# Invertebrates of the H.J. Andrews Experimental Forest, Western Cascade Range, Oregon. V: An Annotated List of Insects and Other Arthropods

Gary L. Parsons, Gerasimos Cassis, Andrew R. Moldenke,  
John D. Lattin, Norman H. Anderson, Jeffrey C. Miller,  
Paul Hammond, and Timothy D. Schowalter

This publication has its roots in the International Biological Programme begun in the 1960's. The H.J. Andrews Experimental Forest was a component of the Western Coniferous Forest Biome. The arthropod specimens collected formed the nucleus for the H.J. Andrews Arthropod Collection. An effort to consolidate this material and build the existing collection was initiated in 1976, leading to the present publication. My sincere thanks to the many, many people who made this document possible.

**Parson, Gary L.; Cassis, Gerasimos; Moldenke, Andrew R.; Lattin, John D.; Anderson, Norman H.; Miller, Jeffrey C.; Hammond, Paul; Schowalter, Timothy D.** 1991. Invertebrates of the H.J. Andrews Experimental Forest, western Cascade Range, Oregon. V: An annotated list of insects and other arthropods. Gen. Tech. Rep. PNW-GTR-290. Portland, OR: U.S. Department of Agriculture, Forest Service, Pacific Northwest Research Station. 168 p.

An annotated list of species of insects and other arthropods that have been collected and studies on the H.J. Andrews Experimental forest, western Cascade Range, Oregon. The list includes 459 families, 2,096 genera, and 3,402 species. All species have been authoritatively identified by more than 100 specialists. Information is included on habitat type, functional group, plant or animal host, relative abundances, collection information, and literature references where available. There is a brief discussion of the Andrews Forest as habitat for arthropods with photographs of representative habitats within the Forest. Illustrations of selected arthropods are included as is a bibliography.

**Keywords:** Invertebrates, insects, H.J. Andrews Experimental forest, arthropods, annotated list, forest ecosystem, old-growth forests.

## **FOREWORD**

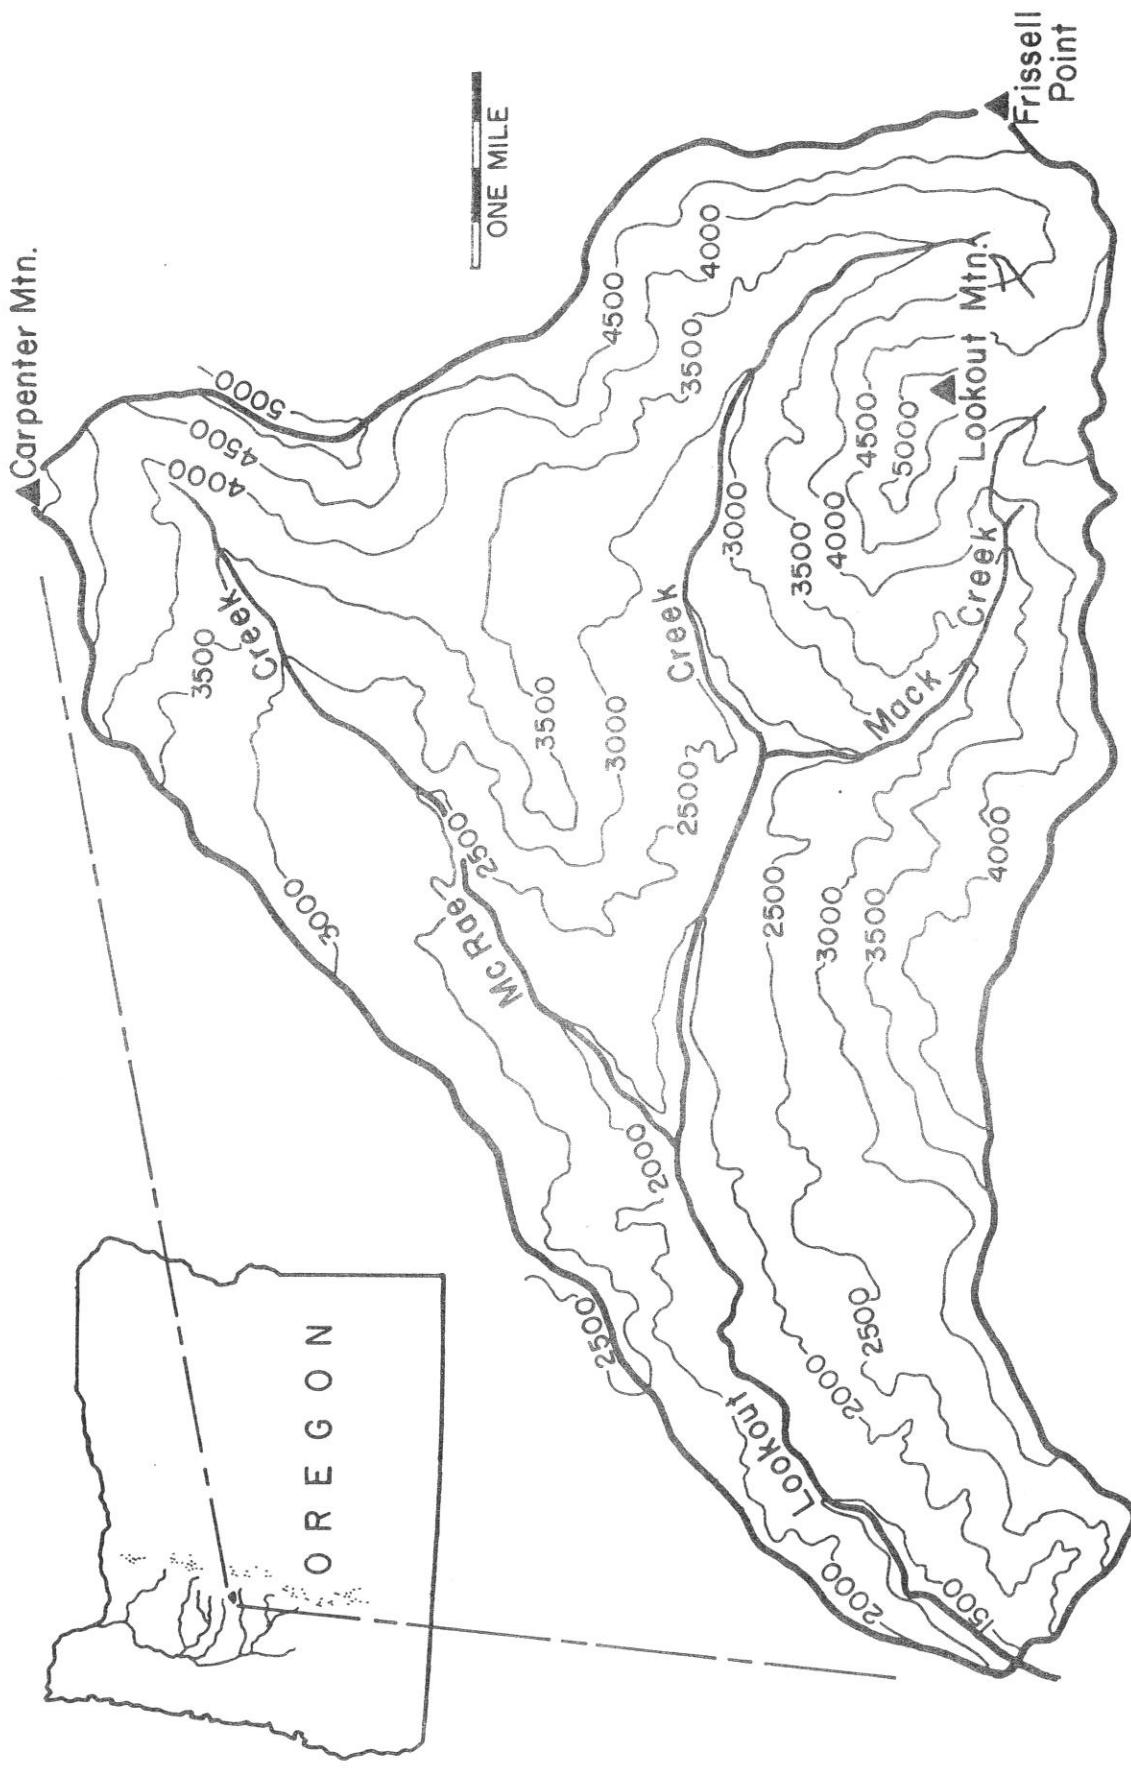

The H.J. Andrews Experimental Forest in the western Cascade Range of Oregon lies within some of the most productive coniferous forest habitat of the Pacific Northwest. The immediate region offers other opportunities: the largest expanse of montane glaciers in the contiguous 48 states (Three Sisters Wilderness), low elevation oak forests, Great Basin desert scrubland, and seacoast. The Andrews Forest has been designated as one of 17 Long Term Ecological Research Sites (LTER) in the United States by the National Science Foundation. The hallmark of the Andrews Forest is the intensive participation in research by scientists and managers over the past four decades, combined with excellent data storage and retrieval systems. Scientists of many disciplines work at every scale here. More than 800 publications compiled for easy reference in McKee and others (1987) and Blinn and others (1988) provide extensive background for investigations at the Andrews Forest.

This publication is not a pro forma species list; rather, it has been generated as the result of diverse ecological studies centered on and around the Andrews Forest during the past 41 years. No attempt has been made to exhaustively collect the area with methodologies appropriate to each invertebrate group. This list provides some insight into the enormous invertebrate diversity present in the coniferous forests of the Pacific Northwest. It provides reference material for investigators who might be engaged in ecological investigations. We hope that these data, set in an ecological context, will stimulate collaboration and facilitate the design of future research.

The Andrews Forest is the premiere site in the Pacific Northwest Conifer Biome, and we invite the scientific community to help us realize its great research potential.

In the Andrews Forest there are large tracts of undisturbed forest in which natural processes can be studied. Trees may attain heights >75 m. Two major age classes predominate (150 and 375 years) due to past wildfires. Some individual trees may be as much as 700 years old.

Elevations and drainage systems within the Andrews Forest boundaries, and location in the state.

