 33. Pursh, 2. p. 587. Nutt. 2. p. 189.

Not above three inches high. Flower small, greenish white. Pursh. With this species I am unacquainted.

Grows in dry grassy places on the high mountains of Virginia and Carolina. Pursh.

Flowers June-July.

### 9. Spectabilis.

O. labello obovato, indiviso, crenato, retu- | ded, crenate, retuse; so; petalis rectis, late-ralibus longioribus; petals straight, the lat-eral ones long; horn cornu clavato germine breviore; bracteis flore clavate, shorter than the germ; bracteas lonlongioribus; caule a- ger than the flower; phyllo.

Lip obovate, undivistem leafless.

Sp. pl. 4. p. 56. Pursh, 2. p. 587. Nutt. 2. p. 189. O. Humilis, Mich. 2. p. 155.

Root palmate, mostly two-leaved; scape acutely pentangular, sometimes producing a leaf, few flowered; bracteas large and lanceolate; spur thick and obtuse, compressed, subclavate, about the length of the germ. Segments of the petaloid calyx all connivent and adhering, never expanding, of a bluish purple; lip white, broad ovate and entire. Pollinia clavate, pedicellate, concealed within the lateral cucullate cells of the genitaliferous column, grains of the pollen agglutinated by the base. Nuttall.

Grows in the mountains of Carolina. Michaux.

Flowers May—June.

# 10. Fuscescens?

si dentato, petalis pa-tentibus; cornu subu-lato, germinis longitudine.

O. labello ovato, ba- | Lip ovate, toothed

Sp. pl. 4. p. 33. Pursh, 2. p. 587. Nutt. 2. p. 189.

Stem about twelve inches high, leafy, glabrous. Leaves large for the size of the plant, lanceolate, glabrous, sheathing at base. Flowers rather scattered in a terminal spike. Rackis angled. Corolla small, (brownish yellow, Pursh,) the labellum longer than the other segments. Horn not as long as the germ.

I have specimens collected by Mr. Jackson near Louisville, Georgia, agreeing very nearly with others sent me from New-York under this name, by Dr. Torrey. In our southern species the bracteal leaves are scarcely longer than the germ, the upper ones not as long, and the horn decidedly shorter than the germ. Whether these plants agree really with the Siberian O. Fuscescens, of which there is no detailed description in Willdenow, remains yet to be determined. I should scarcely expect to meet with a Siberian plant in the alluvial districts of Georgia.

Grows on grassy hills. Pursh.

Flowers July. Pursh.

# 11. BIDENTATA. E.

O. labello ovali, obcaule nudiusculo. E.

Lip oval, oblong, 2longo, basi bidentata; toothed at base; petals petalis ovatis, patenti- ovate, expanding; horn bus; cornu germine shorter than the thick-incrassato-breviore; fo- ened germ; leaves narliis angusto lanceolatis; now lanceolate; stem nearly naked.

To the former species this has much affinity. It appears from specimens to be a taller plant with a more naked stem; the bracteal leaves about as long as the flower, the corolla larger, the labellum oval, longer than the petals, entire, excepting the two very distinct teeth near the base, horn scarcely more than half the length of the germ, somewhat thickened at the point; germ unusually thick; perhaps only differing from O. Fuscescens from a difference of soil and in my specimens of maturity.

Grows in the middle districts of Georgia and Carolina.

Flowers—

# HABENARIA. Willd.

Nutt. 2. 189.

O. Quinqueseta, Mich. 2. p. 155. Pursh, 2. p. 586.

Stem about two feet high, entirely clothed with numerous, oval-lanceolate, acute, glabrous leaves, sheathing at base. Leaves three to four inches long, nearly one and a half wide. Flowers scattered in a long terminal spike. Bractess about the length of the getta, ovate-lanceolate, slightly acuminate. Three exterior segments of the perianth ovate, somewhat acute, concave; of the interior the two lateral biparted, the upper segments small, the lower linear or setaceous, as long as the segments of the labelium. Labelium three-parted, the lateral segments setaceous, longer than the middle one which is also very narrow. Horn twice as long as the germ, somewhat thickened towards the point.

This plant is to me very rare. I have only met with it once or twice,

and then in dry pine barrens—near Beaufort.

Flowers August---October.

#### Nutt. 2. Repens.

Roots tuberous, creeping. Stem eight to twelve inches high, pubescent towards the summit. Leaves of the stem subulate, acute, scarcely more than scales; of the root linear lanceolate, sine to ten inches long, generally decaying before the plant begins to flower. Flowers in a compact spiral spike. Bracteal leaves pubescent, nearly as long as the flower. Segments of the perianth white, connivent, nearly equal in length. The hip creaulate, indistinctly lobed.

Grows in damp soils.

Flowers through the summer.

### 2. CERNUA.

N. foliis lanceolatis, | Leaves trinervibus; caule va- 3-nerved; stem sheathginato, spica oblonga ed; densifiora; floribus re- | densely flowered; flowcurvato cernuis; label- ers recurved, nodding; lo oblongo, integerri- lip oblong, entire, amo, acuto.

lanceolate. spike cute.

Sp. pl. 4. p. 75. Pursh, 2. p. 589. Nutt. 2. p. 190. Limodorum Autumnale, Walt. p. 221. Ophrys Cernua, Mich. 2. p. 158.

Very similar to the preceding species, from which it differs by a more

crowded spike, and by larger flowers.

This genus merits in this country a farther examination. The number of varieties distinguished by the size of the flowers, by the extended or cootracted spires of the spike, by the period of flowering, would lead to a supicion that we had many species, but in the occasional examinations I have given them, I have been able to discover no permanent distinctions.

Grows in damp soils.

Flowers through the summer.

# CRANICHIS. Swartz.

Corolla pentapetala, resupinata, subringens.
Labellum fornicatum.
Anthera stylo parallella, postice inserta.

Corolla 5-petalled, resupine, somewhat ringent. Lip vaulted. Anther parallel with the style, inserted beabind.

### 1. MULTIFLORA.

C. radicibus fasciculatis, teretibus, tomentosis; foliis ovali-lanceolatis, sub sessilibus; scapo multifloro, superne pubescente; petalis interioribus conniventibus; labello forni cato, acuminato. E.

Root fasciculate, terete, tomentose; leaves oval-lanceolate, nearly sessile; scape many flowered, pubescent near the summit; interior petals connivent; lip vaulted, acuminate.

Nutt. 2. p. 191.

Root composed of many terete, villous or tomentose fibres. Scape about two feet high, pubescent towards the summit. Leaves of the root oval-lanceolate, rather acute, glabrous, nerved, attenuated at base but scarcely prolonged to a petiole; of the stem merely sheathing scales. Flowers (fifteen to twenty) somewhat scattered in a terminal spike. Bracteal leaves very small, scarcely half as long as the germ, pubescent. Three exterior segments of the perianth lanceolate, acute, expanding, pubescent on the outer surface, of the interior segments the two upper (turned downwards from the resupine position of the flower) obliquely ensiform, connivent at the summit; labellum fornicate, compressed at the sides, acuminate, generally inclosing the genitaliferous column. Perianth pale green with streaks of deeper green, the sides of the labellum edged with a circle of deep green. Column short, gibbous, with an oblique pointed summit. Anthers inserted behind the summit, but when the column is enclosed in the labellum, appearing to be in front. Germ somewhat triquetous, tapering to the base.

Apparently allied to the C. Pauciflora of Jamaica. Collected by Dr. Macbride in St. John's, Berkeley.

Flowers October.

# . LISTERA. Brown.

Corolla irregularis. pendulum, Labellum bifidum. Columna apanthera tera, parva, Pollen basi inserta. farinaceum.

Corolla irregular. Lip pendulous, 2-cleft. Column without wings, small, the anther inserted at the base. Pollen farinaceous.

## 1. Porescens.

L. foliis radicalibus. ovatis, acutis: scapo aphyllo, pubescente, laxifloro; floribus pedicellatis, labello bilobo, vix petalis conniventibus longiore; capsulis clavatis; radice palmato.

Leaves radical. ovate, acute; scape leafless, pubescent. loosely flowered; flowers on pedicels, with the lip two-lobed. scarcely longer the connivent petals; capsules clavate; root palmate.

Nutt. 2. p. 191. Epipactis Pubescens, Pursh, 2. p. 591. Ophrys Pubera, Mich. 2. p. 158. Arethusa Racemosa, Walt. p. 222. Flowers small, greenish white. Pursh. With this species I am unacquainted. Grows in the pine barrens of Carolina and Georgia. Pursh. Flowers June.

## 2. Convallarioides.

L. caule bifolio: fosubrotundis, acutis; spi | date,

Stem two-leaved; liis oppositis, cordato- leaves opposite, cornearly ca parviflora; labello acute; spike bearing

oblongo, apice dilatato, obtuse bilobo; germine subgloboso; radice fibrosa. small flowers; lip oblong, dilated at the summit, obtusely two-lobed; germ somewhat globular; root fibrous.

Nutt. 2. p. 191.

Epipactis Convallarioides, Sp. pl. 4. p. 88. Pursh, 2. p. 591.

Root fasciculate. Stem about a foot high, bearing near the middle two opposite sessile leaves. Leaves cordate-ovate, acute, nerved, glabrous. Flower's small, in a terminal raceme. Pedicels three to four lines long, bracteal leaves very small. Petals five, somewhat reflected, greenish. Labellum three or four times as long as the petals, deeply two-cleft, the segments acute. Capsule oval.

This plant from the acute segments of the labellum probably belongs to the L. Cordata as described by Mr. Nuttall, but as all the plants sent me from the north as the E. Convallarioides have this characteristic also, I have retained this name until I can have an opportunity of comparing the

two species.

Found near Savannah in damp soils by Dr. Baldwin.

Flowers in March.

††† Anthera termi-nalis, inserta, persis-tens. Pollen angulatum vel farinaceum. ††† Anther terminal, inserted, persistent. Pollen angular or fa-rinaceous.

Nutt. 2. p. 192.

Arethusa Ophioglossoides, Sp. pl. 3. p. 80. Mich. 2. p. 159. Pursh. 2. p. 590.

Root perennial. Stem about twelve inches high, terete, glabrous, generally bearing two leaves and one terminal flower. Leaves alternate, one near the middle, the other at the summit of the stem, lanceolate, acute, nerved, sessile, and semiamplexicaule. Perianth five leaved, purple, approaching to rose colour. Petals distinct, nearly of equal length, somewhat connivent, oblong, the uppermost widest. Labellum scarcely longer than the petals, winged, the centre thickened with elevated crested ridges. Coheme much shorter than the lip, thick, solid. Anthers operculate, contained in a small depression at the summit.

I have specimens with the leaves narrow lanceolate, very acute; and leaves oval-lanceolate, scarcely acute, with the stem shorter and flowers larger. The first from the low country of Carolina and Georgia, the se-

cond from the upper districts.

Grows in damp soils. Flowers April—May.

### 2. DIVARICATA.

radice fibrosa; scapo remote bifoliato, | 1-flowered, with exterioribus longo-linearibus, patulis; labello subtrilobo, crenulato.

Root fibrous; scape unifloro; foliis oblon- distant leaves; leaves go-lanceolatis; petalis oblong-lanceolate; exterior petals long, linear, expanding; somewhat three-lobed, crenulate.

Nutt. 2. p. 192.

Arethusa Divaricata, Sp. pl. 4. p. 81. Walt. p. 222. Mich. 2. p. 160.

Roots fibrous, somewhat carnose. Stem about two feet high, bearing two leaves, one near the middle of the stem, the other at the summit, and one terminal flower. Leaves narrow lanceolate, acute, sometimes abruptly so, nerved, glabrous, and slightly glaucous. Perianth five-leaved, the three exterior linear-lanceolate, two to two and a half inches long, expanding or erect, dark purple; the two interior shorter, lanceolate, somewhat connivent; incurrate. Labellum nearly as long as the exterior petals, obtusely three-

lobed towards the summit with the middle lobe extended, created along the middle, crenulate on the margin. Cohomo much shorter than the lip, clavate, solid. Germ furrowed, one celled, three valved.

Grows in damp soils around ponds in the pine barrens.

Flowers May.

## 3. Verticillata. Muhl.

P. foliis quinis o- | vali-lanceolatis, basi | lanceolate, cuneate at cuneatis, verticillatis; base, verticillate; stem caule unifloro; petalis one-flowered; the three tribus exterioribus lon- exterior petals very gissimis, linearibus, in-terioribus lanceolatis, labello trilobo, lacinia lobed, the middle segmedia undulata.

Leaves five, ovalment undulate.

Nutt. 2. p. 192.

Arethusa Verticillata, Sp. pl. 4. p. 81. Pursh, 2. p. 591.

Root fasciculate, fibres simple and carnose. Stem about twelve inches high, terete, slightly glaucous. Leaves five, verticillate (two, however, inferior,) at the summit of the stem, oval-lanceolate, cuneate, nerved, acuminate, a few scales sheathing the base of the stem. Flower sessile on a long germ at the summit of the stem; three exterior petals linear, two to two and a half inches long, of a greenish brown colour, interior petals paler, oblong, obtuse, connivent, scarcely one third of the length of the exterior petals. Labellum shorter than the interior petals, crested along the centre, winged, with the margins inflected, the terminal lobe broad, pendent, undulate. Coames shorter than the labellum, subclavate. Anther operculate, two celled, unguiculately articulated behind, and received into a margined depression at the summit of the column. Nutt.

Grows in oak lands, very rare in the low country. Silk Hope, Little Ogeechee-near Columbia, South-Carolina, and Milledgeville, Georgia, more abundant-probably common in all of the upper districts.

Flowers May.

Nutt. 2. p. 193. Arethusa Pendula, Sp. pl. 4. p. 82. Pursh, 2. p. 590. Arethusa Parviflora, Mich. 2. p.

' Root tuberous, oblong. Stem about twelve inches high, terete, slightly angled by the decurrent leaves, carnose, the summit when young generally nodding. Leaves short, alternate, nerved, somewhat amplexicatie, with the margins slightly decurrent. Flowers two to four, axillary, erect when expanded, before and after expansion nodding. Peduncles five to six lines long. Segments of the perianth five, lanceolate, acute, white tinged with green and pale purple, the two interior connivent. Labellum scarcely longer than the petals, unguiculate, slightly three-lobed, the lateral lobes inflected, the middle circular with the margin crenulate? Column rather shorter than the lip, flat. Anther one celled, purple. (Pollen farinaceous, the masses separated superficially by two internal lamellæ. Nutt.)

Grows in rich damp soils. Flowers July—August.

## CALOPOGON. Brown.

Petala 5, distincta. | Petals 5, distinct. Labellum resupinatum? | Lip resupine? unguicuunguiculatum, crista- late, crested. Column tum. Columna libera. free. Pollen angled. Pollen angulatum.

## 2. PULCHELLUS.

C. foliis radicalibus, angusto - lanceolatis. nervosis; scapo 6—10 floro; labello erecto, lip erect, tapering at basi attenuato, lamina expansa, disco concavo, piloso.

Leaves radical, narrow lanceolate, nerved; scape 6—10 flowered; base, the lateral segments expanding, the disk concave, hairy.

Nutt. 2. p. 194. Cymbidium Pulchellum, Sp. pl. 4. p. 105. Pursh, 2. p. 592. Limodorum Tuberosum, Mich. 2. p. 159. Ophrys Barbata, Walt. p. 221.

Root tuberous, nearly round. Stem twelve to eighteen inches high, erect, naked, glabrous. Leaf generally one, sheathing the base of the stem, (but showing around its own base the vestiges of other leaves, perhaps those of former years,) eight to ten inches long, scarcely one wide, nerved, acute, erect, somewhat rigid. Flowers resupined rather distant, in a terminal spike. Bracteal leaf small, very acute. Segments of the perianth lanceolate, the two lateral exterior ones oblique, the interior rather narrower. Labellum on the upper side of the perianth (is not the flower as in Cranichis resupine?) about as long as the petals, attenuate and distinctly three-nerved or ribbed along the claw, very much dilated at the summit, very obtuse, conspicuously bearded just where it begins to contract, margin entire, column declining from the lip, curved, tapering to the base, bearing two dilated wings near the summit. Anther, as in all of this division, received into a small cavity at the summit of the column, attached behind by a short jointed pedicel.

Flowers incarnate, large for this class, very handsome.

Vai. Graminipolia.

This variety which is remarkable and most probably a distinct species. yet offers no prominent mark of distinction. Its flowers are scarcely more half the size of the preceding, the leaves one to two lines wide, the bracteal leaves acuminate, and the column I think comparatively shorter. It flowers earlier.

Grows in damp soils. The first variety delights to grow on old decaying and floating logs, in mill ponds, &c. mingled with mosses and aquatic grasses.

Flowers May—June. The second in pine barrens. Flowers April—May,

#### ARETHUSA. Lin.

## 1. Bulbosa.

crenulato.

A. aphylla; radice globosa; scapo vaginato, unifloro; corolla laciniis superioribus incurvatis; labello sub- ments incurved; lip slightly crenulate.

Spl. pl. 4. p. 80. Mich. 2. p. 160. Pursh, 2. p. 590. Nutt. 2. p. 194.

Stem about twelve inches high, the lower part clothed with sheaths, (three to four) which have no expanded blade. Flower solitary, terminal, fragrant. Segments of the perianth nearly equal, purple, the upper incurved, somewhat connivent. Labellum not longer than the petals, the inflected margin crenulate, crested internally. Column shorter than the lip.

Grows in the mountains of Carolina, Mich. I have never seen it in the low country.

Flowers in June, Pursh.

Cymbidium Verecundum, Sp. pl. 4. p. 105. Pursh, 2. p. 592.

Limodorum Trifidum, Mich. 2. p. 159.

With this species I am unacquainted. Pursh mentions, I suspect inaccurately, that it grows in Carolina. Mr. Nuttall considers it as an inhabitant of Florida. Michaux, who cultivated it near Charleston where it flowered in the autumn, received it from the Bahama Islands.

## 2. APHYLLA. Nuttall.

tereti, squamoso, su- rete, scaly, tapering perne attenuato; squa-mis ovatis, alternis; ovate, alternate; lip labello ecalcarato. Nut. | without a spur.

B. aphylla; scapo | Leafless; scape te-

Nutt. 2. p. 194. Arethusa Spicata, Walt. p. 222.

Root tuberous, articulate. Stem one to two feet high, erect, simple. Leaves merely coloured scales, the lower sheathing, the upper sessile. Spikes many flowered, flowers pendulous. Petals five, distinct at base, somewhat connivent, oblong lanceolate, the exterior a little longer than the interior, brown streaked with purple. Lip dilated at the summit, emargin-ete, slightly undulate, crested along the centre with six brightly coloured ridges; shorter than the petals, with no vestige of a spur at base, lateral aegments erect, veined. Column shorter than the lip, incurved, somewhat clavate; operculum emarginate, vertical, yellow, with the summit of the lobes purple. Pollinia two? yellow, deciduous, each with a fiesare through which the farinaceous pollen is discharged. Capeule clavate, somewhat trigonous.

This plant has always been considered by our southern botanists as the A. Spicata of Walter. It grows in rich soils near the margins of swamps. St. John's, Dr. Macbride; Louisville, Georgia, Mr. Jackson; Florida, Dr.

Baldwin.

Flowers August-September.

## TIPULARIA. Nuttall.

4. parallela.

Petala spathulata, Petals spathulate, patentia. Labellum integrum, sessile, basi subtus calcaratum. Columna aptera, libera. Anthera operculata, persistens. Pollinia | late, persistent. Pollinia 4, parallel.

## 1. Discolor.

Nutt. 2. p. 195. Orchis Discolor, Pursh, 2. p. 586.

Bulbe concatenated. Leaf solitary, plaited and nerved. Flowers in a long terminal raceme, nodding. Bracteas 0. Segments of the perianth five, oblong, expanding. Lip entire, very short and concave, cremulate; spur filiform, nearly twice the length of the germ. Column porrected, margined at the sides. Anther operculate, persistent; operculum articulated behind, furnished with two auxiliary valves closing internally upon the four masses of pollen; masses solid and parallel, neither granular nor pulverslent. Nuttail.

Grows in pine barrens. New-Jersey to Carolina, Pursh. Collected in the upper districts of Carolina by Dr. Macbride.

Flowers August.

Roots bulbous. Leaves all radical, two, oval lanceolate, acute, glabrous, slightly nerved, entire, loosely sheathing the base of the stem, about three inches long, nearly two wide, a third, exterior, consisting of scarcely more than a sheath, with an oblique acute summit. Scape angular, six to eight inches high. Flowers numerous in a terminal raceme. (Three exterior segments of the perianth acute, white, the two interior filiform, yellowish, reflexed, the lower lip broad, obovate, with an abrupt point of a pale olive

Grows in the upper districts of Carolina and Georgia, in rich woodland,

among decaying vegetables. I have not seen it in the low country.

Flowers June-July. Pursh. .

#### 2. Ophioglossoides. Muhl.

folio solitario, scapo pentagono; labello apice bifido.

Leaf solitary, ovate, ovato, amplexicaule; amplexicaule; scape 5angled; lip 2-cleft at the summit.

Sp. pl. 4. p. 90. M. Unifolia, Mich. 2. p. 157. Microstylis Ophioglossoides, Nutt. 2. p. 196.

Root bulbous. Stem four to six inches high, with a leaf near the middle and a sheath at base. Leaf ovate, sessile, amplexicaule. Flowers numerous, very small, in a terminal raceme. Petals five, commivent, only one of them deflected, the two interior filiform. Lip about the length of the petals, erect, concave, broadest at the base, cucullate over the anthers, summit truncate, emarginate and divaricate, bidentate, producing also an intermediate denticulation. Cohoun minute, scarcely visible. Anthers two; the exterior whitish, producing two masses of pollen, the interior which is acute and whitish only one. Nutt.

Grows with the preceding. Sometimes though rarely met with in the

low country.

Flowers May-June. Pursh.

## CORALLORHIZA. Haller.

(nec parallela.)

Petala æqualia, conniventia. Labellum vent. Labellum freplerumque basi productum. Columna libera. Pollinia 4, obliqua, (nec parallela) not parallel.

capsule obovate; leaf

Nutt. 2. p. 197. Cymbidium Corallorhizon, Sp. pl. 4. 109.

Root tuberous, branching, divaricate. Stem twelve to fourteen inches high, glabrous, clothed with sheaths which at the summits are abruptly acute, the upper frequently terminating in a subulate leaf nearly an inch long. Flowers in a terminal raceme, nodding. Segments of the perianth oblong lanceolate, connivent; of an obscure purplish brown colour; lip bidentate near the base, with the teeth inflected. Column much shorter than the petals.

Grows in rich wooded lands. I have specimens sent me from Boston by Dr. Bigelow, and some collected at St. Mary's, Georgia, in which I can dis-

cern no difference.

Flowers September—October.

#### 2. ODONTORBIZA. Willd.

C. scapo vaginato; folio nullo; floribus pedicellatis; petalis lan**c**eolatis. æqualibus; labello integro, ovali, obtuso, crenulato, calcare obsoleto, germini adnato; capsula globosa.

Scape sheathed; leaf 0; flowers on pedicels; petals lanceolate, qual; labellum entire, oval, obtuse, crenulate, with the spur obsolete, attached to the germ capsule globular.

Nutt. 2. p. 197.

Cymbidium Odontorhizon, Sp. pl. 4. p. 110. Pursh, 2. p. 593. Ophrys Corallorhiza, Mich. 2. p. 158.

Root much branched, dentate. Scape eight to twelve inches high, slender, clothed with two or three sheaths, acute at the summit. Flowers mumerous, small, in a terminal raceme, pendulous. Segments of the perianth brownish, connivent, the lateral one narrow. Lip dilated, white, spotted with purple. Palate bidentate. Column short, margined at base. aule globose.

Grows in rich shaded soils. In oak lands near Beaufort.

Flowers in March, probably again in the autumn.

## 8. HYEMALIS.

C? folio unico, ovalilanceolato, nervoso. sub plicato; labello unguiculato, trifido, nec basi producto, lacinia intermedia crenulata: petalis conniventibus.

Leaf one, oval lanceolate, nerved, somewhat plaited; labellum unguiculate, three-cleft, not produced at base, middle the segment crenulate; petals connivent.

Nutt. 2. p. 108.

Cymbidium Hyemale, Sp. pl. 4. p. 107. Pursh, 2. p. 593.

Root concatenately bulbous. Leaf solitary, large, oval, lanceolate, somewhat plaited, rigid, springing from the root and tapering at base to a petiole Scape twelve to eighteen inches high, clothed two to three inches long. with about three loose sheaths. Flowers in a terminal raceme, at first erect,

s 3

afterwards pendulous. Petals linear oblong, connivent, distinct, all nearly equal in size and form. Lip unguiculate, distinct at the base, and about the length of the petals, dilated towards the extremity, trifid, ridged along the centre, the middle lobe round, with the margin undulate and crenulate. Column of an equal thickness and slightly curved, shorter than the Kp; lid of the anthers membranaceous, caducous. Pollinia four, lenticular and cereaceous, laterally attached to the summit of the column, at length decida-Nuttall.

Grows in rich shaded soils. Flowers May. Pursh.

# EPIDENDRUM. Lin.

Columna cum labelfilamento elastico, incrassata.

Column with the li ungue in tubum coa-lita, (interdum decur-rens.) Pollinia 4, pa-rallela, septis persis-tentibus divisa, basi granulato, partitions, thickened at base by the granular elastic filament.

#### 1. Conopseum. Aiton?

E. foliis lanceolatis, rigidis, lucidis, perennantibus; caule simplici; floribus spicatis, spikes, erect; labellum erectis; labello apice 3-lobed at the summit, trilobo, lacinia intermedia retusa; petalis interioribus angustioribus.

Leaves lanceolate. rigid, lucid, perennial; stem simple; flowers in the middle segment retuse; the interior petals narrow.

Hort. Kew. 5. p. 219. Nutt. 2. p. 198. E. Magnoliæ, Muhl. Cat. p. 81.

Root composed of thick fleshy fibres matted together and adhering to the barks of trees. Branches short, alternate. Leaves generally two on each branch, approximate, lanceolate, acute, very entire, succulent, obscurely nerved, terminating at base in a closed sheath. Flowers five to eight, in a terminal raceme. Bracteal leaves very small. Exterior segments of the perianth three, lanceolate, a little connivent, six to seven lines long, pale yellow tinged, with purple; the two lateral interior segments cuneate, obovate, pale yellow, as long as the exterior, but more slender. Column more than half as long as the perianth, dilated; summit of the lip threelobed. Policia four, pear the summit of the tube, covered with an operculum having four cells.

Grows along the sea-coast of Georgia and Carolina, on the bark of trees,

principally of evergreens.

The most northern locality in which I have seen this plant is on Edings' Leland, at the entrance of Port Royal inlet. I found it there growing on the bark of the Magnolia Grandiflora, and sent it to Dr. Muhlenberg, who placed it in his catalogue as the E. Magnoliæ. In passing to the south along the sea-coast, it becomes more common, and is found on several species of oak, and I believe on other trees.

Flowers in August and September; probably through the whole summer.

## GYNANDRIA DIANDRIA.

# CYPRIPEDIUM.

Labellum ventrico-sum, inflatum, sacca-tum. Corolla tetrape-tala, patens. Columna led, expanding. Cosuperne lobo petaloideo | lumn near the summit appendiculata.

Labellum ventricose, furnished with a petallike lobe.

- 1. Parviflorum. Salisbury. Trans. Lin. Soc. 1. p. 77.
- C. caule folioso; lo- | Stem leafy; lobe of bo styli triangulari, the style triangular,

viore, compresso.

acuto; petalis exterior- acute, exterior petals ovato oblongis ovate oblong, acumiacuminatis, interiori- nate, the interior linebus linearibus contor-tis; labello petalis bre-shorter than the petals, compressed.

Sp. pl. 4. p. 143. Pursh, 2. p. 594. Nutt. 2. p. 199.

Root perennial, composed of thick fleshy fibres. Stem eight to ten inches high, a little pubescent. Leaves five to six, alternate, lanceolate, acute, nerved, somewhat pubescent underneath, sessile, sheathing at base. Flowers generally solitary. Exterior segments of the perianth three, ovate lanceolate, expanding, two interior narrower, longer, tortuous, bearded on the inner surface near the base, all of an obscure green colour with brown lines externally pubescent. Lobe of the style triangular, somewhat sagittate. Labellum yellow, with obscure spots, shorter than the petals, smooth on the outsides, bearded within at base.

Grows in the upper and mountainous districts of Carolina and Georgia.

Flowers May-June. Pursh.

#### 2. Pubescens. Willd.

C. caule folioso; lo- | bo styli triangulari-oblongo, obtuso; petalis terioribus longissimis linearibus, contortis, labello petalis breviore, compresso.

Stem leafy; lobe of style triangular. the oblong, obtuse; exteexterioribus ovato-ob- rior petals ovate ob-longis, acuminatis, in- long, acuminate, the interior very long, linear, twisted; labellum shorter than the petals, compressed.

Sp. pl. 4. p. 143. Pursh, 2. p. 594. Nutt. 2. p. 199. C. Calceolus, Mich. 2. p. 161. Walt. p. 222.

Petals green, dotted with red. Labellum yellow, contracted at the mouth. From the preceding which it resembles very much, it differs by a flower twice as large and by the different figure of the lobe. Stem one to two flowered. All of the American species have their leaves pubescent, but the hairs in this are more evident. Willd.

The leaves, too, in my specimens are larger, more distinctly nerved, and the narrow segments of the perianth longer; but the plant not as pubescent as C. Spectabile.

Grows in rocky soils on fertile hills in the upper districts of Carolina and Georgia.

Flowers in May.

# 8. Spectabile. Salisbury.

C. caule folioso; lofisso.

Stem leafy; lobe of bo styli elliptico-corda- the style elliptic-corto, obtuso; petalis ex- | date, obtuse; exterior terioribus lato-ovali- petals broad, oval, ob-bus obtusis; labello pe- tuse; labellum longer longiore, antice than the petals, split in the front.

Stem submersed, branched, rough, brittle and gritty when dry. Leaves six to eight, in a whorl as long as the joints and of the same texture, narrow, subulate, slightly channelled on the upper surface, the lower ones simple; the upper bearing on their upper sides rows of erect leaflets, four in a cluster among which the flowers are placed. Anther solitary, sitting at the base of the germ. Germ ovate, spirally striated, crowned with five little leaves. (Stigmas?) Fruit with a hard shell. Seeds imbedded in a reddish pulp. Smith. Eng. Bot. No. 336.

Grows in ponds and ditches. Canada to Carolina, Pursh. I have not

noticed this species in our low country.

Flowers June-July.

# ` 2. Capitata. E.

teretibus, glabris; arti-culis foliolis; fructibus capitatis; bracteis bac-ca paulo longioribus. terete, glabrous; joints leafy; fruit in heads; bracteas a little longer than the berry. E.

C? caule ramulisque | Stem and branches

Stem submersed, floating, terete, glabrous, somewhat diaphanous. Leaves in whorls, generally six, terete, very acute. Flowers, very numerous, collected in axillary heads, at first sessile, afterwards pedunculate. Bracteal leaves 47 transparent, acute, a little longer than the fruit. Berry smooth, yellow.

In this plant, I have not been able to distinguish the anther, nor any spiral striæ around the fruit.

Dr. Schweinitz sent me from Salem, North-Carolina, under the name of Chara Nidifica a plant closely allied to this. It appears to be more lucid. and to bear leaves more numerous and more slender. Its habit is similar, and if not a variety of the present plant may form another species in a distinct genus.

The structure of this genus is obscure, and its real affinity still doubtful. Wallroth, who has examined it with great care, considers its fructifications as of two kinds; Nucules spirally striated, sessile, surrounded by a diaphanous covering, one-celled, many seeded, indehiscent; globules of a reddish colour accompanying the nucules, opening with three to four valves and containing a mass of minute spiral filaments; that it belongs to the cryptogamic plants, where it will constitute the basis of an order, (Characeæ) next to the Confervæ. Leman, on the other hand, considers it as a dicotyledonous plant allied to the Onagrariæ and Salicariæ, forming with a few other

genera a new family under the name of Eleodeæ. Hooker's Flora Scotica,

Part 2. p. 108. Grows in ditches—common in the rice fields on the Ogeechee river. Flowers April—May.

## 1. Minor.

L. foliis ellipticis, tatutrinque planis, basi on both surfaces, cohecohærentibus; radicibus solitariis.

Leaves elliptic, flat on both surfaces, cohering at base; roots solitary.

Sp. pl. 4. p. 194. Walt. p. 227. Mich. 2. p. 163. Pursh, 1. p. 22.

A small floating plant, sometimes nearly covering the surface of stagnant waters. Composed generally of one, two, or three leaves (more correctly fronds) laterally cohering yet each forming an entire plant. The margin of these fronds are slightly cleft, and in these fissures their very minute flowers are produced, or buds which form other fronds. Fronds somewhat thick, succulent, producing from the centre underneath a solitary root. Flowers very rare. Plant generally increasing by buds (gemmæ.)

Var.? Cyclostasa.

L. foliis ellipticis, utrinque planis, Leaves elliptic, flat on both sur-in circulo cohærentibus; radicibus faces, cohering in a circular arc; solitariis.

roots solitary.

