

Puget Sound Polychaetes: Family Phyllodocidae

Family Phyllodocidae Oersted, 1843

Family-level characters (from Blake, 1994)

- Body long, slender, dorsoventrally flattened.
- Prostomium with 4 frontal antennae; some genera have a fifth median antenna and/or nuchal papilla on prostomium.
- Proboscis is eversible and usually covered with soft papillae.
- Two, three, or four pairs of tentacular cirri present on the first one to three segments.
- Parapodia usually uniramous (notopodia reduced to a short stalk to which the dorsal cirri are attached; no aciculae or setae in notopodia); all setae (=neurosetae) compound spinigers, not typically diagnostic...all look alike. Shape, size and placement of dorsal and ventral cirri on parapodium are usually diagnostic for the species.

Genus-level characters

- Presence or absence of median antenna in addition to 4 frontal antennae.
- Number of pairs and arrangement of tentacular cirri.
- Fusion of tentaculate segments, and presence or absence of setae on these segments.
- Presence or absence of elongate dorsal lobe on neuropodium.

Species-level characters

- Shape, size, and orientation of dorsal and ventral cirri.
- Presence, type, and distribution of papillae on proboscis.
- Diagnostic pigment patterns are present, but not dependable; may fade following preservation.

Genus *Eteone* Savigny, 1820

- Two pairs of tentacular cirri on first segment; 4 antennae on prostomium, no median antenna.
- Prostomium wider than long – *Eteone lighti* - we don't get this in Puget Sound.
- We don't know a lot about Puget Sound *Eteone*. We used to call everything *E. longa* (Atlantic species); now we recognize a few described species, but the majority of Puget Sound *Eteone* species remain undescribed.

Family Phyllodocidae

Eteone californica Hartman, 1936

From Blake, 1994

- Prostomium semicircular, dorsoventrally flattened, as long as wide.
- Dorsal cirri as wide as long.
- Body and cirri darkly colored with numerous small pigment granules.
- Body usually chunky in appearance.
- Anal cirri usually 2 times (not 3) as long as wide.

This is the main species we get in Puget Sound, besides *Eteone* spp. (usually the small ones, juvs; or ones that just look different from usual). Most of our Puget Sound species can only be identified to *Eteone* spp.

Dorsal, whole body, robust (chunky) (l); anterior end, dorsal, 2 pair tentacular cirri (tc), 4 frontal antennae (fa) (r); darkly colored with numerous small pigment granules (l,r)

Pygidium with anal cirri 2x as long as wide (l); dorsal cirri (r)

Family Phyllodocidae

Lateral view of parapodium

Eteone leptotes Blake, 1992

From Blake, 1994

- Thin, threadlike species; body with dark brown pigment in spots on dorsum, ventrum, and dorsal cirri.
- Prostomium and first segment fused; tentacular cirri appear to be coming off the prostomium.
- Dorsal cirri present from third segment (second setiger); thickened, rounded distally but becoming elongate and more lanceolate in middle and posterior setigers; shorter than or about the length of the podial lobes.
- Ventral cirri short, without pigment, never longer than podial lobes.

Whole body, threadlike (l); anterior end, dorsal, with dark brown pigment spots (r)