### Cover

The remarkable relationship between this predator and its prey influences the rate at which litter is decomposed on the forest floor. The polydesmid millipede *Harpaphe haydeniana* is an important forest detritivore. It and similar millipedes are the major consumers of coniferous and deciduous leaf litter in western coniferous forests, where earthworms are virtually absent. They chew up and digest leaves, producing feces which are a food resource accessible to many other small arthropods, fungi, and bacteria. Five adults can consume more than 95% of a full gallon can of coniferous or deciduous litter in 2 1/2 weeks. *Harpaphe* and other polydesmid millipedes secrete cyanide and are usually conspicuously colored to warn away would-be predators. The defensive reaction of *Harpaphe* is to roll up into a ball, protecting its neck. In the immature stage it is unpigmented and probably confined underground to the lower humus layers. When about half grown, it becomes pigmented and moves to the surface, where it feeds on litter. *Promecognathus laevissimus* is an unusual carabid beetle in that it feeds only on polydesmid millipedes, which are often much larger than itself. Jim Labonte, a student of carabid beetles, has observed the feeding behavior (personal communication), summarized as follows: approaching to within a distance of less than 1cm, the beetle pounces on its prey, straddling and lining up parallel to the millipede's body. Moving to one end of the body, the predator constantly opens and closes its mandibles around the millipede. If *Promecognathus* chances to reach the posterior end, it quickly turns about-face and moves up to the head. Upon reaching the head, it plunges its long, scimitar-shaped mandibles down around the neck, severing or crushing the ventral nerve cord and paralyzing its prey. The beetle returns to feed on the paralyzed millipede for several days, emptying the body contents and breaking off segments as it works down the body, until only a pile of segment rings remains. It may cache its prey under a shelter between meals.

## INTRODUCTION

This is an annotated list of the arthropods collected on the H.J. Andrews Experimental Forest (HJA). The Andrews Forest, one of the Long Term Ecological Research (LTER) sites established in the United States, is and represents coniferous habitats typical of the western Cascade and Coast Ranges of the Pacific Northwest. Many of the species listed here range widely throughout the region. The list has been compiled from voucher specimens in the Andrews Forest Arthropod Collection (AFAC), and from publications and other lists of arthropods prepared by scientists doing research on the site. We have included biological and ecological information for most species. The voucher specimens have been identified by recognized authorities in each taxon. Although the AFAC does not yet contain all of the arthropods that occur on the site, significant numbers of species (about 3400) have been collected and identified. Supplements will be published. This list is computerized and will be transferred to the Andrews Forest Data Base at the time of publication and updated regularly.

## THE HJA STUDY AREA

The H.J. Andrews Experimental Forest, in the Willamette National Forest (Linn and Lane Counties) in the western Cascade Range of Oregon (latitude: 44°14'N, longitude: 122°11'W), was established in 1948 by the USDA Forest Service. It is administered jointly by the Forest Service, Pacific Northwest Research Station; the Willamette National Forest; and Oregon State University. The Andrews Forest covers 6400 ha (15,800 ac) and includes an entire watershed (Lookout Creek). Elevation ranges from 425 to 1620 m (1350 to 5340 ft). The climate is characterized by mild, wet winters and warm, dry summers. Mean annual temperature is 7.9 °C, with a range of -18 °C to 38 °C. Annual precipitation is about 230 cm (90 in) but is seasonal, with 75 percent falling between November and March. The substantial snowpack melts quickly at elevations below 850 m but may persist above 1350 m into June. The site is typical of the mountain landscapes in the western Cascades and elsewhere in the northwestern United States. The soils are deep, well-drained typic dystrochrept with slope gradients ranging from 20 to 60 percent. There are two major forest zones represented, the Western Hemlock Zone (300-1550 m), dominated by Douglas-fir (*Pseudotsuga menziesii* (Mirb.) Franco), western hemlock (*Tsuga heterophylla* (Raf.) Sarg.), and western redcedar (*Thuja plicata* Donn. ex D.Don), and the Pacific Silver Fir Zone (1050-1550 m), dominated by Pacific silver fir (*Abies amabilis* Dougl. ex Forbes) and noble fir (*Abies procera* Rehd.). In all, more than 480 species of plants have been recorded from the Andrews (Franklin and Dyrness 1971). When designated, about 65 percent of the Andrews Forest contained old-growth forest with dominant trees 400 or more years old. A substantial amount of this old-growth forest remains, along with mature stands containing dominants 140 years old, and a variety of natural stands and plantations from 1 to 40 years old. A wide range of forest phyto-associations and stream community types are represented. Although primarily forested, the HJA also has talus slopes, wet and dry shrub meadows, rock outcrops, and bogs. These habitats are typical of western Cascade forests (Franklin and Dyrness 1973). The Andrews Forest contains 'habitat pockets' that represent a wide variety of ecological regions, including elements typical of the valley oak-grasslands to the west, subalpine and Great Basin areas to the east and north, and drier forest types from the Klamath-Siskiyou mountains to the south. These pockets contain some species of arthropods that represent furthest known extensions from their normal geographic ranges. For example,

the California oakworm, *Phryganidia californica* Packard (Lepidoptera: Dioptidae) was previously believed to barely extend into the drier regions of southern Oregon until it was found living on oaks on low, dry, south-facing slopes in the Andrews Forest (Carmean and others 1989). The seed bug, *Malezonotus obrieni* Ashlock (Hemiptera: Heteroptera: Lygaeidae), was described from Smith Meadow, Tulare County, California (Ashlock 1963), and its occurrence here represents a sizable northward extension. These habitats and other environmental aspects of the Andrews Forest are described in more detail by Dyrness and others (1976), Hemstrom and others (1987), Swanson and James (1975), and Zobel and others (1976).

## COMPILATION OF THIS LIST

This list is compiled from collections and literature representing studies of arthropods from the Andrews Forest. Arthropod studies were started during the International Biome Project when the Andrews Forest was an important part of the Western Coniferous Biome Program. A collection was assembled during that period based on the entomological investigations on this site reported by Krantz and others (1973), McBrayer and others (1977), and Mispagel and Rose (1978). When the Andrews Forest was designated an Ecological Environmental Reserve site, efforts were increased to document the arthropod fauna of the site in conjunction with the research. These efforts continued through the establishment of the HJA as an LTER site and continue today.

A substantial research program on forest ecosystems is being conducted on the site. Over 70 lead investigators working on more than 100 projects are studying the Andrews Forest and nearby Research Natural Areas. These studies, ranging from basic to applied, are funded by a variety of agencies. Extensive data bases exist on many physical, chemical, and biological phenomena that have been researched in terrestrial, aquatic, and atmospheric studies. The studies deal primarily with long-term phenomena, such as environmental changes, productivity, decomposition, and nutrient cycling. From these studies, various arthropod data bases and collections have been compiled. Major research efforts on arthropods at the Andrews Forest include: the biology and ecology of assemblages of soil and litter arthropods and their role in decomposition in a variety of habitats (Krantz and others 1973; Cromack and others, in press); surveys of canopy arthropods, particularly those associated with conifers (Schowalter 1989, Schowalter and others 1988, Voegtlin 1982); the role of arthropods associated with log decomposition (Schowalter and others, in press, Zhong and Schowalter 1989); insect and host-plant associations (Cooper 1981, Stonedahl 1982, 1984); and the ecology and biology of aquatic stream invertebrates (Anderson and others 1982, 1984, Hawkins 1982). Taxonomic groups that have received particular attention include the Orthoptera (Lightfoot 1986), Hemiptera-Heteroptera (Cooper 1981, Schwartz 1981, Stonedahl 1982, 1984), Lepidoptera, Trichoptera (Anderson and others 1982), Coleoptera, Siphonaptera (Lewis and Maser 1981), Araneae, and Oribatid mites (Moldenke and Fichter 1988). As a result, few areas of North America have been as extensively collected for invertebrates as the Andrews Forest. Over 3400 species of arthropods are now represented in the well-documented Andrews Forest Arthropod Collection, mostly as voucher specimens from the above studies. Extensive lists of arthropods have been compiled and published in only a few other sites in the United States. Two that can be compared to the Andrews Forest are Mount Desert, a large island off the coast of Maine, and the Central Plains Experimental Range (CPER), Pawnee National Grasslands, in Colorado, which is another LTER site (table 1). The Andrews

Forest (6400 ha) has compiled 24 insect orders, 344 families, 1812 genera, and 2943 species. Mount Desert (over 24 000 ha) lists 22 orders, 325 families, 2545 genera, and 6365 species (Procter 1946). The CPER (circa 6700 ha) lists 17 orders, 206 families, 940 genera and 1570 species (Kumar and others 1976). The Andrews Forest has a much higher diversity than the similar-sized CPER site, and still compares favorably in some aspects to Mount Desert, which is four times as large and has a much wider range of habitats. Certain species-rich taxa should be useful for intersite comparisons. Included in this category are Lygaeidae and Miridae (Hemiptera: Heteroptera); Carabidae, Chrysomelidae, Curculionidae, and Tenebrionidae (Coleoptera); Geometridae, Noctuidae, and Papilionoidea (Lepidoptera); Orthoptera; and Braconidae and Ichneumonidae (Hymenoptera).

This annotated list is a true composite of many studies and the effort of many individuals. Special mention should be made of the systematists who have cooperated in this effort and who have provided the authoritative identifications of the specimens. Their efforts establish the scientific credibility of the holdings. As biological and ecological information became available, appropriate annotations were made to the list. This information has come from many sources, including our own field work over the years. We have also included references to particular studies or publications in which individual species were recorded. These references often contain more information on the biology and ecology of the species than can be included here.

## COLLECTION

The Andrews Forest Arthropod Collection (AFAC) is maintained as a separate entity by the Systematic Entomology Laboratory (SEL), Department of Entomology, Oregon State University, Corvallis, Oregon, 97331. It is the repository for voucher specimens from all arthropod studies done on the Andrews Forest. These voucher specimens provide valuable ecological and biological data, not only for an individual species, but also for populations and community assemblages. The collection consists of pinned specimens housed in drawers in California Academy-style cases, slide-mounted specimens where appropriate, and a wet collection of specimens and samples in alcohol. The collection is now comprised of more than 3400 species authoritatively identified and documented. The collection is housed in Cordley Hall, Oregon State University, within and adjacent to the OSU-Systematic Entomology Laboratory. The SEL (John D. Lattin, Director) contains over 2,500,000 specimens, ranking in the top 3 percent of such collections (from a total of 586) in North America. It provides extensive coverage of the insects and other arthropods of the Pacific Northwest and beyond. The SEL has major holdings in the Hemiptera-Heteroptera and Homoptera, Coleoptera, Hymenoptera, macrolepidoptera, Diptera, Orthoptera, Ephemeroptera, Plecoptera, Trichoptera and Odonata. The Acarology Laboratory (G.W. Krantz, Director) contains a slide collection of more than 25,000 specimens of the Acarina and also is housed in Cordley Hall, near the SEL. Both of these collections enhance the AFAC by providing additional biogeographical and ecological information about the species found on the Andrews Forest site.

## EXPLANATION OF SYMBOLS USED IN THE LIST

### TAXONOMIC CATEGORY

The order, family, and most current known genus and species names are given, along with the numbers of taxa represented. The term "undetermined specimens" indicates the presence of specimens in the collection that have not been identified below the family level. Names preceded by an asterisk (\*) are new species that have been or will be described, based on specimens first collected on the Andrews Forest. Names followed by an (I) are insects known to be introduced into Oregon; spp. followed by a number indicates that number of unidentified species in that genus. If no number follows, two species were assumed to be the total represented.

