LOVELL AUGUSTUS REEVE, F.L.S., F.G.S.,

CORRESPONDING MEMBER OF THE NATURAL HISTORY SOCIETY OF WURTEMBERG, OF THE LYCEUM OF NATURAL HISTORY OF NEW YORK, OF THE ACADEMY OF NATURAL SCIENCES OF PHILADELPHIA, AND OF THE ZOOLOGICO-BOTANICAL SOCIETY OF VIENNA.

CONTINUED BY

G. B. SOWERBY, F.L.S.

"Thus the Creator
Has sought in every way to honor to him,
From the small leaf that holds an insect's web,
From which ere long a colony shall issue,
With limbs and wings as other wing'd eagles,
To the vast ocean that gives birth
And nourishment to everlasting millions
Of creatures, great and small, beyond the power
Of man to comprehend, how they exist."

J. Montgomery.

TO

T H E T W E N T I E T H V O L U M E.

On the completion of this great work, a few words appear due to the Subscribers.

In the British Museum, England possesses a collection of shells—including that of the late Mr. Hugh Cuming, acquired by purchase in 1865—which for richness and completeness rivals all other collections in the world put together.

The ‘Conchologia Iconica’ was commenced by my late husband, Mr. Lovell Reeve, in 1843, as the exponent of these and other collections. At the time of his decease, in 1865, fifteen volumes of the work had been completed. Although these, containing as they do most of the more important Genera, would have been no inconsiderable contribution to Conchological science, still as many Genera remained unrepresented, it was thought desirable to continue the work to a point at which, for all practical purposes, it might be pronounced complete.

The literary conduct of the work was therefore entrusted to Mr. G. B. Sowerby, F.L.S., who had hitherto supplied the artistic portion.

His Royal Highness the late Prince Consort was amongst the earliest subscribers, and his subscription (for two copies) has been graciously continued by Her Majesty the Queen.