Family Phyllodocidae

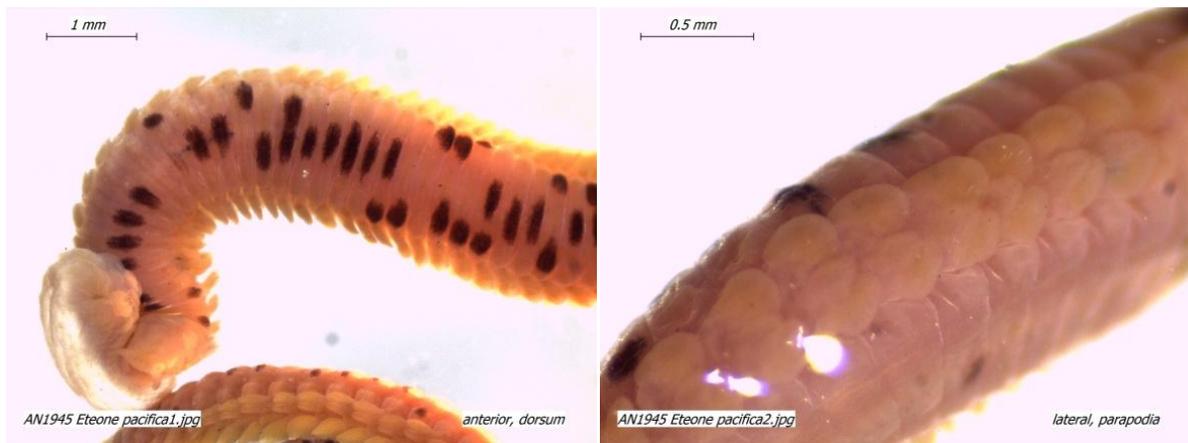

Anterior end, dorsal, 2 pair tentacular cirri (tc), 4 prostomial antennae (pa) (l); dorsal cirri thick and rounded (r)

Eteone pacifica Hartman, 1936

From City and County of San Francisco Voucher Sheet (Dot Norris)

- Prostomium longer than wide.
- Dorsal cirri wider than long and broadly rounded.
- Body bright yellow in life, pale when preserved, with irregularly spaced large black spots.
- A large species, to more than 100 mm. Occurs in intertidal and shallow subtidal from British Columbia to central California in silty mud.

Anterior, dorsum (l); parapodia, lateral (r)

Family Phyllodocidae

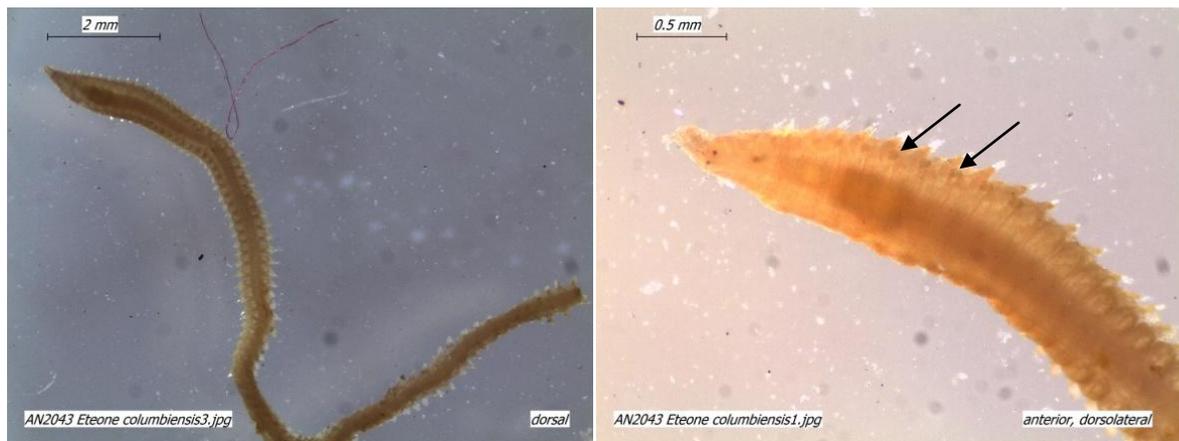

Posterior, dorsal view (l); posterior, lateral view (r)

Eteone columbiensis Kravitz & Jones, 1979

From Kravitz and Jones, 1979

- Not known from Puget Sound; occurs at the mouth of the Columbia River in sand and silty sand.
- Prostomium elongate and abruptly tapered.
- Anterior margin of prostomium one third as wide as posterior margin.
- Dorsal cirri symmetrical, subrectangular and inflated; very small in anterior setigers.
- Ventral cirri small, same length as neuropodia.

Whole body, dorsum (l); anterior, dorsum, elongate and tapered prostomium, very small dorsal cirri (r)

Family Phyllodocidae

Anterior end, dorsum

Genus Lugia, Genus Mystides

- Not known from Puget Sound.

Genus Hesionura Hartman-Schröder, 1958

Hesionura coineaui difficilis (Banse, 1963)

From Blake, 1994

- Three pairs of tentacular cirri on first two segments; setae from segment 3.
- Prostomium longer than wide.
- Pigment limited to ventral cirri.
- Setae with ribbed blades, the 2 innermost setae of the fascicle with blades twice the length of the blades of the other setae.
- Interstitial species, very tiny, usually go through screen so we don't get them often.