### HABITAT--ADULT/IMMATURE

Habitat is the general type of place in which the life-stage is typically found. Note that some species are found in more than one of the following habitats, but only the one where it is most commonly found is given on the species list.

anim = noninsect animal host--adults, immature, or both are external or internal parasites of the host or are found in the host's nest, burrows, or other associated places  
aqt = aquatic sites, usually streams  
bog = boggy sites or seep areas  
carr = carrion associates--either feeding directly on the carrion or predatory on other carrion feeders  
dom = domestic sites--normally found around buildings, in stored products, or otherwise associated with humans  
dung = dung (animal feces)  
F-cn = forest canopy--on foliage, flowers, and other tree and shrub parts (includes all vegetation above the ground, including boles of trees)  
F-gd = forest ground--found moving over the surface of the forest floor or under bark, logs, and other debris on the forest floor  
F-lt = forest litter--litter layer of the forest floor or in litter accumulations in trees and stumps  
F-sl = forest soil--found in the soil below the litter layer  
fung = fungi--in or on larger fungal masses or fruiting bodies such as mushrooms and shelf and bracket fungi (species feeding on fungi in the soil, litter, or wood have these listed as their habitats instead of fungi)  
ins = insect host--immatures internal or external parasitoid of an insect host  
M-vg = meadow vegetation--above-ground foliage, flowers, and stems in natural meadows or other similar open grassy sites  
M-gd = meadow ground--found moving over the ground in meadow areas or under rocks, logs, and other objects in these areas  
M-sl = meadow soil--found in the soil and litter in meadows  
moss = found in moss located on the forest floor, on logs and stumps, and on trees  
nest = animal nest or burrow--living in nests of another organism including ant, termite, bee, rodent, and bird nests

O-vg = open vegetation--found in open or disturbed areas that are not meadows (such as recent clearcut areas or road edges) on the above-ground vegetation (foliage, flowers, stems)  
O-gd = open ground--found moving over the ground surface of open areas or under rocks, logs, or other objects in these areas  
O-rk = open rocky areas--on rock outcroppings or rock ledges  
O-sl = open soil--found in the soil and litter of open areas  
R-vg = riparian vegetation--on vegetation in riparian areas (next to streams)  
S-Aq = Semiaquatic--along the margins and banks of streams under rocks, in gravel, on sandbars  
wood = associated with dead or living wood, including species that bore into logs, branches, and twigs; species found in or under bark; or species that are predators or parasites on wood insects

#### FUNCTIONAL GROUP--ADULT/IMMATURE

The functional group represents a general category based on feeding habits or mechanisms of the adult and immature stages if known. Note that these are general categories, and a given species may fit into more than one functional group. The functional group codes have separate terrestrial and aquatic listings to facilitate conventional interpretations.

##### Terrestrial

A = fed by adult--food provisioned for or regurgitated to the immatures, which are confined in a nest or burrow located in the habitat listed for the immature (prey species or pollen sources provided are listed under host if known)  
D = detritivore--decomposers of litter material and decaying vegetable matter  
Dg = dung feeder  
Fl = flowers--feed on pollen, nectar, or floral parts  
Fu = fungivore--feed on fungal hyphae or spores, molds, slime molds, or other saprophytes  
G1 = gall maker on macrophytic plants  
H = herbivore--chewers, fluid suckers, and miners of above-ground foliage, stems, and flowers of macrophytic plants  
HP = hyperparasite--parasite or parasitoid on another parasitic species  
KP = kleptoparasite--immature stage of a "parasite" species reared by or using provisioned stores in nest of host species without physically harming the host  
Li = lichen feeder  
Mi = microbial feeder--feeds on bacteria, protozoa, and other microbes  
Ms = moss feeder  
nf = nonfeeding stage  
O = omnivore--normally feeds on both plant and animal life  
Pa = parasite or parasitoid--includes external feeders on blood, fur, and feathers, as well as external or internal parasitoids that develop on or in host, usually killing it during development  
Pr = predator--feed on other animals  
Rt = root feeder--feed externally on or bore into roots  
Sd = seed feeder--feed on seeds or in cones  
Sp = sap feeder--feed on plant or log exudates or fermenting fruit

Sv = scavenger-- feed on carrion, dead insects, or other dead animals  
X = xylophagous - feed on wood or bark

Aquatic (based on Merritt and Cummins 1984--applicable only to immature and adult stages with aquatic habitats)

F = filterer (detritivore)--passively collect fine particulate organic matter

Ga = gatherer (detritivore)--actively collect fine particulate organic matter

Go = gougers (herb-detritivore)--chew or bore into saturated woody debris

H = herbivore--feed on aquatic macrophytes

nf = nonfeeding stage

Pr = predator--feed on animals (engulfers and piercers)

Sh = shredder (detritivore)--chew coarse particulate organic matter

Sc = scraper (herb-detritivore)--graze on mineral and organic surfaces

## PLANT/ANIMAL HOST

Specific or general host plants, pollen sources, hosts for parasites and parasitoids, or prey items are given when appropriate. Acronyms are used for all hosts to save space. A key to all acronyms used in this list is given in Appendix B. Host acronyms are preceded by one of the following codes to indicate the host category:

I- = insect host

A- = other animal host

P- = plant host

An exception is "polylec", which is given for pollen collectors that are polyleptic (that is, they collect pollen from a wide range of flowers to feed their young).

Acronyms are generally comprised of the first two letters of the host genus and species names (e.g., *Psme* = *Pseudotsuga menziesii*), which will be italicized. If a species is found on multiple hosts, a more general category is used, such as genus alone or a reference to a broader category (e.g., CONIF indicates multiple coniferous tree hosts). These terms will not be italicized; all capital letters will distinguish them from the specific host acronyms. Each category is further defined below with applications for the acronyms.

**INSECT (I)** - Insect hosts are given, if appropriate, for species that are parasitoids on insects, for species that are normally found in nests or burrows made by insects (e.g., ants, termites, bees), or for predators whose specific prey items are insects.

**ANIMAL (A)** - Noninsect animal hosts are given, if appropriate, for species that are external or internal parasites (e.g., fleas, lice), for species that are normally found in a specific or general host's nest or burrow, or for predators whose specific prey items are noninsects. Hosts included in this category are vertebrates such as mammals and birds, noninsect arthropods, and molluscs. Only the normal, preferred hosts are given, not accidentals.

**PLANT (P)** - Host-food plants for herbivorous or xylophagous species or pollen sources are given, if appropriate, for the adult, immature stages, or both. Predators may have a host plant given if they are restricted to one plant for breeding or because of prey host specificity. All plant species acronyms are taken from Garrison and Skovlin (1976).

## **ABUNDANCE**

Abundance figures usually are not based on hard data--that is, of numbers of specimens collected in the Andrews Forest. For most species, true abundances are not known. When given, the abundance reflects general knowledge of the species based on its biology, habits, habitats, or collectability, or else reflects the abundances given in a few of the reference studies or collections.

A = abundant--easily collected, widespread

C = common--restricted habitat but easily collected in that habitat

U = uncommon--not easily collected because of restricted habitats or general lower abundance

R = rare--difficult to collect or seldom seen

## **COLLECTION**

The pinned, alcohol, and slide collections are currently housed in the Andrews Forest Arthropod Collection (AFAC) in the Systematic Entomology Laboratory, Department of Entomology, Oregon State University, Corvallis, Oregon 97331. Species labelled with P, A, or S have voucher specimens represented in the designated collections.

P = pinned specimens

A = specimens in alcohol

S = specimens on microscope slides

## **REFERENCES LISTING SPECIES FROM THE ANDREWS FOREST**

The numbers refer to the following references that list species collected from the Andrews Forest (unless otherwise stipulated). Some of the species present in this list do not have voucher specimens deposited in the AFAC, however their presence on the Andrews Forest has been indicated in the references. References to published material are included in the Literature Cited.

1. Voegtl 1982
2. Mispagel and Rose 1978
3. Lewis and Maser 1981
4. Anderson and others 1982
5. Mahmoud 1979
6. Cooper 1981
7. Plecoptera species from the Andrews and adjacent areas of the Cascade Mts. compiled by G.W. Courtney (OSU, Dept. of Entomology), April 1982.
8. Ephemeroptera species from the Andrews and adjacent areas of the Cascade Mts. compiled by G.W. Courtney (OSU, Dept. of Entomology), April 1982 (based on collections by D.M. Lehmkohl and P.P. Harper)
9. Plecoptera specimens collected by G.M. Cooper and B. Frost (OSU, Dept. of Entomology) during 1978-79 and identified by B.P. Stark, August 1980
10. Spider species compiled by A.R. Moldenke and B.L. Fichter (OSU, Dept. of Entomology), 1982-83
11. Stonedahl 1982
12. Stonedahl 1984
13. Lightfoot 1986
14. Anderson and others 1984

15. Pselaphidae species collected by D.S. Chandler (Dept. of Entomology, Univ. of New Hampshire, Durham, N.H.) in June 1983. (August, 1983 personal communication)
16. Denning 1982
17. Hawkins 1982
18. Schwartz 1981
19. Plecoptera species compiled by R. Wildman (OSU, Dept. of Entomology) from identifications made by P. Harper on Mack Creek emergence trap data from riparian studies during 1982-83
20. Butterflies of the Andrews Forest, including those species collected within 5 miles in adjacent Linn Co., compiled by P. Hammond (OSU, Dept. of Entomology) (updated periodically from 1983-1989)
21. Aquatic and semiaquatic Diptera compiled by G.W. Courtney (OSU, Dept. of Entomology), 1984
22. Oribatid mites compiled by A.R. Moldenke, B.L. Fichter and D. Walter (OSU, Dept. of Entomology), 1984
23. Pselaphidae and other insects collected during the summer of 1984 by D. Chandler (Dept. of Entomology, Univ. of New Hampshire), 1985-87.  
Specimens in the OSU and/or UNH collection.
24. Plecoptera species from riparian studies compiled by N.H. Anderson (OSU, Dept. of Entomology), February 1985
25. Moldenke and Fichter 1988
26. Oribatid mites collected from the Andrews Forest compiled by D.E. Walter, 1985 (from a manuscript in preparation: The effects of litter type and elevation on colonization of mixed coniferous litterbags by oribatid mites)
27. André 1980
28. André and Voegtlin 1981
29. Apoidea species from the McKenzie River Drainage and adjacent areas (including the Andrews Forest), compiled by A.R. Moldenke (OSU, Dept. of Entomology, 1985) (see also Appendix C)
30. Tenthredinidae collected and identified by D. Smith (USNM), 1984-1985
31. Parasites reared from spiders compiled by A.R. Moldenke and B.L. Fichter (OSU, Dept. of Entomology), March 1985
32. Thrips (Thysanoptera) identified by Kun-Suk Woo (Seoul, South Korea, visiting OSU, Dept. of Entomology), March 1985
33. Homoptera collected in August 1980 by P. Oman (OSU, Dept. of Entomology), compiled March 1985
34. Emerson and others 1984
35. Formicidae of the Andrews compiled by S. Shattuck (manuscript in preparation)
36. Insects found in spotted owl pellets, compiled by G.L. Parsons (OSU, Dept. of Entomology), 1985, from material collected by G. Miller (OSU, Dept. of Fisheries and Wildlife) on the Andrews Forest.
37. Carabidae from the Andrews LTER Site, compiled by D. Kavanaugh (Calif. Acad. of Sciences), October 1985
38. Chandler 1986
39. Chironomidae of Mack Creek, compiled by J.K. Furnish (OSU, Dept. of Entomology), April 1986
40. Litter/soil arthropods collected during the LITCOL study 1982-85, compiled by G.L. Parsons and A.R. Moldenke (OSU, Dept. of Entomology), 1987-1989
41. Arthropods collected during the Log Decomposition Study 1986-87, compiled by T. Schowalter and G.L. Parsons (OSU, Dept. of Entomology), 1987
42. Pselaphidae of the Andrews Forest by D. Chandler (manuscript in preparation)