I wish here merely to notice a variety or species of this genus which many years ago I was accustomed to see floating on the surface of the ponds around Beaufort. The fronds were rather larger than those of the L. Minor, and were so attached near one of the foci of the ellipse as to form constantly segments of circles. I do not recollect that I ever saw a circle completed, though I could not discover what stopped or terminated its progress.

Found in ponds, ditches, and stagnant waters, commonly called "Duck Weed," and considered as a favourite food of many species of the wild duck. The insects which are sheltered by these plants, however, are more

probably the food which these birds so eagerly seek.

Flowers July—August?

## 2. Polyrhiza.

L. foliis ellipticis, Leaves elliptic, flat, planis; basi cohæren- cohering at base; roots tibus; radicibus fasci-|clustered. culatis.

Sp. pl. 4. p. 195. Pursh, 1. p. 22.

Fronds larger than those of the preceding species, convex and dark purple underneath. Roots clustered.

Flowers July—August?

This very obscure genus, whose flowers it is so uncommon to find, has lately been examined with great care by Dr. Hooker of Glasgow. It appears in the Linnæan system to belong to the class Diandria, and its fructification to consist of a single flower composed of an urceolate, membranaceous, monophyllous perianth, from a small opening in the top of which the stigma is protruded, and which bursts irregularly as the stamens become developed. These are two in number, (rarely wanting.) Anthers of two rounded lobes, opening nearly vertically each into two valves. Germen roundish, compressed, carinated on one side, tapering into a style about its own length, and terminated by a flattish stigma. Fruit an utriculus transversely oblong, compressed, emarginate at the top on which is the short persistent style. Seed one, (or more?) very hard, oval, lying horizontally in the utriculus and fixed by its lower sides. Embryo oblong, monocotyledonous, horizontal, central, surrounded by a whitish, fleshy albumen.

Dr. Hooker supported by R. Brown, considers this genus as standing next to Pistia in the natural order of the aroideæ. In order, however, to give it this, its proper location, we must consider the perianth as a spath and the spadix as a point bearing two naked flowers, the upper male and diandrous, the inferior female, and the genus will then stand as it now generally does,

among the monoecious plants.

Sp. pl. 4. p. 201. Mich. 1. p. 60. Pursh, 1. p. 88. Nutt. 1. p. 85.

Root perennial. Stem four to five feet high, glabrous, sometimes compressed and flattened on one edge. Leaves large, sometimes three feet long, one and a half inches wide, acutely serrulate, channelled, scabrous on the upper surface with a few hairs along the midrib, glabrous underneath, contracted and villous at the throat. Flowers in terminal spikes; spikes three to four, (when four brachiately opposite?) bearing flowers on one (the interior) side. Fertile florets two to four, at the base of the spike, sitting in the excavations of the jointed, scabrous, somewhat triquetrous and flexuous rachis. Sterile florets in two-flowered clusters, two clusters in each cavity in the rachis arranged alternately on each margin, but the articulations approach so near that the flowers appear imbricate. Of the sterile flowers the glume is two valved, the exterior oval, obtuse, somewhat scabrous, cartilaginous,

the interior equal, membranaceous; corolla two valved, equal, the valves lanceolate, membranaceous; filaments three; anthers oblong incumbents nectaries two, carnose, triangular, concave and somewhat two-pointed at the summit. Fertile flowers nestling in recesses in the rachis; common glume two-valved, two.flowered, (the exterior generally abortive;) exterior glume lanceolate, glabrous, cartilaginous, closing very nearly the cavity, perforated mear the base? the interior membranaceous; corolla of both florets twovalved, lanceolate, membranaceous, the exterior larger, hearing only the rudiment of a germ and style, the interior with the rudiments of three stamens; germ ovate, glabrous. Style thick. Stigmas very long, feathered. Seed ovate, glabrous.

This species has been to me very rare. I have only seen it growing on a

sandy knowl on the margin of the Ogeechee River.

Flowers May-July.

Calyx of the globose fertile

Sp. pl. 4. p. 945. Mich. 1. p. 75. Nutt. 1. p. 81.

Root annual? Stem erect, two to three feet high, branching, hairy, scabrous particularly near the base. Leaves three to eight inches long, two to five lines wide, acute, keeled, hairy, terminating in an open sheath more hairy than the blade, roughened as well as the stem with small glands from which the hairs arise. Flowers in small spikes, lateral and terminal. Spikes generally fasciculate, each surrounded at base by a sheath, and bearing flowers on one side. Sterile florets (in this species generally neuter) alternating regularly with the fertile along the somewhat flexuous rachis, twovalved, the valves compressed, hairy along the midrib, conspicuous when young almost concealing the fertile florets; corolla two-valved, valves very minute, slender; of the stamen, styles, or nectary, scarcely a vestige. Fertile florets sessile, two-valved, exterior valve orbicular, cartilaginous, entire, (not emarginate at the sides,) corrugated by irregular transverse ridges, the interior oblong, firmly attached to the rachis; corolla two-valved, valves equal, membranaceous; nectary one? leaved, very small; stamens three, exserted; styles two; stigmas feathered. Seed one, round, enveloped by the persistent calvx.

It appears to me somewhat doubtful whether this plant and the M. Myu-

rus of India are really congeners.

I am not certain whether this plant is really indigenous, or has been introduced from the West Indies. I have only seen it around Charleston, where, however, it is very common in dry pastures.

Flowers August-October.

Spikes numerous. alternis, ellipticis, ob- alternate, elliptic, obapproximate; fructibus ovato-lanceo- | fruit ovate lanceolate, pidatis; bractea folia- | bractea leaflike, very lower spike.

Sp. pl. 4. p. 230. Pursh, 1. p. 37. Muhl. Gram. p. 226. Nutt. 2. p. 204.

Stem erect, one to two feet high, obtusely triquetrous, scabrous near the summit. Leaves strap-shaped, longer than the stem, sheathing its base. Spikes very numerous, ten to twenty, ovate, approximate, forming one large, oblong head. Florets in each spike very numerous, imbricate, corolla ovate lanceolate, distinctly two-pointed, nerved, much longer than the ovate scale. Lower bracteal leaf setaceous, as long as the head.

Grows in swamps and wet meadows, in the mountainous districts of Caro-

lina. Dr. Schweinitz.

Flowers—

# 15. Fornea. Muhlenberg?

C. spiculis pluribus, | Spikes numerous, the inferioribus distinctis, lower distinct, comcompositis, superiori- pound, the upper ap-

longioribus; spicæ ultimæ. E.

bus sub approximatis, | proximate, ovate; fruit ovatis; fructibus ovatis, acuminatis, bidentatis, squama paulo the scale; bracteal leaf bractea at the base of the lowsetacea longa ad basin est spike setaceous, long.

Muhl. Gram. p. 227.

Stem one to two feet high, obtusely triquetrous, scabrous near the summit. Leaves strap-shaped, as long as the stem, scabrous along the margins, sheathing the base of the stem for some distance from the ground. numerous, (eight to ten,) the lower separate and compound, the upper forming a continued mass of flowers. Florets numerous, imbricatc. rolls ovate, acuminate, very finely serrulate, very slightly two-cleft at the summit, larger than the ovate lanceolate scale. The lower bracteal leaf subulate, two to three inches long, the upper ones very small.

For specimens of this plant, and for my knowledge of it as a southern

species, I am indebted to Dr. Schweinitz.

Grows in the upper districts of North and South-Carolina.

Flowers—

### 16. Ovalis.

ginatis, bidentatis, ci- two-toothed. liato-serratis.

C. spiculis subsenis, Spikes generally 6, subrotundo - ellipticis, elliptic, nearly round, alternis, sub approxi-matis, inferne masculis; fructibus ovatis, mar-fruit ovate, margined,

Sp. pl. 4. p. 229. Pursh, 1. p. 37. Nutt. 2. p. 204.

Stem about twelve inches high, triquetrous, with the angles acute, scabrous. Leaves narrow, about as long as the stem. Spikes approximate, oval, Scales ovate lanceolate, acute, as long as the corolla. Corolla oblong, acuminate, with the mouth entire. Good. Trans. Lin. Soc. 2. p. 148.

With this species I have no acquaintance. It is mentioned by Dr. Schweinitz, in his letters, as one of our southern species.

Flowers-

### 17. SCOPARIA.

alternis, ellipticis, ob-tusis, subapproximatis; tuse, approximate; fructibus ovato-lanceo- fruit ovate lanceolate, latis, marginatis, bicus- | winged, pidatis; bracteis ob- | bracteas oblong, mulongis, mucronatis.

C. spiculis subquinis, | Spikes generally 5, two-pointed: cronate.

Sp. pl. 4. p. 230. Pursh, 1. p. 87. Nutt. 2. p. 204.

Stem one to two feet high, obtusely triquetrous. Leaves linear, channelled, with the margins and keel scabrous towards the summit, closely sheathing the stem at base. Spikes five to eight, approximate, distinct, lanceolate, sessile, all surrounded at base with a few sterile florets. Lower bracteal leaves longer than the spikes, the upper shorter. Scales ovate, membranaceous, rather acute, white with the midrib green, about as long as the corolla. Corolla ovate, compressed, tapering at the summit, slightly two-cleft, acutely serrulate. Stigmas two, long.

This species, perhaps the most common in our low country, appears to vary with spikes lanceolate, nearly round, (perhaps from age,) and sometimes obovate. It appears almost to be intermediate between the C. Sco-

paria and Straminea of the northern states.

Grows every where in damp soils.

Flowers April—June.

## 18. FESTUCACEA?

C. spiculis subocto- | nis, subapproximatis, | alternis, cylindraceis: fructibus subrotundoovatis, rostratis, bidentatis, margine ciliatoserratis, squama lanceolata mucronata majoribus.

Spikes generally 8, approximate, alternate, cylindrical; fruit ovate, nearly round, beaked, two-toothed, ciliate serrate along the margin, larger than the lanceolate, mucronate scale.

Sp. pl. 4. p. 242. Pursh, 1. p. 38. Nutt. 2. p. 204.

Root perennial. Stem twelve to eighteen inches high, very slender, triquetrous, scabrous on the margins. Leaves narrow, about as long as the stem. Flowers in linear spikes, generally approximate, sometimes patent,

with one or two male florets at the summit, and some frequently intermingled with the fertile. Bracteal leaves very small. Scales oblong lanceolate, very acute, excepting the midrib membranaceous. Stamens three. Corolla of the fertile floret at first shorter than the scale, increasing with age, becoming long, tapering, nerved, very slightly serrulate along the margine, somewhat contracted at the summit of the seed, two-cleft at the summit. Stigmas two, very long. Seed oval, compressed.

The male florets in this species appear to grow very irregularly; they are sometimes on the summit of the spikes, and sometimes occupy near the whole of one of the middle spikes. A specimen resembling this very much was sent me by Dr. Muhlenberg as the C. Paniculata, but the C. Paniculata

of Europe is certainly distinct.

Grows in swamps and damp soils.

Flowers March—April; one of our earliest species.

\*\*\* Spicis sexu dis-tinctis; spica mascula tile spikes distinct; ste-rile spike solitary.

## 19. CESPITOSA. Lin.

C. spicis foemineis, cylindraceis, obtusis, subternis, distantibus, infima brevissime pedunculata; bus; foliis patulis.

fructibus cle; fruit ovate, obovatis, obtusis, squama tuse, larger than the oblonga obtusa majori- oblong, obtuse scale; leaves expanding.

Sp. pl. 4. p. 287. Muhl. Gram. p. 264. Nutt. 2. p. 204.

Stem slender, triquetrous, striate, twelve to eighteen inches high. Leaves linear, acute, scabrous along the margin, as long as the stem. Sterile spikes one to two; fertile alternate, nearly sessile, long, slender, three to four, sometimes bearing sterile florets at the summit. Scale linear lanceolate, dark coloured with a green midrib. Capsule oblong. Bracteal leaves long.

Grows in boggy, turfy soils. Carolina, Dr. Schweinitz.

Flowers—

## 20. CRINITA:

C. spicis masculis | Sterile spikes 2, fergeminis, foemineis qua | tile 4, distant, pedundunculatis, cylindraceis, pendulis; fructibus subrotundo - ellipticis, ventricosis, brevissime rostellatis, ore integris, squama oblonga aristata. brevioribus.

ternis, distantibus, pe- | culate, cylindrical, pendulous; fruit elliptic, nearly round, ventricose, with a short beak entire shorter than the oblong, awned scale.

Sp. pl. 4. p. 300. Pursh, 1. p. 38. Nutt. 2. p. 204.

Stem about two feet high, acutely triquetrous, concave on the sides so as to appear slightly winged, finely serrulate along the margins. Leaves longer than the stem, the lower ones sheathing, channelled, nerved, very glabrous, not even scabrous on the edges. Male spikes with us generally solitary, slender, pendulous, the scales lanceolate, mucronate. Female spikes generally three, not very distant, pendulous, on short peduncles merely enveloped, not inclosed, each terminated by a number of male florets; scales ovate, with a long subulate point. Corolla ovate, compressed, terminating in a simple point, shorter than the scale. Stigmas two.

Grows in river swamps. Flowers April—May.

## 21. ACUTA.

٤

te.

哗

C. spicis masculis binis, ternisve, foemineis subquaternis, sub pedunculatis, subnutantibus, cylindraceis, remotis; fructibus oblongis brevissime rostellatis, ore integro, squamam oblongam acutam sub æquantibus.

Sterile spikes 2 or 3, fertile generally 4, short peduncles, on somewhat nodding, cylindrical, remote; fruit oblong, with short, entire nearly the length of the oblong, rather acute scale.

Sp. pl. 4. p. 304. Pursh, 1. p. 38. Muhl. Gram. p.

Stem about two feet high, triquetrous, scabrous. Leaves narrow, keeled, scabrous along the margin, the lower sheathing the base of the stem, the upper sessile. Sterile spikes one to three, cylindrical; the fertile about three, the upper sessile, the lowest on a short peduncle, and the summit of each for nearly one third of its length frequently occcupied with sterile florets.

VOL. II.

Corolla ovate, nearly entire at the summit, scarcely longer than the dark brown scale.

Grows in bogs and turfy soils. In the upper districts of Carolina. Flowers April—May.

## § 2. Stigmatibus 3.

§ 2. STIGMAS 3.

\* Spica terminali gynis.

\* Terminal spike mascula, cæteris andro- sterile, the rest androgynous.

#### Mich. 22. Triceps.

C. spicis sub quaternis, approximatis, ellipticis, sessilibus; fructibus ovatis, compresovatam sub æquantibus.

Spikes generally 4, approximate, elliptic, sessile; fruit ovate, compressed, glabrous, sis, glabris, squamam about as long as the acuminatam ovate acuminate scale.

Mich. 2. p. 170.

Stem twelve to eighteen inches high, acutely triquetrous, scabrons along the margins, slender. Leaves linear, alightly scabrous on the edges, scarcely longer than the stem, a little pubescent near the sheaths. Spikes generally four, three larger, approximate, whence the name given by Michaux, the fourth smaller, and a little remote, all sessile, or on very short peduncles, the base of the upper spike surrounded with male florets. Scales ovate, slightly acuminate. Corolla of the female florets ovate, somewhat compressed, not pointed at first, shorter than the scale, when old quite as long. Stigmas three. Seeds triquetrous.

Nearly allied to C. Virescens, from which it appears to differ by its cylin-

drical or elliptic spikes and glabrous corolla.

Grows in damp soils. Flowers April-May.

### 28. HIRSUTA.

C. spica androgyna |

Terminal spike anoblonga, obovata, in-ferne mascula; foemi-neis remotiusculis, sub-drogynous, oblong, ob-ovate with sterile florets at base; fertile spikes ternis, oblongis; fructibus o- sessile, oblong; fruit vatis obtusissimis, ob- ovate, very obtuse, obtuse triquetris; foliis tusely triquetrous; vaginisque hirsutis. leaves and sheath hir-

subsessilibus, | generally three, nearly sute.

Sp. pl. 4. p. 252. Pursh, 1. p. 40. Nutt. 2. p. 204.

Stem about a foot high, slender, triquetrous, pubescent near the summit. Leaves narrow, rather longer than the stem, somewhat hairy. Spikes three to four, the terminal sterile at base, the rest generally fertile, the lower somewhat cylindrical on short peduncles. Scales of the fertile florets ovate mucronate, scarcely as long as the mature fruit. Corolla ovate, nerved.

In specimens of this plant collected near St. Mary's, by Dr. Baldwin, the leaves are less hairy, and the lateral spikes more nearly sessile, than in those

I possess from Pennsylvania.

Grows near St. Mary's, Georgia. Dr. Baldwin.

Flowers-

## 24. Buxbaumii. Wahlenberg.

C. spica androgyna | pedunculata, obovata, inferne mascula, foemineis subternis, remotis fructibus ellipticis, tri- | peduncles; fruit elliptic, quetris, obtusis, obsolete bidentatis, squaoblongam cronatam subæquantibus.

Androgynous spike pedunculate, obovate, bearing sterile florets at base, fertile florets sub pedunculatis; | three, remote, on short triquetrous, obtuse, slightly 2-toothed, as long as the oblong, mucronate scale.

Sp. pl. 4. p. 252. Pursh, 1. p. 40. Nutt. 2. p. 204.

Stem one to two feet high, slender, triquetrous, glabrous, somewhat scabrous near the summit. Leaves narrow, long, with the margins scabrous. Spikes three or four, the terminal spike with the lower half, or sometimes more than half, bearing sterile flowers, the lower spikes generally fertile, erect, sessile or on very short peduncles. Scales of both florets in my specimens lanceolate, very dark brown, almost black, with a green midrib, very acute, rather longer than the fruit. Corolla ovate, compressed, smooth, somewhat

triquetrous, nearly white, terminating in a very short, two-cleft summit. Lower bractea longer than the spike, the upper ones shorter.

Grows in swamps and bogs in the upper districts of Carolina. Dr.

Schweinitz.

Flowers July-August. Pursh.

### 25. Trichocarpa.

C. spicis androgynis | tribus, foemineis binis pedunculatis, erectis, cylindraceis, remotis: gioribus.

Spikes 3 androgynous, 2 female, erect, cylindrical, pedunculate, distant; fruit ofructibus ovatis, acu- vate, acuminate, twominatis, bicuspidatis, pointed, hairy, longer pilosis, squama ovato- than the ovate lanceo-lanceolata aristata lon- late, awned scale.

Pursh, 1. p. 40. Nutt. 2. p. 204.

Stem two to three feet high, acutely triquetrous, serrulate along the margins. Leaves four to seven lines wide, rather longer than the stem, chapnelled, very acute, scabrous on the upper surface, the margins and midrib serrulate, sheathing at base. Flowers in distinct spikes, the sterile superior, one to five, alternate, terete, sessile, one to two inches long; fertile spikes two to three, remote, nearly sessile, erect, cylindrical, the fruit expanding. Of the sterile florets the bracteal leaf is setaceous or subulate, the lower longer than the spike, the scale lanceolate, rather obtuse, the midrib rusous. Stamens three. Of the fertile spike the bracteal leaves resemble the root leaves, are very long, and have little or no sheath. Scale lanceolate, slightly mucronate. Corolla ovate, inflated, nerved, acuminate, pubescent, a hittle longer than the scale. Stigmas three. Seed obtusely triquetrous.

Our plant is larger than the specimens sent me from Pennsylvania by Dr. Muhlenberg, and the fruit less hairy. Does it belong to this section?

Grows in deep swamps; to me rare; found in fresh marshes along the Ogeechee river.

Flowers in April.

\*\* Spicis sexu distinctis; mascula solita- | rile spikes distinct; ste-

\*\* Fertile and steria, foemineis subsessi-libus, vel incluse pe-dunculatis.

rile spike one; fertile spikes nearly sessile, or with peduncles sheath-

### 26. VARIA.

C. spicis foemineis subternis, subapproximatis, sessilibus, subglobosis; fructibus subgloboso-triquetris, ros- trous, somewhat glo-tratis, bidentatis, pube- bose, beaked, twoscentibus, squama oblonga brevioribus; culmo erecto.

Fertile spikes generally three, approxisessile. nearly mate, globose; fruit trique. toothed, pubescent. shorter than the oblong scale; stem erect.

Sp. pl. 4. p. 259. Pursh, 1. p. 40. Nutt. 2. p. 205.

Stem slender, six to eight inches high, scabrous along the angles. Leaves generally longer than the stem, narrow, subulate, scabrous along the margins. Flowers in three or four small spikes, the upper sterile, the lower fertile, sometimes approximate, sometimes distinct. Sterile spike oblong lanceolate, the scales lanceolate, with ferruginous sides. Fertile spikes compact, the scales ovate lanceolate, acute, rather shorter than the mature fruit, tinged with brown. Corolla globose, pubescent, with a short acuminate point.

Grows in shaded rich soils. Flowers April—May.

#### 27. DASYCARPA. Muhl.

C. spica mascula | parva, foemineis sub- | fertile generally three, ternis, subapproxima- approximate; fruit o-tis; fructibus ovato tri- vate, somewhat triquequetris, villoso hispidis, | trous, villous and hissquama acuminata lon- | pid, longer than the gioribus.

Sterile spike small, acuminate scale.

Muhl. Gram. p. 236.

Stem twelve to eighteen inches high, triquetrous, glabrous. very narrow, lanceolate, linear, glabrous, all excepting the bracteas shorter than the stem. Sterile spike very small, terminal, scales lanceolate. Fertile spikes generally three, near together, the upper sessile, the lower on short peduncles. Bracteas resembling the leaves, longer than the stem, embracing the base of the peduncle. Scale ovate acuminate. Corolla obtusely triquetrous, somewhat ovate, with the mouth entire, nerved, very villeus,

somewhat hoary. Stigmas three. Style triquetrous.

This species of Carex, which I sent to Dr. Muhlenberg many years ago, I have never found but once; I then met with it in dry pastures, on Paris' Island. Its corolla is more villous than that of any species with which I am acquainted. The spikes and fruit larger than those of C. Virescens.

Flowers in May.

#### Muhl. 28. Marginata.

C. spicis foemineis subgeminis, approximatis, subglobosis, subsessilibus; globosis, tomentosis, mentose, two-toothed, bidentatis, squama oblongo-ovata majoribus; obovate scale; leaves foliis radicalibus, culmo longioribus.

Fertile spikes generally two, approximate, subglobose, nearly sesfructibus | sile; fruit globose, tolarger than the oblong radical, longer than the stem.

Sp. pl. 4. p. 261. Pursh, 1. p. 40. Nutt. 2. p. 205.

Plant scarcely a foot long, growing in tufts. Stem slender, triquetrous, scabrous along the margins. Leaves linear, almost subulate, nearly as long as the stem, slightly scabrous along the margins. Spikes crowded at the summit, sterile spike terminal, cylindrical, six to eight lines long, scales ovate, chestnut coloured with a white margin, the lower obtuse, the upper somewhat acute. Fertile spikes at the base of the sterile, two to three each, bearing three to six flowers, scales ovate, acute, sometimes mucromate, nearly as long as the fruit.

Grows on dry hills and rocks. Pursh.

Flowers April and May.

## 29. VESTITA. Willd.

C. spica mascula | lanceolata, foemineis geminis, ovatis, ses-silibus, approximatis, fructibus ovatis, ros-ked, with an oblique tratis, ore obliquis, pu- summit, pubescent, as bescentibus, squamam long as the ovate acute

Sp. pl. 4. p. 266. Pursh, 1. p. 41. Muhl. Gram. p. 239. Nutt. 2. p. 205.

C. Rostrata? Mich. 2. p. 173.

Stem two feet high, triquetrous. Leaves very long, lanceolate, linear, nerved, scabrous along the margins, sheathing the base of the stem. Sterile spike long, solitary, scale linear lanceolate, mucronate. Fertile spikes three, approximate, the two upper sessile, the third with a short included peduncle. Bracteal leaves much longer than the stem; scale very much dilated at base, mucronate; corolla ventricose, ovate, terminating in a long beak, very slightly two-cleft, nerved, but the nerves less conspicuous than those of the two preceding species, very compactly crowded on the spike.

Grows in wet soils. I have not seen it in the low country.

Flowers April and May.

### 30. LUPULINA.

C. spicis foemineis tribus, pedunculatis, oblongis, approximatis; longissimis, bracteis foliaceis; fructibus ovatis, ventricosis, nervosis, longissime conico-rostratis, ore bicuspidatis, squama ovata multoties l mucronata longioribus.

Fertile spikes three, oblong, approximate, with inclosed peduncles; bracteas long, leaflike; fruit ovate, ventricose, nerved, with long, conical, 2-pointed beaks, much longer than the ovate mucronate scale.

Sp. pl. 4. p. 266. Pursh, 1. p. 41. Muhl. Gram. p. 241. Nutt. 2. p.

Stem two to three feet high, triquetrous. Leaves lanceolate linear, with the margin and midrib scabrous. Sterile spike solitary, sometimes two, scales linear lanceolate, very acute, mucronate. Fertile spikes two to three, approximate, ovate, sometimes globose, on short peduncles, the lower enclosed in a short sheath, scale lanceolate, acuminate, with the point somewhat hispid. Corolla ovate, inflated, distinctly nerved, terminating in a long, two-cleft beak, much longer than the scale. Stigmas three.

Grows in swamps and wet soils.

Flowers April—May.

#### 31. GIGANTEA. Rudge.

## 84. PLANTAGINEA.

C. spicis peduncula-tis, foemineis quaternis | Spikes pedunculate, fertile four, distant; VOL. II.

distantibus; fructibus | frnit elliptic, triqueellipticis, triquetris, pedicellatis, glabris, squabrous, at first shorter than the ovate, cuspidata (trimum), brevioribus; bracteis vaginatis apice subfoliaceis; foliis ramit, leaflike; leaves ramit compute, triquettions, pedicellate, glabrous, at first shorter than the ovate, cuspidate subfoliaceis; foliis ramit compute, triquettions, pedicellate, glabrous, at first shorter than the ovate, cuspidate subfoliaceis; foliis ramit compute, triquettions, pedicellate, glabrous, at first shorter than the ovate, cuspidate subfoliaceis; foliis ramit compute, cuspidate subfoliaceis; foliis ramit compute subfoliaceis; foliis ramit compute, cuspidate subfoliaceis; foliis ramit compute, cuspidate subfoliaceis; foliis ramit compute subfoliaceis dicalibus, lanceolatis, dical, lanceolate, nervnervosis.

Sp. pl. 4. p. 257. Mich. 2. p. 173. Pursh, 1. p. 42. Nutt. 2. p. 205.

Stem twelve to eighteen inches high, glabrous. Leaves lanceolate linear, assuming the lanceolate form more than usual among grasses, nerved, glabrous, thin, very slightly serrulate along the margins. Sterile spike one, terminal, fertile generally about four, distant, erect, linear, the fruit not crowded, the lower on long peduncles, the peduncles of the upper scarcely longer than the sheaths. Bracteal leaves resembling those of the root, all sheathing for at least half an inch the base of the peduncle. Scales of the sterile floret lanceolate, acute, not mucronate; of the fertile ovate macronate. Corolla oblong, somewhat oblique, acute, slightly notched at the summit, very distinctly nerved, and when mature, in my specimens always longer than the scale.

Grows in rich shaded soils.

Flowers April.

#### 35. Castanea. E.

. C. spica mascula solitaria; foemineis tribus, subrotundis, infima longissime pedunculata, cernua, superi- | nodding, the upper sesoribus sessilibus; corolla triquetro ovata, | trous ovate, glabrous, glabra, puncticulosa, squama ovata, obtusa | multo longiore.

Sterile spike solitary; fertile spikes three, nearly round, the lowest on a long peduncle, sile; corolla triqueslightly dotted, much longer than the ovate, obtuse scale.

C. Fulva? Huhl. Gram. p. 246.

Root perennial, stoloniferous. Stem about two feet high, triquetrous, slender, purple at base. Leaves linear, nerved, scabrous along the margin, shorter than the stem. Sterile spike about an inch long, much shorter than its three-nerved bracteal leaf; scales oblong, obtuse, brown with a white margin. Fertile spikes three, (nine to sixteen flowered,) the upper bearing on the summit a few sterile flowers, sessile as well as the middle spike, the lower cernuous on a long peduncle. Corolla inflated, ovate, obtusely triquetrous, distinctly nerved, terminating in a long beak, two-eleft at the summit, somewhat coriaceous, lucid, and transversely striate, resembling under a lens the surface of fine morocco leather. Seed triquetrous.

This species appears to me to have no resemblance to the European C, Fulva, at least as that plant is figured in Trans. Lin. Soc. 2. t. 20. f. 6. I have, therefore, changed its name. Its close and strong affinity is to C. Folliculata, from which, however, it is by its calyx and corolla sufficiently dis-

tinct. It is also a coarser grass.

Grows in wet pine barrens. Chatham county, Georgia.

Flowers in April.

## 36. Anceps.

C. spicis foemineis | Fertile spikes three, tribus, remotis, inferi- distant, the lower peoribus pedunculatis; dunculate; fruit ovate, fructibus ovatis, nervosis, ore membranaceis, squama oblonga mucronata? longioribus. | mucronate? scale.

Sp. pl. 4. p. 278. Pursh, 1. p. 42. Nutt. 2. p. 205.

Stem triquetrous, compressed, almost ancipitous. Bracteal leaves sheathing. The upper fertile spike sessile, the rest on peduncles. Fertile florets

alternate, rather remote. Willd.

I quote the observations of Willdenow on this species, because to me it has been obscure. The plants returned to me by Dr. Muhlenberg as C. Anceps, are too nearly allied to C. Flexuosa. Dr. Muhlenberg has himself referred C. Anceps to C. Plantaginea.

Grows in wet fields on the sides of ditches. Pursh.

Flowers April—May.

### 37. Conoidea.

C. spicis foemineis | Fertile spikes two, binis, remotis, supre- distant, the upper nearma subsessili, infima | ly sessile, the lower on longe fructibus oblongo-coni- oblong conic, obtuse, cis, obtusis, squamam as long as the awned aristatam æquantibus. | scale.

pedunculata; | a long peduncle; fruit

Sp. pl. 4. p. 280. Pursh, 1. p. 43. Muhl. Gram. p. 248. Nutt. 2. p. I have been accustomed, perhaps incorrectly, to refer the following plant

to this species.

Stem about twelve inches high, triquetrous. Leaves narrow, somewhat subulate, those of the root shorter than the stem, all scabrous along the margin. Sterile spike terminal, small, scales lanceolate. Fertile spikes two to three, the upper ones (when two) approximate, on short peduncles, the lower distant on a peduncle one to two inches long, all small, somewhat cylindrical, but not compact. Corolla lanceolate, tapering at each extremity, triquetrous, somewhat oblique, nerved, the mouth nearly entire, longer than the ovate lanceolate scale. The lower bractea leaflike, longer than the stem.

Grows in wet soils. Flowers in April.

## 38. Granularis.

tribus remotis, binis distant, the two lower inferioribus peduncula- pedunculate; fruit otis; fructibus globoso- vate, globular, nerved, ovatis, nervosis, ventricosis, brevissime rostellatis, ore obsolete emarginato, squama ovato-lanceolata longioribus.

C. spicis foemineis | Fertile spikes three, ventricose, with a very short beak, the mouth slightly emarginate, longer than the ovate lanceolate scale.

Sp. pl. 4. p. 279. Pursh, 1. p. 43. Muhl. Gram. p. 247.

Stem about twelve inches high, glaucous, when old decumbent. narrow, somewhat glaucous. Spike of sterile florets solitary, sometimes, though very rarely, there is a second with fertile florets intermingled. Spikes of fertile florets two or three, the lowest on a peduncle, the upper nearly sessile. The peduncles all sheathed at base. Scale ovate acuminate. Corolla nearly round, distinctly nerved, with the mouth entire and recurved.

This species I have not seen in this country. In specimens sent me from Pennsylvania by Dr. Muhlenberg, some pubescence is visible on the leaf

and sometimes on the corolla.

Grows in barren meadows and woods, from Canada to Carolina. Pursh. Flowers in May.

### 39. TETANICA.

C. spicis foemineis binis, remotis, suprema subsessili, infima longe pedunculata; fructibus ovatis, utrinque acutis apice recurvis, ore integris, squama obtusa ovata longioribus.

Fertile spikes two, distant, the upper nearly sessile, the lowest on a long peduncle; fruit ovate, acute at each end, recurved at the summit, entire at the mouth, longer than the

Pursh, 1. p. 43. Muhl. Gram. p. 250. Nutt. 2. p. 205. C. Striatula? Mich. 2. p. 173.

Stem twelve to eighteen inches high, slender, triquetrous, glabrous. Leaves linear, acute, much shorter than the stem. Spikes few, small; sterile one terminal, fertile generally two, very distant, one nearly sessile towards the summit of the stem, the lower pedunculate, erect. Scales of the sterile florets obtuse; of the fertile, in my specimens, acute. Corolla triquetrous, acute at each end, distinctly nerved, somewhat oblique. Grows in Carolina. Mich. Sent to me from North-Carolina by Dr.