Family Phyllodocidae

Anterior, whole body (l); anterior dorsum (r)

Anterior, dorsum (l); mid-body setiger, setal blades of different lengths - 2 innermost setae of the fascicle with blades twice the length of the blades of the other setae (r)

Mid-body setiger, setal blades of different lengths - 2 innermost setae of the fascicle with blades twice the length of the blades of the other setae

Family Phyllodocidae

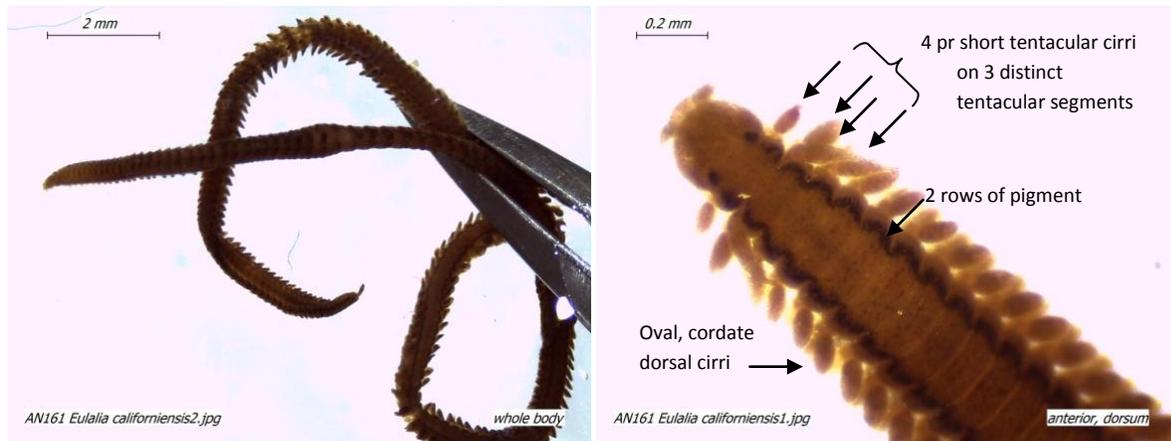

Genus *Eulalia* Savigny, 1817

- 4 pairs of tentacular cirri on the first 3 segments.
- All 3 tentacular segments distinct dorsally.
- Four frontal and one median antennae present.
- Antennae and tentacular cirri cirriform, not flattened.

Eulalia californiensis (Hartman, 1936)

From Blake, 1994

- Dorsal cirri of middle parapodia oval or cordate.
- All tentacular cirri short, none extending more than 3 segments in length (or one-quarter the length of the prostomium).
- Ventral cirri elongate with narrow base.
- Body with 2 longitudinal rows of pigment.

Whole body (l); anterior, dorsum (r)

Family Phyllodocidae

Prostomium, lateral view with median antennae (l); dorsal view with 4 prostomial antennae (r)

Anterior, dorsal view, mid (l); anterior dorsal view, everted pharynx (r)

Whole body, pharynx everted (l); lateral view prostomium with pharynx everted (r)