43. Moths collected from blacklight trap studies, compiled by J.C. Miller and P. Hammond (OSU, Dept. of Entomology), 1986-87
44. Moths reared from host plant studies, compiled by J.C. Miller, P. Hammond, and B. Scacia (OSU, Dept. of Entomology), 1986-87
45. Campbell and Chandler 1987
46. Genera of Tipulidae identified by G.W. Byers and G. Courtney from Mack Creek, compiled by N.H. Anderson (OSU, Dept. of Entomology) 1986
47. Ephemeroptera of the HJA, a revised list, compiled by N.H. Anderson (OSU, Dept. of Entomology), 1988
48. Trichoptera adults from Lookout Creek, a UV-light study, compiled by R.W. Wisseman (OSU, Dept. of Entomology), 1988
49. Schowalter 1989
50. Carmean and others 1989
51. Lepidoptera species collected from the Andrews Forest by D. Ferguson (U.S. National Museum), 1989. Specimens in the USNM collection.
52. Gardner and Shelley 1989
53. Courtney 1989
54. Schowalter and others 1988
55. Aphid species collected from the Andrews Forest by Andy Jensen (OSU, Dept. of Entomology), 1991
56. Schwartz 1989

## ACKNOWLEDGMENTS

The following people have contributed significantly to the preparation of this list by actual collection of specimens, by providing identifications, or by providing biological information. Without their efforts and the efforts of others, this list would not have been possible. The authors express their gratitude for the time and effort put into this project by these people.

The drawing of *Malezonotus obrieni* is from Ashlock 1963. All other illustrations were drawn by Bonnie Hall. The caddis, stonefly, and mayfly illustrations first appeared in Cummins and Wilzbach 1985.

Photographs, courtesy of Art McKee and Gary Parsons are from a collection of photographs of the Andrews Forest.

Editorial assistance was provided by Martha Brookes, editor, USDA, Forest Service, Pacific Northwest Station.

Funding for arthropod related research on the Andrews Forest has been provided in part by the National Science Foundation grants listed below:

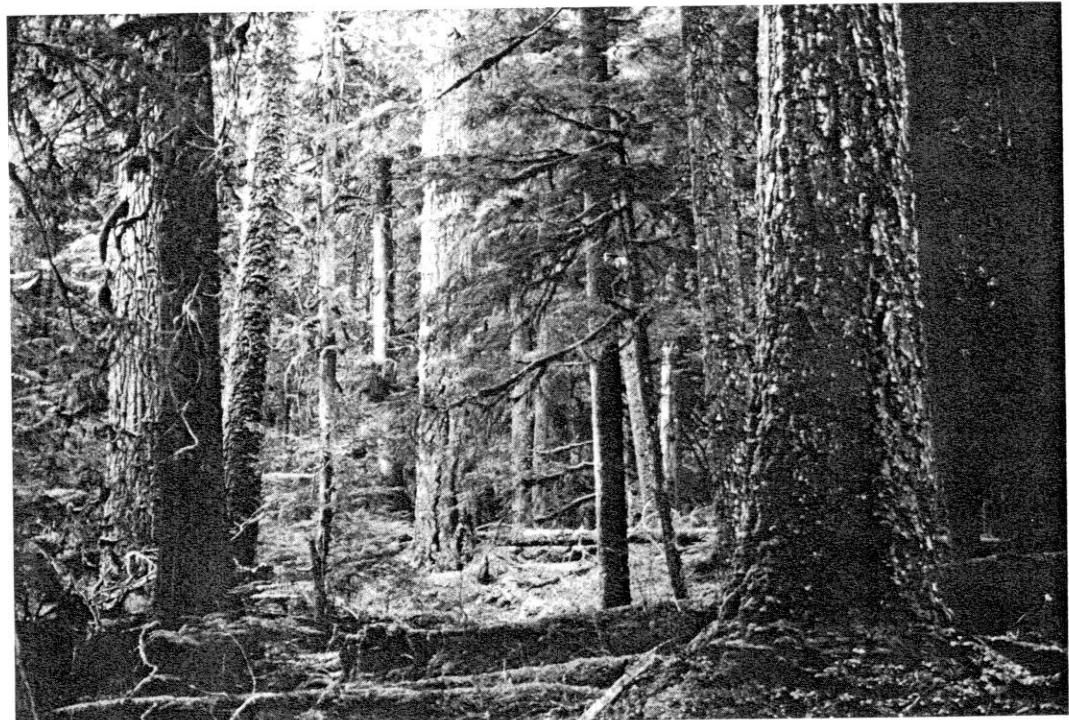

- GB 36810X : Coniferous Forest Biome Studies
- BMS 7514003: Canopy arthropods
- DEB 7803583: Canopy arthropods
- DEB 8012122: Long Term Ecological Research on the HJ Andrews Forest
- BSR 8300370: Support of the HJ Andrews Forest as a national research facility
- BSR 8306490: Nutrient cycling
- BSR 8508356: Riparian Studies on the HJ Andrews Forest
- BSR 8508452: Ectomycorrhizal mat studies
- BSR 8514325: Long Term Ecological Research on the HJ Andrews Forest
- BSR 8516590: Log decomposition/heterotroph structure
- BSR 8717434: Log decomposition/heterotroph structure

This view to the northeast shows much of the Lookout Creek watershed, which drains the Andrews Forest. The patches of snow on the ridgeline are natural meadows. Lookout Mountain is to the right of the snag.

The Cascades are relatively young mountains with steep slopes. Elevation within the Andrews Forest ranges from 300 to 1750 m. Cleared patches indicate past logging activities.

Much of the old-growth forest lacks a significant understory. The fallen trees are decay resistant, requiring 200 to 400 years for complete integration into the soil.

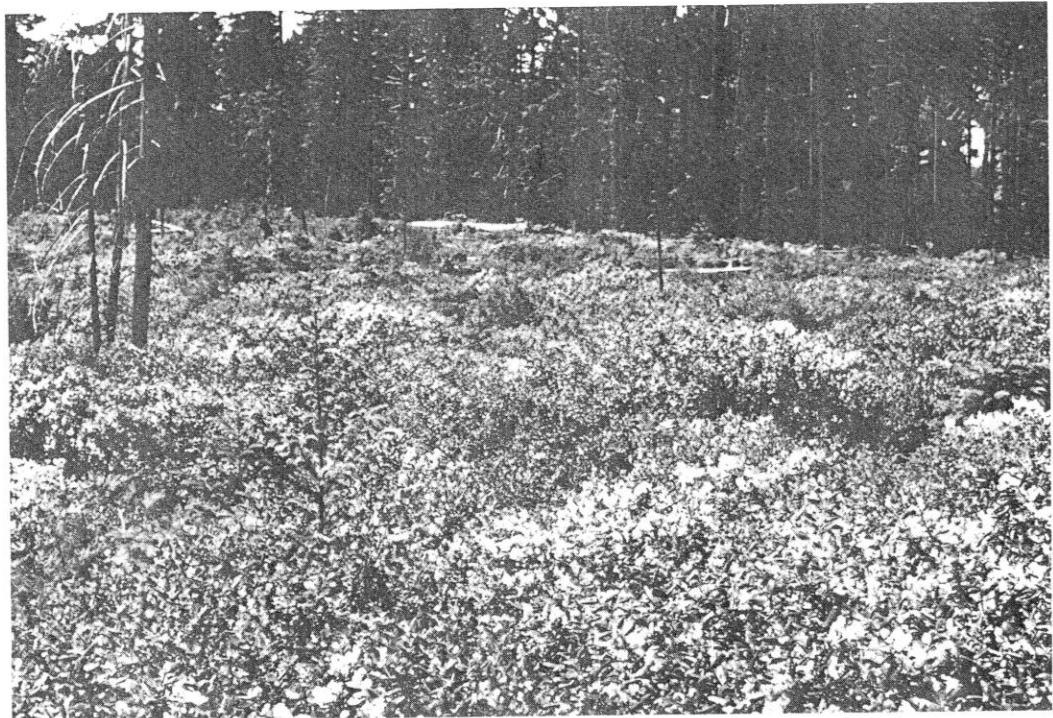

Open areas within old-growth stands contain more understory vegetation, dominated by *Rhododendron macrophyllum* and vine maple, *Acer circinatum*. Downed trunks and branches of conifers average 40 tons dry weight per hectare.

Parts of the Andrews Forest have been logged for experimental studies. The earliest stages of regrowth are usually dominated by a dense cover of low-growing broadleaved herbs and shrubs.

As succession proceeds, young conifers, here 10-year-old Douglas-fir, are subjected to competition by natural deciduous shrubs.

Subalpine meadows, at elevations over 1500 m, are fringed with noble fir, subalpine fir, Douglas-fir, hemlock, and Alaskan yellow cedar. Although seedlings appear to be actively invading the meadow, these small trees (3 to 6 feet tall) may be 50 to 100 years old.

Open ridgetops in this steep terrain, exposed to summer sun and heavy winter snow, have very thin mantles of soil and are characterized by a unique flora and fauna. On the eastern skyline is the McKenzie River drainage and The Three Sisters Wilderness.

Subalpine forests are subjected to harsh conditions, resulting in snags of assorted ages, gaunt dead limbs, and a range in canopy height. Open areas are evident, and many species of plants occur abundantly in the meadow/forest ecotone.

This cold, swift-flowing stream is typical of aquatic habitats on the Andrews Forest. Coarse woody debris has a major impact on structure and diversity in these streams.