Schweinitz. Flowers-

#### 40. Laxiflora. La Marck?

C. spicis foemineis tribus, distantibus, 6— 8 floris, infima remote the lowest distant, pepedunculata; fructibus duncled; fruit oblong oblongis ventricosis, ventricose, obtuse, obtusis, squama ovata | larger than the ovate, mucronata majoribus. | mucronate scale.

Fertile spikes three, distant, 6—8 flowered,

Sp. pl. 4. p. 281. Pursh, 1. p. 43. Muhl. Gram. p. 251. Nutt. 2. p.

Stem one to two feet high, triquetrous, with the margin scabrous. Leaves

narrow lanceolate, nerved, very acute, somewhat scabrous along the margins. Sterile spike terminal, slender. Fertile spikes two to three, the lowest on a peduncle one to two inches long, the upper ones shorter. Spikes few flowered, the flowers unusually distant (for this genus.) Corolla fanceolate, tapering at each extremity, oblique, obtusely triquetrons, nerved, the mouth nearly entire, about as long as the ovate, acuminate, mucronate scale. Bracteal leaves all much longer than the stem.

Grows in damp, shaded soils. Carplina, Dr. Schweinitz. Affied to C.

Conoidea?

Flowers April-May.

#### 41. Hystericina. Muhl.

C. spica mascula solitaria, squamis ovatooblongis sub mucronatis, foemineis cylindranate, fertile spikes cyclindrate lindrical 2—4, the low-pedunculata; fructibus ovatis, multinervibus, fruit ovate, many nervibus, and backed the mouth rostratis, ore bifidis ed, beaked, the mouth squama oblonga crista- two-cleft, longer than ta longioribus.

Sterile spike solitary, scales ovate, obthe oblong awned scale.

Sp. pl. 4. p. 282. Pursh, 1. p. 43. Muhl. Gram. p. 252. Nutt. 2. p.

Stem about two feet high, triquetrous, scabrous along the angles. Leaves long, narrow, scabrous, sheathing the base of the stem. Sterile spike terminal, cylindrical, one to two inches long; scales ovate lanceolate, acute, with a hispid, setaceous point. Fertile spikes three to four, cylindrical, pedunculate, the lower pedancle very long, scabrous, corolla ovate, attenuate into a long, two-cleft beak; scale ovate, small, slightly emarginate, terminated with a hispid, setaceous bristle (mucro) nearly as long as the corolla. Bracteal leaves all longer than the stem.

Grows in bogs and wet soils. Carolina, Dr. Schweinitz.

Flowers April—May.

### 42. FLEXUOSA.

C. spicis foemineis Fertile spikes genesubquaternis, remotis, rally four, distant, filifiliformibus, pedunculis cernuis; fructibus distant, altantibus, alternis, oblongis, rostratis, bifidis, squama ovata mu- long as the ovate mucronata, duplo longiori- cronate scale. bus.

Sp. pl. 4. p. 297. Pursh, 1. p. 48. Nutt. 2. p. 295. C. Debilis, Mich. 2. p. 172.

Stem about twelve inches high, slender, triquetrous, glabrous, with the edges towards the summit slightly glabrous. Leaves linear, rather longer than the stem, scabrous along the margins, slightly channelled. Male spike solitary, terminal, slender; scales lanceolate, rather obtuse; stamens three. Female spikes four, remote, pendulous, with the base of the peduncles enclosed, the lower peduncle four to six inches long, one half or more inclosed, the upper gradually shortening and the sheaths comparatively shorter; scales lanceolate, rather obtuse; corolla ovate, striate, when old, somewhat oblique, scarcely rostrate, nor are the flowers very distant. Stigmas three.

Grows in damp soils. Flowers April-May.

#### 43. Digitalis. Willd.

C. spicis foemineis subternis, remotis, fili- | rally three, distant, filiformibus, pedunculatis, form, pedunculate, cernuis; fructibus ellip- nodding; fruit elliptic, ticis obtusis, squama obtuse, longer than the lanceolata | oblong oblongo longioribus.

Fertile spikes genelanceolate

Sp. pl. 4. p. 298. Pursh, 1. p. 44. Muhl. Gram. p. 255. Nutt. 2. p. 205.

Stem nearly twelve inches high, triquetrous, glabrous. Leaves rather broad, acute, longer than the stem. Sterile spike linear, with lanceolate scales. Fertile spikes two to three, pedunculate, erect, filiform, about tenflowered, flowers distant. Fruit elliptic, ventricose, compressed, triquetrous, very obtuse. Scales oblong lanceolate, shorter than the fruit. Bracteas sheathing, broad, leaflike, longer than the stem. Willd.

This species which I have never seen, I add on the high authority of Dr.

Schweinitz.

MINISTER PER SANDERIA

narrow le لختذ gins. Flowers Mar. est on a few flor olate, 1 C. Fillorm: mouth Brac' G tribus subsessili, reli-Cor suppedunculatis; frucquo ovatis, triquetris, breve rostratis, ore inregris, squama oblonga emarginata aristata

Fertile spikes three, filiform, the upper nearly sessile, the rest pedunculate; fruit ovate, triquetrous, with a short beak and entire mouth, longer than the oblong emarginate awned scale.

Sp. pl. 4. p. 290. Pursh, 1. p. 44. Muhl. Gram. p. 257. Nutt. 2. p. 205.

Stem slender, triquetrous, scabrous along the angles. Leaves linear, acute, scabrous along the margins. Spikes slender, sterile, one terminal; fertile two to three, the lower on a long peduncle, pendulous; the upper sometimes sessile, when on peduncles pendulous also. Bracteal leaf to the lower spike longer than the stem, to the upper small. Scales of the fertile florets emarginate with a mucronate point. Corolla ovate, with only the lateral nerves, the summit acute and nearly entire, longer than the scale.

Grows in wet meadows, Canada to Carolina. Pursh.

Flowers-

longioribus.

## 45. Furcata. E.

C. spicis foemineis tribus, pedunculatis, pendulis, cylindricis; fructibus ovato-lanceolatis, rostratis, furcatis, squama subulata, primum brevioribus demum longioribus.

Fertile spikes three, pedunculate, pendulous, cylindrical; fruit ovate lanceolate, beaked, forked, at first shorter, finally longer than the subulate scale.

Stem about two feet high, thick, acutely triquetrous, very scabrous along the margins near the summit. Leaves longer than the stem, channelled, three to four lines wide, scabrous along the edges, the long bracteal leaves scabrous also along the midrib, nerved, with small nodosities between the nerves which become conspicuous as the leaf begins to wither. Male spikes long, slender, scales linear lanceolate, acute. Female spikes generally three, pendulous, cylindrical, on peduncles generally increasing in length as they descend, inclosed at base by the amplexicaule bracteal leaf. Corolla ovate, rostrate, nerved, conspicuously forked with the divisions disposed to become revolute. Scale small, with a long, subulate, serrulate point, at first longer than the corolla, afterwards shorter. Stigmae three.

There is to this species sometimes a fourth female spike somewhat remote;

this when it occurs generally has the base of the peduncle inclosed.

This species has usually been considered in the southern states at least, as the C. Pseudo-Cyperus, but though nearly allied it does not agree entirely with the character of that species; the summit is much more pointed and divided than the figure in English Botany, No. 242, and it is, I think, unquestionably indigenous.

Grows in deep swamps.

Flowers April.

## 46. GLAUCESCENS.

C. spicis foemineis 3—4, cylindricis, pel cylindrical, peduncu-dunculatis, demum pen- late, finally pendulous; dulis; corollis ovatis, compressis, enervibus, glaucis, squamam emarginatam, mucronatam subæquantibus; foliis glaucoscontibus glaucescentibus. | glaucous. foliis

Fertile spikes 3—4,

Mem about two feet high, triquetrous, glabrous, the margins near the summit slightly roughened. Leaves narrow, channelled, acutely serrulate, the lower conspicuously glaucous, shorter than the stem. Sterile spike cylindrical, solitary, pedunculate, scales ovate, emarginate, mucronate, ferruginous with the midrib green. Fertile spikes on slender pedancles one to three inches long, not enclosed at base, becoming pendulous as the fruit matures, scales ovate, deeply emarginate, mucronate, ferruginous with the midrib green. Corolla ovate, with a very short two-cleft mouth, very glaucous, the nerves excepting the two lateral ones indistinct, much longer than the blade of the scales and nearly as long as the mucronate point. Seed triquetrous.

Grows around pine barren ponds. Flowers April—May.

\*\*\*\* Spicis sexu distinctis; masculis pluribus.

Spikes distinct; sterile spikes nu-

### 47. Pellita.

spicis masculis geminis, foemineis gecylindraceis, minis ovatis, bifidis, pilosis, squama oblonga aristata brevioribus.

Sterile spikes two; fertile two, cylindrical, erect, remote, the uperectis, remotis, supe- per sessile; fruit ovate, riore sessili; fructibus | two-cleft, hairy, shorter than the oblong awned scale.

Sp. pl. 4. p. 302. Pursh, 1. p. 44. Muhl. Gram. p. 258. Nutt. 2. p. 205.

C. Striata? Mich. 2. p. 174.

Stem eighteen to twenty-four inches high, triquetrous. Leaves linear, long, scabrous along the margins. Sterile spikes two to four, the upper pedunculate, the lower sessile, scale ovate, obtuse, ferruginous with a darker midrib. Fertile spikes two to three, the upper sessile, the lower on peduncles, erect; scales lanceolate, mucronate. Corolla ovate, very hispid, acuminate, the point short, two-cleft.

Grows in damp woods, Pursh. In Carolina, Mich.

Flowers—

### 48. RIPARIA.

C. spicis masculis quaternis; foemine is tribus, erectis, pedunculatis, apice masculis; gis, nervosis, bifurca- | long, nerved, 2-forked, tis, squama mucronata pàulo brevioribus. E.

Sterile spikes four; fertile three, erect, on peduncles, bearing sterile flowers at the sumfructibus ovato-oblon- mit; fruit ovate oba little shorter than the mucronate scale.

Sp. pl. 4. p. 306. Muhl. Gram. p. 259.

Stem about two feet high, triquetrous, smooth, scabrous on the edges towards the summit. Leaves longer than the stem, strap-shaped, the lower forming short sheaths at base, the upper nearly amplexicable, scabrous along the margin. Spikes dioecious and androgynous. Male spikes generally four, each about two inches long; scales tapering to an acute point, chaffy, scarious. Androg: spikes two to three inches long, erect, on moderately long peduncles, the lower one enclosed at base in a short sheath, the two upper merely enveloped. Scale ovate, tapering to an acute point, at first shorter than the corolla, when mature rather exceeding it in length. rolla ovate, slightly acuminate, nerved but not very conspicuously, two-cleft at the summit. Stigmas three, long, glandular. Seed triquetrous.

Grows in the fresh marshes and rice field ditches. Ogeechee.

Flowers March—April.

#### 49. VERRUCOSA. Muhl.?

C. spicis masculis tribus, foemineis plurimis (4—6), erectis, cy-lindraceis, apice mas-culis; corollis compres-6), erect, cylindrical, bearing sterile flowers at the summit; corolla sis, ovatis, brevissime compressed, bifidis, squama ovata, subemarginata, mucronata brevioribus. E.

Sterile spikes three, fertile numerous (4slightly two-cleft, shorter than the ovate, somewhat emarginate. mucronate scale.

Muhl. Gram. p. 261.

Stem two to three feet high, triquetrous, glabrous. Leaves very long, acute, nerved, somewhat glaucous, sheathing the base of the stem. Sterile spikes generally three, the terminal one two to three inches long, cylindrical, very obtuse, scale ovate mucronate, dark brown; fertile spikes three to six, two to three inches long, all terminated with sterile flowers. Lower peduncle about one and a half inches long, sheathed at base; the upper shorter, nearly surrounded by the long bracteal leaves. Scale ovate, obtuse, sometimes emarginate, mucronate, dark brown. Corolla ovate, obscurely nerved, glaucous, with a very short, slightly cleft mouth, about as long as the scale exclusive of the mucronate point. Seed triquetrous.

Collected many years ago along the road between Stono and Combahee

Ferry; probably at the latter place.

Flowers April.

### 50. BULLATA?

spicis masculis cylindraceis, peduncu- pedunculate, ovato-globosis, rostra- | beaked, two-forked, tis, bifurcatis, rostris (the beaks hispid,) larolata majoribus.

Sterile spikes three; tribus, foemineis binis, fertile two, cylindrical, latis, erectis; fructibus | fruit ovate, globose, hispidis, squama lance- ger than the lanceolate scale.

Sp. pl. 4. p. 309. Pursh, 1. p. 45. Nutt. 2. p. 295.

Stem about two feet high, slender, acutely triquetrous, slightly scabrous on the margins. Leaves narrow, longer than the stem, somewhat channelled, scabrous along the edges, with a very short sheath at base. Male spikes frequently but two, slender, scales lanceolate, rather obtuse, the summit and margins membranaceous. Female spikes two, a little distant, erect, cylindrical, on short peduncles merely enveloped at base. Scales lanceolate, acute. Corolla ovate, almost globular at base with an attenuated two-cleft beak, nerved, the nerves pubescent near the summit. Stigmas three. Seed triquetrous.

This plant differs but not materially from the description of Willdenow.

I have had no opportunity of comparing specimens.

Grows in bay galls and ditches. Near Beverly, Chatham county, Geo. Flowers April.

S. culmo gracili, tri- | Stem slender, triquelong peduncle; nut very smooth and polish-

Mich. 2. p. 167?

Stem twelve to eighteen inches high, slender, triquetrous, nerved, a little scabrous along the margins and slightly pubescent near the summit. Leaves linear, nerved, acute, slightly scabrous on the upper surface, a little pubescent near the base and on the sheath, shorter than the stem. Flowers in . small fascicles or spikes, two sometimes three, sessile near the summit, one on a long peduncle (two to three inches) near the middle of the stem, each containing one fertile and two to three? sterile florets at its base. Bracteal leaves resembling those of the stem, the two upper ones much longer than the spikes, the lower sheathing the base of the peduncle. Scales of the sterile florets ovate, acute, very slightly pubescent; of the fertile longer, very acute, glabrous. Seed one, white, very smooth, and polished.

It appears to me probable that this species is the S. Oligantha of Michaux, for the upper spikes are distinct, which in S. Pauciflora are fasciculate. His silence respecting the seed must, however, leave this uncertain, unless his own herbarium can resolve the doubt. This, however, is not the S. Pauciflora of Pursh, nor S. No. 4, of Muhl. Gram. p. 268, under which a reference is made to S. Oligantha, Mich. as both of those plants have rugose seeds.

Grows in wet pastures and pine barrens. St. John's, Dr. Trescott.

Flowers May.

## 2. Gracilis. E.

S. culmo filiformi, triquetro, foliisque gla- | trous, and bris; spiculis paucis, leaves glabrous; spikes paucifloris, fasciculatis, few, few flowered, fassubterminalibus; glu- | ciculate, nearly termi-

Stem filiform, triquewith the mis glabris; nuce lævi, nal; glumes glabrous; nut smooth, polished.

Plant about a foot high, very alender, and in my specimens entirely smooth. Leaves linear, very narrow, shorter than the stem. Bracteal leaf resembling those of the root, these to four inches long. Spikes two or three, clustered together at the summit of the stem, each bearing one fertile floret. Scales ovate lanceolate, slightly mucronate, ferruginous, glabrous. white, showing in some specimens slight longitudinal ribs.

Collected by Dr. Baldwin near St. Mary's, Georgia.

Flowers-

#### 3. Triglomerata? Mich.

S. caule triquetro, scabrato; foliis lanceolato-linearibus, canali- lanceolate linear, chan-culatis, scabriusculis nelled, somewhat parce pilosis; spicis la- rough, a little hairy; teralibus terminalibus- | spikes lateral and terque fasciculatis; glumis | minal, ciliatis; nuce lævi. E.

Stem acutely triquetrous, rough; leaves fasciculate; glumes fringed; smooth.

Sp. pl. 4. p. 319. Mich. 2. p. 168. Muhl. Gram. p. 260. Nutt. 2. p. 205.

Stem about two feet high, very acutely triquetrous, striate, scabrous, and a little hairy near the summit. Leaves about twelve inches long, three to four lines wide, somewhat scabrous, hairy along the angles, sheathing the stem at base. Flowers generally in one terminal and one lateral cluster each composed of three or four aggregated spikes, the lateral cluster usually pendulous. Bracteal leaves much longer than the spikes, pendulous. Calyx of both florets three-valved, valves ovate, carinate, mucronate, somewhat unequal, conspicuously fringed. Female florets two or three in each spike. *Style* one. Stigmas three. Seed white, polished, showing some slight inequalities on its surface.

This is the most common of our species. I have always doubted whether it is the S. Triglomerata of Michaux; but it agrees better with that than with

any other of his species. It is not the S. Triglomerata of Pursh.

Grows in dry soils.

Flowers April—October.

- \*\* Nuce corrugato. | \*\* Nut wrinkled.
- 4. PAUCIFLORA.
- S. caule triquetro, | Stem triquetrous and

Fertile florets—A-Calyx squama. ment. Calyx a scale.

### 1. ASPLENIFOLIA.

Sp. pl. 4. p. 820. Mich. 2. p. 203. Pursh, 2. p. 635. Nutt. 2. p. 206.

A small shrub two to four feet high. Leaves long, linear-lanceolate, alternate, sessile, irregularly pinnatifid after the manner of a fern, lohes obtuse. Flowers in oyal, sessile, axillary spikes (aments.) Of the sterile florets, calyx reniform, acuminate, one-flowered; corolla and filaments shorter than the calyx; filaments three, divided; anthers six. Of the fertile florets, corolla six-leaved, much longer than the calyx. Nut oval, without valves.

The whole plant when bruised is aromatic.

In specimens which I have from Pennsylvania the stem and leaves are slightly pubescent, and the lobes of the leaves somewhat remote. In specimens from the mountains of Carolina, the leaves on the upper surface are more or less hairy, on the under surface tementose, the lobes nearly orbicalar, overlaying one another; the branches tomentose. The scales so deeply fringed as to make the young aments almost resemble a ball of hair.

Grows in the mountains of Carolina and Georgia. Flowers April.

## 1. Linearifolia.

T. caule suberecto, subramoso, pubescente; rect, sparingly branchfoliis linearibus, pubeded, pubescent; leaves seentibus; spicis longibus. E. Stem generally e-rect, sparingly branched, pubescent; linear, pubescent; spikes long.

Stem twelve to eighteen inches high, pubescent, almost tomentore. Leaves alternate, sessile, one to two inches long, linear, pubescent, in my specimens entire. Spikes axillary, numerous near the summit of the stem, longer generally than in our other species of Tragia. Sterile florets very small. Capsules hirsute.

I am not certain whether this plant is the T. Urens var. Linearis of Mich.

it appears to me, however, to be very distinct from that species.

Grows in the southern districts of Georgia.

Flowers-

## 2. URENS. Lin.

centibus.

T. foliis lanceolatis, Leaves lanceolate, sessilibus, obtusis, api- sessile, obtuse, slightly ce subdentatis; caule toothed near the sumerecto, ramoso pubes- mit; stem erect, branching, pubescent.

T. Innocua, Walt, p. 229.

Stem about twelve inches high, branching, villous. Leaves alternate, sessile, lanceolate, dentate, pubescent, somewhat hoary underneath. *Plosers* in small spikes generally terminal. Of the sterile floret, calyx fourparted, the segments lanceolate, pubescent; filaments two to four, short, thick; anthers two to four, united by pairs. Fertile floret on a short peduncle, calyx six-parted, the segments small; corolla none. Style very short. Stigma three-cleft. Capsule hispid, composed of three united, globalar, two-valved cells each one-seeded. Seed spherical.

Varies with leaves oval, or more or less lanceolate.

Grows in dry soils.

Flowers May—August.

#### 3. URTICIFOLIA. Mich.

T. foliis cordatis, erecto, hirsutissimo.

Leaves cordate, oovatis, serratis; caule vate, serrate; stem e-| rect, very hirsute.

Mich. 2. p. 176. Sp. pl. 4. p. 324. Pursh, 2. p. 604. Nutt. 2. p. 206. T. Mercurialis, Walt. p. 229.

.. Stem twelve to eighteen inches high, erect, very hirsute. Leaves alternate, on short petioles, cordate ovate, deeply serrate, very hirsute particularly along the veins. Spikes opposite the leaves. Sterile florets numerous towards the summit. Fertile on short peduncles near the base of each spike. Capsules very hirsute.

Grows in dry soils. Common in the middle country of Carolina and

Georgia.

Flowers May—August.

. Stem about twelve to fourteen inches high, obtusely four-angled, bairy, somewhat hispid, branching. Leaves opposite, cordate ovate, rugose, hairy, coarsely toothed, three-nerved, with the exterior nerves divided, sprinkled besides the hairs with white prickles. Petioles nearly an inch long. Flowers in axillary racemes, two in each axil, shorter than the petiole, and fertile florets intermingled. Of the sterile floret chlyx four-leaved, leaves hairy, obtuse; filaments longer than the calyx, expanding elastically and discharging elastically the pollen; nectarium cyathitorm; of the fertile floret calyx two-leaved, persistent, seed compressed.

Grows in damp soils, common around Beaufort; St. Mary's, Georgia.

Flowers December to February.

# 3. CHAMCEDBOIDES. Pursh.

U. foliis oppositis, sub- Leaves opposite, nearsessilibus, ovatis, serra- ly sessile, ovate, serrate, tis, subtus strigosis; glo- strigose underneath; silibus, subglobosis, re- lary, sessile, somewhat Bexis; caule stimuloso.

merulis axillaribus, ses- | eluster of flowers axilglobose, reflexed; prickles stimulant.

Pursh, 1. p. 112. Nutt. 2. p. 203.

Stem nearly simple, glabrous, four to six inches high. Leaves ovate, on short petiols, hairy underneath, sprinkled with a few hairs and white prickles on the upper surface, small, and for their size coarsely toothed. Flowers in compact axillary clusters scarcely longer than the petioles, the upper florets fertile, the lower sterile. Calyx of both florets hairy. Collected on St. Simons, Georgia, by Mr. Lyon.

Flowers February to March.

#### 4. Dioica.

grosse serratis; floribus | coarsely serrate; flow-

U. foliis oppositis, cor- Leaves opposite, cor- datis, ovato-lanceolatis, date, ovate lanceolate, dioicis; spicis panicula-tis, glomeratis, gemina-tis, petiolo longioribus. longer than the petiole; flowers clustered.

Sp. pl. 4. p. 352. Mich. 2. p. 179 Pursh, 2. p. 113. Nutt. 2. p. 208.

Stem branching and with the leaves and whole plant very hispid. Leaves cordate, ovate, slightly acuminate; acutely and deeply serrate, nerved, on neticles one to one and a half inches long. Plowers dioecious, (more frequently monoecious, Mich.) in clustered panicles, two from each axil.

In this species and in U. Urens the calyx of the fertile floret is four-leaved, two leastets ovate cordate, two others opposite, very small. Leers in

Sp. pl. l. c.

Grows along roads and in waste places, from Canada to Carolina, Pursh. I have not seen this species in the low country.

Flowers June—August.

#### 5. Procena. Muhl.

Sp. pl. 4. p. 363. Walt. p. 230. Pursh, 1. p. 113. Nutt. 2. p. 208.

Stem four to five feet high, obtusely four-angled, somewhat scabrous, furrowed. Leaves oblong, oval or lanceolate, coarsely toothed, scabrous, three-nerved; sometimes slightly cordate, large; those of the stem generally opposite, of the branches alternate; petioles long, unequal, when the leaves are opposite. Flowers in sessile clusters, lateral and axillary. Sterile and fertile florets intermingled. Calyx a little hairy. Seed compressed ovate.

Grows in shaded wet soils.

Flowers July—August.

liosis, caule nudo.

#### 7. DIVARICATA.

U. foliis alternis, ovatis, acuminatis, ser- vate, acuminate, serratis, glabriusculis; pe- | rate, nearly glabrous; tiolis longis, ciliatis; petioles long, cili-paniculis axillaribus, ate; panicles axillary, solitariis, divaricato ra-solitary, divaricately mosissimis, petiolo lon- branched, longer than gioribus; caule stimu- the petioles; stem stiloso. Pursh.

Leaves alternate, omulant.

Sp. pl. 4. p. 365. Pursh, 1. p. 113. Nutt. 2. p. 208.

This species is nearly allied to the following, but is sufficiently distinct, in the leaves being not cordate and smooth, the panicles solitary and mixed with fertile florets, and in the general appearance of the plant. Pursh.

With this species I am unacquainted. Grows in damp soils in rocky situations, from Canada to Carolina. Pursh.

Flowers July—August.

#### 8. Canadensis.

dato ovatis, acuminatis, serratis, utrinque hispidis; paniculis axil- surfaces; panicle axillaribus, plerumque ge- | lary generally in pairs, minatis, divaricatis, ra- divaricately branched, mosissimis, inferioribus | the lower sterile, longer masculis, petiolo longio- than the petiole, the ribus, superioribus elon- upper spikes long, fergatis, femineis; caule tile; stem very hispid, hispidissimo, stimuloso.

U. foliis alternis, cor- | Leaves alternate, cordate ovate, acuminate, serrate, hispid on both stimulant.

Sp. pl. 4. p. 365. Walt. p. 230. Mich. 2. p. 178. Pursh, 1. p. 114. Nutt. 2. p. 208.

Stem four to eight feet high, branching, hispid. Leaves ovate, slightly acuminate, coarsely toothed, thin, sprinkled with hairs, sometimes cordate. Flowers in loose divaricate panicles nearly as long as the leaves, the lower panicles, perhaps most of the early flowers sterile, the later fertile; branches of the panicle very hispid. Calyx hairy. Seed oblique, resembling much one joint of the pods of the Hedysarum.

The fibres of the two last described species are so strong that it has been

strenuously proposed to substitute them in many cases for hemp.

Grows in Carolina along the mountain streams, Pursh. I have not seen this species in the maritime districts of Carolina or Georgia.

Flowers July-August

Sp. pl. 4. p. 369. Walt, p. 241. Mich. 2. p. 179. Prush, 2. p. 639. Nutt. 2. p. 209. Mich. arb. for. 3. p. 282.

A tree which, in favourable situations, is said by Michaux to attain the height of sixty to seventy feet, and a diameter of eighteen to twenty-four inches, branches long, virgate. Leaves of the old tree, ovate, acuminate, serrate, scabrous on the upper suface pubescent underneath; those of the young plants frequently palmate and very scabrous. Flowers, I believe, always dioecious. Sterile florets in a spike or ament one to two inches long, calyx four parted, stamens four, longer than the calyx. Fertile florets in a short spike. Calyx four-leaved, after flowering closing becoming juicy, forming a cylindrical fruit composed of many one seeded berries.

Grows in rich alluvial soils, along the margin of rivers and swamps, not uncommon though rarely becoming in the low country a large tree. The timber is durable and is generally preferred in building boats, or for the light

timbers of vessels to any wood excepting the red ceder.

Flowers March.

A caule herbaceo, pa- | Stem herbaceous, extulo; foliis triangulari | panding; leaves trianacuminatis, gular, hastate, acumisubdentatis; fructus ca- | nate, slightly toothed; lycibus rhombeis, a- | calyx of the fruit rhompice denticulatis, disco boidal, toothed at the summit, slightly muricate on the disc.

Sp. pl. 4. p. 964. Nutt. 1. p. 197.

Annual. Stem prostrate, somewhat angled, branching, glabrous, one to two feet long. Leaves attenuate, triangular, hastate, generally entire, glabrous, on petioles nearly an inch long. Flowers clustered on axillary and terminal spikes. Calyx persistent, denticulate near the summit, muricate or crested on the back.

The plant of our low country which has been referred to this species appears to be certainly indigenous. It grows in brackish soils at the head of tide water in many of our creeks. Bees creek, Pocotaligo, and near Charleston. I have, however, at present no specimen with mature seed, which I could compare more accurately with the European plant.

Flowers June to September.

## 2. Angustifolia.

A. caule herbaceo. ditato lanceolatis, inte- olate, entire. gerrimis.

Stem herbaceous, divaricato; foliis inferio- | varicate; lower leaves ribus hastatis, subden- | hastate, slightly toothtatis, superioribus lan- ed, the upper lanceoceolatis, integerrimis; late, entire; calyx of fructus calycibus has- the fruit hastate lance-

Sp. pl. 4. p. 965.

Annual. Stem divaricate, somewhat prostrate, angled, glabrous. (Lower leaves hastate slightly toothed, Willd.) upper lanceolate, narrow, entire, glabrous, attenuated at base. Flowers in compact clusters axillary and terminal. Calvx of the fruit deltoid, hastate, sometimes denticulate, the back strongly veined but not crested.

Found though rarely near the margin of salt water around Charleston, perhaps an exotic. I have never seen the lower leaves hastate, but the early leaves of plants frequently decay before the flowers are expanded.

Flowers June—July.

#### 3. LACINIATA.

A. caule erecto, her-baceo. foliis triangula-ribus profunde denta-tis, subtus albidis; fruc-tus calycibus rhombeis, trinerviis, denticulatis. toothed.

Sp. pl. 4. p. 963. Walt. p. 252. Pursh, 1. p. 199. Nutt. 1. p. 198.

The whole plant covered with a thin separating epidermis. Stem erect. terete, naked, virgate. Leaves, except the very lowest, alternate, deltoid, toothed, silvered over with small plates or scales. Terminal spikes hermaphrodite with the anthers light red. Female florets axillary, in pairs. Calyx of the fruit compressed, five toothed, the intermediate one the largest. Lin. Leaves when growing spontaneously almost snew white underneath, when cultivated pale white. Will.

Grows generally along the margins of salt or brackish streams. Walter appears to have seen this species; I have not met with it.

Flowers June—August.

### 4. Arenaria. Nuttall.

A. caule herbaceo, patente; foliis subsespanding; leaves nearly silibus oblongo-ovatis, integerrimis, argentatis; fructus calycibus muricatis, dentatis, retusis.

Nutt. 1. p. 198. A. Glauca. Walt. p. 252.

Stem about two feet high, geniculate, much branched, glabrous, frequently purple, the epidermis generally in a state of separation. Leaves alternate, oblong, mucronate, the lower rather obtuse, covered on both surfaces with silvery scales, nearly sessile. Flowers monoecious; the sterile in terminal spikes clustered; the fertile in axillary clusters. Of the sterile florets; Calys: five-leaved, the leaves lanceolate, small; Filaments five, longer than the calyx. Anthers didymous bright purple. Of the fertile florets, the calyx twoleaved persistent. Leaves appressed, three-lobed; the lateral lobes twotoothed; the intermediate, long acute, each bearing two short dentated crests. Styles two, longer than the calyx. Seed orbicular, compressed.

Grows in soils that are occasionally inundated by the ocean.

Flowers July—November.

A. glomerulis trian- | Flowers clustered, tri-

Sp. pl. 4. p. 386. Pursh, 1. p. 207. Nutt. 2. p. 210.

Plant annual. Stem 2-3 feet high, smooth, generally purple. Leaves alternate, more commonly ovate as described by Linnæus, than elliptic, obtuse, emarginate, slightly undulate, strongly veined, glabrous, on petioles 1-2 inches long. Spikes compound, axillary and terminal. Sterile and fertile florets intermingled, small clusters of fertile florets in the axils of the Calyx 3-leaved. Stamens 3, longer than the calyx. two and three, very short. Capsule rugose, somewhat persistent.

Grows in cultivated lands and about buildings-common.

Flowers from June—September.

#### 2. Pumilus.

A. glomerulis pentandris axillaribus; fo- in axillary clusters; liis ovatis, obtusis, emar- leaves ovate, obtuse, ginatis, carnosis, rugo- | emarginate, carnose, sis; caule procumbente, rugose; stem procumglabro. E.

Flowers pentandrous bent, glabrous.

Rafinesque Med. Repos. 2. p. 360. Nutt. 2. p. 210.

Plant annual. Stem one to two feet high, procumbent and ascending, somewhat carnose, generally purple. Leaves ovate, ribbed, succulent; with the margin entire and cartilaginous, dotted, slightly glaucous underneath. Flowers in sessile clusters, crowded towards the summit of the stem. Sterile and fertile florets intermingled. Calyx 5-leaved, leaves oval. Filaments 5, as long as the calyx. Styles 3. Capsule rugose, persistent.

Grows on the drifting sands along the margin of the ocean.

Flowers August—October.

#### 3. Hybridus.

vato-lanceolatis.

A. racemis pentan- | Flowers pentandrous, dris, decompositis, con- in decompound, erect, gestis, erectis; foliis o- clustered racemes; leaves ovate lanceolate.

Sp. pl. 4. p. 389. Walt. p. 232. Pursh, 1. p. 207. Nutt. 2. p. 210.

Stem four to six feet high, furrowed, and somewhat hairy. Leaves ovate, lanceolate, acute, muncronate, ribbed, pubescent, slightly scabrous, on petioles about an inch long. Spikes axillary and terminal, supradecompound, sterile and fertile florets intermingled. Calyx 5-leaved, leaves lanceolate, acute; filaments five, nearly as long as the calyx. Germ obovate, acuminate. Styles two to three. Capsule rugose, circumscissed.

Grows in cultivated grounds, very common.

Flowers July-October.