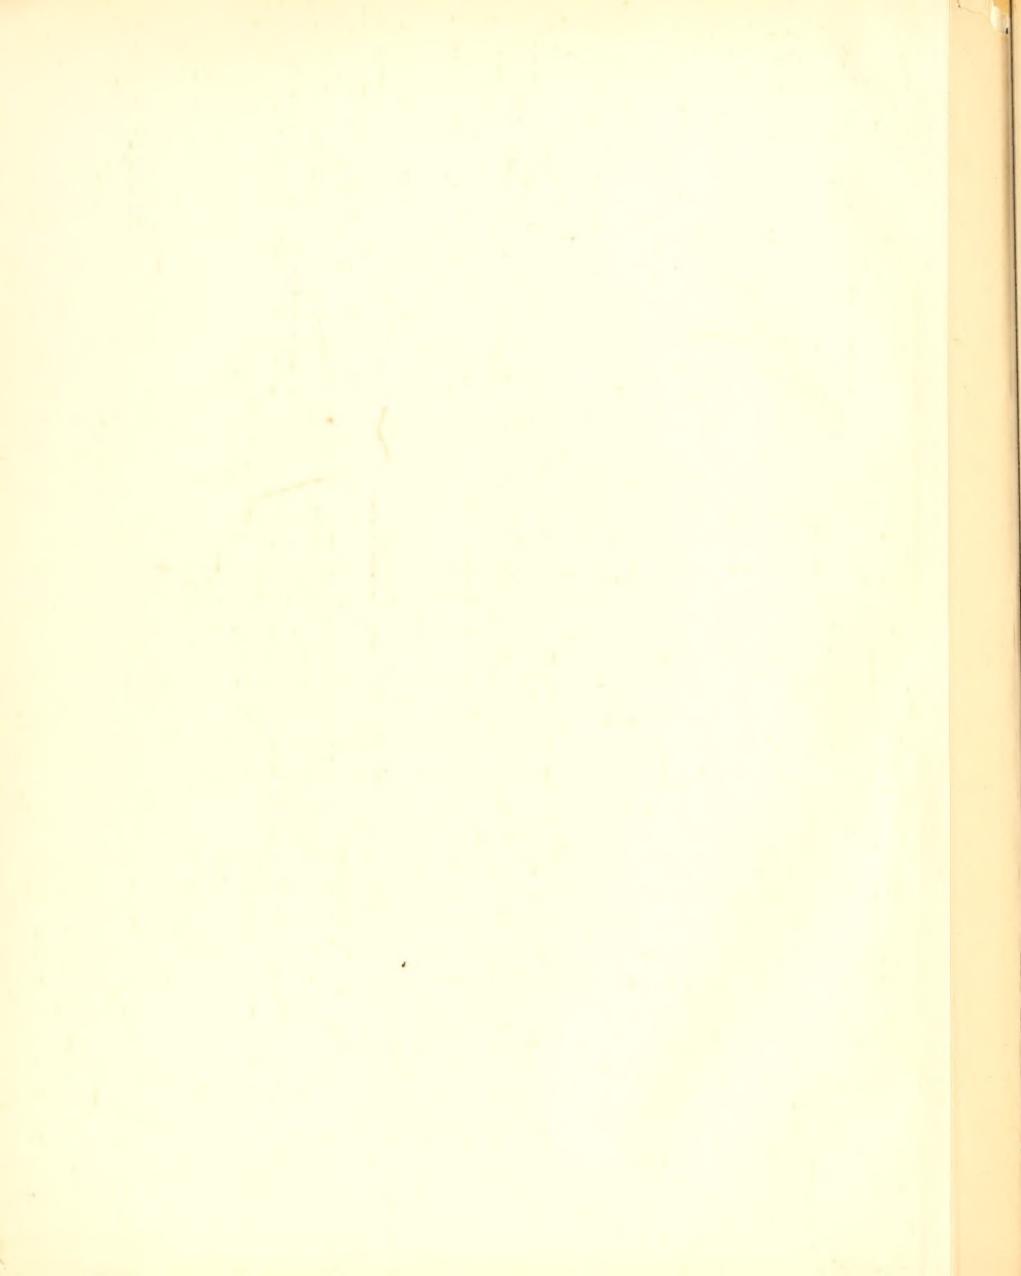

Many of the earlier subscribers have not lived to see the completion of the work, in the commencement of which they took a lively interest, but their subscriptions have been continued by members of the family, or have been replaced by other individuals.

To Her Most Gracious Majesty the Queen, and to the rest of the Subscribers, I beg to tender my most grateful acknowledgments, for the continued support which has enabled me to bring the work to what I trust will be deemed a satisfactory conclusion.

MARTHA REEVE.