### **Canopy**

The forest canopy provides an extensive and structurally diverse habitat for arthropods and other organisms. Various conifer species dominate the overstory, but a diverse understory occurs below. The canopy in old-growth stands may extend some 60m above the forest floor, providing enormous surface area. Here photosynthetic rates are high, and abundant lichens are important as nitrogen fixers. Leaf surfaces, small and large twigs and branches, and the bark on the trunks all harbor distinct assemblages of organisms. In spite of chemical protection afforded by terpenes and endophytic fungi, leaves and cones are consumed by numerous herbivores. Hemlocks, Douglas-fir, and true firs share a variety of generalist feeders and their associated predators and parasitoids. Western redcedar is attacked by a limited number of specialist feeders. Defoliators have not been discovered on Pacific yew. The larvae of sawflies and moths make up much of this leaf-chewing community. Many of the more than 100 species of Geometridae found on the Andrews Forest, such as the hemlock looper, *Lambdina fiscellaria somniaria* (top), occur in the canopy. Aphids, some mirid bugs, leafhoppers, and thrips suck fluids from the leaves and branches. Lichens and bark fungi are fed on by springtails, oribatid mites, and bark lice. Abundant predators and parasitoids contribute to regulation of the numbers of herbivores, thus influencing their impact on the forest. Spiders such as *Metaphidippus aeneolus* (lower right) are among the most abundant generalist predators in the canopy, but also present are predaceous larvae and adults of beetles, lacewings, and snakeflies. Some predatory bugs are host-plant specific; the mirid *Phytocoris nobilis* (lower left) is found chiefly on noble fir. Hymenopterous and dipterous parasitoids abound, many attacking specific herbivores. Some of these parasitoids may in turn be hosts to hyperparasitoids.

### Newly Fallen Log

A newly fallen log contains vast quantities of stored nutrients unavailable for use in the forest ecosystem until they are released through decomposition. Hundreds of species of arthropods are associated with the decomposition of fallen logs in the Andrews Forest. M.A. Deyrup (1975, 1976) studied dead and dying Douglas-fir and found more than 150 different kinds of arthropods (wood feeders, predators, and parasitoids) on this one tree species alone. Some of the first insects to invade a fallen log are bark beetles, feeding on the cambium, and ambrosia beetles, such as *Trypodendron lineatum* (lower left), which burrow into the sapwood. They inoculate their initial tunnels with a diverse array of fungi, bacteria, phoretic mites, nematodes, and protozoans. A common predator of bark beetle larvae is the larva of the dolichopodid fly, *Medetera aldrichi* (lower right). After the beetle larvae are reared and the gallery is abandoned, it becomes overgrown with yeasts, bacteria, and the fruiting bodies of fungi. Fungi mobilize nutrients out of the wood and translocate them to the fruiting structures in the gallery, providing a basis for a complex ecosystem. Microarthropods, including prostigmatid and oribatid mites and springtails, feed on individual hyphae and spores. Larvae of sciarid flies and mycetophagid beetles graze on beds of fungi. Larvae of the fly *Drosophila montana* (upper left) masticate fungal hyphae to promote yeast growth and then feed on the yeast. Galleries abandoned for a year contain countless nematode worms, themselves fed upon by nematophagous mites. After the nutrient-rich cambium is decomposed, log breakdown slows. Wood-boring beetles such as the cerambycid *Rhagium inquisitor* (upper right) generally take several years to mature. As the larvae of these beetles tunnel deeper into the log, further access is opened for other arthropods and microorganisms. Many of these sapwood and heartwood feeders have evolved intricate symbiotic relationships with gut-inhabiting microbes for efficient conversion of the various components of the wood substrate.

### **Decomposed Log**

Conifer forests in the Pacific Northwest are characterized by the greatest quantities of coarse woody debris of any ecosystem in the world. Much of the physical degradation of logs is accomplished by a succession of arthropods associated with each advancing stage of decomposition. In the middle stages of decay, nutrients within the remaining sapwood and heartwood are often more difficult to use. Carpenter ants, such as *Camponotus modoc* (lower left), remove vast quantities of wood in constructing their nests. The dampwood termite, *Zootermopsis angusticollis* (upper right), is able to use remaining wood as a food source with the aid of symbiotic gut bacteria. In the later stages of decay, the remaining punky wood is processed into the soil system through the feeding activity of the terrestrial isopod *Ligidium gracile* (upper left) and other organisms typically associated with litter decomposition. Complete decomposition may take 200 years or more. Decaying logs also offer refuge sites for small mammals, salamanders, and many other creatures that live on the forest floor. Logs in shaded old-growth forests provide a good substrate for mosses, which in turn are food for the flightless lace bug *Acalypta saundersi* (center). Flightlessness is a characteristic of many arthropods inhabiting old growth, as distinct from those inhabiting younger forests. For example, *Acalypta* has two common species in the Andrews Forest--*A. saundersi* in mature and old-growth forests and *A. barberi* in open sunny habitats. *A. saundersi* is always flightless, but *A. barberi* is dimorphic, having both fully winged and flightless individuals. The flightless condition of *A. saundersi* appears to have developed in conjunction with long-term stability of habitat. Related flightless species of *Acalypta* in North America also have associations with habitat permanence.

### **Forest Floor/Litter**

In Pacific Northwest coniferous forests, the litter layer is a seasonally renewed mixture of deciduous leaves, conifer needles, and small twigs and branches raining down from the canopy. Mosses, lichens, and fungi are abundant. This assemblage provides a stable habitat supporting a rich assortment of characteristic species of arthropods. Within the Andrews Forest, as many as 200 species per square foot of forest floor can be found. Detritivores, such as the millipede *Harpaphe haydeniana* (see cover), Collembola, and oribatid mites are very abundant, processing the litter material into humus. Because herbaceous plants are not abundant, true herbivores are scarce, although snails and slugs abound. Many root-feeding beetles, such as the weevil *Lobosoma horridum* (top right), probably feed on both living and dead plant material. Seeds dropping to the forest floor are eaten by lygaeid bugs and a diverse assemblage of other seed-feeding insects. Mushrooms provide food for fungivorous beetles and fly larvae. Many canopy insects use the forest floor litter layer as a pupation or hibernation site. A variety of predators, such as spiders, beetles, and centipedes, occur here. The smaller forms crawl through the litter, while the larger ones patrol the surface. The large, nocturnal, flightless tiger beetle, *Omus dejeani* (bottom), wanders through the forest attacking any small arthropod it encounters. Its larval stage is hooked securely in a burrow, from which it springs out to grab passing prey. Slugs and snails are pursued by specialized snail-eating carabid beetles. *Cychrus tuberculatus* (left), which has an elongated head and mouthparts adapted for reaching into the narrow opening of a snail shell, is an example. These larger surface-wandering arthropods are in turn fed upon by salamanders, birds, and shrews.

### **Humus/Soil**

The humus layer is a zone of important biological activity where small pieces of litter are broken down into base nutrients by arthropods, fungi, and microbes. These nutrients percolate into the underlying soil where they are taken up by the roots of plants and returned to the canopy biomass. The humus/soil habitat is relatively uniform and stable, supporting a specialized arthropod fauna. Soil dwellers tend to be small, flightless, blind, and, in the case of springtails like *Onychiurus* sp. (center), with reduced spring mechanisms. Individual numbers and species richness of oribatid mites and springtails are comparable to the richest soil faunas reported anywhere in the world. More than 100 species of oribatid mites, like *Nanhermannia* sp. (left), with up to 150,000 individuals per m<sup>2</sup>, are present in Andrews Forest soils. Some 40 species of springtails, with up to 15,000 individuals per m<sup>2</sup>, have been recorded as well. Although most species are generally widespread, abundance is usually related to a specific stage of forest succession or a narrow range within a temperature-moisture gradient. Detritivores drive the soil ecosystem by reducing large pieces of litter into small particles readily attacked by microbes and fungi. These are then grazed by oribatid and prostigmatid mites, springtails, and a great diversity of insects. Subterranean predators include geophilomorph centipedes, pseudoscorpions, gamasid mites, and pselaphid, carabid, cantharid, and staphylinid beetles, of which *Fenderia capizzi* (right) is an example.

### **Clearcut**

The Andrews Forest contains many small stands where, for research purposes, the trees have been cut and removed at various times over the past 40 years. These cut areas include complete clearcuts with and without the slash burned, various conifer replanting schemes, cuts with shelterwood retained for natural seeding, and selective tree removal with minimal understory disturbance. In the early stages of regrowth, annual plants and deciduous shrubs are dominant. The arthropod fauna found in clearcuts is a complex mixture of immigrants from adjacent forested land, remnants from the mature pre-logged forest, immigrants from natural meadow and forest gap communities, and some exotic species. A few species associated with forest trees can be found on seedlings as well. The diverse fauna associated with deciduous and annual plants elevates species richness to levels greater than those found in later stages of forest succession. In the early stages of regrowth, herbivores comprise a significant portion of the fauna. Most conspicuous are winged grasshoppers (not the wingless taxa common in natural meadows), sucking bugs, and caterpillars such as the larva of the adult noctuid moth, *Oncocnemis dunbari* (top left). In the open, sunny, hot places typical of clearcuts, seed-feeding carabid beetles and lygaeid bugs, such as *Malezonotus obrieni* (lower right) display great species richness and abundance. The major predators in clearcuts include large carabid beetles, wandering spiders such as the wolf spider, *Schizocosca mccooki* (upper right), and ants such as *Formica neorufibarbis* (lower left).

### **Meadow**

The few natural meadows found on the Andrews Forest are primarily at the higher elevations. They range from xeric, shallow-soil types with exposed bedrock and soil as found on ridgetops, to lush, moist, deep-soil types on hillsides. Grasses, sedges, and a variety of annual and perennial flowering plants are the predominant vegetation. Meadows are extremely rich in characteristic arthropods that are generally not shared with the forest habitat. The xeric ridgeline communities contain isolated populations of species generally characteristic of dry habitats east of the Cascade Range, of warm communities to the south, and of scrub communities in the far north. Some species of the meadow fauna, wolf spiders and winged locusts for example, invade newly clearcut regions. However, many of the native meadow insects, such as the grasshopper *Boonacris alticola* (bottom), are flightless and not vagile. They may represent remnants of formerly widespread meadow communities that existed during xeric periods. Meadow communities support diverse and abundant pollinator faunas. Butterflies such as *Parnassius clodius* (top left), syrphid flies, bee-flies, bees, and wasps abound on flowers. Nearly all bee species are generalist foragers, as is the bumble bee *Bombus vosnesenskii* (top right). A few bee species specialize on one plant family or even a single genus of plant.

### **Aquatic**

Aquatic habitats on the Andrews Forest are dominated by cold, clear, steep-gradient streams. Flows are typically high after fall rains and winter snow-melt, and low during the summer. Large amounts of coarse woody debris along with boulders of all sizes create a diverse habitat of riffles, falls, and pools. Substrates are mostly gravels and sands. The forest and clearcuts provide various degrees of shading to the streams, with abundant riparian vegetation contributing organic material. The full array of aquatic and semi-aquatic microhabitats is effectively used by a rich and abundant fauna, which has been intensively studied. Mayflies, stoneflies, and caddisflies are especially well represented, as are the stream-dwelling Diptera. Many unique adaptations are exhibited for coping with the rigors of the stream environment. Larvae of the psychodid fly *Maruina lanceolata* (upper right) inhabit rocks in the splash zone where they maintain position by means of ventral sucker-like disks. Glossosomatid caddisfly larvae (bottom) use materials at hand for building protective cases carried about as they graze on plant and animal material. Stoneflies (left) patrol the substrate where some are shredders of organic material and others prey on aquatic organisms. Mayfly naiads (center) are found in strong current, feeding on passing organic particles.