#### 4. Sanguineus.

A. racemis pentanoblongis, acutis.

Flowers pentandrous dris, supradecomposi- in supradecompound, tis, erectis; ramis pa- erect racemes; branch-tentibus, glabris; foliis es expanding, glabrous; leaves oblong, acute.

Sp. pl. 4. p. 390. Pursh, 1. p. 207. Nutt. 2. p. 210.

Stem naked. Racemes terminal, erect; the lateral and the partial ones expanding. Leaves lurid on the upper surface, entirely red underneath.

Grows in cultivated grounds, Virginia to Carolina. Pursh. Flowers July—August.

#### 5. Hypochondriacus.

cronatis.

A. racemis pentandrous, dris, compositis, confertis erectis; foliis oblongo lanceolatis, mucronate.

Sp. pl. 4. p. 392. Pursh, 1. p. 207. Nutt. 2. p. 210.

Annual. Stem four to eight feet high, glabrous, furrowed. Leaves long, large, lanceolate, entire, ribbed, lurid on the upper surface, generally purple on the under, on long petioles. Racemes terminal, paniculate. Sterile and fertile florets intermingled. Calyx 5-leaved, leaves very acute, bright purple. Stamens five, longer than the calyx. Styles three. Capsules circumscissed.

Grows in cultivated ground, not indigenous, at least in the low country of Carolina.

Flowers June—October.

#### 6. Spinosus.

A. racemis pentan- | Flowers pentandrous, dris, terminalibus, com- | in compound, terminal positis; axillis spinosis. racemes; axils spiny.

Sp. pl. 4. p. 393. Walt. p. 232. Pursh, 1. p. 208. Nutt. 2. p. 210.

Stem two to three feet high, diffusively branched, glabrous, generally coloured. Leaves lanceolate, rather obtuse, mucronate, entire, glabrous, slightly glaucous underneath. Petioles as long as the leaves, with two spinous stipules at their base. Spikes compound axillary and terminal, the upper florets generally sterile. Calyx five-leaved, the leaves lanceolate, very acute, filaments five, longer than the calyx. Styles three. Capsule ovate, transparent, somewhat persistent.

A very common weed around buildings and in cultivated land.

Flowers June—October.

In several species of this genus the two halves of the capsule appear to cohere until they both decay; in others the upper half falls as soon as the seed matures.

## SCHISANDRA. Michaux. Stellandria. Brickell.

Masculi. Calyx 5phyllus, inferus, imbricatus. Corolla 5-petala. Filamenta 0. Antheræ receptaculo sessiles.

phyllus, imbricatus. Co-rolla 5-petala. Stamina | Iyx 5-leaved, imbri-0. Germina plurima ca- cate. Corolla 5-petalled. Stamens 0. Germs ceptaculo demum elon- numerous, collected into gato. Baccæ 1-spermæ. heads, receptacle extended when mature. Berries 1-seeded.

#### 1. COCCINEA. Mich.

Mich. 2. p. 219. Pursh, 1. p. 212. Nutt. 2. p. 209.

Stem voluble, glabrous, ten to fifteen feet long. Leaves alternate, lanceolate, sometimes denticulate, glabrous, occasionally somewhat cordate, petiolate. Flowers solitary, axillary, on short peduncles. Corolla and receptacle? of the sterile florets of a deep crimson colour, and acquiring from the pale yellow, sessile anthers, that stellular appearance from which the name of Brickell was derived. In the fertile floret the germs are aggregated as in the flowers of the Rubus, but the receptacle extends as it matures, and the berries do not unite and form one fruit as in the Rubus or Morus, but become detached and scattered. Berries red, one seeded. Dr. Brickell considered the fruit as a two celled, one seeded drupe.

In my description of this plant I have followed, in a great measure, the manuscript notes of the late Dr. Brickell, who, I believe, had examined it

with great attention.

Grows in rich damp soils, near Savannah.

Flowers May-June.

## CROTONOPSIS. Michaux.

tala.

chotome - ramosissimo; | mously foliis supra stellato pi- leaves on the lepidotis.

C. caule erecto, di- | Stem erect, dichotobranching: losis, subtus argenteo-| surface stellularly hairy, underneath covered with silvery scales.

Mich. 2. p. 186. Sp. pl. 4. p. 380. Pursh, 1. p. 206. Nutt. 2. p. 209.

Stem twelve to eighteen inches high, dichotomously branched, with the divisions generally remote, covered like the under surface of the leaves, with silvery scales. Leaves linear-lanceolate or ovate, entire, on short petioles. Flowers in short terminal and axillary spikes, small, the upper florets sterile. Capsule oval, covered also with scales.

The leaves of this plant vary from linear-lanceolate to ovate; the extremes appear sufficiently distinct, but intermediate specimens seem to connect

them.

Grows in dry pine barrens, near Georgetown, and in the middle districts of Carolina.

Flowers June-May.

A small tree generally about twenty-five to thirty feet high, twelve to fifteen inches in diameter, branches slender, virgate. Leaves ovate, acute, serrate, slightly scabrous on short petioles. Flowers monoecious, expanding before the leaves. Sterile florets in small sessile clusters near the extremity of the last year's wood. Stamens longer than the calyx, 3-4 or 5. Fertile florets solitary, or in small clusters intermingled with the sterile. Nut ovate, one-celled, not winged, but covered with loose ovate scales.

Grows along the margin of river swamps; most common in the middle

districts of Carolina and Georgia.

Flowers March.

## CELTIS. GEN. PL. 1591.

Stamina 5-6.

## 1. Occidentalis.

C. foliis ovatis, acuminatis, serratis, basi | minate, serrate, uneinæqualibus, supra sca- | qual at base, scabrous bris, subtus hirtis.

Leaves ovate, acuon the upper surface, hairy underneath.

Sp. pl. 4. p. 994. Walt. p. 250. Mich. 2. p. 249. Porsh, 1. p. 200. Nutt. 1. p. 202.

Mich. arb. for. 3. p. 225.

A tree which sometimes on the sea-islands obtains a height of sixty to seventy feet, with a diameter of two to four feet; branches erect and expanding; bark united but corrugate, rimose. Leaves attenuate, ovate, acuminate, oblique at base, when old nearly glabrous; the young somewhat hairy, scabrous and entire. Petioles three to five lines long, hairy. Flowers axillary, the lower sterile frequently by threes; the upper fertile solitary. Pediacles four to ten lines long. Stipules two, pubescent, as long as the peduncles. Of the sterile floret, calyx five to six parted; filaments five to six, as long as the calyx, united at base. Anthers greenish. Of the fertile floret, germ superior; style or rather stigmas two, expanding curved. Fruit, a globular dry drupe, of a purple colour and saccharine taste.

Around Beaufort formerly this tree was very common, and several of them in the town had obtained the size I have mentioned. The wood, however, appears not to be strong; the branches are easily broken from the stem by high winds, and in the frequent gales to which the sea-coast of Carolina and Georgia has been exposed during the last twenty or twenty-five years, the finest of these trees have literally been torn to pieces. Along the margin of the sea-islands this tree, perhaps, occurs more frequently than in any other

situation.

Flowers March.

Z. panicula pyrami-data, inferne divarica-ta mascula, superne spicata foeminea; pedi-cellis florum clavatis; aristis langist semina aristis longis; semine | flower clavate; awns long; seed long.

Walt. p. 283. Pursh, 1. p. 60. Nutt. 2. p. 210.

Z. Palustris, Sp. pl. 4. p. 395.

Z. Clavulosa, Mich. 1. p. 75.

Root perennial. Stem 6-12 feet high, terete, glabrous, polished, encircled at the joints with a silken pubescence. Leaves oblong-lanceolate, slightly channelled, finely serrulate, glabrous on both surfaces, of a light green colour, 2-4 feet long, one to one and a half inches wide, closely sheathing at base, the sheaths shorter than the internodes. Flowers in a large terminal panicle, the branches verticillate, the lower expanding, bearing sterile florets, the upper somewhat erect, the florets all fertile, on short incrassated pedicels; of the sterile floret glume 2-valved, valves equal, ciliate along the back and margins; nectary 2 very small lanceolate membranes at the base of the filaments; filaments 6, short; anthers oblong; the sterile flower pendulous caducous. Of the fertile floret glume 2-valved, valves unequal, the exterior linear-lanceolate, tapering to a bristle nearly 2 inches long, ciliate; the interior smaller, very acute; nectary as in the sterile floret; germ short, oval. Styles 2, short. Seed oblong.

This grass grows in great abundance near the mouths of our fresh water rivers. It constitutes a considerable portion of the fresh water marshes; preferring those situations where the soil is overflowed one or two feet deep at high water. Its leaves are succulent and eaten with avidity by stock of all descriptions. In Savannah, under the name of wild oats, it is used almost exclusively during the summer season as green fodder for their cows and horses. It is said not to make good hay, but I suspect it has not been fairly tried; perhaps the experiments have been made on leaves or plants not sufficiently mature. The seed are more saccharine than those of any other of the gramineæ which I have ever tasted, but they are also the most cadu-

Flowers October and November.

#### 2. MILIACEA. Mich.

pyramidata; glumis pyramidal; glumes with brevi-aristatis; floribus short awns; florets stemasculis et foemineis rile and fertile intermixtis; stylo 1; semine mingled; style 1; seed ovato, lævi; foliis pe- ovate, smooth; leaves · rennantibus centibus.

Z. panicula effusa, Panicle expanding, glauces- perennial, glaucescent.

Mich. 1. p. 74. Sp. pl. 4. p. 394. Pursh, 1. p. 60. Nutt. 2. p. 210. Z. Palustris, Walt. p. 233.

Z. Aquatica, Sp. pl. 4. p. 394?

Stem erect, 6-10 feet high, terete, glabrous, even at the joints. Leaves 1-6 feet long, one to one and a half inches wide, flat, strinte, serrolate, glaucous; perennial, sheath at base open, shorter than the internodes. Flow, ers in a large terminal pyramidal panicle, the lower branches generally by threes, the upper lanceolate. Flowers sterile and fertile intermingled, the upper florets generally sterile. Of the sterile floret glume 2-valved, valves equal, lanceolate, slightly mucromate, nerved, serrulate near the summit; filaments 6, very short; nectaries 2, minute. Of the fertile floret valves 2, unequal, lanceolate, mucronate. Style 1, longer than the interior valve of Stigmas 2. Seed oval, glabrous.

This species is more common than the preceding, and grows in similar situations; its leaves are harsh and coarse, eaten, I believe, by no animal, ;

perennial, and of a dull glaucous colour.

Flower's April—May.

#### Mich. 3. FLUITANS.

glumis muticis.

Z. pusilla, culmis gra- | Plant small; stem cilibus, ramosis; foliis slender, branching; linearibus, planis; spi-cis solitariis axillaribus, setaceis, subquadifloris; ry, setaceous, generally 4-flowered; glumes unawned.

Mich. 1. p. 75. Sp. pl. 4. p. 395. Pursh, 1. p. 61. Nutt. 2. p. 210.

This species is said by Dr. Ballawin, to be vary common in the vicinity of Savannah. A small, creeping, jointed grass, floating whenever the soil on which it grows is overflowed. I have had no opportunity of examining it when in flower, nor of ascertaining whether our Southern plant is really the species described by Michaux. In habit and appearance it is totally unlike the two preceding species.

Roof perennial. Stem about 12 inches high, terete, procumbent and assurgent, floating, taking root at the lower joints. Leaves verticillate, generally by fours, the lowest setaceous resembling fibres, the upper linear, pinnatifid, rarely an inch long, with 2 segments usually on each side. Flowers verticillate, also by fours, sessile, small; the upper sterile. Corolla of both florets pale purple. Stamens 6, scarcely longer than the corolla. Fruit as if composed of 4 seed united each having an elevated broad 2-edged rib along the back.

Grows in shallow ponds.

Flowers April—June, and probably through the whole summer.

## 3. Heterophyllum.

M. foliis inferioribus | Lower leaves capilcapillaceo pinnatis, su- lary, pinnate, the up-

perioribus ovalibus, ar-gute serratis; floribus 6-andris. per oval, acutely ser-rate; flowers hexan-drous. drous.

## 1. Sagittifolia, var. Latifolia.

S. foliis ovatis, sub acutis, sagittatis, lobis rally acute, sagittate, lobes ovate, acuminate, tis; scape simplicity, floribus monoicis; bracteis ovatis, acutis.

Leaves ovate, generally acute, sagittate, lobes ovate, acuminate, straight; scape simple; flowers monoecious; bracteas ovate, acute.

Mich. 2. p. 189. Walt. p. 283. Nutt. 2. p. 213. S. Latifolia, Sp. pl. 4. p. 409. Pursh, 2. p. 396.

Root perennial. Stem 0. Leaves all from the root, ovate, maittate, acute, sometimes obtuse, entire, very glabrous, strongly nerved, lobes long, acuminate, and very acute; with the lobes 6-14 inches long, 4-7 wide, on petioles 1—2 feet long dilated at base. Scape 1—2 feet long. Proper peduncles by threes, verticillate, scarcely an inch long, upper flowers sterile, the lower fertile. Involucrum S-leaved, (perhaps 1-leaved, deeply 3-parted, with the segments S-cleft,) leaves ovate, acute, frequently S-cleft. Calyx 3-leaved, of the sterile floret deciduous. Petals 3, larger than the calvx, round, white. Stamens about 30, shorter than the corolla. Germs very numerous, collected into a globular head. Style very short. Capsule: incurved, gibbous on one side, not opening, containing one oval seed.

Grows in ponds, ditches, and wet places.

Flowers August-October.

#### 2. Pubescens. Muhl.

S. pubescens; foliis! mis.

Pubescent: leaves oblongo-ovatis, acutis, oblong ovate, acute, sagittatis; lobis ovatis, acuminatis, rectis; scapo simplici; floribus monoicis; bracteis submonoecious; bracteas rotundis, pubescentissi- | nearly round, very pubescent.

Muhl. Cat. p. 86. Nutt. 2. p. 213.

A plant very similar in most respects to the preceding, but with the stem and leaves pubescent, and the bracteal leaves and calyx very pubescent, As far as it has fallen under my observation, it appears to bear smaller leaves, longer in proportion to their size, and the lobes less divaricate; and the bracteal leaves which in the former species are with us ovate and acute, are in this shorter, nearly round, and obtuse.

Grows very common in the western districts of Georgia. I do not re-

member to have seen it along the sea coast.

Flowers August---October.

### 3. HASTATA. Pursh.

S. foliis oblongo-lan-ceolatis, sensim-acutis, sagittatis, lobis paten-tibus, lanceolatis, lon-lanceolate, with very

gissime - acuminatis; long acuminate points;

tusis.

scapo simplici; floribus | scape simple; flowers dioicis; bracteis calycibusque subrotundis, ob- | calyx nearly round, obtuse.

Pursh, 2. p. 213. Nutt. 2. p. 213. S. Gracilis, Pursh, 2. p. 396.

A plant in its general habit resembling the two preceding, but the leaves are long, very narrow, with long, slender, divaricate lobes. In the var. Gracilis, Pursh remarks that the leaf (from the summit of the petiole) rarely exceeds 3 inches in length.

Grows (at least the var. Gracilis) in the mountainous districts of Carolina

and Georgia.

Flowers July-August.

#### Mich. 4. NATANS.

subcordatis; scapo sim-plici, paucifloro; pedun-culis inferioribns elon-slightly cordate; scape simple, few-flowered; lower peduncles very gatis.

S. foliis natantibus, Leaves floating, eleliptico-lanceolatis, obtusis, nervosis, infimis tuse, nerved, the lowest long.

Mich. 2. p. 190. Pursh, 2. p. 897. Nutt. 2. p. 213.

Root perennial, the fibres articulated. Leaves generally floating, elliptic, entire, 3-nerved, the lowest ovate cordate, 7-nerved, 1-2 inches long. Scape generally erect, 3-6 inches long. Flowers not numerous, small, the upper sterile. Leaves of the calyx lanceolate. Petals round. Stamens about 8. Germs numerous.

Grows in shallow ponds. When deserted by water it becomes erect, but

rarely exceeds 6-8 inches in height.

Flowers May-August.

#### 5. Lancipolia.

S. foliis lato-lanceolatis, utrinque acutis, ceolate, acute at each

Leaves broad, langlabris, coriaceis, sub- end, glabrous, coriace-perennantibus; scapo ous, somewhat perennisimplici; seminibus | al; scape simple; seed compressis, subfalcatis. | compressed, slightly E.

Sp. pl. 4. p. 410. Walt. p. 233. Mich. 2. p. 189. Nutt. 2. p. 213. S. Falcata, Pursh, 2. p. 397.

Root somewhat tuberous, creeping. Sap, as in most of this genus, lactescent. Leaves large, 10-14 inches long, 3-5 wide, lanceolate, entire, striate, many nerved, coriaceous. Petioles 1-2 feet long. Scape 2-3 feet long. Flowers verticillate by threes, the upper sterile. Leaves of the involucrum ovate, acuminate, glabrous. Leaves of the calyx round, tinged with purple. Petals much larger than the calyx, white as in all of this genus. Filaments numerous, (nearly 60) hairy. Germs numerous. Stigma 3-5 cleft. Capsules collected into a compact globular head.

Grows in deep marshes and wet and boggy soils.

Flowers April—June.

#### 6. GRAMINEA. Mich.

ceolatis, triplinervibus, olate, triplinerved, subperennantibus; sca-po simplici; floribus monoicis; bracteis ova-monoecious; bracteas tis, acuminatis.

. Root perennial. Leaves linear-lanceolate, entire, glabrous, 3-4 inches long, scarcely half an inch wide, many of them living through the winter.

Petioles about a foot long. Scape rather longer than the petioles. Places. verticillate by threes, the upper sterile. Leaves of the calyx lanccolate, small. Petals much longer than the calyx. Filaments about 10, hery. Anthers frequently 2 on each filament. Capsules obliquely macronate, collected into a globular head.

Grows in shallow ponds; very common in pine barrens.

Flowers April-June.

Mich. arb. for. 2. p. 74. Mich. Quer. N. 7 to 12. (Q. Phellos Sylvatica.)

A tree 30-60 feet high, erect, straight, generally slender for its height. Leaves linear-lanceolate, entire, very slightly mucronate, nearly sessile, generally deciduous, when young of a very light green colour, resembling somewhat those of the willow. Spikes of sterile florets near the termination of the last year's wood. Fertile florets solitary in small clusters. Fruit (an acorn) nearly spherical, mucronate, small, sitting in a scaly cup.

The leaves of the young plant have generally one tooth or angle, rarely

more, on each side.

Grows generally in swamps or along their margins; the timber is but little used. Willow oak.

Flowers March and April.

#### 2. CINEREA. Mich.

Q. foliis perennanțilanceolatis, integerrimis, margine subrevotosis; fructibus sessili- mentose bus; nuce subglobosa.

Leaves perennial. bus, coriaceis, oblongo- coriaceous, oblong-lanceolate, entire, with the margin slightly revolutis, apice mucronatis, lute, mucronate at the subtus stellatim tomen- summit, stellularly tounderneath; fruit sessile; nut nearly spherical.

Mich. 2. p. 197. Sp. pl. 4. p. 425. Pursh, 2. p. 626. Natt. 2. p. 214. Q. Pumilis, Walt. p. 234. Icon. Mich. Querc. No. 8 t. 14. Mich. arb. for. 2. p. 81.

A small tree rarely exceeding 20 feet in height, with irregular crooked branches. Leaves on short petioles, oblong-lanceolate, sometimes acute, sometimes obtuse, always mucronate, very slightly revolute along the margin, covered underneath with a very close and short tomentum, of a greyish bue, but very generally discoloured with shades of brown. Acorn small, not abundant, nearly spherical. Cup shallow, sessile.

Grows on the dry and barren hills in the middle districts of Carolina and Georgia, sometimes called high ground Willow Oak, Turkey Oak, Scrub Oak, which last name, however, includes the Q. Nigra or Black Jack and

Q. Catesbæi, to which it more peculiarly belongs.

Flowers March—April.

#### 3. Pumila. Walt.

Q. foliis deciduis, oblongo-lanceolatis, subundulatis, basi obtusis, apice acutis, mucronatis, subtus tomentosis, supra glabris; nuce subgloboso.

deciduous. Leaves oblong lanceolate. slightly undulate, obtuse at base, acute and mucronate at the summit, glabrous on the upper surface, tomenunderneath; nearly spherical.

Walt. p. 234. Nutt. 2. p. 214.

Q. Phellos, var Pumila, Mich. 2. p. 197.

Q. Sericea, Sp. fol. 4. p. 424. Pursh, 2. p. 626.

Icon. Mich. Querc. t. 13-f. 1, 2. Mich. arb. for. 2. p. 84.

A small shrub with creeping roots, rarely exceeding two feet in height. Stem slender, virgate, tomentose when young, sparingly branched. Leaves on short petioles, oblong-lanceolate, obtuse at base, undulate particularly when young, the under surface covered with a dense hoary tomentum, the upper when young sprinkled with a stellular pubescence, becoming glabrous with age. The sterile florets are produced in such profusion, as to render the plant very conspicuous at the season of flowering. Acorn small, not produced in any abundance even when not destroyed by fire, nearly spherical. Cup shallow, on a very short peduncle.

The figure of Michaux the younger, arb. for which recalls the plant very accurately to my recollection, represents the leaves as tapering at base, specimens before me have them all very obtuse. In this respect it probably

This has always appeared to me a very distinct species, marked by many characteristic features. In many situations where the woods have not for years been burnt, I have seen it growing, without exceeding the height I have specified. I know not how Mr. Nuttall was led to consider it as a Swamp variety of the Q. Cinerea; for although it does not generally grow in a soil as arid as the sand hills in the middle country to which the Q. Cinerea appropriately belongs, it is found only in the driest pine barrens along that district which is emphatically called the "low country of Carolina and Georgia."

Flowers March—April.

### 4. VIRENS. Aiton.

Q. foliis perennanti- Leaves perennial, bus, coriaceis, ovali- coriaceous, oval-lancelanceolatis, integerrimis, margine revolutis,
basi obtusis, apice sub
acutis, subtus stellatim
pubescentibus; fructibus pedunculatis; nuce underneath; fruit on oblonga.

peduncles; nut oblong.

Sp. pl. 4. p. 425. Mich. 2. p. 196. Pursh, 2. p. 626. Nutt. 2. p. 214. Q. Sempervirens, Walt. p. 234. Icon. Mich. Querc. t. 10-11. Mich. arb. for. 2. p. 67.

A large tree, with spreading curved and twisted branches, rarely exceeding 50 feet in height, but covering with its enormous limbs when growing in open situations, a large circumference. The Stem sometimes attains a diameter of 5-7 feet, but generally divides into large branches at 8 or 10 feet from the ground. Leaves oval-lanceolate, with the margins conspicuously revolute, pubescent, almost tomentose underneath, entire on the old tree, toothed or angled on the young, frequently obtuse: Aments of sterile forets small, fertile florets very numerous. Fruit oval, nearly black, mucronate.

pedunculate, generally in pairs.

The timber of this oak is perhaps the most valuable that is known for the purposes of naval architecture. Its fibre is compact, heavy, strong, and derable, twisted so as to split with difficulty, and hardening with age or on exposure to weather. The natural curvature of the branches is in general precisely such as the timbers of a ship require, so that the strength of the wood may, with a little care, be entirely preserved. It is also used in machines, for the fellows of cog wheels, and in general wherever strength and durability are required, and where its weight and crookedness form no objection. Its bark is excellent for the use of the Tanner, and its smaller branches are generally used for fuel, and constitute in fact the best firewood in our country.

This tree is now becoming scarce in the forests, as the soil and situation in which it naturally grows, is that peculiarly adapted for the cultivation of the Sea-Island Cotton. It is only seen in perfection in old fields, or as an ornamental tree near buildings, or on the margins of islands or points of lands projecting into salt water. It is much to be regretted, that residents on the Sea-Islands do not plant avenues of this noble tree along the roads leading up to their houses, as a means not only of preserving and eventually increasing the supply of timber, but of adding embellishments to situations, which have frequently all the beauties that water and wood can give to the scenery of a level country. We perhaps want the variety which cultivation even in its most regular aspect can bestow. All, however, who have seen the fine avenues of Live Oak near Dorchester, will acknowledge, that they would add magnificence to any landscape.

Grows along the sea coast, often flourishing luxuriantly when a portion of

its roots are washed by the salt water at a very high tide. Flowers and sheds a portion of its leaves in April.

5. Maritima. Willd.

Q. foliis perennanti-bus, coriaceis, lanceola-tis, integerrimis, gla-bris, basi attenuatis, apice acutis, mucrona-tis; nuce ovali.

Leaves perennial, coriaceous, lanceolate, entire, glabrous, taper-ing at base, acute at the summit, mucronate; nut oval.

Sp. pl. 4. p. 424. Pursh, 2. p. 625. Nutt. 2. p. 214. Q. Phellos, var. Maritima, Mich. 2. p. 197. Icon. Mich. Querc. t. 13. f. 3.

A shrub 4--10 feet high, growing along the sea coast. Leaves oblonglanceolate, (often sinuately toothed, smooth and of the same colour on both sides, Nutt.) on very short petioles. Nut oblong, mucronate, rather large. Cup pedunculate.

This species has always appeared to me to be most nearly allied to the Q.

Virens. Its acorn is similar in shape, but larger.

Grows in the vicinity of salt water. Flowers April.

Į,

### 6. Myrtifolia. Willd.

Q. foliis perennantibus, coriaceis, parvis, coriaceous, small, ob-oblongo-obovatis, mu- long-ovate, unawned, ticis, utrinque acutis, acute at each end, gla-glabris, supra nitidis brous, shining and reti-reticulatisque, margine culate on the upper surrevolutis.

perennial. Leaves face, margin revolute.

Sp. pl. 4. pl. 424. Pursh, 2, p. 626l Nutt. 2. p. 214.

Branches terete. Leaves on short petioles, coriaceous, oblong, rather acute at base, entire and slightly revolute, shining on the upper surface, opake and glabrous underneath, resembling very much those of the common Myrtle, willd; scarcely larger than those of the Box, Nutt.

This specie of oak was discovered, I believe, by Mr. Kim, on Cumberland Island in Georgia, and probably extends along the sea-coast of Florida; its

fruit is still unknown.

Flowers.

#### 7. LAURIFOLIA. Mich.

subovata.

Q. foliis sub perennantibus, sessilibus, oblongo - lanceolatis, sub acutis, basi attenuatis, integerrimis, under the session of the session o trinque glabris; nuce surfaces; nut somewhat ovate.

Mich. 2. p. 197. Sp. pl. 4. 427. Pursh, 2, p. 627. Nutt. 2. p. 214. Q. Hemisphærica, Bartram's Travels, p. 320. Icon. Mich. Querc. t. 17 and 18; perhaps also t. 20. f. 2.

A tree sometimes growing 40-50 feet high, and 2-4 feet in diameter, with its branches regularly expanding and forming a large handsome hemispherical head. Leaves oblong-lanceolate, sometimes obovate, acute or obtuse, nearly sessile, very glabrous on both surfaces, with the margins slightly revolute; those of the young plant toothed and irregularly sinuate; all somewhat clustered near the summit of the small branches. Fruit ovate. Cup

shallow, nearly sessile.

This is one of our handsomest species of oak, and is frequently cultivated around buildings instead of the live oak, as it is supposed to be more easy to remove, more rapid in its growth, and by some considered, on account of the regularity of its branches, more beautiful. The old trees shed their leaves freely towards the close of the winter, and are nearly naked in March. The young plants generally retain their foliage. The timber is supposed to possess neither the strength nor durability of the live oak.

The figure in Mich. Querc. t. 20. f. 2. exactly resembles the young plants of this species. And as this oak, though growing in dry soils, is more known by the name of "Water Oak," than by any other appellation, it is not impossible that Michaux may have been misled by its popular denomination

to insert a figure of it among the real Water Oaks.

I have always considered this as the real Q. Hemisphærica of Bartram. It certainly is the species to which his description most appropriately ap-

plies.

Grows in rich sandy soils along the margin of swamps, appearing to take the place of the live oak as you leave the margin of the ocean, but growing also with the live oak on the sea-islands.

Flowers April.

#### Mich. 8. Imbricaria.

Q. foliis deciduis, obmucronatis, integerri-mis, nitidis, subtus pu-bescentibus; nuce sub-derneath; nut nearly globosa.

Leaves deciduous. longis, utrinque acutis, oblong, acute at each spherical.

Mich. 2. p. 197. Sp. pl. 4. p. 428. Pursh, 2. p. 627, Nutt. 2. p. 214. Icon. Mich. Querc. t. 15, 16. Mich. arb. for. 2. p. 78.

A tree 40-50 feet high, 12-18 inches in diameter, with numerous integular branches. Leaves lanceolate, entire, mucronate, shining on the upper surface, very pubescent and somewhat ferruginous underneath, on very short petioles. Fruit rather small, nearly spherical. Cup shallow, nearly sessile.

The leaves of this species are much larger than those of the Q. Lanrifolia, and are very pubescent underneath; the fruit also differs in figure. The wood is said by Michaux to be of little value, but it splits easily, and is used in the Western States, where it more frequently occurs, for shingles.

Grows in the mountains of Carolina, Dr. Macbride; not found in the low

country.

Flowers—

\*\* Foliis apice lo-\*\* Leaves lobed at the summit. batis.

### 9. AQUATICA. Walter.

Q. foliis obovatocuneiformibus, glabris, integerrimis, apice ob-solete trilobis, muticis, at the summit, unawnlobo intermedio majore; ed, the glande subglobosa.

Leaves obovate cumiddle lobe large; nut nearly spherical.

Sp. pl. 4. p. 441, Walt. p. 234. Mich. 2. p. 198. Pursh, 2. p. 628.

A tree rarely exceeding 30 or 40 feet in height, and 12-18 inches in diameter. Branches somewhat regular but never forming a handsome head. Leaves sessile, cuneate obovate, obscurely 3-lobed at the summit, very glabrous, the veins underneath prominent. Fruit not abundant. Germs generally in pairs. Acorn ovate, rather small. Cup shallow, on a very short peduncle.

This tree bears some resemblance to the Q. Laurifolia, but is, I think,

sufficiently distinct. It is neither valued for timber nor fuel.

Grows in damp, springing soils, around ponds and in shallow swamps. Flowers March—April.

### 10. Nana. Willd.

Q. foliis cuneiformibus, glabris, apice tri- ped, glabrous, 3-lobed lobis, basi subsinuatis, at the summit, slightly lobis divaricatis, mucronatis. majore, axillis venarum | cronate, the middle one subtus pubescentibus; nuce ovato-subglobosa.

Leaves wedge-shasinuate at base. the intermedio lobes divaricate, muthe largest, axils of the veins pubescent underneath; nut ovate, nearly glabrous.

Sp. pl. 4. p. 443. Pursh, 2. p. 628. Q. Hemisphærica, var. Nana, Nutt. 2. p. 214.

With this species I am personally unacquainted. A single leaf, however, which was sent me under this name by Dr. Muhlenberg, agrees minutely with the description of Wildenow, and certainly belongs to no variety of the Q. Agautica or Q. Laurifolia that I have seen. It resembles the leaves of the Q. Ilicifolia more nearly than those of any species that I possess; but differs from that by being more distinctly 3-lobed at the summit, by being glabrous underneath except in the axils of the large leaves. Leaves between 2 and 3 inches long, deeply 3-lobed and mucronate at the summit, obtusely sinuate near the base.

Grows in the pine barrens of Carolina and Georgia, Pursh.

Flowers.

#### 11. NIGRA.

Q. foliis coriaceis, cuneiformibus, vi-ovata.

Leaves coriaceous. basi wedge shaped, slightly subcordatis, apice dila- cordate at base, dilated tatis, retuso-subtrilo-bis, junioribus mucro-natis, supra glabris, mucronate, glabrous on subtus rubiginoso-pul- the upper surface, rusvérulentis; glande bre- ty and pulverulent underneath. nut ovate.

Sp. pl. 4. p. 442. Walt. p. 234. Mich. 2. p. 198. Prush, 2. p. 629. Nutt. 2. p. 214.

Icon, Mich. Querc. t. 22, 23. Mich. arb. for. 2. p. 92.

A small tree 20-25 feet high, rarely exceeding 10 inches in diameter, irregular in its growth, and covered with a thick rough black bark. Leaves on short petioles 5-7 inches long, obovate, dilated at the summit, obscurely 8-lobed, glabrous on the upper surface, covered underneath with a ferruginous dust. Nut short, ovate, mucronate, not abundant. Cup rather deep, sessile.

The wood of this tree is of little or no value as timber, but it is much esteemed for fuel. It is universally known by the name of Black Jack, while the name of Black Oak is as generally given to another species. It varies with the lobes, sometimes obsolete unarmed, sometimes very distinct and

Grows on the poorest sand hills, and always indicates a dry barren soil. Flowers March, April.

#### 12. TINCTORIA. Bartram.

Q. foliis obovatooblongis, lævissime si- long, slightly sinuate, nuatis, subtus in axillis pubescent underneath pubescentibus, lobis ob- in the axils, lobes oblongis, obtusis, obsolete long, obtuse, obscurely denticulatis, setaceo- toothed, mucronate; mucronatis; glande de- | nut depressed, globular. presso-globosa.