Family Phyllodocidae

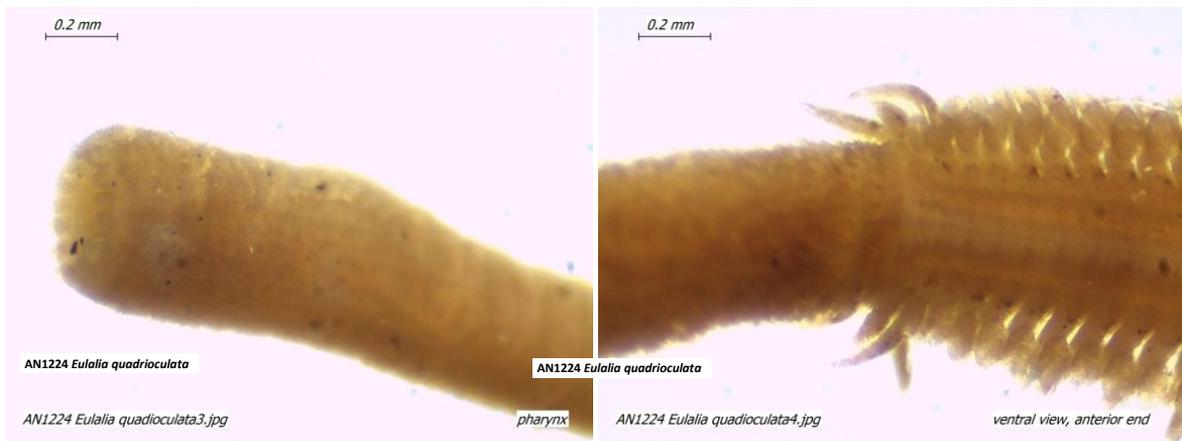

Eulalia quadrioculata Moore, 1906

From Blake, 1994

- Prostomium bearing two eyes, plus two faint pigment spots resembling eyes (may fade in preservative).
- Proboscis elongate and heavily papillated.
- Dorsal cirri of middle parapodia elongate, lanceolate.
- Body greenish with black transverse stripes in intersegmental grooves (may be faded).
- Ventral cirri small, oval to elliptical, oriented in same direction as aciculae.

Whole body, dorsal view, pharynx everted (l); anterior dorsal view, transverse stripes (r)

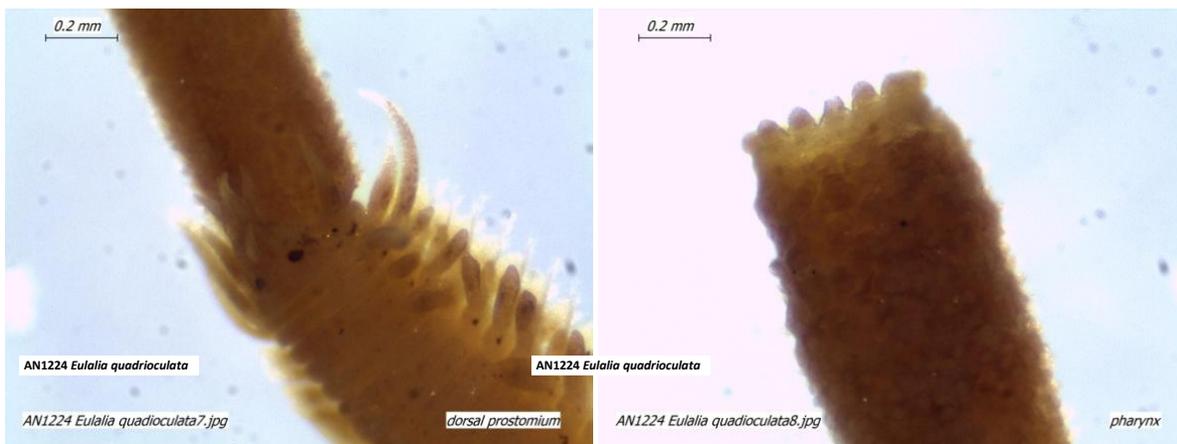

Everted pharynx (l); anterior, ventral, everted pharynx (r)

Family Phyllodocidae

Lanceolate dorsal cirri, mid-body (l); whole body, dorsal view, pharynx everted (r)

Dorsal prostomium (l); distal end of everted pharynx, terminal papillae (r)

Genus *Sige* Malmgren, 1865

- Four frontal and 1 median antennae present.
- First tentacular segment reduced with first pair of tentacular cirri lateral to prostomium.
- Differs from all other described phyllodocids with five antennae by having a neuropodia with elongate superior dorsal lobe.

Sige montereyensis Hartman, 1936

From Light, 2007

- Prostomium pentagonal, wider than long, with posterior nuchal projections.
 - Two large dark eyes present, each with prominent lens.
 - Four frontal and 1 median antennae present.
-

Family Phyllodocidae

- Neuropodium with elongate superior dorsal lobe.
- Dorsal cirri long, pointed, and foliaceous.