## APPENDIX A: HOST ACRONYMS

Listed below are all the acronyms used under the host category in this list. They are subdivided into Animal (A-), Insect (I-), and Plant (P-) hosts. Acronyms generally relate to a family, genus, or specific name for the host, although sometimes a more general name is used. The acronym "polylec" is included at the end of the plant list.

### ANIMAL (A-)

A-ACARI = mites  
A-BIRD = birds  
A-Clca = *Clethrionomys californicus* (Merriam), California red-backed vole  
A-DEER = deer and elk(?)  
A-DIPLO = DIPLOPODA - millipedes  
A-Euto = *Eutamias townsendii* (Bachman), Townsend chipmunk  
A-Glsa = *Glaucomys sabrinus* (Shaw), northern flying squirrel  
A-Mior = *Microtus oregoni* (Bachman), creeping vole  
A-Negi = *Neurotrichus gibbsii* (Baird), shrew-mole  
A-ORIBA = oribatid mites  
A-Pema = *Peromyscus maniculatus* (Wagner), deer mouse  
A-RODNT = rodents (+/- shrews)  
A-Scor = *Scapanus orarius* True, coast mole  
A-SNAIL = snails and slugs  
A-Sorex = *Sorex* spp., shrews  
A-Spbe = *Spermophilus beechyi* (Richardson), California ground squirrel  
A-SPID = spiders (ARANEAE)  
A-SQUIR = squirrels and chipmunks  
A-Thma = *Thomomys mazama* Merriam, Mazama pocket gopher  
A-WORM = annelid worms  
A-Zatr = *Zapus trinotatus* Rhoads, Pacific jumping mouse

### INSECT (I-)

I-ACRID = ACRIDIDAE (ORTHOPTERA), grasshoppers  
I-Adco = *Adelges cooleyi* (Gillette) (HEMIPTERA:HOMOPTERA;ADELGIDAE)  
I-AGROM = AGROMYZIDAE (DIPTERA), agromyzid leafminer flies  
I-Altic = *Altica* spp. (COLEOPTERA;CHRYSOMELIDAE), flea beetles  
I-ALEYR = ALEYRODIDAE (HEMIPTERA:HOMOPTERA), whiteflies  
I-Andre = *Andrena* spp. (HYMENOPTERA;ANDRENIDAE), andrenid bees  
I-Antho = *Anthophora* spp. (HYMENOPTERA;ANTHOPHORIDAE), anthophorid bees  
I-APHID = APHIDOIDEA (HEMIPTERA:HOMOPTERA), aphids, adelgids, etc.  
I-ARCTI = ARCTIIDAE (LEPIDOPTERA), tiger moths  
I-BEES = various bees (HYMENOPTERA;APOIDEA)  
I-BRACO = BRACONIDAE (HYMENOPTERA), braconid parasitic wasps  
I-Bombu = *Bombus* spp. (HYMENOPTERA;APIDAE), bumble bees  
I-BUPR = BUPRESTIDAE (COLEOPTERA), metallic wood-boring beetles  
I-CECID = CECIDIOMYIDAE (DIPTERA), cecidiomyid gall midges  
I-CERAM = CERAMBYCIDAE (COLEOPTERA), long-horned wood-boring beetles  
I-CHRYS = CHRYSOMELIDAE (COLEOPTERA), leaf beetles  
I-CICDL = CICADELLIDAE (HEMIPTERA:HOMOPTERA), leaf hoppers  
I-COCCD = COCCOIDEA (HEMIPTERA:HOMOPTERA), scale insects  
I-COLEO = COLEOPTERA, beetles  
I-Colle = *Colletes* spp. (HYMENOPTERA;COLLETIDAE), colletid bees  
I-CURC = CURCULIONIDAE (COLEOPTERA), weevils  
I-CYNIP = CYNIPIDAE (HYMENOPTERA), gall wasps  
I-DIASP = DIASPIDIDAE (HEMIPTERA:HOMOPTERA), armored scales

I-DIPRI = DIPRIONIDAE (HYMENOPTERA), conifer sawflies  
 I-DIPT = DIPTERA, flies  
 I-EGGS = insect eggs  
 I-EUCER = EUCERINI (HYMENOPTERA; ANTHOPHORIDAE), *Melissodes* & *Synhalonia* spp.  
 I-EUMEN = EUMENIDAE (HYMENOPTERA), eumenid wasps  
 I-Formi = *Formica* spp. (HYMENOPTERA; FORMICIDAE), thatch nest ants  
 I-FORMI = FORMICIDAE (HYMENOPTERA), ants  
 I-GALL = gall forming insects (DIPTERA, HYMENOPTERA)  
 I-GEOM = GEOMETRIDAE (LEPIDOPTERA), measuring worms  
 I-HALIC = HALICTIDAE (HYMENOPTERA), halictid bees  
 I-HETER = HEMIPTERA:HETEROPTERA, true bugs  
 I-HOMOP = HEMIPTERA:HOMOPTERA, leafhoppers, aphids, scales, etc.  
 I-HYMEN = HYMENOPTERA, bees and wasps  
 I-ICHNE = ICHNEUMONIDAE (HYMENOPTERA), ichneumonid parasitic wasps  
 I-LEAFM = leafmining insects (LEPIDOPTERA, DIPTERA)  
 I-LEPID = LEPIDOPTERA, moths and butterflies  
 I-LYGAE = LYGAEIDAE (HEMIPTERA:HETEROPTERA), seed bugs  
 I-MEGAC = MEGACHILIDAE (HYMENOPTERA), megachilid leafcutting bees  
 I-Megac = *Megachile* spp. (HYMENOPTERA; MEGACHILIDAE), leafcutting bees  
 I-MYCET = MYCETOPHILIDAE (DIPTERA), fungus gnats  
 I-NEURO = NEUROPTERA, lacewings  
 I-NOCT = NOCTUIDAE (LEPIDOPTERA), noctuid moths  
 I-NYMPH = NYMPHALIDAE (LEPIDOPTERA), brush-footed butterflies  
 I-ORTH = ORTHOPTERA, grasshoppers, crickets, etc.  
 I-Osmia = *Osmia* spp. (HYMENOPTERA; MEGACHILIDAE), bees  
 I-PCOCC = PSEUDOCOCCIDAE (HEMIPTERA:HOMOPTERA), mealybugs  
 I-PENT = PENTATOMIDAE (HEMIPTERA:HETEROPTERA), stink bugs  
 I-PSOC = PSOCOPTERA, bark lice  
 I-SCOLY = SCOLYTIDAE (COLEOPTERA), bark beetles  
 I-SIMUL = SIMULIIDAE (DIPTERA), black flies  
 I-SIRIC = SIRICIDAE (HYMENOPTERA), horntail wasps  
 I-SPHEC = SPHECIDAE (HYMENOPTERA), sphecid wasps  
 I-SYRPH = SYRPHIDAE (DIPTERA), syrphid flies  
 I-TENTH = TENTHREDINOIDEA (HYMENOPTERA), sawflies  
 I-THRIP = THRIPIDAE (THYSANOPTERA), thrips  
 I-THYSP = THYSANOPTERA, thrips

## PLANT (P-)

P-Abam = *Abies amabilis* (Dougl.) Forbes (PINACEAE), Pacific silver fir  
 P-Abpr = *Abies procera* Rehder (PINACEAE), noble fir  
 P-Abies = *Abies* spp. (PINACEAE), firs  
 P-Acci = *Acer circinatum* Pursh (ACERACEAE), vine maple  
 P-Acer = *Acer* spp. (ACERACEAE), maples  
 P-Alnus = *Alnus* spp. (BETULACEAE), alder  
 P-APOCY = APOCYNACEAE, dogbane Family  
 P-Arcto = *Arctostaphylos* spp. (ERICACEAE), manzanita  
 P-Arme = *Arbutus menziesii* Pursh (ERICACEAE), Pacific madrone  
 P-Arceu = *Arceuthobium* sp. (LORANTHACEAE), dwarf mistletoe  
 P-Ascle = *Asclepias* spp. (ASCLEPIADACEAE), milkweed  
 P-Berbe = *Berberis* spp. (BERBERIDACEAE), barberry, Oregon grape  
 P-Cach = *Castanopsis chrysophylla* (Dougl.) A.DC. (FAGACEAE), golden chinkapin  
 P-Caloc = *Calocortus* spp. (LILIACEAE), mariposa lily  
 P-Campa = *Campanula* spp. (CAMPANULACEAE), bellflower  
 P-CAPRI = CAPRIFOLIACEAE, honeysuckle Family  
 P-Casti = *Castilleja* spp. (SCROPHULARIACEAE), paintbrush  
 P-Ceano = *Ceanothus* spp. (RHAMNACEAE), ceanothus, buckbrush  
 P-Cirsi = *Cirsium* spp. (COMPOSITAE), thistles  
 P-COMP = COMPOSITAE, aster Family