Leavés obovate, ob-

Sp. pl. 4. p. 444. Mich. 2. p. 198. Pursh, 2. p. 629. Nutt. 2. p. 214. Icon. Mich. Querc. t. 24-25.

This is one of our largest species of Oak, growing in the rich high land of the upper country, 60-70 feet high, and 3-4 feet in diameter, covered with a very dark-coloured bark, from whence it has derived its common name of Black Oak. Leaves on petioles about an inch long, obovate, angled, alightly and obtusely sinuate, mucronate, glabrous on the upper surface, when young slightly pubescent or pulverulent on the under, afterwards only pubescent in the axils. Nut depressed ovate, rather large. Cup deep, sessile.

This tree appears to vary much; besides the var. Sinuosa figured by Michaux the elder, t. 25. and which evidently belongs to this species, the plate of Michaux the younger, arb. for. 2. p. 110. t. 22. seems to represent an entirely distinct species. I have specimens of this latter variety or species sent me from Philadelphia by Mr. Kim, as the Q. Tinctoria, which agree exactly with Michaux's figure; they would be Q. discolor, but they are glabrous underneath, and are not discoloured.

Grows in the rich uplands of the upper country, rare along the sea-coast.

Flowers March—April.

#### 13. Discolor. Aiton.

pinnatifido - sinuatis, natifid, sinuate, pubesubtus pubescentibus, scent underneath, lobes lobis oblongis, dentatis, oblong, toothed, mucrosetaceo - mucronatis; nate; nut ovate. glande ovata.

Q. foliis oblongis, Leaves oblong, pin-

Sp. pl. 4. p. 444. Parsh, 2. p. 629. Nutt. 2. p. 214. Icon. Abbot's Insects of Georgia, t. 111-56.

Leaves nearly resembling these of Q. Coccinea, but pubescent underneath; by the Autumn, however, the leaves are nearly naked, only pubescent VOL. II.

along the veins. In the Spring they are hoary and pubescent of both surfaces, which is not the case with either the Q. Coccines or Q. Rubra-Willd.

With this species I am not well acquainted. The leaves in the figures of Abbot resemble very much those of the last variety mentioned under Q. Tinctoria, but are hoary from their pubescence.

Grows in the oak lands of the middle and upper country—a large tree.

Flowers April.

# 14. Coccinea. Wangenheim.

Q. foliis oblongis, Leaves oblong, deep-profunde sinuatis, gla- ly sinuate, glabrous, uatis.

bris, lobis divaricatis, lobes divaricate, toothdentatis, acutis, seta-ceo-mucronatis; calyci-bus fructus basi atten-ded, acute, mucronate, calyx of the fruit taper-ing at base.

Sp. pl. 4. p. 445. Mich. 2. p. 199. Pursh, 2. p. 630. Nutt. 2. p. 214 Icon. Mich. Querc. t. 31, 82. Mich. arb. for. p. 116.

A large tree 70-80 feet high, and 3-4 feet in diameter. Leaves deeply sinuate, very glabrous, the sinuses obtuse, the lobes very acute, acutely notched and toothed, and mucronate. Petioles 2-4 inches long. Frint very abundant. Nut ovate, oblong, mucronate. Cup turbinate, sessile, enclosing about half of the nut.

This species, which constitutes a large proportion of the oak forests of the upper country, is distinguished by the brilliant colour of its leaves towards the close of Autumn. Its wood is principally converted into staves or rails or fuel. It is one of the many species to which the name of Red Oak is indiscriminately applied. Its leaves are perhaps more dissected than those of any other species except the Q. Palustris.

Grows in the rich oak lands of the upper country. Not common in the

Flowers in April.

### 15. Rubra.

Q. foliis oblongis, Leaves oblong, ob-obtuse sinuatis, glabris, lobis acutiusculis, den-lobes nearly acute, subtus planis.

tatis, setaceo-mucrona- toothed, mucronate; catis; calycibus fructus | lyx of the fruit flat at base.

Sp. pl. 4. p. 445. Mich. 2. p. 200. Pursh, 2. p. 680. Nutt. 2. p. 214. Icon. Mich. Querc. t. 35—36. Mich. arb. for. 2. p. 126.

A large tree growing 70—80 feet in height, and 3—4 in diameter. Leaves glabrous, sinuate, with the re-entering angles frequently acute, the lobes very acute and very acutely notched, mucronate. Petioles 2—4 inches long. Fruit abundant. Nut oyate, mucronate, nearly truncate at base. Cup shallow, very flat, sessile.

This species has a strong affinity to the Q. Coccinea, but its leaves are generally larger, not so deeply sinuate, the base of the sinus more frequently acute, and in Autumn they change to a dull red and finally become yellow. The acorn also in this species is larger, and remarkable for its flat base and

shallow cup.

This tree is very abundant in the oak land of the upper districts of Carolina and Georgia. It is rare along the sea-coast. Its wood is used for staves, and rails for fences. Its bark is valuable to the tanner. For the purposes of the Architect, however, the timber of none of the "Red Oaks" is equal either in strength or durability to that of the different species and varieties of the White and Chesnut Oaks.

Grows in dry soils. Flowers April.

### 16. CATESBEI. Mich.

Q. foliis lævissime petiolatis, basi cuneatis, oblongis, coriaceis, glabris, profunde sinuatis, lobis divaricatis, acutis, mucronatis; cupula turbinata, ampla, squamis obtusis, marginalibus introflexis; nuce ovata.

Leaves on very short petioles, wedge shaped at base, oblong, coriaceous, glabrous, deeply sinuate, the lobes divaricate, acute, mucronate; cup turbinate, large, scales obtuse, those of the margin bent inwards; nut ovate.

Mich. 2. p. 199. Sp. pl. 4. p. 446. Pursh, 2. p. 680. Nutt. 2. p. 214. Q. Lævis? Walt. p. 284. Icon. Mich. Querc. t. 29, 30. Mich. arb. for. 2. p. 101.

A small tree from 15 to 36 feet high, and rarely exceeding 12 inches in diameter, the branches and stem irregular and crooked. Leaves nearly sessile, coriaceous, glossy, deeply sinuate, the lobes very commonly simple, divaricate and falcate, sometimes bearing 1 or 2 acute teeth. Fruit not abundant. Nut rather ovate. Cup large for the size of the fruit, deep, inclosing commonly half of the acorn, sessile, and remarkable for its obtuse scales, which cover a portion of its inner surface.

The leaves of this species are lobed very much lik those of Q. Rubra,

but the lobes are much more simple, the leaf itself is more corinceous and sessile, and the fruit and tree altogether distinct.

It is not used at all as timber. Its wood makes excellent fuel, and its bark

is valuable to the tanner, but is not easily procured.

Grows in dry, poor, sandy soils; the largest that I have seen are to be found on the Sea-Islands.

Flowers April.

### 17. FALCATA. Michaux.

Q. foliis longe petiolatis, basi obtusis, sub- tioles, obtuse at base, tus tomentosis, trilobis, tomentose underneath, sinuatis, lobis subfal-catis, setaceo-mucrona-lobes somewhat falcate, tis, terminali elongato; mucronate, the termiglande globosa.

Leaves on long penal one long; nut globular.

Mich. 2. p. 199. Pursh, 2. p. 631. Nutt. 2. p. 214.

Q. Elongata, Sp. pl. 4. p. 444.

Q. Rubra, Walt. p. 234.

Icon. Mich. Querc. t. 28. Mich. arb. for. 2. p. 104.

This is one of our largest trees, growing 70 to 80 feet in height, and in favourable situations 3-4, and sometimes 5 feet in diameter, having generally a straight trunk and large branches regularly expanding. Leaves on long petioles, deeply lobed, lobes in general not numerous (3-5) falcate, simple, acute, mucronate, smooth and glossy on the upper surface, covered with a dense tomentum underneath. Nut small abundant, ovate. Cup shallow, somewhat turbinate on a short peduncle.

This, along the sea-coast of Carolina and Georgia, is the most common species of Oak, particularly in soils that are dry and only moderately fertile. Its wood is principally used for staves, or more commonly consumed for fencing or as fuel. Its bark, however, is preferred to that of every other

species of Oak for tanning.

## Var. a. Triloba.

Q. foliis cuneiformi- Leaves wedge shap-bus, basi obtusis, apice ed, obtuse at base,

subæqualiter trilobis, nearly equally 3-lobed mucronatis, supra gla- at the summit, mucronbris, subtus tomentosis. ate, glabrous on the upper surface, tomentose underneath.

Q. Triloba, Sp. pl. 4. p. 443. Mich. 2. p. 199. Pursh, 2. p. 629. Icon. Mich. Querc. t. 26.

This variety grows promiscuously with the preceding, and resembles it esstirely in size, habit and appearance; yet, I do not recollect to have seen any tree bearing indiscriminately the 3-lobed and falcate leaves. If not a distinct species, it is certainly a very permanent variety.

These two trees are called by the inhabitants Red Oak or Spanish Oak. Where I have seen any distinction made, Red Oak was applied to the Q.

Triloba—Spanish Oak to the Q. Falcata.

Grows in dry soils, moderately fertile.

Flowers April.

#### Var. b. PAGODÆFOLIA.

Q. foliis oblongis, Leaves oblong, mamultilobatis, basi sub ny lobed, nearly acute acutis, lobis simplici- at base, lobes simple, bus, divaricatis, mucro-natis, sub oppositis, generally opposite, pu-subtus pubescentibus; bescent underneath; nuce ovata.

nut ovate.

This tree, which has a strong affinity to the Q. Falcata, may deserve a further examination. Its leaves on petioles 2-3 inches long, have frequently 11-13 lobes generally opposite, simple, acute, and diminishing very regularly upwards from the first or second pair; the under surface is only pubescent, not tomentose. The acorn is small, ovate. The tree itself

This tree I first noticed on the banks of the Roanoke in North-Carolina, along the road from Petersburg to Raleigh. I have since seen it near Granby, South-Carolina, growing in both places in rich swamp land.

# 18. Ilicifolia. Wangenheim.

margine mucronatis; nuce sub-|lobes mucronate; globosa.

Q. foliis longe petio- | Leaves on long petilatis, obovato-cuneifor-mibus, tri-quinquelobis, margine integerri-mis, subtus cinereo to-le, obovate, wedge-shaped, 3—5 lobed, en-tire along the margin, cinereous and tomenmentosis, lobis setaceo tose underneath, the nearly spherical.

Sp. pl. 4. p. 447. Nutt. 2. p. 215. Q. Banisteri, Mich. 2. p. 199. Pursh, 2. p. 681. Icon. Mich. Querc. t. 27. Mich. arb. for. 2. p. 96.

A small shrubby Oak, generally growing from 3-4 feet high, sometimes 8-10. Leaves cuneate, usually 5-lobed, the lobes rather acute and mucronate, the upper surface smooth, the under covered with a white tomentum. Petioles about an inch long. Fruit so abundant as sometimes to cover the branches. Nut ovate. Cup large for the size of the acorn, shallow, Mich.

Grow in dry, poor, gravelly soils-New-York to Georgia, Muhl. I have

never seen this species in our low country.

Flowers.

\*\* Fructificatio an-nua; folia mutica. | \*\* Fructification annual; leaves unaun-

† Foliis lobatis.

† Leaves lobed.

nuce ovali.

Q. foliis oblongis, sinuatis, basi cuneatis, subtus pubescentibus, lobis obtusis, superioribus dilatatis; calycibus fructus hemisphæricis, aval oval.

Mich. 2. p. 194. Pursh, 2. p. 632. Nutt. 2. p. 215.

Q. Stellata, Sp. pl. 4. p. 452.

Q. Villosa? Walt. p. 235.

Icon. Mich. Querc. t. 1. Mich. arb. for. p. 36.

A tree generally from 30-40 feet high, and 1-2 in diameter, but sometimes attaining a height of 50-60 feet, and a diameter of 3-4; branches generally straggling, irregular, and the foliage not dense. Leaves on short petioles generally 5-lobed, the upper lobes dilated and emarginate, or bilobed; all very obtuse, glabrous on the upper surface, covered with a stellular pubescence underneath. Nut oblong. Cup hemisphærical, inclosing nearly half of the acorn.

This tree is very common in cold, stiff, gravelly soils. Its timber is supposed in strength and durability to surpass that of any other species of the Oak, except the Live Oak; and, therefore, it is highly prized when it can be

obtained sufficiently large, to be used in the construction of vessels. The small trees are much used in fencing for posts, hence its common name of "Post Oak." Near the sea-coast of Carolina and Georgia it rarely becomes a large tree; but, in the fertile lands in the State of Alabama, it attains a great size.

Grows in moist or gravelly clay soils.

Flowers April.

## 20. Lyrata. Walter.

sinuatis, glabris, lobis ate, glabrous, lobes oboblongis, sub acutis, long, nearly acute, the superioribus dilatatis, upper dilate, angled; angulato-truncatis; ca- calyx of the fruit as lycibus fructus nucis large as the nut; nut magnitudine; globosa, subtecta.

Walt. p. 235. Sp. pl. 4. p. 453. Mich, 2. p. 295. Pursh, 2. p. 623. Nutt. 2. p. 215.

A large tree attaining the height of 60-70 feet, and a diameter of 2-4, with branches somewhat regular, and a head of dense and handsome foliage. Leaves long, irregularly and lyrately sinuate, the lower lobes generally acute, the upper obtuse and sometimes emarginate, glabrous on both surfaces, nearly sessile. Nut of a middling size, almost globular, covered excepting its mucronate summit, with its scaly cup. Cup muricate, on a short pe-

The timber of this tree is said by Michaux to be valuable, but inferior to the White Oak. It is, in fact, so circumscribed in its habitat, that it is but little used or known. Over Cup Oak.

Grows almost exclusively in the rich swamps that border our large rivers.

By no means rare in its native habitations.

Flowers April.

## 21. ALBA. Lin.

Q. foliis oblongis, pinnatifido - sinuatis, natifid, sinuate, pubesubtus pubescentibus, scent underneath, lobes lobis oblongis, obtusis, integerrimis; calycibus fructus pedunculatis, basi planis; nuce ovata. scent underneath, lobes oblong, obtuse, entire; calyx of the fruit on peduncles, flat at base; nut ovate.

Leaves oblong, pin-

Sp. pl. 4. p. 448. Walt. p. 235. Mich. 2. p. 195. Purch, 2, p. 683. Nutt. p. 215.

Leon. Mich. Querc. t. 5. Mich. arb. for. p. 13.

This is one of the largest and most valuable trees in the American Forests, growing frequently to the height of 70 or 80 feet, with a diameter of 3—5, and, according to Michaux, sometimes of 7 feet. Its trunk is often straight for 40 or 50 feet, and free from branches. Leaves on short petioles, deeply pinnatifid, pubescent and glaucous underneath, lobes oblong, obtuse. Fruit large, frequently in pairs. Nut ovate. Cup deep, inclosing nearly half of the acorn.

This tree is supposed to produce the best timber of any Oak in the United States, excepting the Q. Virens. It furnishes to Naval Architecture, from its straight trunk and great size, many pieces of timber which cannot be procured from the Live Oak. In Civil Architecture, in Machinery, to the Carriage-Maker, and to numerous other artizans, it offers many advantages, and is employed wherever a wood, straight, compact, strong, elastic, durable but heavy, is required. Its staves are also preferred to those of any other tree; and its bark, not much used, is said to be valuable to the tanner. Perhaps

no tree in the United States possesses so many good qualities. It grows in a rich damp soil. In the low country of Carolina and Georgia, it is found along the margins of swamps, and in flat rich high lands. In the upper country it seeks a rich and rather damp soil. In all of these situations it attains a large size. But, the district which contains the finest forests of the Q. Alba, the Q. Obtusiloba, and the Q. Prinus (Palustris) in the United

States, and probably in the world, is the country which encloses the Ala-

bama and its tributary streams.

Flowers April.

Sp. pl. 4. p. 439. Walt. p. 234. Mich. 2. p. 195. Pursh, 2. p. 633. Nutt. 2. p. 215.

Icon. Mich. Querc. t. 6. Mich. arb. for. 2. p. 51.

A large and magnificent tree, growing 70-80 feet in height, and 2-5 or 6 feet in diameter, with a shaft frequently 40-50 feet without branches, and a fine regular head. Leaves large, on petioles about an inch long, obovate or frequently oblong-lanceolate, regularly, equally and obtusely toothed, glabrous on the upper surface, slightly pubescent underneath. Fruit very abundant. Nut large, ovate. Cup nearly hemispherical, inclosing about one-third of the acorn, on short peduncles.

This tree grows in the same soil and situation as the Q. Alba. In the low country it is more abundant, and generally attains a large size than the White Oak. Its timber, though perhaps inferior, is generally employed indiscriminately with that species with which even in name it is often con-Swamp Chesnut Oak.

founded.

tus hemisphæricis; nu-|calyx of the fruit hemispherical; nut ovatece ovata.

Sp. pl. 4. p. 440. Pursh, 2. p. 634. Nutt. 2. p. 216. Q. Prinus Monticola, Mich. 2. p. 196. Icon. Mich. Querc. t. 7. Mich. arb. for. p. 55.

A tree belonging to the large division of the Chesnut Oaks, but not as large as either of the preceding species. It grows from 30-50 feet high, · and from 1 to 3 feet in diameter, rarely, however, attaining the largest of these dimensions. To the Q. Michauxii it has much affinity, but its leaves are more uniformly toothed, less obtuse at base, and its acorns scarcely half as large as those of that species. Its timber and bark are said by Michaux to be more valuable than those of the other Chesnut Oaks, and for fuel it is in the Northern States much prized.

Grows in rocky situations and soils, common along the base of the Alle-

ghany Mountains.

Flowers.

#### Muhl. 25. Castanea.

Q. foliis oblongo- Leaves oblong-lan-lanceolatis, acuminatis, ceolate, acuminate, tosubtus tomentosis, grosse dentatis, dentibus subæqualibus, dilatatis, apice callosis; calyce fructus hemisphærico; mentose underneath, coarsely toothed, teeth nearly equal, dilated, callous at the point; calyx of the fruit henuce ovata.

mispherical; nut ovate.

Sp. pl. 4. p. 441. Pursh, 2. p. 634. Nutt. 2. p. 216. Q. Prinus Acuminata, Mich. 2. p. 196. Icon. Mich. Querc. t. 7. Mich. arb. for. 2. p. 61.

A large tree growing 60-70 feet in height and 2-4 in diameter. Leaves on long petioles, narrower than usual among the Chesnut Oaks, acuminate, with coarse obtuse and nearly equal teeth, glabrous on the upper surface, tomentose and white underneath. Fruit oval, of a middling size. Cup hemispherical, inclosing one-third of the acorn, sessile.

This tree is disseminated rather sparingly in rich damp soils. I have never seen it in the low country. Michaux found it along the Savannah River as low down as the Sister's Ferry, about 35 miles above the city of Savannah. It is probably confounded both in name and use with the Q.

Prinus and Q. Michauxii.

### 26. CHINQUAPIN. Mich.

. Q. foliis obovatis, obtusis, glabris, grosse | tuse, glabrous, coarsedentatis, dentibus sub- ly toothed, teeth nearly æqualibus, apice callosis; calyce at the point; calyx of fructus hemisphærico; the fruit hemispherical; nuce parva ovata.

Leaves obovate, obdilatatis, equal, dilated, callous nut small, ovate.

Q. Prinus Pumíla, Mich. 2. p. 196.

Q. Prinoides, Sp. pl. 4. p. 440.

Icon. Mich. Querc. t. 9. fig. 1. Mich. arb. for. p. 64.

A small shrub 3-4 feet high, Stem slender, smooth. Leaves on short petioles, oblong-lanceolate, coarsely toothed, glaucous underneath, slightly pubescent when young, glabrous when mature. Fruit very abundant.

very small, ovate. Cup sessile.

This small Oak grows in sterile rocky soils, and is most common near the base of the Mountains. According to Michaux, it rarely occurs solitary, but generally covers patches of from 50 to 100 acres, frequently intermingled with the Q. Ilicifolia, and bears its acorns so abundantly, as frequently to bend to the earth under their weight. In my specimens the fruit is very small, and more covered with the cup. than in the figure given by Michaux, arb. for. l. c.

basi acutis; nucibus
ovato triquetris, obtuLeaves ovate, acuminate, slightly toothed, fringed along the
margin, acute at base;
nuts ovate-triquetrous, sis cum mucrone.

obtuse but mucronate.

Sp. pl. 4. p. 459. Walt. p. 233. Pursh, 2. p. 624. Nutt. 2. p. 216. F. Sylvestris, Mich. 2. p. 194. Icon. Mich. arb. for. 2. p. 170.

A large and beautiful tree, growing sometimes from 50 to 60 feet in height, and 2 to 3 in diameter. The trunk covered with a smooth white bark, branches numerous, and forming a very compact handsome head. Leaves alternate on short petioles, oval, lanceolate, acuminate, ribbed, serrate. Aments or Spikes of sterile florets, somewhat terminal or on short peduncles, fertile florets axillary, very small. Calyx persistent, somewhat like those of the chinquapin, but 4-cleft, and the spines weak and flexible. Seeds generally triquetrous.

This is one of the handsomest of our forest trees. The verdure of its leaves in the Spring surpasses in delicacy and beauty that of any other of our trees. The grain of its wood is fine and close, yet it is but little used, as the dog wood (Cornus Florida) and some other of our close grained trees, sur-

pass it much in strength and durability.

It grows in damp and rich soils, and where the substratum is clay, the soil is generally as durable as it is fertile. Where the substratum however is as is frequently the case in the low country of white sand, no soil is more speedily exhausted.

Flowers March-April.

# CASTANEA. Tournefort.

acuminatis, mucronato- | acuminate, mucronate-

C. foliis lanceolatis, Leaves lanceolate, serratis, utrinque gla- ly serrate, glabrous on both surfaces.

Sp. pl. 4. 459. Mich. 2. p. 193. Pursh, 2. p. 624. Nutt. 2. p. 217. Fagus Castanea, Lin. Walt. p. 233. Icon. Mich. arb. for. 2. p. 156.

A very large tree, growing sometimes from 60-70 feet in height, and 3 -5 feet in diameter, the trunk generally erect and straight, the branches often irregular. Leaves large, oblong-lanceolate, pubescent underneath when young, very glabrous when old. Spikes or Aments of sterile flowers, axillary, very long, florets in small clusters, mostly dodecandrous, but varying from 5-20 stamens. Corolla 6-parted, somewhat lateral. Stamens longer than the corolla. Fertile Spikes 2-3 together, short, thick. Calyx or Involucrum 2-3 flowered, solitary, squamose, at length muricate. Corolla tubular, irregularly 6-8-parted. Style 1. Stigmas numerous, rigid and white. Abortive stamens about 12. Nuts generally 3, enclosed in the persistent and spinous involucrum. Nuttall.

The wood of this tree is very extensively used; it is supposed to resist vicissitudes of the weather better than that of most of our forest trees, and is therefore employed wherever that quality is particularly required.

Grows very abundantly in dry, stony, gravelly ridges; not found along the sea-coast.

Flowers April—May.

### 2. Pumila.

foliis oblongis, acutis, mucronato-ser- cute, mucronately serratis, subtus albo to- rate, tomentose mentosis.

Leaves oblong. hoary underneath.

Sp. pl. 4. p. 461. Mich. 2. p. 193. Pursh. 2. p. 624. Nutt. 217. Fagus Pumila, var. Serotina, Walt. p. 233. Icon. Mich. arb. for. 2. p. 166.

A small tree, sometimes growing 30-40 feet in height, and 12-15 inches in diameter, but more commonly assuming the form of a shrub from 12-15 feet in height. Leaves much smaller than those of the preceding species, oval and obovate, mucronately serrate, tomentose underneath, and as in all of this genus, very regularly ribbed. Fertile florets generally 1 in each involucrum; if more, the rest commonly prove abortive. Nut small, ovate, acute, enclosed in the spiny involucrum.

The wood of the Chinquapin, whenever it can be obtained large enough for posts, is much valued, as it is supposed to be more durable when exposed

to the weather than any of our trees, excepting the Red Cedar.

Grows in light fertile soils; very abundant near the sea-coast; I believe rare in the upper country.

Flowers in May.

#### Muhl. 8. Nana.

B. Lanulosa, Mich, 2. p. 181.

B. Rubra, Mich. arb. for. 2. p. 142.

A tree growing commonly 30-40 feet, and from 1-2 feet in diameter, though sometimes attaining a much greater size; the trunk covered with a smooth scaly bark, the branches long and flexible. Leaves on short petioles, ovate, acuminate, somewhat angled and acutely serrate, very pubescent underneath when young. Fruit in small oval aments, scales 3-cleft villous, the segments equal.

Grows along the margins of rivers whenever the soil is wet and sandy.

The wood, I believe, is very little used in the Southern States.

Flowers March.

### 2. Lenta.

B. foliis cordato-o-l vatis, argute serratis, vate, acutely serrate, acuminatis, nervis sub- acuminate, nerves untus petiolisque pilosis; derneath and petioles amenti squamis glabris, hairy; scales of the alobis obtusis æqualibus | elevato-venosis.

Leaves cordate oment glabrous, lobes obtuse, equal, with elevated veins.

Sp. pl. 4. p. 464. Pursh, 2. p. 621. Nutt. 2. p. 218. B. Carpinifolia, Mich. 2. p. 181. Icon. Mich. arb. for. 2. p. 147.

A tree sometimes growing 70 feet in height and 2-3 in diameter, with long slender branches frequently speckled when young. Leaves on petioles about an inch long, ovate, cordate, acuminate, finely and acutely serrate, very hairy along the mid rib and veins. Sterile ament 3-4 inches long, pendulous; fertile cylindrical, about an inch long, terminating the small branches. Scales with divaricate lobes strongly veined.

The wood of this tree possesses a fine and handsome grain susceptible of polish. It is therefore valued when it grows freely, and is used for many of the purposes of the Cabinet-Maker. It has been called from the quality

and colour of its wood Mountain Mahogany, or Cherry Birch.

Grows along the borders of mountain torrents. In the Southern States, only found among the ridges of the Alleghany Mountains. Mich.

Flowers May. Pursh.

This is one of the largest trees of the American forest. In the low country of Carolina, where it is rather scarce, it rarely exceeds 3 feet in diameter by 70-80 in height; but in the fertile vallies of the Ohio, it is said by Michaux to have been found from 13 to 16 feet in diameter, and frequently with an undivided trunk of from 60 to 70 feet in height. Leaves alternate on long petioles, cordate, nearly round, acuminate, angled and toothed with the nerves almost tomentose. Aments axillary on long peduncles, globular. Seed forming a compact ball on a spherical receptacle.

This tree is generally distinguished in this country as the Sycamore; to the Northward it is commonly called the Button Wood. Its wood is soft, and when exposed to the weather not durable, and is excelled in many respects by so many of our other forest trees, that it is only as an ornamental

tree that it is now valued.

Grows in damp fertile soils. Flowers March—April.

## 1. STYRACIFLUA. Lin.

L. foliis palmato-lo-batis, lobis acuminatis, serratis, sinubus baseos venarum villosis.

Leaves palmately lobed, lobes acuminate, serrate, with the sinu-ses at the base of the veins villous.

Sp. pl. 4. p. 475. Walt. p. 237. Mich. 2. p. 202. Pursh, 2. p. 635. Nutt. 2. p. 219.

Icon. Mich. arb. for. 3. p. 194.

A large tree 70-80 feet in height, and 2-4 in diameter. Leaves alternate on petioles 2-3 inches long, palmately lobed, and cordate, the lobes acuminate and serrate, when young sprinkled with a few hairs; when old, hairy only in the axils of the leaves. Sterile ament terminating the small branches, ovate, composed of globular heads. Stamens numerous. Fertile ament globular near the base of the sterile. Calyx glandular. Germs numerous. Styles 2, thick. Stigmas obtuse. (Ament at length ligneous and alveolate, capsules by pairs inserted in the alveoli, 1-celled, 1-valved, folliculate, internally lined with collateral rows of angular scrobiform deciduous bodies, applied to the few winged and perfect seeds, Nuttall.)

The leaves of this tree when bruised are fragrant, and it exudes a gum which is pleasant and slightly aromatic. Its wood decays rapidly when exposed to the weather; and though fine grained and adapted to some of the uses of the Carpenter and Cabinet-Maker, it is yet but little employed.

Grows every where in wet and damp soils. Attains its greatest size in

our river swamps.

Flowers March and April.

perne augustatis, sub-tus petiolisque sub-pu-bescentibus; fructibus globosis, scabro-punc-tapering to the summit, the under surface and petioles slightly pube-scent; fruit globular, scabrous, dotted.

Sp. pl. 4. p. 456. Walt. p. 235. Mich. 2. p. 191. Pursh, 2. p. 636. Nutt. 2. p. 220.

Icon. Mich. arb. for. 1. p. 157.

A large tree growing 50-60 feet in height, and 2-4 in diameter, with a large and spreading head when permitted to expand freely. Leaves alternate, pinnate, the leaflets numerous, (15-21) ovate lanceolate, somewhat cordate or unequal at base, the partial petioles very short, and with the underside of the leaves very pubescent when young. Aments of sterile flowers axillary near the termination of the last year's wood, simple, two or three inches long; fertile florets terminal. Fruit spherical, covered with a thick spongy undivided pericarp, externally dotted and scabrous, which decays after heavy frosts, and exposes the black corrugated nut.

The timber of the black walnut is compact, fine grained, heavy and dark coloured when exposed to the air. It is now much valued; and were it not for the facility with which mahogany is obtained, it would form a great portion of the furniture of our houses. The fruit is well tasted, and is very

commonly introduced on our tables.

This tree grows only in the richest soils. It is sparingly disseminated along the sea-coast; more frequent, I believe, in the vallies near the Mountains.

Flowers April.

## 2. CINEREA. Lin.

J. foliis numerosis, | Leaves numerous, lanceolatis, serratis, lanceolate, serrate,

basi rotundatis, subtus | round at base, pubepubescenti - mollibus, petiolis villosis; fructi-bus oblongo-ovatis, nuce oblonga acumina-ta, insigniter insculpta.

Sp. pl. 4. p. 456. Walt. p. 235. Mich. 2. p. 191. Pursh, 2. p. 636. Nutt. 2. p. 220.

Icon. J. Cathartica, Mich. arb. for. 1. p. 165.

This species becomes also a large tree, and bears much resemblance to the preceding. Its leaves are pinnate, leaflets oblong-lanceolate, (15-19) very pubescent. The habit and fructification very similar to that of the preceding species, but the fruit is oblong, with a protuberant summit; the nut oblong, acuminate, much more deeply and irregularly sculptured. The wood, though somewhat similar to that of the Black Walnut, is said to be inferior. The decoction of its bark has long been used and celebrated in the Northern States as a cathartic medicine. Its nuts are so oily and so soon grow rancid, that I believe they are never eaten.

This tree, so commonly known to the inhabitants of the United States as the Butter-Nut, is said by Michaux to inhabit the mountains of Carolina and Georgia. I believe it has never been found along the sea-coast of these two

States.

Grows in fertile soils. Flowers in April.

#### 1. SULCATA. Willd.

C. foliolis subnovenis, obovato-lanceola- obovate-lanceolate, ga, læviter compressa, slightly longe mucronata.

Leaflets generally 9, tis, acuminatis, serratis, cuminate, serrate, pusubtus pubescentibus; bescent underneath; fructibus subrotundis fruit nearly round, 4-4-carinatis, nuce oblon- angled, nut oblong, compressed, conspicuously mucronate.

Juglans Sulcata, Sp. pl. 4. p. 457. Pursh, 2. p. 687.

J. Mucronata, Mich. 2. p. 192.

Icon. J. Laciniosa, Mich. arb. for. 1. p. 199.

A large tree when growing in fertile soils, 60-80 feet high, 2-4 feet in diameter. Leaves pinnate, leaflets 7—9. Sterile aments 3-parted, pendulous, 4 to 6 inches long. Scales 3-parted. Stamens 4—6. Fertile florets terminal. Nut oblong, conspicuously pointed, with a tapering summit, angled, covered with a very thick, 4-parted pericarp.

This, like all of the other species of Hickory, grows only in fertile soils. It is rare in the low country of Carolina; but the greater part of our bickories resemble each other so closely in their leaves, and vary so much in their fruit, that it is very difficult to discriminate the species. This is remarkable for the thickness of its pericarp, from whence it is frequently called "thickshelled Hickory. Its nuts are well flavoured.

Flowers April.

#### Lin 2. Alba.

tenisve, longe petiolatis, long petioles, oblong-oblongo-lanceolatis, a- lanceolate, acuminate, cuminatis, argute ser- | sharply serrate, villous ratis, subtus villosis; underneath; aments fiamentis filiformibus, liform, glabrous; fruit glabris; fructibus de depressed, globular; presso-globosis; compressa.

C. foliolis quinis sep- | Leaflets 5 or 7, on nuce nut compressed.

Nutt. 2. p. 221. Juglans Alba, Lin. Sp. pl. ed. prior, p. 14-15. Mich. 2. p. 193. Pursh, 2. p. 637.

Juglans Compressa, Willd. Sp. pl. 4. p. 458. Icon. J. Squamosa, Mich. arb. for. 1. p. 190.