Anterior, dorsal view (l, r)

Anterior, dorsolateral view, large eyes (l, r)

Family Phyllodocidae

Midbody, ventrolateral aspect – elongate superior dorsal lobe (l); whole body, dorsal view (r)

Prostomium, dorsal view, large eyes

Genus *Eumida* Malmgren, 1865

- Four frontal and 1 median antennae present.
- Segment 1 dorsally reduced, fused to segment 2.
- 4 pairs of tentacular cirri, all of the same form.
- Surface of proboscis with minute papillae, with larger terminal papillae.
- Parapodia lack neuropodial superior dorsal lobe.

Family Phyllodocidae

Eumida longicornuta (Moore, 1906)

From Blake, 1994

- Prostomium about as long as wide, rounded anteriorly, tapered posteriorly, with two large black eyes in posterior half.
- Dorsal cirri heart-shaped and slightly longer than wide; ventral cirri small, distally pointed, shorter than the neuropodial lobe.
- Body pigmented, with dark transverse stripes; dorsal cirri with dark pigmentation.

Anterior, dorsal view, dark eyes and transverse stripes, segments 1&2 fused (l); whole body, pharynx everted (r)

Heart-shaped dorsal cirri (l, r)

Family Phyllodocidae

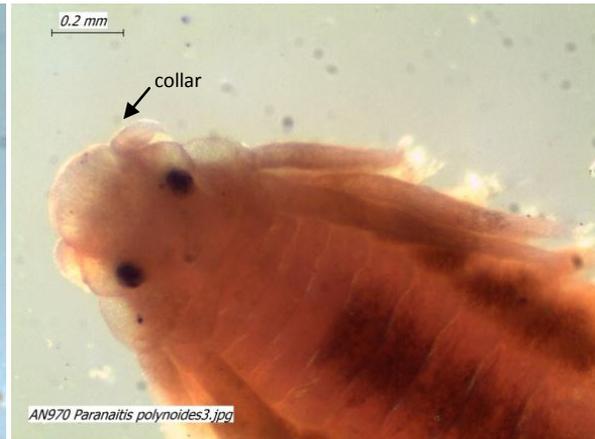

Genus *Paranaitis* Southern, 1914

- Four frontal antennae present; tentacular cirri elongate.

Paranaitis polynoides (Moore, 1909)

From Blake, 1994

- Prostomium pentagonal, as wide as long, narrowing posteriorly, extending into first segment; with large knoblike nuchal papilla at posterior of prostomium.
- Segments 1 to 2 well-developed, forming distinct collar around tapering posterior half of prostomium.
- Body light or dark tan with dark or chestnut-colored spots mid-dorsally and in the center of the dorsal cirri; without ventral pigment.

Anterior, dorsal view, pigment spots mid-dorsal and on dorsal cirri (l); segments 1&2 “collar” (r)

Anterior, dorsal view, note pigmentation (l); lateral view, pigmentation faded (r)

Family Phyllodocidae

Anterior, mid-body, dorsal cirri (l); pygidium and pygidial cirri (r)

Genus *Nereiphylla* Blainville, 1828

- Prostomium rounded with four frontal antennae.
- Segments 1 and 2 fused dorsally and reduced.
- Four pairs of tentacular cirri, 1 pair on segment 1, 2 pairs on segment 2, and 1 pair and normal ventral cirrus on segment 3.
- Setae first present from segment 2.

Nereiphylla castanea (Marenzeller, 1879)

From Blake, 1994

- Prostomium elongated, rounded anteriorly.
- 2 very large black eyes present.
- Frontal antennae large and thickened.
- Tentacular cirri weakly flattened in cross-section.
- Dorsal tentacular cirri of segment 2 longest, extending posteriorly about 6 segments.
- Dorsal cirri heart-shaped, sometimes concealing dorsum.
- Ventral cirri broadly oval, larger than podial lobe.
- Color in alcohol dark red or orange, with dark-orange-brown pigment on dorsum, dorsal cirri, podial lobes, and ventral cirri.