P-CONIF = coniferous tree hosts  
 P-Cornu = *Cornus* spp. (CORNACEAE), dogwoods  
 P-Coryl = *Corylus* sp. (BETULACEAE), hazelnut  
 P-CRUCI = CRUCIFERAE, mustard Family  
 P-CUPR = CUPRESSACEAE, cypress Family  
 P-DECID = deciduous tree hosts  
 P-Epilo = *Epilobium* spp. (ONAGRACEAE), fireweed, willowweed  
 P-Equis = *Equisetum* spp. (EQUISETACEAE), horsetail, scouring rush  
 P-ERICA = ERICACEAE, heath Family  
 P-Eriog = *Eriogonum* spp. (POLYGONACEAE), buckwheat  
 P-Fraga = *Frageria* spp. (ROSACEAE), strawberry  
 P-FORBS = a variety of forb hosts  
 P-FUMAR = FUMARIACEAE, fumitory Family  
 P-Galiu = *Galium* spp. (RUBIACEAE), bedstraw  
 P-GENER = generalist feeder on a wide range of plants  
 P-GRASS = a variety of grass hosts  
 P-Hodi = *Holodiscus discolor* (Pursh) Maxim. (ROSACEAE), cream bush, ocean spray  
 P-Hype = *Hypericum perforatum* L. (HYPERICACEAE), klamath weed  
 P-LEGUM = LEGUMINOSAE, pea Family  
 P-Lide = *Libocedrus decurrens* Torr. (CUPRESSACEAE), incense cedar  
 P-LILIA = LILIACEAE, lily Family  
 P-LORAN = LORANTHACEAE, mistletoe Family  
 P-Lotus = *Lotus* spp. (LEGUMINOSAE), deerweed  
 P-Lupin = *Lupinus* spp. (LEGUMINOSAE), lupine  
 P-MALVA = MALVACEAE, mallow Family  
 P-Merte = *Mertensia* spp. (BORAGINACEAE), bluebells  
 P-Monet = *Monotropa* sp. (ERICACEAE), indian pipe  
 P-ONAGR = ONAGRACEAE, evening-primrose Family  
 P-Penst = *Penstemon* spp. (SCROPHULARIACEAE), penstemon  
 P-Phace = *Phacelia* spp. (HYDROPHYLLACEAE), phacelia  
 P-Picea = *Picea* spp. (PINACEAE), spruce  
 P-Pico = *Pinus contorta* Dougl. ex Loud. (PINACEAE), lodgepole pine  
 P-Pinus = *Pinus* spp. (PINACEAE), pine  
 P-Plant = *Plantago* spp. (PLANTAGINACEAE), plantain  
 P-POLYG = POLYGONACEAE, buckwheat Family  
 P-Popul = *Populus* sp. (SALICACEAE), cottonwood  
 P-Poten = *Potentilla* spp. (ROSACEAE), cinquefoil  
 P-Prvid = *Prunus virginiana demissa* (Nutt.) Torr. (ROSACEAE), western chokecherry  
 P-Psme = *Pseudotsuga menziesii* (Mirbel) Franco (PINACEAE), Douglas-fir  
 P-Ptaq = *Pteridium aquilinum* (L.) Kuhn (POLYPODIACEAE), braken fern  
 P-Querc = *Quercus* spp. (FAGACEAE), oaks  
 P-Quga = *Quercus garryana* Dougl. (FAGACEAE), Oregon white oak  
 P-Ranun = *Ranunculus* spp. (RANUNCULACEAE), buttercup  
 P-RHAMN = RHAMNACEAE, buckthorn Family  
 P-Rhma = *Rhododendron macrophyllum* G. Don (ERICACEAE), Pacific rhododendron  
 P-Ribes = *Ribes* spp. (GROSSULARIACEAE), currant, gooseberry  
 P-ROSAC = ROSACEAE, rose Family  
 P-Rubus = *Rubus* spp. (ROSACEAE), blackberry  
 P-Salix = *Salix* spp. (SALICACEAE), willows  
 P-Sagl = *Sambucus glauca* Nutt. (CAPRIFOLIACEAE), blue elderberry  
 P-Sambu = *Sambucus* spp. (CAPRIFOLIACEAE), elderberry  
 P-SCROP = SCROPHULARIACEAE, figwort Family  
 P-Sedum = *Sedum* sp. (CRASSULACEAE)  
 P-Seja = *Senecio jacobaea* L. (COMPOSITAE), tansy ragwort  
 P-SHRUB = a variety of shrub hosts  
 P-Sidal = *Sidalcea* spp. (MALVACEAE), checker-mallow  
 P-Smila = *Smilacina* spp. (LILIACEAE), Solomon-plume  
 P-Stach = *Stachys* spp. (LABIATAE), hedge-nettle  
 P-Symp = *Syphoricarpos* spp. (CAPRIFOLIACEAE), snowberry

P-Thpl = *Thuja plicata* Donn. (CUPRESSACEAE), western redcedar  
P-TREES = a variety of tree hosts  
P-Trifo = *Trifolium* spp. (LEGUMINOSAE), clover  
P-UMBEL = UMBELLIFERAE, parsley Family  
P-URTIC = URTICACEAE, nettle Family  
P-Vacci = *Vaccinium* spp. (ERICACEAE), blueberry, huckleberry  
P-Vame = *Vaccinium membranaceum* Dougl. (ERICACEAE), big whortleberry  
P-Vicia = *Vicia* spp. (LEGUMINOSAE), vetch  
P-VIOLA = VIOLACEAE, violet Family  
polylec = polyleptic: gathers pollen from a wide range of flowers (generalist)

**APPENDIX B:**  
**LIST OF PARASITES ASSOCIATED WITH HOSTS**  
**KNOWN TO BE PRESENT IN THE ANDREWS FOREST**

These parasites are known to be associated with hosts present on the Andrews Forest. Most parasites are fairly specific in their host associations and probably are present wherever their hosts are found. No actual collections of these parasites have been made in the few studies where the hosts were collected. Most of these parasite/host associations have been made on hosts collected elsewhere in Oregon, and thus probability is high that they also occur here. Those parasites definitely known from collections of hosts from the Andrews are included in the main list. This information was provided by Chris Maser, Forest Science Laboratory, Oregon State University (see Emerson and others 1984, and Whitaker and Maser 1985). Species followed by an asterisk (\*) are associated with hosts known to be present, however, these parasites have not yet been recorded from Oregon but could occur here. A host list with scientific names is given at the end of the parasite list. Mammal host names are from Hall 1981 and Chapman and Feldhamer 1982.

Taxonomic category of parasite	Hosts at Andrews Forest
<b>PHTHIRAPTERA</b> (from Emerson and others 1984)	
(suborder) <b>MALLOPHAGA</b>	
<b>BOOPIDAE</b>	
<i>Heterodoxus spiniger</i> (Enderlein)	dog, coyote
<b>TRICHODECTIDAE</b>	
<i>Bovicola concavifrons</i> (Hopkins) *	elk
<i>Bovicola longicornis</i> (Nitzch) *	elk
<i>Eutrichophilus setosus</i> (Giebel)	porcupine
<i>Felicola</i> spp. *	mountain lion, bobcat
<i>Neotrichodectes minutus</i> (Paine)	long-tailed weasel
<i>Neotrichodectes osborni</i> Keler	spotted skunk
<i>Stachiella erminea</i> Hopkins	short-tailed weasel
<i>Stachiella larseni</i> Emerson	mink
<i>Stachiella retusa martis</i> Werneck *	marten
<i>Trichodectes canis</i> (de Geer)	coyote
<i>Trichodectes octomaculatus</i> Paine *	raccoon
<i>Tricholipeurus lipeurooides</i> (Megnin)	mule deer
<i>Tricholipeurus parallelus</i> (Osborn)	mule deer
<i>Tricholipeurus pinquis euarctidos</i> (Hopkins) *	black bear
(suborder) <b>ANOPLURA</b>	
<b>ENDERLEINELLIDAE</b>	
<i>Enderleinellus osborni</i>	
	Kellogg & Ferris
<i>Enderleinellus tamiasciuri</i> Kim	Beechy ground squirrel
<i>Microphthirus incinatus</i> (Ferris)	chickaree
	northern flying squirrel
<b>HOPLOPLEURIDAE</b>	
<i>Hoplopleura hesperomydis</i> (Osborn)	deer mouse
<i>Hoplopleura sciuricola</i> Ferris	chickaree
<i>Hoplopleura trispinosa</i> (Kellogg & Ferris)	northern flying squirrel

Taxonomic category of parasite	Hosts at Andrews Forest
<b>LINOGNATHIDAE</b>	
<i>Linognathus setosus</i> (van Olfers)	coyote, dog
<b>POLYPLACIDAE</b>	
<i>Neohaematopinus inornatus</i>	
<i>Kellogg &amp; Ferris</i>	bushy-tailed woodrat
<i>Neohaematopinus sciuropteri</i> (Osborn)	northern flying squirrel
<i>Neohaematopinus semifasciatus</i> Ferris	chickaree
<i>Polyplax auricularis</i> Kellogg & Ferris	deer mouse
<b>ACARI</b> (from Whitaker & Maser, 1985)	
<b>ACARIDAE</b>	
<i>Acotyledon</i> sp. nr. <i>paradoxus</i> Oudemans	northern flying squirrel
<b>CHEYLETIDAE</b>	
<i>Acaropsellina summersi</i>	
<i>Smiley &amp; Whitaker</i>	northern flying squirrel (nest)
<i>Camincheyletus glaucomys</i>	
<i>Smiley &amp; Whitaker</i>	northern flying squirrel (nest)
<i>Eucheyletia bishoppi</i> Baker	Trowbridge's shrew, spotted skunk
<i>Eucheyletia oregonensis</i>	
<i>Smiley &amp; Whitaker</i>	northern flying squirrel (nest)
<b>CHIRODISCIDAЕ</b>	
<i>Alabidocarpus calcaratus</i> Lawrence	California myotis bat
<b>CHORTOGLYPHIDAE</b>	
<i>Aplodontopus latus</i> Fain	mountain beaver
<b>DERMANYSSIDAE</b>	
<i>Dermanyssus gallinoides</i> Moss	northern flying squirrel
<b>GLYCYPHAGIDAE</b>	
<i>Dermacarus hylandi</i> Fain	creeping vole
<i>Dermacarus jonesi</i> Fain & Whitaker	Townsend's chipmunk
<i>Dermacarus newyorkensis</i> Fain	Pacific jumping mouse
<i>Dermacarus spermophilus</i>	
<i>Fain &amp; Whitaker</i>	Townsend's chipmunk, golden-mantled ground squirrel
<i>Dermacarus tamiasciuri</i>	
<i>Rupes, Yunker &amp; Wilson</i>	northern flying squirrel, chickaree
<i>Glycyphagus hypudaei</i> (Koch)	shrews, many rodents, short-tailed weasel
<i>Gohieria</i> sp.	northern flying squirrel
<i>Microlabidopus americanus</i> Fain	mountain beaver
<i>Orycteroxenus soricis</i> (Oudemans)	shrews
<i>Xenorytes latiporus</i> Fain & Whitaker	spotted skunk
<i>Zibethacarus ondatrae</i>	
<i>(Rupes &amp; Whitaker)</i>	creeping vole
<b>LAELAPIDAE</b>	
<i>Alphalaelaps aploontiae</i> (Jellison)	shrews, mountain beaver, Townsends chipmunk
<i>Androlaelaps casalis</i> (Berlese)	mole, shrews, northern flying squirrel, deermouse