One of the largest and most valuable trees of this genus, remarkable for The exfoliation of the epidermis in old trees, whence it has acquired the name of shag or shaggy-barked Hickory. Leaves alternate, pinnate, leaflets 5-7, large, oblong-lanceolate, acuminate, finely serrate. Ament of the sterile florets 3-parted, long, pendulous. Female flowers terminal. Nut nearly spherical, with two sides flattened and somewhat angled, the shell thinner than that of most of the other species of this genus. Pericarp thin, 4-parted, globular, depressed at the summit.

The timber of this tree is much used and valued wherever a close grained. strong, elastic fibre is required. It decays, however, quickly when exposed to the weather. Its nuts are preferred for the table to those of any other

species.

Grows in fertile soils. I have never seen it along the sea-coast of Carolina or Georgia. Around Columbia, however, it begins to appear, and probably multiplies as you approach the Mountains,

Flowers April.

#### 3. Tomentosa. Michaux.

C. foliolis sub-septenis novenisve, obovate- or 9, obovate-lanceo-lanceolatis, acuminatis, late, acuminate, slightlæviter serratis, subtus ly serrate, pubescent pubentissimis, sub-scabris; amentis filifor-scabrous; ament fili-mibus, tomentosis; fruc-form, tomentose; fruit tibus sub-globosis, læ- nearly vibus; nuce sub-sexan- | smooth; nut somewhat gulata, putamine crassa | 6-angled, the durissima.

Leaflets generally 7 spherical. thick and very hard.

Nuttall, 2. p. 221. Juglans Tomentosa, Mich. 2. p. 192. Pursh, 2. p. 637. J. Alba, Willd. Sp. pl. 4. p. 457. Walt. p. 235. Icon. Mich. arb. for. 1. p. 184.

A large tree. Leaves pinnate, leaflets sometimes only 5, generally 7, pubescent on the upper surface along the veins, very pubescent underneath, almost tomentose; pubescence, as in all of the species of this genus, stellular. Ament of the sterile florets 3-parted, long, very tomentose. (Scales 2-parted, and with a dorsal bractea resembling a 3-parted calyx?) Stamens 8. Fruit large. Nut compressed, somewhat oval, with 4 prominent angles VOL. II. **R4** 

on the sides, and 2 obscure ones on the ends. Pericary thick, separating

into 4 parts.

This is the most common species of this genus in the Southern States. and that which is in general exclusively meant by the generic name of Hickory; all of the other species have some peculiar epithet to distinguish them. The wood of this species, like that of the preceding, is used for many purposes by the Wheelwright; Millwright and Carpenter, and for fuel, the different species of hickory are preferred in this country to all other wood, one or two species of oak perhaps excepted. The nut of this species is well

The variety Maxima, Nutt. distinguished by its very large fruit, grown,

though sparingly, on the sea-islands.

It is certainly singular, that shoots of this species of Carva should be found disseminated over extensive tracts of pine barren, where it is very rare to discover a tree large enough to bear fruit. They are called Hickory Grabs. and are supposed to indicate a soil adapted for cultivation.

Grows in rich soils.

Flowers April.

## 4. Amara. Mich.

ratis, utrinque glabris; glabrous on both surfructibus sub-globosis, faces; fruit nearly sphenuce lævi, mucronata; rical; nut smooth, muputamine fragili.

C. foliolis subnove- Leaflets generally 9, nis, ovato-oblongis, a- ovate oblong, acumicuminatis, argute ser- nate, acutely serrate, cronate, with the shell fragile.

Nutt. 2. p. 222. Juglans Amara. Pursh, 2. p. 638. Icon. Mich. arb. for. 1. p. 177.

A large tree. Leaves pinnate, leaflets generally 9, sessile, oblong-lanceolate, large, acutely serrate, glabrous on both surfaces, except the nerves and midrib, which are pubescent, almost tomentose. Fruit globular, the nut almost obeerdate, very bitter, enclosed in a pericarp which in general is only divided to the middle.

This species grows generally in very flat rich soils; and in the Southern States is, I believe as remarked by Michaux, universally confounded with

the next species.

Flowers April.

#### Mich. 5. Porcina.

C. foliolis sub-septenis, lanceolatis, acumi- lanceolate, acuminate, natis, serratis, utrinque serrate, glabrous on glabris, fructibus parvulis; nuce lævi, durissima.

Leaflets generally 7, both surfaces; small; nut smooth, very

Nutt. 2. p. 222. Juglans Porcina, Pursh, 2. p. 638. J. Obcordata and J. Glabra, Willd. Sp. pl. 4. p. 458. Icon. Mich. arb. for. 1. p. 206.

A very large tree, growing 70-80 feet in height, and in favourable soils frequently occurring 3-4 feet in diameter. Leaves pinnate, leaflets 7-9; smaller, narrower, and more glabrous than those of the C. Tomentosa. Fruit small, varying much. Nut oblong or spherical, very bitter, with a hard shell

This tree, in the low country of Carolina and Georgia, generally grows to a larger size than any other species. It is found along the margins of swamps, or on the flat knowls with which our swamps are frequently broken, and is commonly known as the Swamp or Pignut Hickory.

Flowers April.

## 6. AQUATICA. Mich.

C. foliolis sub-undenis, angusto oblique- eleven, narrow and oblanceolatis, acuminatis, liquely lanceolate, acu-sub-serratis, glabris minate, slightly serrate, sessilibus; fructibus pe- glabrous, sessile; fruit dunculatis, ovatis, sutu- on peduncles, ovate, ris 4, prominulis, nuce subrotunda, compressa.

Leaflets generally sutures 4, prominent; nut nearly round, compressed.

Pursh, 2. p. 638. Nutt. 2. p. 222. Mich. arb. for. 1. p. 182.

A tree growing 40-50 feet high, and resembling in its habit the other species of this genus. Leaves pinnate, leaflets 9-13 long, very narrow aud obliquely lanceolate, very acute, slightly acuminate, serrate, more glabrous than those of any other species of Carya, except the midrib, which is tomentose, the lateral ones sessile, the terminal petiolate. Frait on thort peduncles, ovate, nearly round. Pericarp and Nut both with prominent

angles; shell of the nut thin, kernel very bitter.

This tree is, I believe, exclusively confined to swamps. In the midst of forests it is easily overlooked and confounded with other species. But it is very frequently found on the margin of rivers hanging over the stream, and is then generally a crooked, stunted tree.

Grows very abundantly along the Ogeechee River.

Flowers April.

### 7. Myristicæformis. Mich.

C. foliolis quinis, ovatevato-lanceolatis, acuminatis, serratis, glabris, impari sub-sessili; fructibus ovalibus, rugose-scabris; nuce ovali; brevi-acuminata, sulcato-lineata, durissima. | very hard.

Pursh, 2. p. 638. Nutt. 2. p. 222. Icon. Mich. arb. for. 1. p. 211.

Nothing is yet known of this species but what is contained in the very valuable work of Michaux the younger, on the Forest Trees of North America. The specimens of the tree and nut which he obtained in Charleston, had been collected on Mr. Izard's plantation near Goose Creek, and appear to be sufficiently distinct from the Pignut Hickory. Many searches have since

been unsuccessfully made for this tree; and we only notice it to invite the further inquiries of those who feel an interest in our Botany.

Flowers probably in April.

Sp. pl. 4. p. 480. Walt. p. 224. Mich. 2. p. 188. Pursh 2. p. 399. Nutt. 2. p. 222.

Root tuberous, perennial. Stem 0. Petioles about 1 foot high, sheathing at base, and inclosing the base of the scape, and sometimes of younger leaves. Leaves ternate, leaflets oval-lanceolate, acuminate, entire, glabrous, the lateral ones sometimes oblique. Scape 8-12 inches high. Spathe at base somewhat tubular, expanding at the summit into a flat ovate, acuminate, Spadix scarcely longer than the tube of the spathe, bearing generally either germs or stamens near the base, the summit thick cylindrical or clavate. Berries scarlet, 3-4 seeded.

The sterile and fertile scapes are said to grow from the same root, (Lin.)

more probably dioecious, (Nutt.)

The spathe is sometimes purple handsomely striped with white; sometimes green with a purple border; sometimes green.

Grows in rich soils generally in shaded places.

Flowers March.

### 4. Virginicum.

spatha elongata incurva; spadice superne longius masculifloro.

A. acaule; foliis oblongis, hastate cordate, acutis, lobis obtusis, acute, with the lobes obtuse; spathelong, incurved; spadix for a long distance from the summit bearing sterile flowers.

Sp. pl. 4. p. 484. Walt. p. 224. Pursh 2. p. 399. Nutt. 2. p. 222. Calla Virginica, Mich. 2. p. 187.

Root tuberous perennial. Leaves 12-15 inches long, slightly acuminate, entire, very glabrous, cordate, with the lobes sometimes hastate, sometimes straight, generally obtuse. Petioles nearly 12 inches long, sheathing the scape at base. Scapes many from one root 12-18 inches long. Spathe ong, acute, slightly repand or undulate along the margin, closely embracing the spadix. Spadix nearly as long as the spathe. Berry many seeded.

Grows in swamps and marshy soils, very common.

Flowers April—May

Caladium Sagittifolium, Nutt. 2. p. 222. Calla Sagittifolia, Mich. 2. p. 187. Arum Sagittifolium, Pursh 2. p. 399.

Root tuberous, perennial. Petioles 12-15 inches long. Leaves hastate cordate, abruptly acuminate, entire, glaucous particularly on the under surface, the lobes long, slightly divaricate, generally obtuse, and with the leaf from 5-7 inches long. Scape about as long as the petioles. Spathe somewhat tubular at base, dilated at the summit, cucullate, very white. Spedix longer than the tube. Female florets at base. Male flowers numerous, extending to the summit of the spadix. Anthers many (covered by a peltate operculum?) Berries many seeded, red?

This plant is certainly neither of the species of Esculent Arum to which Linnæus refers. It is smaller than the Arum Virginicum, and like the Calla Ethiopica, which it somewhat resembles, merits culture as an ornamental plant. Considering it a North-American species, I have ventured to me

pose on it a new name.

In the low country of Carolina and Georgia it is rare. I have only seen it in the neighbourhood of Savannah, where it formerly grew abandantly about a mile to the south-east of the city, in springing, spungy soils.

Flowers May-June.

## PINUS. GEN. Pl. 1451.

Sp. pl. 4. p. 496. Mich. 2. p. 204. Pursh 2. p. 640. Nutt. 2. p. 223. P. Squarrosa? Walt. p. 237? Icon. Mich. arb. for. 1. p. 58.

A small tree, rarely attaining the height of 30 or 40 feet, and 12-I5 inches in diameter, with scattered, tough, flexible and smooth branches. Leaves, as in all of the genus linear, acute, 1-2 inches long, united in pairs in each seath. Cone ovate, about 2 inches long; spines near the summit of the scales subulate, straight, acute.

This is a scrubby species of pine, and its wood is said to be of little value. It is said by Pursh to grow in Carolina; and it is probably one of the 2-leaved species described by Walter. I have, however, never seen it in the low

country of Carolina or Georgia. Grows in dry gravelly soils.

Flowers—

## 2. VARIABILIS.

uibus, canaliculatis; channelled; cones gestrobilis ovato-conicis nerally solitary; spines subsolitariis; squama- of the scales incurved. rum aculeis incurvis.

P. foliis elongatis Leaves by pairs and binis ternatisque ten- by threes, slender,

Sp. pl. 4. p. 498. Pursh, 2. p. 643. Nutt. 2. p. 223. P. Mitis, Mich. 2. p. 204.

P. Glabra? Walt. p. 237.

Icon. P. Mitis, Mich. arb. for. p. 52.

A large tree, sometimes growing 70-80 feet in height, and 2-3 feet in diameter, more disposed to branch near the surface of the ground than is common in this genus, and it therefore is only in very thick woods that it is found with a straight naked stem. Leaves generally 2 in each sheath, (sometimes 3 on young branches, Mich.) 4-5 inches long, of a darker green than those of our other pines. Cones small, solitary, not exceeding 2-3 inches in length.

This species is, I believe, universally known along the sea-coast of Carolina and Georgia as the spruce or short-leaved pine. The name of yellow pine is, with us, exclusively applied to the Pinus Palustris. The timber of this tree is not valued. Indeed, I know not that I have ever seen it applied to any use whatever. This, however, may be caused by the abundance which we possess of the very superior Pinus Palustris.

Grows along the sea-coast of Carolina and Georgia only in the most fer-

tile soils-becoming there a tree of great magnitude.

Flowers April.

### 3. Rigida.

P. foliis ternis, vagi-nis abbreviatis; amen-tis masculis erecto-in-line Leaves by threes, the sheaths short; ste-rile aments incumbent aculeis reflexis.

cumbentibus; strobilis | nearly erect; cones oovatis, sparsis vel ag- vate, scattered or clusgregatis, squamarum tered, spines of the scales reflexed.

Sp. pl. 4. p. 498. Pursh, 2 p. 643. Nutt. 2. p. 223. Icon. Mich. arb. for. p. 89.

A large tree, growing sometimes from 70-100 feet in height, and 2-3 in diameter. Leaves 4-6 inches long. Cones generally clustered 2-4 inches long, the scales with acute rigid spines, and closing strongly on each other.

This tree is not very common in the low country of Carolina, where it generally grows intermingled with trees of other kinds not forming forests exclusively of pine. The variety with clustered cones is very conspicuous; and if it really belongs to this species, appears also to vary in having its scales more loosely imbricate.

Michaux remarks, that on the ridges of the Mountains this pine is sometimes exclusively found for many miles—that the cones in such situations are solitary and the tree small. The timber is inferior to that of several

other species. Flowers April.

#### 4. SEROTINA. Mich.

Mich. 2. p. 205. Sp. pl. 4. p. 499. Pursh, 2. p. 643. Nutt. 2. p. 223. Icon. Mich. arb. for. 1. p. 86.

A small tree, sparingly disseminated in close or damp poor soils, rarely exceeding 80-40 feet in height, or 12-15 inches in diameter. Leaves 3 in each sheath 6-8 inches long. Cone 3 to 4 inches long, globular, frequently opposite on the small branches, with the scales closely imbricate, not opening and discharging the seed before the second year; sometimes, according to Mich. not until the third or fourth year.

This species in habit, leaf, bark and colour, resembles the young or stinted loblolly pines (P. Tæda) so much, that the cone alone appears to distinguish them. The cone resembles that of G. Rigida in some respects, but it is larger and more globular, and I think the leaves are longer than those of

that species.

Grows around ponds and in damp soils.

Flowers April.

# 5. Pungens. Lambert.

inferioribus reflexis.

P. foliis geminis, brevibus, acutis; strobilis ovato-conicis, aculis squamarum elongatis, subulatis, incurvis, inferioribus reflexis er reflexed.

Pursh, 2. p. 643. Nutt. 2. p. 223. Icon. Mich. arb. for. 1. p. 61.

A tree 40-50 feet high, 1-2 feet in diameter, with many irregular branches. Leaves 2-3 inches long, 2 in each sheath, somewhat rigid. Cones ovate, sessile, 3—4 in a cluster. Scales closely imbricate, armed

with large, rigid, acute spines.

Of this tree I have no personal knowledge: I am even uncertain whether it grows within the limits assigned to this work. The knob of the Alleghany Mountains however, generally known as the Table Mountain, is in South-Carolina. Mr. Nuttall considers its habitat as confined to the high ridges around the sources of the Catawba, North-Carolina; and perhaps from some summit in that neighbourhood it may have taken its popular name of Table

I think it probable, however, that it may be found on some of the high ridges of the Cherokee Mountains.

## 6. TEDA. Lin.

P. foliis elongatis, Leaves flexis.

long, ternis, vaginis elongatis, threes, the sheaths tis, strobilis oblongoconicis, deflexis, folio brevioribus, spinis ininflexed.

Sp. pl. 4. p. 498. Mich. 2. p. 205. Pursh, 2. p. 644. Nutt. 2. p. 223

This is probably the largest species of pine in the Southern States. Along the margins of swamps it grows sometimes upwards of an hundred feet in height, and 3 feet in diameter. I have measured the trunk of one, which was 72 or 3 feet long without a branch. Its bark is thicker and coarser and more deeply furrowed than that of any species. Leaves 6-10 inches, 3 in a sheath. Cones 2-5 inches long, conical. Scales loosely imbricate,

armed with a rigid spine.

This species is very abundant in South-Carolina and Georgia, along the sea-coast perhaps even more common than the P. Palustris. Its wood is used for all of the purposes to which that species is applied; but the heart or real wood is much smaller in proportion to its diameter, and even in its best state it is very inferior. It is therefore only as a substitute that it is conployed where the P. Palustris cannot be readily obtained. There is so little rosin in this pine, that when dead it decays entirely and forms no lightwood. Its seed is dispersed so easily and so universally over the country, that all lands which are thrown out of cultivation are immediately covered with this tree, intermingled however if the soil be sandy with the P. Palastris.

## Var. HETEROPHYLLA.

Along the marshes near the mouths of the fresh-water rivers, (at least in Georgia) this pine is very common. It is frequently called the smooth-bark Loblolly Pine. It becomes occasionally a very large tree; its bark is as smooth as that of P. Palustris but in longer scales; it has more sap-wood than any of our pines, and its leaves I have found in some instances by two and threes indiscriminately mingled even on the old branches. Not having had an opportunity of seeing Lambert's splendid monograph on the genus Pinus, I was, until lately, accustomed to consider this as his P. Variabilis.

This species, (as all I believe of the real pines) bears aments of sterile flowers in clusters at the summit of the branches, the calyx yellow, tinged more or less with violet, the flowers when mature discharge so much pollen, that surface of stagnant pools appears to be almost covered with this "yellow dust." Even in the streets of Charleston, after heavy storms, I have seen small pools margined with the pollen which had been born by the winds

across the adjacent rivers.

"Grows in damp soils and those that are partially mingled with other forest trees. Much of the land bearing this pine is fertile, and becomes productive when well drained and broken up.

Flowers early in April.

### 7. PALUSTRIS.

sistentibus; subcylindraceis muri- what cylindrical, muricatis.

P. foliis ternis, lon-gissimis, stipulis pinna-tifidis, ramentaceis, per-natifid, ramentaceous, strobilis | persistent; cones somecate;

Sp. pl. 4. p. 449. Walt. p. 237. Mich. 2. p. 204. Pursh, 2. p. 644 Nutt. 2. p. 223.

Icon. P. Australis, Mich. arb. for. 1. p. 64.

This fine tree generally grows from 80-100 feet in height, and from 24 -30 inches in diameter. Its trunk is usually from 40-50 feet without branches. Its bark is smoother than common in this genus, and divided into an innumerable quantity of thin scales, which appear to be constantly exfoliating. Leaves 3 in each sheath, those of the old trees about 12 inches long, those of the young tree frequently 18. Cone 6-10 inches long, cylindrical or conical, the scales separating and discharging their seed early in the fall. This tree is almost universally distinguished in the two Southern States as the Yellow Pine; it is sometimes called the Long-leaved Pine, and sometimes Pitch Pine. It is more extensively used than any other species of timber we possess. For the frames, the covering, and even the roofing of houses, it is used wherever cypress cannot be obtained; for the flooring of houses, it is preferred to any wood that is known. It is extensively used in ship-building, for the beams, plank, and running timber of vessels. It is used to make the casks in which we ship our rice, and the fencing of our plantations.

This tree contains more rosin than any other species of pine; the fibre is sometimes protected from the operations of the atmosphere by the abundant formation of this substance; and when the tree begins to decay, portions of the trunk in which this rosin has accumulated; knots at the junction of the branches or callosities where injuries have been sustained, are converted into lightwood; this, when charred afterwards by the annual fires which run through our forests, become almost imperishable. The large pieces are used for the sills of houses, the smaller for posts, and the irregular fragments are used for fuel or as torches, or are employed in the manufacture of Tar. From the sap of the living tree most of the turpentine of commerce is ob-

The name originally imposed on this species is unfortunate, as it produces a false impression, and has been the source of error to foreigners, if not to our own countrymen. If an inhabitant of the Southern States, ignorant o

Botany, should be interrogated respecting the P. Palustris or Swamp Pine, he would instantly revert to the P. Tæda, and his answers would be drawn

from that species.

Grows in dry sandy soils, where the sub-soil however, though 2 or 3 feet below the surface is usually of clay, covering nearly all of the ridges along the coast of Carolina and Georgia within 120 miles of the ocean. ever the land becomes moist or sertile, the P. Tæda, and sometimes the P. Rigida encroach upon it.

Flowers April.

### 8. STROBUS. Lin.

P. foliis quinis gracilibus, vaginis brevissimis; strobilis pendulis, cylindraceis, folio longioribus, squamis Leaves by fives, slender, sheaths very short; cones pendulous, cylindrical, longer than the leaf, scales loose. laxis.

Sp. pl. 4. p. 501. Mich. 2. p. 205. Pursh, 2. p. 644. Nutt. 2. p. 223. Icon. Mich. arb. for. 1. p.

This tree attains a greater size than any other species of North-American Pine. It has been known to grow upwards of 140 feet in height, and from 6-7 in diameter. The bark is smoother than that of the 3-leafed pines, and the aspect of the tree somewhat different. Leaves about 4 inches long, pale, almost glaucous green, 5 in a cluster, confined by a sheath scarcely a line long. Cones solitary, much longer than the leaves, the scales very loosely imbricate, and unarmed at the summit.

The wood of this tree is very extensively used; it is soft, fine grained and light, and free from turpentine; it is therefore used for all the interior work of houses except the floors, and in the Northern States for the covering, and even for the frames. From its size and lightness it is preferred for the masts of vessels to all other wood. To the yellow pine (P. Palustris) it is inferior

in strength, in hardness, and in durability.

This tree perhaps attains its greatest size in the States of Maine, New-Hampshire and Vermont. In the Southern States it is confined to the ridges of the Alleghany Mountains, and I believe there does not attain to any great size.

Grows (on the declivities of Mountains) in damp sphagnous soils along the margins of streams.

Flowers April—May.

\*\* Abies. Foliis \*\* Fir. Leuves solitariis, basi distinct- solitary, distinct at is; coni squamis lævibase, scales of the cone smooth, tapering.

### 9. Balsamea.

foliis solitariis, planis, emarginatis in-| emarginate or entire, tegrisve, subtus glaucis, subpectinatis, supra suberectis, recurvatopatentibus; conis cylin- rect, below recurved, draceis erectis, bracteolis abbreviatis obovatis, longe mucronatis, subserrulatis.

Leaves solitary, flat, glaucous underneath, somewhat pectinate, at the summit nearly eexpanding; cones cylindrical, erect; bracteas short, obovate, mucronate, slightly serrulate.

Sp. pl. 4. p. 504. Pursh, 2. p. 639. Nutt. 2. p. 223. Abies Balsamisera, Mich. 2. p. 207.

A small tree, rarely exceeding 30 to 40 feet in height, from 12 to 15 inches in diameter; the leaves 6 to 10 lines long, solitary, bright green on the upper surface, glaucous underneath. Cone solitary, erect, somewhat cylindrical. The scales closely and handsomely imbricate, with the margins thin and smooth.

This species, like all the rest of the firs, is only to be found in the Southern States on the highest summits of the Alleghany Mountains. The P. Fraseri of Pursh seems only to be a variety of this species. It is commonly called the Silver Fir, Balm of Gilead, or Balsam Fir.

Flowers April—May.

### 10. Canadensis.

P. foliis solitariis, planis, denticulatis, sub denticulate, somewhat distichis; strobilis ova- | distichous; cones ovate tis, terminalibus, vix terminal, scarcely longfolio longioribus.

Leaves solitary, flat, er than the leaf.

Sp. pl. 4. p. 505. Pursh, 2. p. 640. Nutt. p. 223. Abies Canadensis, Mich. 2. p. 206. Icon Abies Canadensis, Mich. arb. for. 1. p. 137.

This tree, in favourable situations, attains a large size, and is found 70-80 feet high and 2-3 in diameter; its branches are generally horizontal, and the leaves irregularly distichous, and somewhat crowded near the extremities of the branches which are also distichous. Leaves 6-8 lines long, flat. glabrous, though pubescent when young. Cones very small, terminal with

smooth imbricate scales.

Even when this tree is abundant its wood is little valued. Its grain is said by Michaux to be irregular and almost spirally contorted, and it decays soon when exposed to the weather. It is therefore only used where better timber cannot be procured. Its bark is extensively used for tanning, and is valuable though inferior to the oak. It is generally known as the Hemlock Spruce, or Pine.

In the Southern States this tree is confined to the highest ridges and val-

lies of the Alleghany Mountains.

Flowers April—May.

### Aiton. 11. Nigra.

tetragonis, undique angled, scattered on all sparsis, erectis, strictis; sides, erect, straight; strobilis ovatis, squam-is ellipticis, margine undulatis, apice eroso-denticulation denticulatis.

P. foliis solitariis, Leaves solitary, 4denticulate.

Sp. pl. 4. p. 506. Pursh, 2. p. 640. Nutt. 2. p. 223. Abies Denticulata, Mich. 2. p. 206. Icon. Abies Nigra. Mich. arb. for. 1. p. 123.

This fir, in favourable situations, also becomes a fine tree, attaining sometimes 60-80 feet in height, and 12-18 inches in diameter, generally forming a handsome pyramid at summit. Leaves very numerous, scarcely exceeding half an inch in length, of a very dark green. Comes oval, 1—2 inches long, growing near the extremities of the small branches, generally turned towards the earth. Scales imbricate, broad, the margins crenulate or divided.

The tall slender bodies of this tree are extensively used for the spars of vessels, and from its young branches principally the spruce of commerce is prepared. In the sphagnous swamps among the Mountains in the northeastern districts of the United States, the fir is very abundant. In the Southern States it is rare, and confined to the high ridges of the Alleghany Moun-

Sp. pl. 4. p. 508. Walt. p. 238. Mich. 2. p. 209. Pursh, 2. p. 646. Nutt. 2. p. 224.

Icon. Mich. atb. for. 3. p. 29.

A small tree, sometimes however reaching the height of 40-50 feet, and about 2 feet in diameter, with spreading irregular branches, the small branches generally somewhat distichous. Leaves perennial, resembling small oyate scales, imbricate, in four rows, and closely appressed. Aments of sterile flowers oblong, somewhat conical. Cone oblong, terminating the small branches, composed of scales loosely imbricate, and opening down to the base. Seeds small, winged, and emarginate.

The wood of this tree is said by Michaux to be one of the most darable which our forests produce; it is therefore eagerly sought after, and employed for the poets and rails of enclosures, and for every purpose to which its small

and generally irregular trunk can be applied.

In the Southern States it is confined like the firs to the high Mountains, and to the margin of the mountain streams, and, I believe, enters very little into the domestic economy of our farmers.

Flowers in May.

### 1. DISTICHA.

planis, deciduis; flori- | flat, deciduous; sterile bus masculis aphyllo- florets paniculate, leafpaniculatis; sub-globosis.

C. foliis distichis, Leaves two-rowed, strobilis less; cones spherical.

Sp. pl. 4. p. 512. Walt. p. 238. Mich. 2. p. 208. Pursh, 2. p. 645. Nutt. 2. p. 231. Icon. Mich. arb. for. 3. p. 4.

This is the largest, and in some respects, the most remarkable tree in the low country of the Southern States. Its usual height is from 90-100 feet, and though commonly only from 2-4 feet in diameter, it is frequently found nearly twice that size, and if measured within 3 feet of the surface of the ground, its dimensions would be still greater. Its roots for 6 or 7 feet beneath the surface of the ground, appear to be but a continuation of the stem. while its small ramifications rise to the surface of the earth, and produce at 15, 20 or 30 feet from its base, small conical knobs from 1-2 feet high, which are always hollow, and never discover any signs of vegetation. The trunk of this tree for 50 or 60 feet is naked and almost undiminised in sizes its branches then rise obliquely, and terminate in a flat or fastigate summit: From this peculiar conformation of the branches, a cypress tree can be distinguished as far as the eye can reach; while from the fineness of its leaves. the comparatively small size of its head, and its massive and extended roots. it resists the violence of our autumnal gales more obstinately than any other of our forest trees.

The leaves of the Cypress are small, linear, acute, glabrous, arrayed distichally along small deciduous branches, which serve as a common petiole; a few are sometimes scattered along the small woody branchlets. The sterile flowers in terminal aments. Calyx a scale, ovate-lanceolate, imbricate. Corrolla 0. Filaments 0. Anthers 4, nearly round, sessile. The fertile florets in obovate sessile cones, clustered near the summit of the branches. Calyx a scale, ovate-lanceolate, 1-flowered? Styles 2, thick. Cone globular, with an irregular surface, exuding an aromatic gum. Seeds or Nut angular, enclosing a cylindrical kernel which contains the embryo.

The Cypress grows only in wet miry soils, and it is in situations where a wet alluvial soil of 5 or 6 feet deep overlays a bed of sand, that it attains its greatest dimensions. It begins to decay at the centre in small vesicular cells, from whence, in this state, it is commonly said to be honey-combed at heart. From the straightness of its fibre, it is very liable to be "heart-

shaken."

The wood of this tree is soft, rather fine-grained, and when exposed to the weather is the most durable of our timber. Where it can be procured easily it is preferred to the yellow pine for the frames and coverings of houses; and if it were not for its price, would be preferred to the white pine for the interior work. It is universally employed for shingles. Nearly all the canoes or small boats of the country are fabricated out of it. It could be employed advantageously in the construction of vessels, and is particularly sought after for all of those works which, from the rise and fall of the tide, or from other circumstances are perpetually exposed to the action of heat and moisture.

Our inhabitants distinguish two varieties of this tree, called from slight shades of difference in the colour of the bark and wood, White and Black Cypress; the wood of the latter is preferred, and the tree is supposed by some to grow in a richer soil. This, however, is but prejudice; the two varieties are found mingled indiscriminately in the same swamps, and the causes of their difference is not understood.

Var. Imbricaria, Nutt. This is a small tree growing in pine-barren ponds. It produces its knobs (Exostoses) more alundantly than the large variety; and on its lower branches the leaves are frequently imbricate after the manner of the Junipers. But on the upper branches the leaves are often expanded and

distichous. It is perhaps only a stunted variety, growing in an unfavourable soil.

Flowers in February.

### 2. THYODES.

globosis, parvis.

C. ramulis compresssis; foliis quadrifariam ed; leaves in 4 rows imbricatis, ovatis, basi imbricate, ovate, tubertuberculatis; strobilis culate at base; cones spherical, small.

Sp. pl. 4. p. 512. Mich. 2. p. 208. Pursh, 2. p. 646. Nutt. 2. p. 224. Icon. Mich. arb. for. 3. p. 20.

A tree of moderate dimensions, sometimes however attaining the height of 70 or 80 feet in height, and from 2 to 3 in diameter. The leaves are perennial, nearly resembling scales, imbricate on the compressed branches. Flowers axillary among the small branches. Cone globular, on a short pedicel 3 to 4 lines in diameter. The scales somewhat rhomboidal.

The wood of this tree is soft, fine-grained, light and durable. It has nearly all the good qualities of the Cupressus Disticha; and, therefore, where it is abundant, it is applied as far as its size will admit, to all of the uses for

which that species is employed.

Grows in the great morasses which are found near the sea-coast in the Middle States. In the Southern States it becomes rare. I have been informed that it grows in and around the savannas in Horry and Williamsburg Districts. Michaux mentions that he heard of it as far south as the borders of the Savannah River.

Mich. 2. p. 215. Sp. pl. 4. p. 535. Pursh, 2. p. 603. Nutt. 2. p. 225.

With regard to this species I can add nothing to the description of Michaux. I once saw specimens of it collected by Mr. Lyon on the sand-hills around Fort Barrington on the Altamaha, but I had no opportunity of examing them.

Grows in very dry soils in Carolina and Georgia, Mich.

Flowers June—September.

#### Lin. 3. GLANDULOSUM.

C. foliis oblongis, serratis, subtus hirtis, rate, hairy underneath, basi subintegerrimis, biglandulosis; caule tri-chotomo, herbaceo; spi-herbaceous trichotolis.

Leaves oblong, sercis in dichotomia cau- mous; spikes in the division of the stem.

Sp. pl. 4. p. 26. Walt. p. 239. Mich. 2. p. 214. Parsh, 2. p. 605. Nutt. 2. p. 225.

Plant annual. Stem about 2 feet high, hispid, often coloured, trichotomously divided towards the summit. Leaves alternate, on very short petioles, crowded near each division of the stem, elliptic, coarsely and obtusely serrate, pubescent on the upper surface, hairy underneath. Flowers in the divisions of the stem, the fertile sessile, the sterile in small spikes intermingled with them. Sterile florets. Calyx 1-leaved, tubular. Corolla 5-petalled, petals lanceolate, white, longer than the calyx inserted into its base. Stamens 10. as long as the corolla. Fertile florets. Calyx 5-leaved, persistent, hisped, 2 large, 3 smaller. Corolla 0. Styles 3, 2-cleft. Stigmas simple. Capsules hispid, the cells separating when mature, each 2-valved, 1-seeded.

Grows in all cultivated land, very common.

Flowers June-October.