Family Phyllodocidae

Anterior, dorsal view, setiger 2 with long tentacular cirri (l); heart-shaped dorsal cirri (r)

Whole body (l); anterior, dorsum, segments 1 and 2 fused dorsally and reduced (r)

Anterior, dorsal view, proboscis everted

Family Phyllodoceidae

Genus *Phyllodoce* Lamarck, 1818

From Blake, 1994

- Prostomium with four cirriform frontal antennae, cordate (heart-shaped) with posterior lobes variously developed, posterior notch with small nuchal papilla for all four of our most common Puget Sound species.
- 2 small eyes present on posterior half of prostomium.
- Proboscis with proximal and distal parts, proximal section with soft papillae arranged in rows or scattered diffusely, distal part with 6 longitudinal divisions, sometimes with papillae. Distribution and size of papillae are diagnostic for the species.
- Four pairs tentacular cirri, 1 pair on segment 1, 2 pairs on segment 2, 1 pair and normal ventral cirri on segment 3.
- Four species found commonly in Puget Sound, a few others are rare.

Phyllodoce hartmanae Blake and Walton, 1977

- Body pale with intersegmental mid-dorsal black pigment and similar smaller ventral markings; additional dark pigment on anterior of prostomium around bases of tentacular cirri, and near insertion of dorsal cirri.
- Proboscis with proximal part bearing numerous rows of small papillae arranged in **oblique rows**; distal portion with 6 thickened ridged sections, each with indistinct lobes.
- Parapodia bearing enlarged, thin, irregularly shaped dorsal cirri.
- This species may be distinguished from other *Phyllodoce* species due to the dorsal cirri usually retaining red rose bengal stain.
- This species is smaller, not as beefy as *P. cuspidata* and *P. groenlandica*.
- Setae present from segment 4 (*P. cuspidata* and *P. groenlandica* from segment 3).

Dorsal view, whole body (l); anterior dorsal, oblique rows of papillae on everted proboscis (r)

Family Phyllodoceidae

Anterior parapodium, note rose bengal stain in dorsal cirrus (l); dorsal view (r)

Dorsal, anterior, mid-dorsal black pigment, proboscis papillae (l); dorsal cirri – rose bengal stains (r)

Phyllodoce groenlandica Oersted, 1843

- Body light tan to brown with dorsal **segments from segment 1 bearing dark, often iridescent green, transverse bands of pigment**; dark pigment on anterior half of prostomium; dorsal cirri with dark spots. Pigmentation starts right after the prostomium, can fade in alcohol, smaller individuals appear striped, rather than solid pigment. Individuals can grow to large size.
- **Proboscis with 6 longitudinal rows of 13-16 papillae on each side of proximal half, leaving dorsum and ventrum smooth, without papillae**; distal half with 6 longitudinal rows of large tubercles or folds.
- Dorsal tentacular cirri of segments 2 and 3 longest, extending posteriorly for 10 or more segments.
- Dorsal cirri large, foliaceous, rectangular in shape, longer than wide anteriorly, becoming wider posteriorly; **ventral cirri longer than neuropodial lobe, pointed apically, with distinctly ventrally directed tip.**

Family Phyllodocidae

Dorsal ant., note pigmentation, proboscidal papillae (l); 6 longitudinal rows of proboscidal papillae (r)

Dorsal cirrus large, foliaceous, rectangular (l); mid-body parapodium, lateral view (r)

Ventral cirri longer than neuropodial lobe, with distinctly ventrally-directed tip (l); pygidium (r)

Family Phyllodoceidae

Phyllodoce cuspidata McCammon and Montagne, 1979

- Similar to *Phyllodoce groenlandica* - large, with dark pigmentation; differences are in **bold**.
- Body light tan with brown pigment on anterior half of prostomium and dorsum of individual segments from segment 5 (setiger 2); dorsum of posterior half of prostomium and **segments 1 to 4 not pigmented**.
- **Proboscis with proximal region bearing 6 rows of flattened plate-like papillae on either side; these papillae becoming smaller and irregularly scattered distally**, gap between rows of papillae; distal region of proboscis with 6 rows of large, rugose papillae.
- Dorsal tentacular cirri of segments 1 and 2 shortest, only 2 to 4 segments long.
- Dorsal cirri large, foliaceous; **ventral cirri as long as, or slightly shorter than, neuropodial lobe**.

