B. Systematic index to new amphipod genera and species in AN 23

This list covers all taxa indexed in AN 23, and follows similar indexes for AN 11-19 (in AN19, pp 37-51), AN 20, AN 21 and AN 22.

The rationale for my use of family names, for which there is as yet little agreement among taxonomists, has been spelled out in AN 21; it is entirely practical. here I have, however, split the Caprellidea and Lysianassoidea (but not the Eusiroidea and Hyperidea) into their constituent families.

Technical details: new taxa are written in capitals, '(rev.)' stands for older genera and species that have been revived, ssp stands for a taxon described with the rank of subspecies. new species are indexed in the genus in which they were

originally described, even when transferred to a different genus by a later author in AN 22.

A question mark before a genus name signifies that the family is somewhat uncertain; a question mark before a species name, that the genus is uncertain.