#### ELLIPTICUM? Nutt.

C. foliis ovali-lanceimmixtis.

Leaves oval-lanceoolatis, integerrimis, se- late, entire, when old nioribus obtusis, stella- obtuse, stellularly toto-tomentosis, subtus mentose, pale underpallidioribus; floribus neath; flowers termiterminalibus, congestis, nal, clustered, sterile foemineis masculisque and fertile intermingled.

Nutt. 2. p. 225.

Plant annual, when bruised aromatic. Stem 1-2 feet high, pubescent, tomentose when young, branching irregularly. Leaves on short petioles, oblong-lanceolate, sometimes obtuse, light green and somewhat smoother in the upper surface, hoary underneath. Flourers in terminal clusters, the sterile spike growing from the midst of the sessile fertile flowers. Calyx of both tomentose. Styles 3, each compoundly dichotomous. Capsules very tomentose. Cells 1-seeded.

This species agrees in many respects with the C. Capitatum of Mich. and the C. Ellipticum of Nutt. and differs slightly from both. Not having speci-

mens of each, I have hesitated where to place it.

Grows in the pine-barrens near Columbia, Mr. Herbemont.

Flowers in the summer.

# JATROPHA. Gen. Pl. 1463.

Masculi. Calyx 0, sive 5-phyllus.  $Corol \mid lyx 0$ , or 5-leaved. Cola 1 petala, infundibu-liformis. Stamina 10, shaped. Stamens 10, alterna breviora.

## 1. STIMULOSA. Michaux.

palmato-lobatis, lobis kles; leaves palmate-obtusiusculis, subsinu- lobed; lobes rather obatis dentatisque; cymis tuse, slightly sinuate brevi pedunculatis; co- and toothed; cymes on rollis albis.

J. herbacea, pilis | Herbaceous, hispid stimulosis hispida; foliis | with stimulating pricshort peduncles; corolla white.

Mich. 2. p. 216. Pursh, 2. p. 603. Nutt. 2. p. 225. J. Urens, Walt. p. 239.

Root perennial, the fibres very long. Stem 6-18 inches high, branching, terete, covered as well as the leaves and fruit, with stimulating prickles. Leaves 3 or 5-lobed, cordate at base, the lobes toothed or sinuate, ciliate, strongly veined. Flowers in a terminal cyme, di or trichotomously divided, the fertile florets generally sitting in the divisions of the peduncle. Sterile flowers. Calyx 0. Corolla hypocrateriform, pubescent, the tube aslo ng as the 5-cleft border. Stamens 10, united at base, those in the centre the longest. Fertile florets. Calyx 0. Corolla 5-petalled. Style appearing short, thick, many (12) cleft, (composed really of 3 styles, soldered together, each compoundly dichotomous;) an orange-coloured gland surrounds the base of both stamens and germ. Capsule rough, very hispid, 3-celled. Seed, 1 in each cell.

For so small a plant the root is very remarkable, the principal fibres or branches are rather larger than a quill. They penetrate the loose soil in

VOL. II.

which this plant delights to grow, to a great distance. I have followed them

by digging 3, 4 or 5 feet, but never to their termination.

The prickles of this plant, like those of the Nettle, produce on delicate skins great irritation for a few minutes. Children are very much accustomed to annoy each other with them. But of the serious injury which, according to Pursh, the feet of our Negroes sustain from them, I can only say I have never heard.

Grows in light sandy soils.

Flowers through the whole summer.

#### GEN. PL. 1470. STILLINGIA.

Masculi. Calyx hemisphæricus, multiflo- lyx hemispherical, marus. Corolla tubulosa, ny flowered. Corolla erosa.

ralem vix superantibus. the bracteal scale.

S. herbacea; foliis | Herbaceous; leaves sessilibus, oblongo-lan-ceolatis, basi attenua-tis, serrulatis; flosculis masculis squamam flo-

Sp. pl. 4. p. 588. Walt. p. 239. Mich. 2. p. 213. Pursh, 2. p. 608. Nutt. 2. p. 226.

Root large, woody, perennial. Stem herbaceous, 2-3 feet high, somewhat angled by the base of the leaves, with the whole plant glabrous and lactescent. Leaves alternate, irregularly serrulate, somewhat coriaceous, shining on the upper surface, paler underneath. Stipules? several small subulate glands in the axils of the leaves and flowers. Flowers in a terminal spike, the upper crowded as in an ament, sterile, with interposing cupulate glands. Fertile florets few at the base. Sterile florets. Calyx a scale, ovate, obtuse, mucronate, many flowered (7.) Corolla 1-petalled, funnelshaped, rugose, yellowish, the border somewhat bilabiate, undulate, filaments 2, thick, longer than the corolla. Fertile florets. Calyx obtuse. Corolla superior, 1-petalled, with the margin fimbriate. Style erect, 8-cleft, (perhaps 3 united.) Capsules rather rough, 3-celled, one seed in each cell.

Grows in dry sandy soils.

Flowers May-June.

### 2. Sebifera.

S. arborea; foliis petiolatis, rhombeis, acuminatis, integerrimis, infra basin glandula petiolari; floribus masculis pedicellatis.

A tree; leaves on petioles, rhomboidal, acuminate, entire, with a petiolar gland below the base; sterile florets on pedicels.

Sp. pl. 4. p. 588. Mich. 2. p. 213. Pursh, 2. p. 608. Nutt. 2. p. 226. Croton Sebiferum, Lin.

A tree 20-40 feet high, the young branches and leaves glabrous and somewhat lactescent. Leaves alternate, broad and rhomboidal, conspicuously acuminate, on petioles 1-2 inches long. Flowers interminal spikes, the sterile very much crowded towards the summit, the fertile few at base. Sterile floret. Calyx ovate, obtuse, 10-12-flowered, having 2 greenish glands at base, each floret on a pedicel 2-3 lines long. Corolla 1-petalled, 4-toothed. Filaments 2, longer than the corolla. Fertile floret. Calyx a scale, 3-parted, persistent. Corolla . Styles 3, subulate, reflexed. Stigma simple. Capsule a little rough, black, 3-celled. Seed one in each cell, very white.

This tree, originally from China, is now completely naturalized along the sea-coast of our country. It bears its fruit in great abundance, but though

they contain much oil no use is yet made of them.

Grows in rich close soils. Flowers June—July.

#### Mich. 3. LIGUSTRINA.

lanceolatis, attenuatis, mis, petiolatis; flosculis tioles; sterile florets on masculis brevissime pe- short pedicels. dicellatis.

S. fruticosa, foliis | A shrub; leaves lanutrinque ceolate, tapering at integerri- each end, entire, on peMich. 2. p. 213. Sp. pl. 4. p. 588. Pursh, 2. p. 608. Natt. 2. p. 226.

A shrub 6-12 feet high, diffusely branching, the branches and leaves glabrous. Leaves scarcely an inch in length, lanceolate and dval-lanceolate, very acute; on petioles 2-3 lines long. Flowers in terminal spikes. Sterile florets towards the summit numerous. Fertile florets few at base. rile florets, Scale or Bractea, short, ovate, 1-2-flowered. Corolla 3cleft. Stamens generally three. Filaments very short. Fertile florets. Scale small. Corolla 3-cleft, persistent. Styles 3, united at base, reflexed. Stigmas simple. Capsule 3-celled, 1 seed in each cell.

In all of the specimens I have seen of this species, there are as usual in

this genus 2 or 3 fertile florets at the base of each spike.

In this genus I think the scale that surrounds each group of sterile florets can only be considered as a bracteal leaf, and the corolla a real calyx.

Grows along the margin of creeks and swamps in the middle districts of

Carolina and Georgia. Flowers May—July.

Sp. pl. 2. p. 895. Mich. 2. p. 211. Pursh, 2. p. 605. Nutt. 2. p. 227.

Stem annual, erect, 2-3 feet high, branches opposite, divaricate. Leaves opposite, sessile, oval, acutely serrate, unequal at base, glabrous, 3-nerved, nearly an inch long. Flowers small, solitary I suspect at each joint, but from the shortness of the upper joints they are crowded and appear fascicu-

Grows in the upper districts of Carolina and Georgia. Milledgeville, Dr. Boykin.

Flowers June—September, Pursh.

#### 4. MACULATA. Lin.

E. erecto-patula; foliis oppositis, serratis, leaves bus axillaribus solitariis: involucri laciniis interioribus coloratis.

Erect, expanding; opposite, seroblongis, pilosis; flori- rate, oblong, hairy; flowers axillary, solitary, interior segments of the involucrum coloured.

Sp. pl. 2. p. 896. Walt. p. 144. Mich. 2. p. 211. Pursh, 2. p. 605. Nutt. 2. p. 227.

Plant annual. Stem erect or procumbent, dichotomously branching, slightly pubescent, generally coloured, (purple) 2-3 feet high. Leaves opposite, on short petioles, oblong, hairy, unequal at base, 3-nerved, serrate, excepting on one side near the base, paler underneath, when young conspicuously spotted near the base. Flowers crowded near the summit, but really solitary at each axil. Involucrum glabrous, the petaloid segments (4-5) Capsule glabrous.

Grows in dry cultivated soils.

Flowers June—October.

### 5. THYMIFOLIA? Lin.

E. humifusa, gracilis, | Procumbent, pubescens; foliis oppo- | der, pubescent; leaves

sitis, ovali-oblongis, opposite, oval-oblong, obtusis, superne subserratis; capitulis axillaribus, glomeratis, sub-sessilibus. opposite, oval-oblong, obtuse, slightly serrate near the summit; heads axillary, clustered, nearly sessile.

Sp. pl. 2. p. 898. Walt. p. 144. Mich. 2. p. 212. Pursh, 2. p. 606. Nutt. 2. p. 227.

This species is described by Michaux as inhabiting the borders of the Ohio and Mississippi. Walter mentions it among the plants of this country. It is probable that the following species is the one intended by Walter. At least, I have seen no one agreeing with the character of E. Thymifolia, or with the figure of Plukenet, t. 113. p. 2. It may be remarked also, that the original E. Thymifolia is a native of the East-Indies.

# 6. Depressa. Torrey.

E. caule humifuso, gracili, pubescente; foliis oppositis, ovalibus, sub-serratis, basi inæqualibus, supra glabris; subtus pilosis pallidis; floribus solitariis, axillaribus, folio multo brevioribus. E.

Plant annual. Stem prostrate, branching, 8-12 inches long, hairy, almost villous, branches alternate. Leaves finely serrate, obtuse, sometimes acute, somewhat glaucous underneath, about half an inch long, on petioles 1—2 lines long. Flowers solitary, appearing clustered at the extremity of the branches, from the shortness of the joints. Peduncles 1-2 lines long. Stipules 4 at each joint, 3-4 lines long, plumose; petaloid segments of the involucrum 4, white, small. Capsule hairy.

This species has commonly been considered here as the E. Thymifolia, Mich.; but its flowers are certainly not in axillary heads or clusters. Dr. Torrey sent me some time ago specimens of it from New-Jersey, under the

name of E. Depressa.

Grows in cultivated dry soils, very common.

Flowers through the whole summer.

### 7. Cordifolia.

E. humifusa, ramosissima, glabra; foliis parvulis, oppositis, laribus axillaribus, soli- solitary. tariis.

Procumbent, branching, glabrous; leaves small, opposite, broadto-ovalibus, integerri-mis, basi cordatis; flo-base; flowers axillary,

Plant annual. Stem prostrate, 8 to 15 inches long, very glabrous, branches alternate. Leaves on petioles scarcely a line long, oval, entire, glabrous, unequal and cordate at base, generally 3-4 lines long. Flowers solitary, axillary, on pedicells about half as long as the leaves, surrounded at base with incised almost feathered stipules; petalloid segments of the involucrum white.

Grows in cultivated land, common around Beaufort in dry soils.

Flowers in the summer.

#### Lin. 8. Polygonifolia.

E. humifusa, ramosa, glaberrima, carnolis simplicibus. E.

Procumbent.branchvery glabrous. ing, sa; foliis oblongo-ova-tis, ovalibusque, inte-long-ovate and oval, gerrimis, basi obtusis entire, obtuse at base, interdum sub-cordatis; sometimes slightly corfloribus solitariis in di- date; flowers solitary chotomia caulis; stipu- in the division of the stem; stipules simple.

Sp. pl. 2. p. 900. Walt. p. 145. Pursh, 2. p. 606? Nutt. 2. p. 227.

In many respects resembling the preceding species, but from its habitat more succulent, its leaves also are longer, more ovate, on longer petioles, more crowded near the summit of the branches, and less cordate, the flowers on shorter peduncles, and the petaloid segments of the involucrum uncolour-The stipules which in the former species are many cleft, in this are bulate, simple, or sometimes one has a single division.

Grows on the drifting sands of the sea-shore, frequently covered with sand excepting the extremities of the branches. This appears to be the real E.

Polygonifolia of Clayton, (consequently of Linnæus) who speaks of it as a maritime plant. I quote Pursh with great hesitation.

Flowers through the whole summer.

## 9. IPECACUANHÆ, Lin.

E. procumbens erectaque, pumila, glabra; rect, small, glabrous; foliis oppositis, obova- leaves opposite, obo-tis lanceolatisque; pe- vate and lanceolate; unifloris, elongatis.

Procumbent and eaxillaribus; | peduncles axillary, oneflowered, long.

Sp. pl. 2. p. 900. Mich. 2. p. 212. Pursh, 2. p. 606. Nutt. 2. p. 227.

Plant perennial, with very long creeping roots. Stem generally short, sometimes buried in the sand and appearing fasciculate and leafless, some-times erect 12—15 inches high. Leaves opposite, sessile, elliptic or obovate, (sometimes linear, Mich.) entire, glabrous. Flowers solitary in the - divisions of the stem. Peduncle about as long as the leaves.

Grows in dry sandy soils.

Flowers from April to July, perhaps through the whole summer.

#### 10. GRACILIS. $\mathbf{E}$ .

E. caule erecto, dichotomo, glabro; foliis oppositis, remotis, sesriis in dichotomia cau- the divisions foliis longioribus.

Stem erect, dichotomous, glabrous; leaves opposite, remote, sessilibus, linear-lanceola- sile, lineari-lanceolate; tis; pedunculis solita- peduncles solitary in sile, lineari-lanceolate; stem, longer than the leaves.

#### E. Polygonifolia? Mich. 2. p. 211.

Plant perennial. Stem about 12 inches high, like the whole plant glabrous, very regularly dichotomous, the divisions remote for the size of the plant. Leaves opposite at the divisions of the stem, linear or linear-lanceolate, entire, sessile. Peduncle solitary, longer than the leaf, petaloid segments scarcely coloured.

I have always been accustomed to consider this plant as the E. Tolygonifolia of Michaux. Yet it resembles very much, and may be the linear-leaved variety of E. Ipecacuanhæ. The E. Polygonifolia of Pursh I do not know. Grows in dry sandy soils near Ogeechee Ferry.

Flowers May-July.

#### 11. Pubentissima. Michaux.

E. perennis, erecta,

Perennial, erect, vepubentissima; caulibus ry pubescent; stem sub-dichotomis; foliis oppositis, sessilibus, sub-cordato-ovalibus, obtusis; pedunculis solitariis; involucri laciniis interioribus albis.

Mich. 2. p. 212. Pursh, 2. p. 606. Nutt. 2. p. 227.

Stem 12 to 18 inches high, divided towards the summit, hirsute. Leaves opposite, sessile, nearly an inch long, elliptic, entire, not so hairy on the stem, except along the midrib. Flowers solitary in the divisions of the stem. Peduncle nearly as long as the leaf. Petaloid Segments white.

Grows in the pine-barrens in the middle districts of Carolina and Geor-

gia.

Flowers April—July, perhaps as most of our species until October.

#### 12. Helioscopia? Lin.

capsulis lævibus.

E. umbella quinque-fida, trifida, dichotoma; cleft, dichotomous; flo-foliis floralibus obova-ral leaves obovate; tis; foliis cuneiformi- leaves wedge-shaped, bus, serratis, glabris; serrate, glabrous; capsules smooth.

Sp. pl. 2. p. 914.

· Plant annual. Stem 12-18 inches high, glabrous, branching. Leaves alternate, sessile, cuneate, obovate, finely serrate, glabrous, those at the divisions of the umbel broad-lanceolate. Umbel 5-cleft, 3-cleft, the small branches finally dichotomous. . The flowers solitary in the divisions of the umbel, small, on peduncles one to two lines long. Fruit tuberculate.

This species approaches very nearly to the E. Helioscopia of Europe, although its roughened fruit and the lanceolate leaves of the umbel may serve to distinguish it. It is, I think, certainly indigenous.

Found in damp clay soils near the Horse-shoe Bridge, Ashepoo; on

Hutchinson's Island, opposite Savannah,

Flowers May.

### 13. COROLLATA. Lin.

E. umbella 5-fida, Umbel 5-cleft, 3-fida, dichotoma; foliis | cleft, dichotomous; flofloralibus foliisque ob-longis, obtusis; involu-the stem oblong, obcri laciniis interioribus tuse; interior segments petaoideis, obovatis.

of the involucrum resembling petals, obovate.

Sp. pl. 2. p. 916. Walt. p. 145. Mich. 2. p. 210. Pursh, 2. p. 607. Nutt. 2. p. 227.

Root perennial. Stem herbaceous, about 2 feet high, terete, a little hairy, rarely branched. Leaves alternate, oval, glabrous on the upper surface, paler and sprinkled with hairs underneath, on petioles 1-2 lines long. Flowers in a terminal umbel, each floret solitary in the divisions of the stem, on peduncles 3-4 lines long. Petaloid segments of the involucrum more conspicuous than usual in this genus, obovate, white. Fruit glabrous.

This species varies much in the size and breadth of its leaves. I have found it also with 5 rays to the umbel. The following, if no more than a

variety, deserved to be noticed.

### Var. Angustifolia.

Leaves 3-4 inches long, linear-lanceolate, sessile as in the common variety, paler and hairy underneath. Umbel 3-fid, rays elongated, the upper branches dichotomous. Flowers few, small, thinly scattered near the summit of the branches.

Very common, preferring dry soils. The variety Angustifolia was collected by Mr. Caradeux in St. Thomas, near Charleston.

Flowers May—September.

#### 14. PANICULATA. E.

dichotoma; floribus ter- | chotomous; flowers terminalibus, sub-panicu- minal, somewhat panilatis; foliis alternis, ova- culate, oval, sessile, libus, sessilibus, subtus slightly hairy undersub-pilosis; caule sub- neath; stem somewhat piloso. E.

E. umbella trifida, | Umbel 3-cleft, dihairy.

Stem 1-2 feet high, slightly angled, very hairy around the base of the leaves. Leaves about 11 inches long, one inch wide, entire with the margin revolute, hairy along the midrib. Unibel at first generally 3-fid, the up per branches dichotomous, and near their summits the flowers are numerous, axillary and terminal, with small opposite bracteal leaves at each joint. Fruit smooth.

Grows in the middle districts of Carolina and Georgia. Columbia, Mr.

Herbemont.

Flowers August-September.

Many opinions have been entertained as to the real structure of the flowers of this genus. Each involucrum (Calyx, Lin.) contains one central female floret, and several points near the base bearing stamens, these points or receptacles are as numerous generally as the petaloid segments of the involucrum. Linnæus considered the whole as one flower, the stamens inserted into the calyx, and coming to maturity irregularly. Jussieu first suggested the now prevailing opinion that the structure was monoecious, a common involucrum with a pistilliferous floret in the centre, surrounded by clusters of monandrous florets, each cluster generally containing 3-5 florets, separated by bristles or membranaceous multifid leaves, and these florets naturally coming to maturity at different periods.

P. Obovatus, Sp. pl. 4. p. 574. Pursh, 2. p. 443. Nutt. 2. p. 227.

Plant annual. Stem about 12 inches high, glabrous, with alternate branches distichally expanding. Leaves alternate, oval, generally obtuse, entire, glabrous, the upper ones lanceolate, all distichous, on petioles about 1 line long. Flowers axillary, nodding, on very short pedicels, 2-4 at each axil, fertile and sterile intermingled. Calyx of both florets 6-leaved? Leaves reddish at base, white along the margin. Stamens 6, united at base. Style 3, very short, 2-cleft. Capsule globose, somewhat depressed, 6? celled, 6valved, the valves opening elastically. Seed striate with elevated dots.

As the leaves of this plant are very rarely obovate, I have restored the

original name proposed by Walter.

Grows in damp soils, Prince William's, near Charleston.

Flowers September—October.

## MELOTHRIA. GEN. Pl. 68.

Sp. pl. 4. p. 606. Nutt. 2. p. 228.

A large, coarse, strong-scented vine, generally procumbent, but sometimes running over reclining trees. Stem and leaves tomentose. Leaves cordate, nearly round, 10—15 inches in diameter, undulate or slightly lobed. Flowers solitary, axillary, the early florets and those near the summit of the branches generally sterile. Corolla large, white. Fruit varying like all cultivated plants very much, round, pyriform, clavate, straight or curved, the exterior coat hard, almost woody.

The Calabash is rarely found growing in woods, and is certainly not indigenous. It appears to have been brought by the antient inhabitants of our country from a warm climate. It now grows spontaneously around the settlements, particularly on the sea-islands, and delights in a rich dry soil.

Flowers through the whole summer.

Sp. pl. 4. p. 625. Mich. 2. p. 217. Pursh, 2. p. 444. Nutt. 2. p. 229.

A small procumbent vine. Stem pubescent. Leaves alternate, on petioles 1-2 inches long, cordate, 5-angled, the angles rather acute, scabrous. pubescent particularly along the veins, finely denticulate. Tendrils axillary, divided. Flowers axillary, the sterile at the summit of racemes 4—6 inches long. The fertile clustered at the summit of peduncles 1—2 inches long. Peduncles very hairy. Corolla deeply 4-cleft, whitish with green veins. Styles 3 united, each bearing 2 or more? anthers. Female floret 6—10 in a head. Fruit small, oval or ovate, very hispid.

Grows in the upper districts of Carolina and Georgia, Dr. Macbride.

Flowers June—September.

An aquatic plant, floating or growing in stagnant or slow-flowing streams. Leaves all radical. Scapes axillary. Female flowers generally furnished with a spiral filiform scape, so as to admit them to rise to the surface of the water when ready to expand. Scape of the sterile floret very short, always submersed; the flower itself, when mature, separates from the scape, rises to the surface of the water, expands and floats among the female florets until it decays. The female floret, after the period of inflorescence, sinks beneath , the surface of the water and matures the fruit. Nutt.

Grows from New-York to Florida. Nutt. This, like many of our aquatic

plants, has escaped my notice.

Flowers August-October. Pursh.

Leaves lanceolate, acuminate, glabris; petiolis pube- | glabrous; petioles pubescent; aments appeartetrandris; ing with the leaves, tetrandrous; germs on pedicels, subulate, glabrous.

Sp. pl. 4. p. 657. Pursh, 2. p. 614. Nutt. 2. p. 231.

S. Pentandra, Walt. p. 243. S. Caroliniana, Mich. 2. p. 226.

A small tree, from 15-20 feet high, generally branching from the base. Leaves alternate, lanceolate, slightly acuminate, serrulate, glabrous; the ear-Hest leaves slightly pubescent. Petioles 1-2 lines long. Sterile aments about 3 inches long. Scales obovate, obtuse, villous. Filaments generally 5, but varying from 3—6, much longer than the scale. Ament of fertile flowers 10-15 lines long. Stigmas 3-cleft. Capsule oblong, ovate, glabrous.

We have a remarkable variety of this plant, the young branches and leaves pubescent, somewhat hoary, almost tomentose; but I have been able to perceive no other difference either in the shape or size of the leaves of the tree,

or in the period of flowering.

This, I believe, is the only species of Salix which is found in the low country of Carolina, except the exotic S. Babylonica and the S. Vitellina,

which are occasionally cultivated in gardens.

It grows in great abundance along the margins of fresh-water rivers, in swamps and wet soils. On the rivers where the stems are found sufficiently. large, I am informed that they are used for the timbers of boats, and are considered light and durable.

An evergreen shrub, 4-8 feet high, branches virgate, somewhat vertical late; when young tomentose. Leaves linear, glabrous, rigid, with the margins revolute, 6—8 lines long, verticillate, 3—4 in each whord. Flowers axillary, verticillate, sessile. Scales of the calyx tomentose on the margin, persistent. Berry small, yellowish, 2-seeded, somewhat persistent. Seed

This singular plant, which resembles the genus Erica so much in its appearance and habit, though not in its seminal affinities, grows generally in the most dry and sandy soils. Near Murphy's Bridge, on the Edisto River, it covers a space of 3 or 400 yards wide and two or three miles long, which appears to have been a sand bank formed by some of the antient freshets of that river, and on which only lichens and a few stunted oaks (Q. Catesbei and Nigra) are found intermingled with it. Near Augusta, Mr. Nuttall. St. Mary's, Pursh. On the sand-hills between Camden and Columbia.

Flowers August and September? The berries are ripe in November.

I. foliis ovali-lance- Leaves oval-lanceo-

Sp. pl. 1. p. 708. Mich. 2. p. 228. Pursh, 1. p. 117. Nutt. 1. p. 109. J. Aquifolium, Walt. p.

A very beautiful tree, growing in rich soils 30-40 feet in height, and I -2 feet in diameter, with a compact, dense, generally oblong head. Leaves alternate, oval-lanceolate, dentate, the teeth spinous, glabrous, coriaceous, perennial, lucid on the upper surface, on short petioles. Flowers clustered at the base of the small branches, on short peduncles. Calyx small, with 4 minute teeth. Corolla small, rotate, 4-parted, white. Fruit, as in all of our species, a bright scarlet berry, bearing four seeds.

This is one of our most ornamental trees; its bright deep green, perennial leaves, and the brilliant colour of its berries, which remain on their pedicels generally until February, render it in the depths of our winter very conspicuous in our forest scenery. The wood is fine-grained, compact, hard, and is used by Cabinet-Makers and Turners in many of their fabrications.

Grows in rich dry soils. Flowers April-May.

#### Walt. 2. Dahoon.

I. foliis oblongo-lansub-integris; fasciculis! florum pedunculatis.

Leaves oblong-lanceolatis, junioribus spi- | ceolate, when young noso-serratis, veteribus armed with spiny serratures, when old frequently entire; clusters of flowers pedunculate.

Pursh, 1. p. 117. Nutt. 1. p. 109. Walt. p. 241. Mich. 2. p. 228. J. Cassine, Sp. pl. 1. p. 709.

A very handsome shrub, 4 to 10 or I2 feet high, with long virgate branches. Leaves alternate, lanceolate, coriaceous, glabrous, acute; when young the serratures are sometimes as acute as those of the L Opaca; when old the leaves are frequently entire. Flowers axillary in paniculate clusters, 6-10 in each cluster. Corolla white, small. Berry red, persistent.

This plant, wherever in this country it has a popular name, is distinguish-

ed as the Dahoon Holly.

Grows in swamps. Flowers May.

## 8. LIGUSTIRNA.

I. foliis lineari-lanmis; floribus fertilibus | florets solitary. solitariis.

Leaves linear-lanceceolatis, basi cuneatis, olate, cuneate at base, plerumque integerri- generally entire; fertile I. Angustifolia, Muhl. Cat.

I. Angustifolia var. Ligustrifolia, Pursh, 2. p. 118.

A shrub 6-10 feet high, like the rest of the genus Stoloniferous, branthes expanding. Leaves acute, rigid, coriaceous, perennial. Fruit scatter-

ed. solitary.

This shrub has been to me very rare. I have only seen it once, and then in fruit. Its leaves are as long as those of the I. Dahoon, but not half as wide; entire, very acute, but not mucronate. It is the I. Angustifolia of Muhl. Cat.; but this name has been applied to the next species, and to avoid confusion I have restored to this plant the name under which I understand it was cultivated in the garden of the late William Hamilton of the Wood-lands, Philadelphia.

Found in fruit in the little Ogeechee Swamp at Preston's Old Field, about

12 miles from Savannah.

## 4. Myrtifolia. Walt.

I. foliis lineari-lanceolatis, mucronatis, ri- | olate, mucronate, rigid, gidis, utrinque glaber- very glabrous; fertile rimis; floribus fertili- flowers solitary. bus, solitariis. Mich.

Leaves linear-lance-

Walt. p. 241. Mich. 1. p. 229.

I. Angustifolia, Pursh, 1. p. 118. Nutt. 1. p. 109.

I. Rosmarinifolia, La Marck. Muhl.

A shrub, or rather a small irregular tree, with branches expanding, rigid, pubescent when very young. Leaves alternate, perennial, sometimes entire. occasionally with 2 or 3 sharp serratures. Petioles 1-2 lines long, pubescent. Pedancles of the sterile flowers compoundly triflorous. Segments of the calyx as long as the tube, acute, erect. Corolla white. Segments. oval. Anthers nearly white. (Fertile flowers axillary, solitary. Mich.)

Grows around ponds in flat pine-barrens.

Flowers in May.

## 5. CASSENA.

I. foliis ovalibus, u-| Leaves oval, obtuse trinque obtusis, crena- at each end, crenately serrate. to-serratis.

Walt. p. 241. Mich. 2. p. 229. I. Vomitoria, Sp. pl. 1. p. 709. Pursh, 1. p. 118. Nutt. 1. p. 109. VOL. II.

A shrub 6-15 feet high, stoloniferous, branches virgate, erect, the small branches expanding, bark glabrous, smooth, when very young pubescent. Leaves alternate, perennial, glabrous, shining, coriaceous. Flowers in axillary clusters, each peduncle triflorous. Peduncles short, slightly pubescent. Teeth of the calyx very minute. Segments of the corolla obtuse. Filaments shorter than the corolla, into which they are inserted between the segments. Berry globose, scarlet, 4-celled. Seed, one in each cell, boney.

This is a handsome shrub, although its flowers are not conspicuous. It forms neat hedges, but not sufficiently strong to resist hogs and cattle; they

are therefore only used as ornaments along the borders of gardens.

Grows in loose soils; very abundant near the ocean. A strong decoction of this plant is used by the tribes of the Creek Indians at the opening of their councils. They send annually to the sea-coast for a supply of the leaves. It acts as a mild emetic; hence the name given it in the Hortus Kewensis. It is universally known in this country as the Cassena, its old and appropriate name. But even if the name of Aiton should be retained to this plant, it is surely incorrect to apply the name of Cassena to another species, and one to which, in this country, it is never given.

Flowers March and April.

#### 6. Princides.

bus solitariis.

I. foliis deciduis, o-vali-lanceolatis, utrin-que acutis, serratis; pe-dunculis 1-floris, fertili-1-flowered. the fertile solitary.

Sp. pl. 1. p. 709. Mich. 2. p. 229. Pursh, 1. p. 118. Nutt. 1. p. 109. J. Decidua, Walt. p. 241.

A shrub 6-8 feet high, and sometimes, I believe, becoming a small tree. Branches somewhat virgate. Leaves lanceolate, slightly acuminate, glabrous with appressed serratures. (I find that the leaves, as well as flowers of the sterile plant are always smaller than those of the fertile; in each the flowers appear to be clearly hermaphrodite, but in one always abortive. Dr.

Grows in dry sandy soils. Flowers April—May.

Walt. p. 253.

N. Villosa, Mich. 2. p. 258. Sp. pl. 4. p. 1112. Pursh, 1. p. 177. Nutt. 2. p. 236.

N. Sylvatica, Mich. arb. for. 2. p. 260.

A tree 40-50 feet high, and 1-2 feet in diameter, with a head rather compact and close. Leaves oval-lanceolate, entire, rather short, the petiole and under surface generally pubescent, sometimes though rarely villous. Flowers in small somewhat umbellate clusters. Fertile florets 5 to 8 or 10 in a cluster, though rarely maturing more than three. Sterile florets more numerous. Common peduncle axillary, solitary, 1-2 inches long. Drupe nearly spherical, black-blue.

This tree grows generally in damp clayey soils. Its wood does not easily split, and it is used therefore for the nuts of wheels, and for a few other purposes. It is usually called the Black Gum or high-ground Gum. The leaves with us rarely exceed two inches in length, and differ much from the figure

of Michaux.

Flowers in April.

#### 2. AQUATICA. Lin.

mineis bifloris.

N. foliis oblongo- Leaves oblong-lanlanceolatis, integerri- | ceolate, entire, acute at mis, utrinque acutis, each end, glabrous; glabris; pedunculis foe- | fruit bearing peduncles 2-flowered

Sp. pl. Ed. pr. 1511. Mich. arb. for. 2. p. 265. N. Biflora, Walt. p. 253. Mich. 2. p. 259. Pursh, 1. p. 177. Nutt. 2. p. 286.

A tree, which around ponds or in poor soils rarely exceeds 30-40 feet in height, but which, in the deep river swamps becomes one of the largest trees of our forests, 60-80 feet in height, and 2-4 in diameter. Leaves oblonglanceolate, very acute, entire, sometimes slightly pubescent underneath. Sterile flowers numerous, very small. Stamens in the whole genus, as remarked by Nuttall, variable, but more frequently I believe 5 than 10. Fertile florets almost invariably 2. Fruit oval, compressed, dark blue.

Leaves with us longer than those of the N. Multiflora.

Grows in swamps and wet soils.

Flowers April—May.