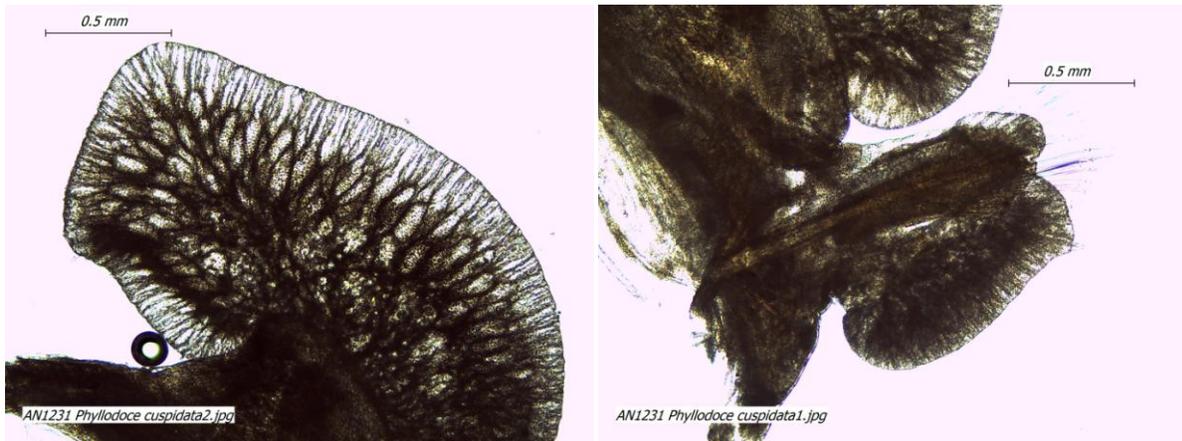

Dorsal, anterior, note pigmentation (l); dorsal everted proboscis with six rows of papillae becoming scattered distally (r) (note: they are not usually darkly colored)

Ventral everted proboscis with six rows of papillae becoming scattered distally (r) (note: they are not usually darkly colored); mid-body parapodium - dorsal cirri large, foliaceous, ventral cirri as long as, or slightly shorter than, neuropodial lobe.

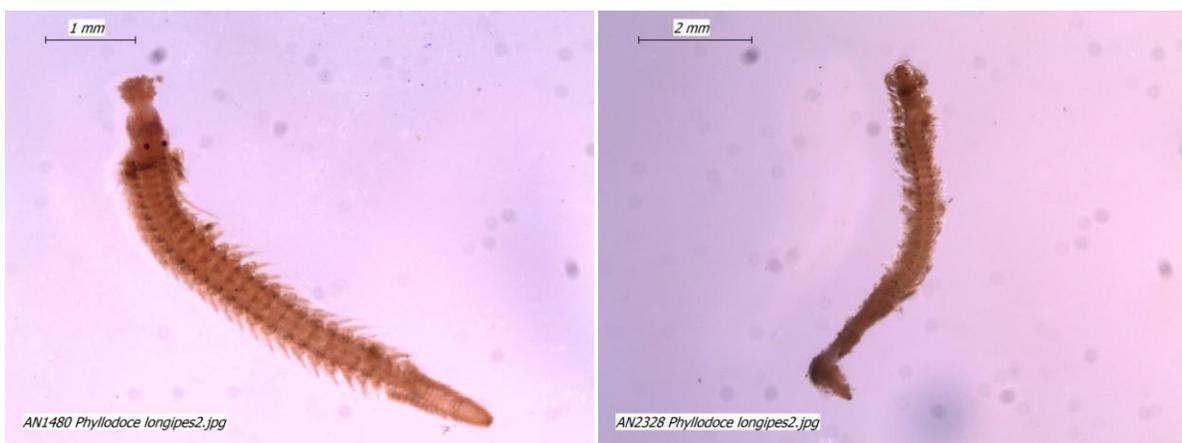

Family Phyllodoceidae

Mid-body parapodium - dorsal cirri large, foliaceous (l); ventral cirri as long as, or slightly shorter than, neuropodial lobe (r).