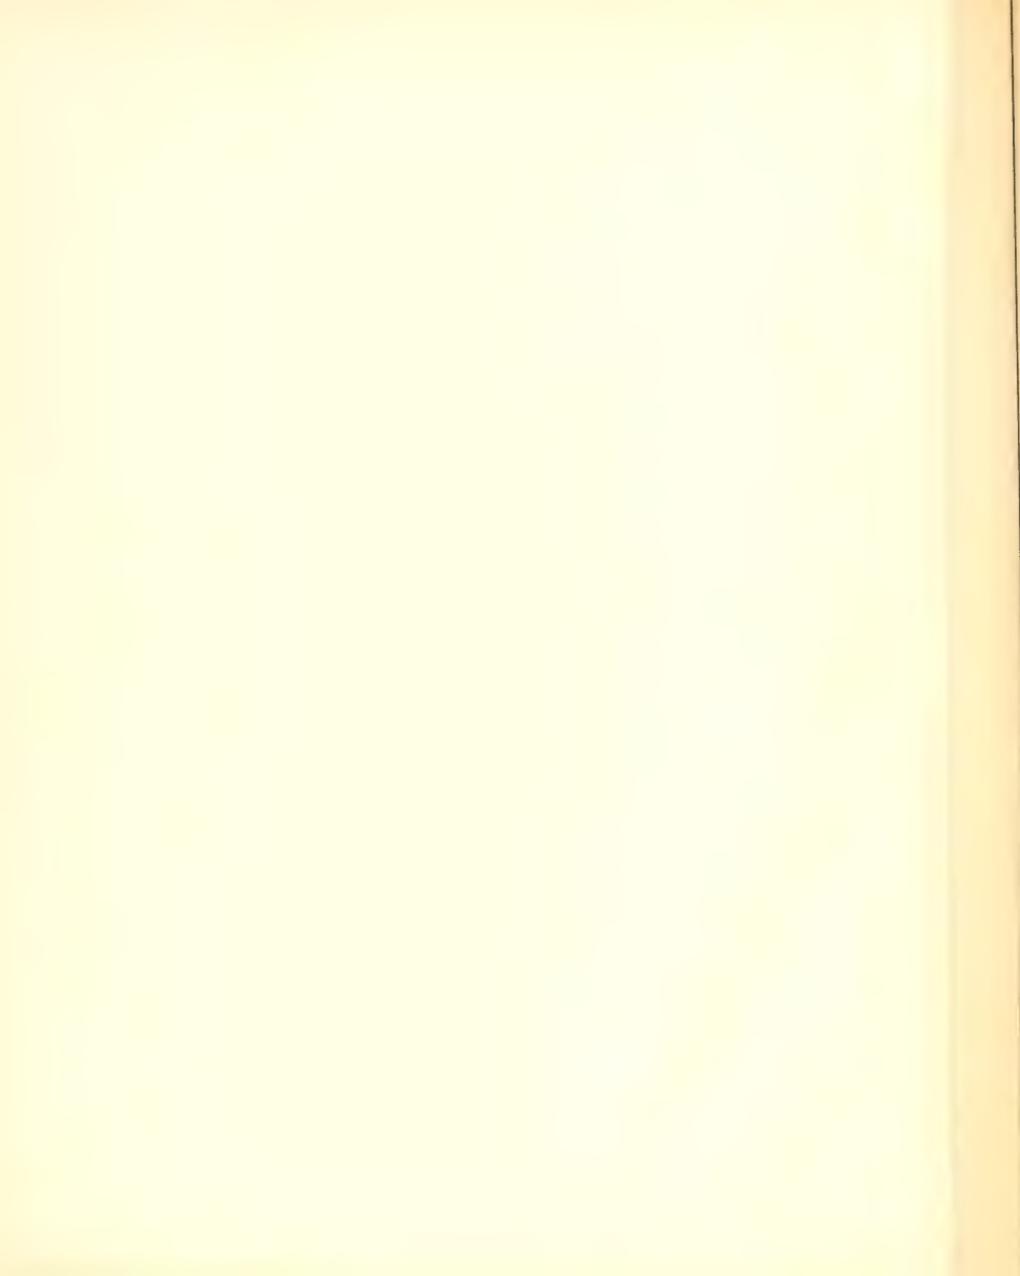

THE COTTAGE, GILSTON, NEAR HARLOW:

March 29, 1878.

MONOGRAPH
OF THE GENUS
S O L E M Y A.

"Out of the deep th' Almighty King
Did vital beings frame. — *Watts.*

S O L E M Y A.

Genus SOLEMYA, Lamarck.

Testa arquicostata, inequilateralis, transversè oblonga, utrinque obtusa, epidermide cava, valvo, nictuante fissa, ultra marginem calcaram extenso induta. Cardo dentatus. Ligamentum pectinum internum post callum trigonam instrectum. Impressiones duae remotae, subtriangulares.

Shell equilateral, inequilateral, transversely oblong, obtuse at each end, covered with a strong shiny brown horny epidermis extending beyond the edges of the valves. Hinge without teeth, ligament partly internal, inserted behind a three-cornered callus; muscular impressions two, distant, subtriangular.

To the four or five species previously known one has recently been described and well characterized by Mr. Edgar Smith, of the British Museum—namely, the *Sol. Parkinsoni* from New Zealand, which appears to be very distinct from the comparatively well-known Australian species. The northern parts of the United States present one or two species, which, with the familiar *Solemya Mediterranea*, complete the little list. The *Solemya*, like the *Solen*s and *Mya*, are mud-burrowers, and from the construction of the foot and thinness of the shell leap with surprising activity. The shell is described as having a cardinal tooth in each valve, but the term seems quite inapplicable to the internal callus, behind which the ligament is inserted in a groove.

Species 1. (Mus. Brit.)

SOLEMYA OCCIDENTALIS. *Sol. testa parvæ, angustâ, elongatâ; latere postico brevissimo, margine laterali obliquè truncato; latere postico attenuato, ad terminum acuminato.*

THE WESTERN SOLEMYA. Shell small, narrow, elongated; posterior side very short, lateral margin obliquely truncated; posterior side attenuated, acuminate at the end.

DESHAYES. MS. Brit. Mus.
Hab. —?

The specimens in the British Museum appear young, and the shape of the callus and ligamental insertion not sufficiently developed to determine the distinctness of the species. It is, however, a larger shell than *Solemya Mediterranea*.

Species 2. (Figs. a, b, c, Mus. Brit.)

SOLEMYA MEDITERRANEA. *Sol. testa soleniformis, elongatâ, radiatâ; latere postico angustiâscalo, brevissimo, obliquè truncato; latere antico elongatâ, versâ terminum ampliâculo; callo cardinali angusto, arcuato, obliquè trigono; arcu ligamentifero post callum trigonam, infra linearia productâ; ligamentato partim etiam in sulcâ obliquâ linearum ante callum instructo.*

THE MEDITERRANEAN SOLEMYA. Shell soleniform, elongated, rayed; posterior side rather narrowed, very short, obliquely truncated; anterior side elongated, rather more ample towards the end; cardinal callus narrow, curved, obliquely trigonal; ligamental area behind the callus trigonal, linearly produced below; also a part of the ligament inserted in an oblique linear sulcus in front of the callus.

LAMARCK. Anim. s. Vert., ed. Deshayes, vol. vi. p. 125.
Solemya Solen, Sais Marchlius.
Hab. Mediterranean.

Species 3. (Mus. Brit.)