## 3. CAPITATA. Walt.

N. foliis brevissime | Leaves on petiolatis, oblongo-lanceolatis, ovalibusque,
sub-integerrimis, subtus pubescentibus subcanisque; pedunculis
masculis capitatis; foemineis unifloris. E.

Leaves on very
short petioles, oblonglanceolate and oval,
nearly entire, pubescent and somewhat
hoary underneath; sterile florets capitate;
fertile one-flowered.

Walt. p. 253. Mich. arb. for. 2. p. 257.

N. Candicans, Mich. 2. p. 259. Sp. pl. 4. p. 1113. Pursh, 1. p. 177. Nutt. 2. p. 236.

A small irregular tree, very often not exceeding the size of a shrub, and, I helieve, rarely reaching the height of 20 feet. Leaves oblong-oval, often varying, ovate or obovate, sometimes obtuse, sometimes cuneate at base, always pubescent and somewhat hoary underneath, sometimes denticulate. Sterile' flowers in compact heads. Calyx tomentose. Stamens much longer than the calyx. Fertile florets solitary, on a short peduncle. Calyx very tomentose. Style sometimes 2-cleft. Fruit ovate; when ripe of a dull red colour and pleasantly subacid.

The Ogeechee River appears to be the northern limit of this tree; the pleasant acid of its fruit induced some of the early inhabitants of Georgia to use it as a substitute for the lime, hence its common name of the Ogeechee

Lime, but its last flavour is austere.

Grows around ponds in wet sandy soils.

Flowers April—May.

#### 4. Tomentosa. Mich.

N. Grandidentata, Mich. arb. for. 2. p. 252.

A large tree 60-80 feet in height, 2-4 in diameter. Leaves large, ovate and oval-lanceolate, irregularly and acutely toothed, sometimes only on one margin, pubescent underneath, particularly along the nerves, the lower or older leaves distinctly cordate. The sterile florets I have never noticed. Fertile solitary, axillary. Fruit oval or ovate, large, dark blue.

Grows in deep swamps. A truly aquatic tree. I have seen it flourishing in mill-ponds and "back waters," where the water has been maintained for half a century from 5 to 8 feet deep. I believe the N. Aquatica grows also in similar situations. The root of this tree is as light as the bark of the cork

tree, (Quercus suber) but wants elasticity.

Flowers April-May.

#### Mich. 1. Rotundifolia.

V. foliis utrinque lucidis, cordatis, inæqualiter dentatis; racemotrum floribus pluries capitulatis; baccis magnis.

Leaves on both sides lucid, cordate, unequally toothed; flowers of the raccemes in many small heads; berries large.

Mich. 2. p. 231. Pursh, 1. p. 169. Nutt. 1. p. 143.

V. Vulpina, Walt. 243.

V. Vulpina? Sp. pl. 1. p. 1181.

This vine varies much in size, sometimes ascending the loftiest trees, more frequently humble. Young branches tomentose. Leaves 2-3 inches in diameter, cordate, round, shining, glabrous, but with small tufts of hair at the junction of the veins, commonly with 3-5 prominent teeth, and the residue by no means equal. Flowers polygamous, in racemes composed of simple heads, 6-8 flowered. Fruit large, 7-8 lines in diameter, covered with a coriaceous integument, the flavor not unpleasant. This species of grape may be, perhaps at some future day, cultivated advantageously.

The real V. Vulpina of Linnæus has been a subject of some doubt. have long supposed that this may have been his original species. The characters agree sufficiently well, and notwithstanding the remark of Michaux, that this is commonly called the Muscadine Grape, as far as my observations reach, it is, in our low country, uniformly and universally known under the name of Fox Grape. Linnseus may have received his name and specimens from the Southern States.

Grows in light rich soils.

Flowers May. Fruit ripens in July and August.

#### 2. Cordifolia. Mich.

V. foliis cordatis, a | ter dentatis, utrinque toothed, glabrous multifloris; baccis par- loosely many flowered; vulis serotinis.

Leaves cordate, acucuminatis, sub-æquali- minate, almost equally glabris; racemis laxe each surface; racemes berries small, late.

Mich. 2. p. 231. Pursh, 1. p. 169. Nutt. 1. p. 143.

Berries pale, small, ripening late in the season, of a very tart taste. Pursh. Winter Grape.

Grows in rich soils and along the margins of rivers.

Flowers May.

#### Mich. 8. RIPARIA.

V. foliis inæqualiter | Leaves cule trifidis; bescentibus.

unequally incisodentatis brevius- notched and toothed; petiolo, slightly 3-cleft; the penervis margineque pu- tiole, nerves and margin pubescent.

Mich. 2. p. 231. Pursh, 1. p. 169. Nutt. 1. p. 143.

Flowers very fragrant. Pursh.

To this species probably belongs the winter grape of our upper districts, which promises to become valuable when duly cultivated. It is said to surpass in flavour all of our native grapes. I have endeavoured several times unsuccessfully to cultivate it in our low country, and can only speak of it from report.

Grows in rich soils along the margin of rivers.

Flowers May-July. Pursh.

Mich. 2. p. 230. Pursh, 1. p. 169. Nutt. 1. p. 148. V. Labrusca, Walt. p. 242,

A vine climbing the loftiest trees in our forests, the old branches glabrous with the bark fibrous, the young tomentose. Leaves nearly round, sometimes entire, sometimes much dissected, always dentate. Petioles 2-5 inches long, tomentose. Plant polygamous and dioicous. The flowers similar on every plant. Panicles opposite the leaves, composed of small fascicles 3-6-flowered, a short villous leaf at the base of each fascicle. Calyx persistently entire, binding the base of the germ. Corolla 5-petalled, caducous, greenish, the petals adhering at the summit. Nectary a yellow, truncate gland, surrounding the germ. Pilaments longer than the corolla, inserted with the petals between the calyx and the germ. Anthers erect. In the sterile flowers only the rudiments of a germ can be discovered. In the fertile the germ is above, turbinate, tapering to a short style. Stigma obtuse. Berry small, black, very acid and austere.

Grows in rich lands, and its size is supposed by many to be one of the

best indications of soil which our forests furnish.

Flowers May.

#### 5. Labrusca. Lin.

majoribus.

V. foliis lato-corda- Leaves broad, cortis, sublobato-angula- date, somewhat lobed tis, subtus incano-to- and angled, hoary and mentosis; racemis ferti- tomentose underneath; libus parvis; baccis racemes fertile, small; berries large.

Sp. pl. 1. p. 1181. Mich. 2. p. 230. Pursh, 1. p. 169. Nutt. 1. p. 143. V. Taurina, Walt. p. 242.

This is one of our largest species of vine, climbing over the loftiest trees of our forest, and covering them with large, thick and almost tomentose leaves. The fruit large and in small clusters of an austere and disagreeable flavour, ripening in August and September.

Grows on high spots in the deep river swamps, preferring always the

richest soils.

Seed 1 within the lea-fy calyx.

### 1. Lupylus. Lin.

Sp. pl. 4. p. 769. Mich. 2. p. 280. Pursh, 1. p. 199. Nutt. 2. p. 287.

Root perennial. Stem herbaceous, twining, scabrous. Leaves opposite, 3—5 lobed, veiny, scabrous, serrate, on petioles 2—4 inches long. Sterilé flowers alternate and coarsely paniculate, axillary and terminal. Fertile florets verticillate and sessile, densely spiked, forming axillary and terminal panicles. Seed one, small, covered by the persistent calyx forming a strobilus in which the fragrant bitter so valuable if not indispenable in the manufacturing of beer resides.

Grows in the mountains of Carolina. Dr. Macbride.

Flowers June—August.

Pursh, 1. p. 249. Nutt. 2. p. 238.

I refer to the S. Ovata of Pursh the sea-shore species of Smilax so remarkable for the fragrance of its flowers. Stem nearly terete, unarmed, branching, geniculate and covering the small shrubs over which it grows. Leave perennial, ovate and oval, generally obtuse, always mucronate, 3-nervel, reticulate, on short petioles. Flowers in small umbels, common pedice about half an inch long. Corolla greenish, very fragrant. Berries black

Grows in dry sandy soils, common on the sea islands near the margin of

the ocean.

Flowers June and July.

### 7. LANCEOLATA. Lin.

S. inermis; foliis lanceolatis ovatisque, a- lanceolate and cutis vel acuminatis, 3 acute or acuminate, 3 -5 nervibus, glaberri- | -5 nerved, very glamis, umbellis multifloris, pedunculis brevibus. E. | peduncles short.

Unarmed; perennantibus; brous, perennial; bels many flowered:

Sp. pl. 4. p. 783. Pursh, 1. p. 250. Nutt. 2. p. 238. S. Pseudo China? Walt. p. 244.

A vine climbing over shrubs sometimes 15 or 20 feet high, terete, with its upper branches unarmed. Leaves somewhat membranaceous, entire, varying a little in their figure, acute or slightly acuminate, and very often a little oblique near the summit, paler underneath, with 3 distinct though not prominent and two obscure nerves, on a petiole about 3 lines long. Flowers numerous in small axillary umbels on a common peduncle rarely half an inch long. Berries red.

Grows like most of the genus in damp rich soils.

Flowers May—June.

## 8. Laurifolia. Lin.

S. aculeata, ramis inermibus; foliis ovali- unarmed; leaves oval lanceolatis, paulo acu- lanceolate, slightly acuminatis, 3-nervibus, minate, 3-nerved, coricoriaceis, lucidis, pe- aceous, lucid, perennirennantibus; brevissime peduncula- duncles. tis.

Sp. pl. 4. p. 779. Walt. p. 245. Mich. 2. p. 237. Pursh, 1. p. 250. Nutt. 2. p. 238.

Stem climbing to a considerable height, armed near the base, the branches terete, smooth. Leaves numerous, somewhat crowded, oblong, elliptic with a sudden and slight acumination at the point, rigid, coriaceous, lucid, perennial. Plowers small, in axillary umbels, common peduncle very short, not as long as the pedicels. (Berries spherical, black, one-seeded. Walt.) Grows in swamps and wet soils.

Flowers July. The fruit matures late in the winter.

### 9. PUMILA. Walt.

S. inermis; foliis cor- | Unarmed; caule procumbente. E. cumbent.

dato-ovatis, integerri- cordate, ovate, entire, mis, sub 5-nervibus, somewhat 5-nerved, subtus molliter pubes-centibus; umbellis bre-viter pedunculatis, pe-dicellis brevissimis; peduncles, pedicels ve-ry short; berries ob-baccis oblongis acutis; long acute; stem proWalt. p. 244.

S. Pubera, Mich. 2. p. 238. Sp. pl. 4. p. 785. Pursh, 1. p. 250. Nutt. 2. p. 238.

Stem prostrate, rarely exceeding 3 or 4 feet long, pubescent, sparingly branched, unarmed. Leaves perennial, alternate, cordate ovate, obtuse, mucronate, scabrous on the upper surface, almost tomentose and hoary underneath, 5-nerved the exterior obscure, on petioles 1-3 inches long. Flowers in small axillary umbels, the common peduncle 5-10 lines long, the partial 1-2 lines. Calyx of both florets 6-leaved, 3 exterior, oblong, greenish yellow. Corolla 0. Stamens shorter than the corolla, rugose, between the interior petals of the fertile flower are often found the rudiments of 3 sta-Germ superior. Style short thick. Berry oval, white, 1-seeded?

Grows in rich shaded soils.

Flowers September—October. Matures its fruit in March.

### 10. PSEUDO CHINA. Lin.

ermibus, caulinis cor- armed, those of the datis, rameis ovato-ob-longis, 5-nervibus; pe-dunculis longissimis. stem cordate, of the branches ovate oblong, 5-nerved; peduncles

S. inermis; foliis in- | Unarmed; leaves unvery long.

Sp. pl. 4. p. 785. Pursh, 2. p. 250. Nutt. 2. p. 238. S. Sarsaparilla, Walt. p. 245.

Roots tuberous, creeping, nodose. Stem climbing over small shrubs. Leaves as in most of the genus semiperennial, many of them adhering to the stem during the winter. The lower leaves distinctly cordate, nerved, the

young ones ovate. Berries black?

Most of the species of this genus have large tuberous roots, but in this they are very conspicuous. This species is, I believe, the one generally preferred in medicine as an alterative, and forms the basis of many "diet-drinks" among the "unlicensed faculty." From these roots, with Indian corn, (maize) sassafras and molasses, the negroes manufacture a very pleasant beer.

Grows in almost all soils, frequently found in dry sandy situations.

Flowers June—July?

### 11. ROTUNDIFOLIA. Lin.

S. caule aculeato, te-Stem prickly, someretiusculo; foliis subro- what terete; leaves tundo-ovatis, acumina- ovate, nearly round,

tis, lævissime cordatis, acuminate, slightly cordate, 5-nerved. quinquenervibus.

Sp. pl. 4. p. 779. Walt. p. 245. Mich. 2. p. 287. Pursh, 1. p. 250. Nutt. 2. p. 238.

Stem terete, sometimes slightly angled, flexuous, armed with small acute prickles. Leaves cordate, nearly round, mucronate, entire, 5-7 nerved, 3 more distinct than the others, paler or glaucescent underneath. (Berries spherical. Mich.)

Grows in rich shaded soils.

Flowers June. Pursh.

#### 12. CADUCA. Lin.

ovatis. membranaceis, 5 nervi- | branaceous, 5-nerved; bus; pedunculo commu- common ni vix petiolis longiore. | scarcely longer than

S. aculeata; foliis | Prickly; leaves omucronatis, vate, mucronate, mempeduncle the petioles.

Sp. pl. 4. p. 780. Pursh, 1. p. 250. Nutt. 2. p. 238.

Stem flexuous, sometimes angled, very thinly armed with prickles. Leaves annual, ovate, entire, mucronate, with 3 nerves as usual more distinct than the rest, when young often acuminate, very thin, on petioles about half an inch long. Flowers in axillary umbels, the pedicel as long as . the common peduncle.

Grows in dry fields. Pursh. Very common around ponds.

Flowers June-July.

#### 13. Tamnoides. Lin.

S: caule aculeato, tereti; foliis ovato oblon- | leaves ovate oblong, gis, acutis, sub-pandu- | acute, slightly panduriræformibus, obsolete | form, obsoletely corcordatis, quinquenervibus, pedunculo commu- mon peduncle longer ni petiolis longiore.

Stem prickly, terete; date, 5-nerved; comthan the petiole.

Sp. pl. 4. p. 780. Nutt. 2. p. 238. S. Panduratus, Pursh, 1. p. 251.

Stem twining, terete, prickly. Leaves on petioles 6-8 lines long, panduriform, acute, sometimes almost hastate, with the lobes round, lucid, somewhat rigid, with 3 distinct and 2 or 4 obscure nerves. Flowers in axillary umbels, common peduncle about an inch long, twice as long as the pedicels. Berry spherical, black.

I feel some hesitation in referring to this species the S. Tamnifolia of Michaux, (2. p. 238.) The plant I am describing is certainly not herbaceous.

Grows often in dry soils.

ed; peduncles very

Sp. pl. 4. p. 782. Walt. p. 248. Mich. 2. p. 288. Pursh, 1. p. 251. Nutt. 2. p. 228.

Root perennial. Stem herbaceous, 2 to 3 feet high, erect, slightly angled, glabrous, bearing sometimes one or two small branches. Leaves when young oval or ovate, when old slightly cordate, acuminate, 5 to 7 nerved, very pubescent on the under surface, particularly along the nerves, the lower alternate, the upper somewhat verticillate at the summit of the stem, 4 to 5 inches long, 3 to 4 wide, on angled petioles 2 to 4 inches long. Flowers on the lower part of the stem. Umbels on very long compressed peduncles. Stigmas 3. Germ 3-celled, each bearing the rudiments of 2 seeds, but maturing only one, sometimes neither. Berry spherical, black, 2 to 3 seeded.

Grows in fertile soils. Flowers May-July.

This genus is very extensive in the Southern States and merits a more careful examination than it has yet received. While waiting for that day which so often eludes our expectations, when I should be able to collect and examine them at leisure in a living state, I have permitted some opportunities which I really enjoyed to escape, I feel now that my knowledge of the genus is incomplete, perhaps inaccurate. The two last species will probably constitute a distinct genus.

Sp. pl. 2. p. 225. Pursh, 1. p. 220. Nutt. 1. p. 218. P. Gronovii, Mich. 2. p. 236.

A large shrub sometimes becoming a small tree. Leaves on petioles about five lines long, oval, acuminate, finely serrate, pubescent, somewhat hairy underneath. Flowers hexandrous. The sterile distinctly axillary in small umbellate clusters, the fertile few, aggregated, when in fruit commonly solitary. Berries red.

Nearly allied certainly to the preceding species, but differs somewhat in the shape and serratures of the leaves, in its hexandrous flowers, and the

umbellate structure of its sterile florets.

Grows in light fertile soils. Flowers April—May.

## S. Integrifolia.

P. foliis deciduis, ovalibus, integerrimis, oval, entire, mucro-mucronatis, petiolatis, nate, on petioles, glautrinque glabris; flori-bus foemineis solitariis, fertile florets solitary, longe pedunculatis.— on long peduncles. Nutt.

Leaves deciduous.

P. Ambiguus, Nutt. 1. p. 213.

A small tree with a smooth whitish bark. Leaves oval, always entire, about one and a half inches long and one inch wide, on petioles near half an inch long. Peduncles of the fruit often two inches in length. Nutt.

This species I have inserted from Mr. Nuttall, who considers it as the real P. Ambiguus of Mich. The one I have described under that name is. however, certainly the Cassine Caroliniana of Walter, and therefore probably the plant of Michaux, agreeing also in the "partitione quaternaria."

The habitat is not mentioned, but it probably belongs to the Southern

States.

### 4. LANCEOLATUS. Pursh.

deciduis, foliis

Leaves deciduous. lanceolatis, tenuissime et remote serrulatis, utrinque acutis, utrinque glabris, floribus foeminis, pedunculatis, 6-fidis, masculis aggregatis, 3-andris.

Leaves deciduous, lanceolate, finely and remotely serrulate, acute at each end, glabrous on each surface, fertile florets scattered, generally in pairs, on peduncles, 6-cleft, sterile aggregate, triandrous

Pursh, 1. p. 220. Nutt. 1. p. 213.

Berries small, scatlet. Purah.

Grows in the lower districts of Capolina and Georgia. Pursh.

Flowers June.

This species has escaped my notice. But I believe there are several species of this genus with deciduous leaves yet to be described. I saw in the Herbarium of Mr. Lyon many years ago, one collected near Augusta, and one or two collected near Tuckabatchie on the Talapoosa river which appeared to be unknown. I have, however, no memorandums of them.

## 5. GLABER. Lin.

P. foliis semperviren- Leaves perennial, tibus, cuneato-lanceo- cuneate-lanceolate, colatis, coriaceis, glabris, nitidis, superne parce serratis; pedicellis foemineis solitariis, mas-tile pedicels solitary, culis 3—6 floris.

sterile 3—6 flowered.

Sp. pl. 2. p. 226. Walt. p. 247. Mich. 2. p. 236. Pursh, 1. p. 220. Nutt. 1. p. 213.

A small shrub, the fertile plants rarely exceeding 3 feet in height, branching, bushy, the sterile 3-5 feet high, virgate, the young branches slightly pubescent. Leaves alternate, cuneate-lanceolate, perennial, very glabrous excepting along the midrib, on petioles 5—6 lines long. Flowers axillary, the peduncles of the sterile flowers sometimes clustered, each 3-6 flowered. Sterile flowers generally 6-parted and hexandrous, the stamens inserted at

the base of the rotate corolla, between the segments, and bearing the radiments of a germ. Fertile florets often 7-8 parted, bearing abortive stamens. Style short, thick. Stigma somewhat 3-lobed. Berry black, 6, 7, 8 seeded.

Grows in damp poor soils. Flowers April—May.

#### 6. Coriaceus. Pursh.

P. foliis perennantitis 8-andris.

Leaves perennial, bus, lato ovalibus acu- broad oval, acute, sertis, apice serratis, su- rate near the summit, perne nitidis, subtus lucid on the upper suratomiferis; floribus fo-emineis solitariis, ple-rumque octo-partitis, rets solitary, generally masculis subaggrega- | 8-parted; sterile aggregate octandrous.

Pursh, 1. p. 221.

P. Atomarius, Nutt. 1. p. 213.

A shrub generally 5-6 feet high with virgate branches, (viscid when young, Nutt.) Leaves perennial, somewhat oval but very wide for their length, coriaceous, acutely serrate near the summit, sprinkled frequently on the under surface with minute dark coloured atoms. Flowers very commonly 8-parted and 8-androus. Berry 6, 7, 8 seeded.

Grows in rich high lands; near the margin of swamps, Chatham County,

Georgia.

Flowers May.

G. ramis subspinosis; foliolis ovato-oblongis, acutis; leguminibus ovalibus, mucronatis, oval, mucronate, generally 1-seeded.

Walt. p. 254. Sp. pl. 4. p. 1097. Mich. 2. p. 257. Pursh, 1. p. 221. Nutt. 2. p. 239.

A tree 40-60 feet high, 1-2 in diameter, armed on the trunk and branches with spinous processes, (aculei properly which adhere only to the bark) sometimes simple but very commonly bearing two lateral spines near the summit. Leaves equally and compoundly pinnate. Leaflets very numerous, small, oval, slightly crenulate, glabrous. Flowers small, in small axillary racemes. Calyx 6—8 leaved, 3—5 leaves interior, all oval lance-olate, pale green. Legumen or pod somewhat oval oblique, compressed, mucronate, 1-seeded, not bearing as in the next species a saccharine pulp.

Grows in the river swamps in the middle districts of Carolina and Geor-

gia. Is not found in the immediate vicinity of the ocean.

Flowers-

## 2. Triacanthos.

G. ramis spinosis, spinis crassis, triplicibus compositisque; foliolis ovali oblongis; leguminibus polyspermis. Branches spiny, spines thick, triple and compound; leaflets oval and oblong; legumes many seeded.

Sp. pl. 4. p. 1097. Walt. p. 254. Mich. 2. p. 257. Pursh, 1. p. 221. Nutt. 2. p. 239.

A large tree 50-60 feet in height, and 2-3 feet in diameter, armed on the stem and branches with spines which grow generally in clusters and very commonly bear 2 or more lateral spines. Leaves equally and abruptly pinnate, leaflets small, oval lanceolate, glabrous, slightly crenulate near the summit. Flowers in small axillary raceines, the sterile florets clustered. Legumen falcate, 12-14 inches long, mucronate, many seeded, the intervals between the cells of the seed filled with a saccharine pulp.

This tree is thinly scattered through our forests. On the sea islands I believe it occurs more frequently than on the adjacent main land. Its timber is considered durable and would be valued, but the tree is itself so scarce that it does not enter into the arrangements of our farming or manufacturing economy.

Grows in rich light soils.

Flowers May?

## DIOECIA OCTANDRIA.

## 1. GRANDIDENTATA. Mich.

P. foliis subrotundo- | Leaves ovate, nearovatis, acutis, inæqua- ly round, acute, uneliter sinuato-dentatis, qually and sinuately glabris, junioribus vil- toothed, glabrous, the

losis; petiolis superne | younger villous; petioles compressed near compressis. their summit.

Mich. 2. p. 243. Pursh, 2. p. 619. Nutt. 2. p. 289. Mich. arb. for, 3. p. 287.

A tree 40-50 feet high, with smooth bark and branches thinly dispersed. Leaves alternate, nearly circular, with large irregular teeth, and prominent veins, when young tomentose, becoming glabrous with age, on petioles 2-4 inches long. Flowers in small axillary cylindrical aments, shooting out early in the spring with the first buds, very small and inconspicuous. Capsules small, containing many minute seeds surrounded by long cottonlike hairs which causing them to float readily on the air, render them easy of dispersion, and have given to several species in different parts of the United States the common name of Cotton-trees.

Grows in the mountainous districts of Carolina and Georgia.

Flowers March.

### 2. Angulata. Aiton.

P. foliis ovato-deltoideis, acuminatis, ob- toid, acuminate, obtuse-

Leaves ovate-deltuse uncinato-dentatis, ly and uncinately glabris, junioribus amplissimis cordatis; rapoung very large and cordate; branches angled, slightly winged.

Sp. pl. 4. p. 805. Pursh, 2. p. 619. Nutt. 2. p. 239. P. Nigra? Walt. p. 248. P. Angulosa, Mich. 2. p. 243. Mich. arb. for. 3. p. 302.

A large tree, growing 50-80 feet in height and 2-3 in diameter; the young branches are all winged and angled by the decurrent petioles or by the junction of different branches, and these vestiges are not effaced for several years. Leaves ovate-deltoid, acuminate, serrate, glabrous, sometimes slightly cordate, on the young shoots 5-7 inches long, 4-5 wide, on the old trees smaller, on compressed petioles 2-4 inches long. Flowers very small. Seed not as conspicuously villous and white as in some other spe-

This is, I believe, the only species of this genus which is found along the sea-coast of Carolina and Georgia. Its leaves are easily agitated by the wind. Its wood is light, brittle, and not durable.

Grows along the margin of rivers.

Flowers March.

#### 3. HETEROPHYLLA. Lin.

P. foliis subrotundo- | Leaves ovate, nearovatis, obtusis, subau- ly round, obtuse, slightriculatis, serratis, juni- ly auriculate, serrate, oribus tomentosis.

when young tomentose.

. Sp. pl. 4. p. 806. Walt. p. 248. Mich. 2. p. 244. Pursh, 2. p. 619. Nutt. 2. p. 289.

P. Argentea, Mich. arb. for. 3. p. 290.

A large tree growing sometimes 60-80 feet in height and 2-3 in dismeter. Branches not angled as in the preceding species. Leaves dehold ovate, serrate at base, slightly cordate, with lobes or auricles that often conceal the insertion of the petiole, when young tomentose. (Sterile florets polyandrous; flowers of the glabrous fertile ament remote, pedicelled. Mich.)

Grows along the margins of rivers. Common in the middle and appear

districts of Carolina and Georgia.

Flowers March.

## DIOSPYROS. GEN. PL. 1598.

-6 fidus. Corolla ur- | lyx 4-6 cleft. Corolceolata 4-6 fida. Sta- | la urceolate 4-6 deft. mina 8-16, filamentis | Stamens 8-16, the filplerumque biantheriferis.

#### 1. VIRGINIANA. Lin.

D. foliis ovatis ovalibusque, acuminatis, oval, acuminate, retireticulato-venosis, sub culately veined, some glabris, petiolis pubes- | what glabrous, petioles

Leaves ovate and

centibus; gemmis gla- pubescent; buds glabris.

Sp. pl. 4. p. 1107. Walt. p. 253. Mich. 2. p. 258. Pursh, 1. p. 265. Nutt. 2. p. 40.

Mich. orb. for. 2. p. 195.

A small tree rarely exceeding 20-40 feet in height, or 12-16 inches in diameter, with scattered irregular branches. Leaves alternate, on short petioles, sometimes ovate, more frequently oval lanceolate, acuminate, paler undermeath and slightly pubelcent along the margia. Flowers solitary, axillary, on short peduncles. Corolla greenish yellow. Calyx of the fertile floret persistent. Berry red, containing 8-12 compressed, hard seeds immersed in a pulp which when fully ripe is well flavoured, and might by cultivation be added to the fruits of the table.

Var. Pubescens.

Leaves acute, pubescept underneath. Petioles long. Fruit bearing few

The leaves of our common persimmen are generally puttercent along the margins, but I have never seen them at much so as represented in the figure of Michaux. I have noticed, however, that this tree in Maryland and Virginia bears fruit much more attendantly than it does along the sea-coast of Carolina and Georgia.

Grows in light rich soils.

Flowers May.

latis, basi vesiculosis.

H. monoica; foliis | Monoecious; leaves natantibus, rotundato- floating, round, corcordatis, subtus reticu- date, reticulate underneath, with vesicles at base.

Bosc. Annales du Museum, 9. p. 396. H. Cordifolia, Nutt. 2. p. 241.

Since I have become acquainted with the different views which have been taken of this plant, I have had no opportunity of examining it in a living state. I shall, therefore, merely insert the notes I took of it many years

Root perennial, sarmentose. Leaves from the root, floating, arbicular, cordate, glabrous, 1-2 inches in diameter, with prominent purple veins underneath, and some inflated vesicles near the summit of the stem. Petioles 2-4 inches long. Flowers axillary, monoecious. Sterile florets:-Spathe - leaved, - flowered; leaves membranaceous, hyaline, nerved. Calyx S-leaved, leaves oval, membranaceous, without nerves, green. Corolla white, 3-petalled, petals as long as the calyx, but narrower, pedancle longer than the sheath, hyaline; filaments generally 12, united at base; the interior ones abortive; anthers attached to the sides of the filaments. Fertile florets:—Spathe one-leaved, one-flowered, peduncle of the flower very short, of the fruit long deflected. Calyx and corolla like those of the sterile floret. Glands 6 very small, setaceous, inserted by pairs between the petals. Germ inferior, ovate, truncate. Styles 6, as long as the corolla, deeply 2-cleft, furrowed on the interior surface. Stigmas simple, spotted. Capsule striate, 6-celled. Seeds numerous, striate, (hirsute. Nuttall.)

Grows in stagnant water. Flowers July-September.

### DIOECIA POLYANDRIA.

Fertile florets. Calyx and Corolla as in the sterile. Germs 2 -4 with the styles slightly 2-cleft at the summit. Drupes resembling berries, reniform nearly round, 1seeded.

### 1. Canadense.

M. foliis peltatis, subglabris, subcordatis, subrotundo - angulatis, angulis obtusiusculis, terminali abrupte aristato, mucronato; racemis solitariis compositis; petalis 8.

Leaves peltate, somewhat glabrous, slightly cordate, nearly round, angled, the angles obtuse, the terminal abruptly awned, mucronate; racemes solitary compound; petals 8.

De Candolle, reg. veg. 1, p. 540.

Sp. pl. 4. p. 824. Mich. 2. p. 241. Pursh, 2. p. 370. Nutt. 2. p. 244.

Stem climbing over small shrubs, glabrous, when young pubescent. Petioles 1-3 inches long, young leaves pubescent, when old glabrous, all peltate, with the petiole inserted near the margin. Sterile florets racemore, sometimes paniculate, solitary, often shorter than the petiole, shooting out a little above the axil. Calyx 8-leaved. Corolla yellow, 8-petalled, smaller than the calyx. Stamens 18-20. Anthers obtusely 4-angled, 4-furrowed. Fertile florets few, corymbose. De Cand.

Grows from Canada to Carolina. Mich. I have never seen this plant in

the low country of Carolina. It probably inhabits our mountains.

Flowers in July. Pursh.

#### 2. SMILACINUM.

M. foliis peltatis sub- | Leaves peltate, someglabris, cordato-subro- what glabrous, cordate, tis, subtus glaucis, ra- angled, glaucous un-cemis subsimplicibus, derneath; racemes gepetalis 4.

tundis, obtuse angula- nearly round, abtusely nerally simple; petals

De Cand. reg. veg. 1. p. 541.

Cissampeles Smilacina, Willd. Sp. pl. 4. p. 363.

This species only differs from the preceding by its pale glancone leaves and its petals, which are 4 and not 8. De Cand.

Grows in Carolina in rich moderately dry soils.

Flowers June to August.

J. foliis ternis, basi | Leaves ternate, uni-

adnatis, junioribus pa- ted at base, when tulis, senioribus ap- young expanded, when pressis, imbricatis. old appressed, imbri-

Sp. pf. 4. p. 853. Walt. p. 243. Mich. 2. p. 245. Pursh, 2. p. 647. Nutt. 2. p. 245.

Mich. arb. for. 3. p. 42.

A tree of irregular growth; along the margin of salt-water streams it is generally covered with horizontal branches; in thick woods it grows like the fir, tall and slender; in old fields it extends like the live oak, and in such situations sometimes attains the height of 40 or 50 feet and a diameter of 2 -3. Leaves very small, resembling scales, verticiliate by threes, on young shoots expanding and very acute, on old branches closely imbricate. Flowers axillary. Ament of sterile florets very small. Berry dry, 1-2 seeded, roughened with the persistent calyx. (Seeds nuciform. Nutt.)

The wood, leaves and berries of this tree have all an aromatic flavour. The wood is light, close grained, reddish purple, and perhaps more durable than any other timber in our country. Those which grow along the seacoast with their roots partially immersed in salt-water, though smaller in their dimensions, are much more durable than those which inhabit the forests. Often when surrounded and finally destroyed by the encroachments of the salt-water, their bodies remain in the marshes for an indefinite period, the roosting places of vultures and of sea-birds, become incrusted with pulverulent lichens and seem to moulder away like rock rather than decay like a vegetable product.

The timber of the Red Cedar is extensively used by ship carpenters and boat builders, by cabinet makers and turners, and is in many articles of domestic use. The aroma of the wood is so disagreeable to insects that in. chests newly made woollens may be preserved for one or two years without

receiving any injury from moths.

Grows in almost all soils; very common along the sea-coast of Carolina and Georgia; more rare in the interior country. In the state of Alabama. however, at a distance from the ocean, it sometimes is found covering almost exclusively many acres of land.

Flowers April.