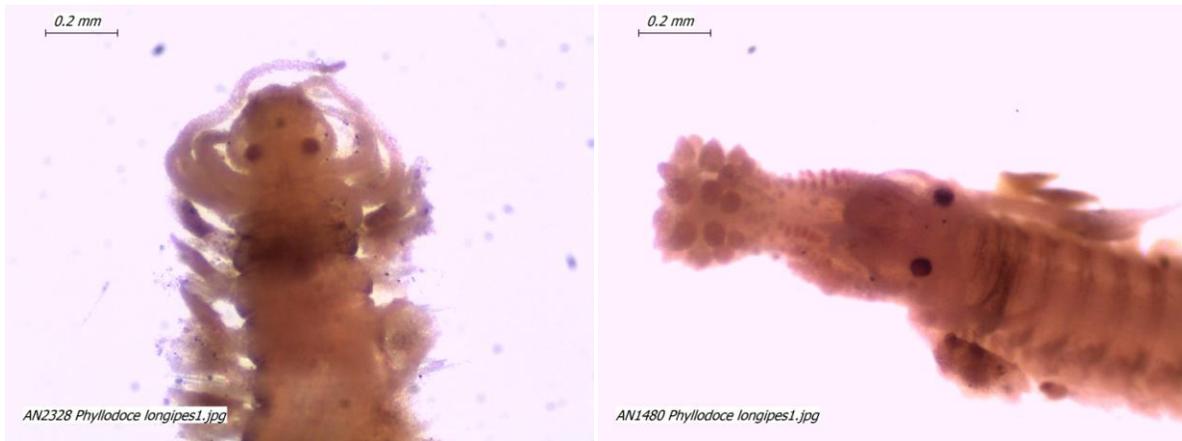

Phyllodoce longipes Kinberg, 1866

- Body light tan with brown pigment lightly scattered on prostomium, borders of body segments, dorsal and ventral cirri, and concentrated across dorsum of segments 1 to 2 (looks like a dark band just posterior to the prostomium).
- Dorsum of the prostomium with an unusual elevated crest that forms a transverse anterior edge in the middle of the prostomium, and which bears 2 large eyes.
- Proboscis with proximal and distal sections, each bearing papillae; proximal part with 6 rows of small papillae on each side; distal part with larger conical papillae of different sizes, diffusely arranged.
- Dorsal cirri broad, leaf-like; ventral cirri elongated, pointed, as long as neuropodial lobe.
- Neuropodium elongate, with short superior lobe.

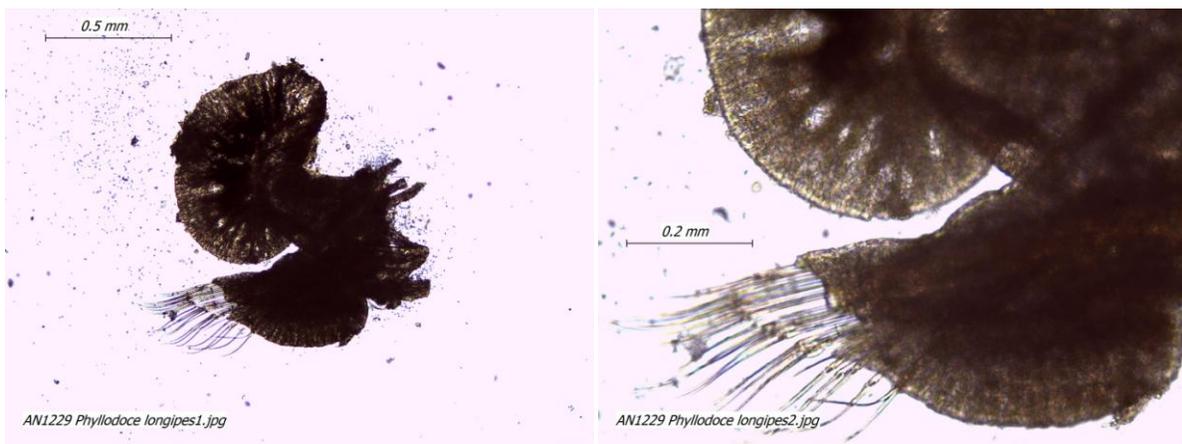

Anterior, dorsal, whole body, note dark pigment band and everted proboscis (l); anterior, whole body (r)

Family Phyllodoceidae

Anterior, dorsal, note dark pigment band (l); anterior, dark pigment band, everted proboscis (r)

Mid-body parapodium with broad, leaf-like dorsal cirrus; ventral cirri elongated, pointed, as long as neuropodial lobe.