Taxonomic category of parasite	Hosts at Andrews Forest
<b>LAELAPIDAE</b> (continued)	
<i>Androlaelaps fahrenholzi</i> (Berlese)	mole, shrews, many rodents, carnivores
<i>Androlaelaps geomys</i> (Strandtmann)	Mazama pocket gopher
<i>Echinonyssus affinis</i> (Jameson)	Townsend's chipmunk
<i>Echinonyssus cynomys</i> (Radford)	long-tailed weasel
<i>Echinonyssus nr. cynomys</i>	northern flying squirrel
<i>Echinonyssus isabellinus</i> (Oudemans)	shrews, many rodents
<i>Echinonyssus longichelae</i> (Allred & Beck)	northern flying squirrel, gopher, long-tailed weasel
<i>Echinonyssus neotomae</i> (Eads & Hightower)	bushy-tailed woodrat
<i>Echinonyssus obsoletus</i> (Jameson)	shrews, California red-backed vole, deermouse, weasels
<i>Echinonyssus staffordi</i> (Strandtmann & Hunt)	long-tailed weasel, spotted skunk
<i>Echinonyssus thomomys</i> (Allred & Beck)	Mazama pocket gopher, long-tailed weasel
<i>Echinonyssus utahensis</i> (Allred & Beck)	pica, deermouse, short-tailed weasel
<i>Eubrachylaelaps debilis</i> Jameson	Trowbridge's shrew, chipmunk, deermouse, weasel
<i>Eubrachylaelaps stabularis</i> (Koch)	shrews, mole, many rodents, weasel, skunk
<i>Haemogamasus occidentalis</i> (Keegan)	shrews, moles, many rodents
<i>Haemogamasus onychymidis</i> (Ewing)	Mazama pocket gopher
<i>Haemogamasus pontiger</i> (Berlese)	northern flying squirrel, bushy-tailed woodrat
<i>Haemogamasus reidi</i> Ewing	many shrews, moles, rodents
<i>Haemogamasus thomomysi</i> Williams, Smiley, & Redington	Mazama pocket gopher
<i>Haemogamasus</i> sp.	mountain beaver
<i>Haemogamasus</i> n.sp.	California red-backed vole, <i>Microtus</i> spp.
<i>Laelaps alaskensis</i> Grant	water vole, Mazama pocket gopher
<i>Laelaps kochi</i> Oudemans	shrew-mole, <i>Microtus</i> spp., deermouse
<i>Patriyssus hubbardi</i> (Jameson)	mountain beaver
<b>LISTROPHORIDAE</b>	
<i>Aplodontochirus borealis</i>	mountain beaver
<i>Leporacarus sylvilagi</i> Fain, Whitaker, & Lukoschus	brush rabbit
<i>Listrophorus mexicanus</i> Fain	Pacific water shrew, <i>Microtus</i> spp.
<i>Lynxacarus mustelae</i> (Megnin)	long-tailed weasel
<i>Lynxacarus nearcticus</i> Fain & Hyland	mink
<i>Quasiliostrophorus microticolus</i> Fain, Whitaker, & Lukoschus	white-footed vole, red tree vole
<b>MACRONYSSIDAE</b>	
<i>Cryptonyssus desultorius</i> Radovsky	big brown bat, California myotis bat
<i>Macronyssus crosbyi</i> (Ewing & Stover)	big brown bat, California myotis bat
<i>Macronyssus macrodactylus</i> Rhadovsky & Beck	silver-haired bat
<i>Steatonyssus furmani</i> Tipton & Boese	hoary bat
<i>Steatonyssus occidentalis</i> (Ewing)	big-brown bat
" <i>Macronyssid</i> " n.sp.	big-brown bat, silver-haired bat, Calif myotis bat

Taxonomic category of parasite	Hosts at Andrews Forest
<b>MYOBIIDAE</b>	
<i>Acanthophthirius caudatus eptesicus</i>	
Fain & Whitaker	big brown bat
<i>Amorphacarus hengererorum</i> Jameson	shrews
<i>Amorphacarus soricis</i> Fain & Whitaker	Pacific water shrew
<i>Eadiea neurotrichus</i>	
Lukoschus, Klompen, & Whitaker	shrew-mole
<i>Eutalpacarus peltatus</i> Jameson	shrew-mole
<i>Protomyobia brevisetosa</i> Jameson	shrews, California red-backed vole
<i>Pteracarus aculeus</i>	
Dusbabeck & Lukoschus	big brown bat
<i>Pteracarus</i> sp. nr. <i>minutus daubentoni</i>	Dusbabeck long-legged myotis bat
<i>Radfordia ewingi</i> (Fox)	Pacific jumping mouse
<i>Radfordia hylandi</i> Fain & Lukoschus	creeping vole
<b>MYCOPTIDAE</b>	
<i>Mycoptes japonensis</i> Radford	water vole, California red-backed vole
<b>OTOEDRIDAE</b>	
<i>Notoedres</i> ( <i>Bakeracarus</i> ) sp.	big brown bat
<b>PYGMEPHORIDAE</b>	
<i>Pygmephorus designatus</i> Mahunka	Trowbridge's shrew, California red-backed vole, spotted skunk
<i>Pygmephorus horridus</i> Mahunka	coast mole, Trowbridge's shrew, vagrant shrew
<i>Pygmephorus johnstoni</i>	
Smiley & Whitaker	shrew-mole
<i>Pygmephorus scalopi</i> Mahunka	coast mole
<i>Pygmephorus whitakeri</i> Mahunka	coast mole
<b>SPINTURNICIDAE</b>	
<i>Spinturnix americanus</i> (Banks)	big brown bat
<i>Spinturnix bakeri</i> Rudnick	big brown bat

## SCIENTIFIC NAMES OF HOST SPECIES

### INSECTIVORA

<i>Neurotrichus gibbsi</i> (Baird)	shrew-mole
<i>Scapanus orarius</i> True	coast mole
<i>Sorex bendirei</i> (Merriam)	Pacific water shrew
<i>Sorex trowbridgii</i> Baird	Trowbridge's shrew
<i>Sorex vagrans obscurus</i> (Merriam)	dusky shrew
<i>Sorex vagrans vagrans</i> Baird	vagrant shrew
<i>Sorex vagrans yaquinae</i> (Jackson)	Yaquina shrew

### CHIROPTERA

<i>Eptesicus fuscus</i> (Palisot de Beauvois)	big brown bat
<i>Lasionycteris noctivagans</i> (LeConte)	silver-haired bat
<i>Lasiurus cinereus</i> (Palisot de Beauvois)	hoary bat
<i>Myotis californicus</i> (Audubon and Bachman)	California myotis

### LAGOMORPHA

<i>Ochotona princeps</i> (Richardson)	pika
<i>Sylvilagus bachmani</i> (Waterhouse)	brush rabbit

### RODENTIA

<i>Aplodontia rufa</i> (Rafinesque)	mountain beaver
<i>Arborimus albipes</i> Merriam	white-footed vole
<i>Arborimus longicaudus</i> True	red tree vole
<i>Clethrionomys californicus</i> Merriam	Calif. red-backed vole
<i>Erethizon dorsatum</i> (Linnaeus)	porcupine
<i>Eutamias townsendii</i> (Bachman)	Townsend's chipmunk
<i>Glaucomys sabrinus</i> (Shaw)	northern flying squirrel
<i>Microtus oregoni</i> (Bachman)	creeping vole
<i>Microtus richardsoni</i> (DeKay)	water vole
<i>Neotoma cinerea</i> (Ord)	bushy-tailed woodrat
<i>Peromyscus maniculatus</i> (Wagner)	deer mouse
<i>Spermophilus beechyi</i> (Richardson)	Calif. ground squirrel
<i>Spermophilus lateralis</i> (Say)	Golden-mantled ground squirrel
<i>Tamiasciurus douglasii</i> (Bachman)	chickaree
<i>Thomomys mazama</i> Merriam	Mazama pocket gopher
<i>Zapus trinotatus</i> Rhoads	Pacific jumping mouse

### CARNIVORA

<i>Canis latrans</i> Say	coyote
<i>Felis concolor</i> Linnaeus	mountain lion
<i>Lynx rufus</i> (Schreber)	bobcat
<i>Martes americana</i> (Turton)	marten
<i>Mustela erminea</i> Linnaeus	short-tailed weasel
<i>Mustela frenata</i> Lichtenstein	long-tailed weasel
<i>Mustela vison</i> Schreber	mink
<i>Procyon lotor</i> Linnaeus	raccoon
<i>Spilogale putorius</i> (Linnaeus)	spotted skunk
<i>Ursus americanus</i> Pallas	black bear

### ARTIODACTYLA

<i>Cervus elaphus canadensis</i> Erxleben	elk
<i>Odocoileus hemionus</i> (Rafinesque)	mule (black-tailed) deer

**APPENDIX C:**  
**LIST OF APOIDEA PRESUMED TO BE ON THE ANDREWS FOREST**

During 1980, A.R. Moldenke (Department of Entomology, Oregon State University) collected and compiled a list of bees (Hymenoptera: Apoidea) from the McKenzie River drainage of the Willamette national Forest, in which the HJ Andrews Forest is located (Reference #29). The Apoidea species included on the list below are those he believes should be present on the Andrews Forest. This is based on habitats and host plants present on the Andrews, and on his field notes, personal collections and literature reviews. These species have not been included in the main list because there are no actual records or voucher specimens verifying their presence on the Andrews Forest. This list represents a robust picture of the bee fauna of the central Cascades, and as such may include rare taxa that may not indeed be found at all times on the Andrews Forest (principally bees of the valley floor/low altitude and those from subalpine fell fields -- regions poorly represented within the Andrews Forest). Within the conifer zone, the vast majority of bee species are ephemeral colonists in open regions following clear-cutting, landslides/avalanches and floods. Most species are encountered as wandering males, and their presence on the Andrews would not necessarily imply stable resident populations. The large unmonographed genera Andrena (some subgenera), Lasioglossum (s. lato), Stelis and Nomada are not treated.

**Parson, Gary L.; Cassis, Gerasimos; Moldenke, Andrew R.; Lattin, John D.; Anderson, Norman H.; Miller, Jeffrey C.; Hammond, Paul; Schowalter, Timothy D.** 1991. Invertebrates of the H.J. Andrews Experimental Forest, western Cascade Range, Oregon. V: An annotated list of insects and other arthropods. Gen. Tech. Rep. PNW-GTR-290. Portland, OR: U.S. Department of Agriculture, Forest Service, Pacific Northwest Research Station. 168 p.

An annotated list of species of insects and other arthropods that have been collected and studies on the H.J. Andrews Experimental forest, western Cascade Range, Oregon. The list includes 459 families, 2,096 genera, and 3,402 species. All species have been authoritatively identified by more than 100 specialists. Information is included on habitat type, functional group, plant or animal host, relative abundances, collection information, and literature references where available. There is a brief discussion of the Andrews Forest as habitat for arthropods with photographs of representative habitats within the Forest. Illustrations of selected arthropods are included as is a bibliography.

Keywords: Invertebrates, insects, H.J. Andrews Experimental forest, arthropods, annotated list, forest ecosystem, old-growth forests.

The **Forest Service** of the U.S. Department of Agriculture is dedicated to the principle of multiple use management of the Nation's forest resources for sustained yields of wood, water, forage, wildlife, and recreation. Through forestry research, cooperation with the States and private forest owners, and management of the National Forests and National Grasslands, it strives—as directed by Congress—to provide increasingly greater service to a growing Nation.

The U.S. Department of Agriculture is an Equal Opportunity Employer. Applicants for all Department programs will be given equal consideration without regard to age, race, color, sex, religion, or national origin.