SOLEMYA BOREALIS. *Sol. testa brevissima, anticâ latâ, subtruncatâ, posticè latissimo, ad terminum truncato; callo cardinali trigono crasso, lato; infra bifurcatâ; impressione musculari anticâ elongatâ, subtrigonal; epidermide crasso.*

THE BOREAL SOLEMYA. Shell rather short, anteriorly broad, rather truncated, posteriorly very broad, truncated at the end; cardinal callus trigonal, thick, broad; bifurcate below; anterior muscular impression elongated, subtriangular; epidermis thick.

SOLEMYA.

TOTTEN. Siliman's Journal, vol. vi, p. 124.

Solemya velum, Say.

Hab. North America.

GRAY. MS. in Brit. Mus. Deser. E. Smith, Zool. Erebus

and Terror, p. 6.

Hab. New Zealand.

Species 4. (Mus. Brit.)

SOLEMYA PARKINSONI. *Sol. testâ latâ, breviâsculâ, radiatim subundato, utriusque latâ truncato; callo cardinali valde obliqua, arenato, versus terminum internum attenuato: ligamento partim citius in elevata elongatum verticaliter ante callum instruato; impressione musculari latâ.*

PARKINSON'S SOLEMYA. Shell broad, rather short, radiately slightly grooved, broadly truncated at each end; cardinal callus very oblique, curved, attenuated towards the inner termination; ligament also partly inserted in an elongated vertical sulus in front of the callus; anterior muscular impression broad.

Species 5. (Mus. Brit.)

SOLEMYA AUSTRALIS. *Sol. testâ breviâsculâ, ad terminalis obtusâ, aequaliter latissimâ; callo cardinali latâ, trigono, infra attenuato; ligamento etiam partim in foram subquadratum ante callum inserente.*

THE AUSTRALIAN SOLEMYA. Shell rather short, obtuse at the ends, equally rather broad; cardinal callus broad, trigonal, attenuated below; ligament also partly inserted in a rather square pit in front of the callus.

LAMARCK. Anim. s. Vert., Deshayes ed., vol. vi, p. 124.

Hab. Australia.

MONOGRAPH

OF THE GENUS

M Y A.

"To dive like buckets in concealed wells." — *Shakspeare*.

MYA.

PLATE I.

Genus MYA, *Linnæus.*

Testa æquivalvis, bimuscularis, plurimarginata ad extremitates hispana, oblonga, epidermide rugosa induta. Cardo dentatus, lamina ligamentifera trigona, excavata, projecta, in rotula sinistra levata. Impressio pallii plusminus sinnata.

Shell equivale, bimuscular, generally gaping at each end, covered with a wrinkled epidermis. Hinge toothless, furnished in the left valve with a ligament-bearing, trigonal, hollow projecting plate. Pallial impression more or less sinuated.

Genus CRYPTOMYA, *Conrad* (included).

In the more restricted genus *Mya*, typified by *M. arenaria* and *M. truncata*, the siphons are long and produced, and covered with a coriaceous epidermis in continuation of that which covers the shell; but in the *Cryptomya* there is not the same epidermis-covered projection. But the construction of the hinge and general characters of the shell, and the mud-boring habits of the animal are alike in both groups; and no useful purpose is served in keeping them apart. The *Mya* are few in number, and are principally inhabitants of Northern shores.

Species 1. (Mus. Sowerby.)

MYA ARENARIA. *Mya testa ornata, solidá, fulvá, concentrica; leviter rugatá, utrinque valde hianti; latere antico ventricoso, late, latere postico cunctato, subdepresso, leviter angulato, ad terminum suboblique truncato; lamina ligamentifera in valoi dextrá magni, producta; impressione pallii late et quadram sinnata.*

THE SAND *MYA*. Shell ovate, solid, brown, concentrically lightly wrinkled, gaping strongly on each side; anterior side ventricose, broad, posterior side cuneate, subdepressed, slightly angular, rather sinuate.

rather obliquely truncated at the end; ligament-bearing plate in the left valve large, produced, pallial impression broadly and squarely situated.

LINNEUS. *Systema Naturæ.*

Hab. British Coasts.

Species 2. (Mus. Brit.)

MYA ELLIPTICA. *Mya testa tenui, ovata, compressa, angustè hianti; latere antico breviæsculo; latere postico prop' marginam dorsalem obliquè depresso, angulata, ad terminum oblique truncata; margine ventrali rectæsculo.*

THE ELLIPTICAL *MYA*. Shell thin, ovate, compressed, narrowly gaping; anterior side rather short; posterior side obliquely depressed near the dorsal margin, angular, obliquely truncated at the end; ventral margin rather straight.

A. ADAMS (*Cryptomya*). MS. Mus. Brit.

Hab. ——?

More nearly equal-sided than *Mya Californica*, the anterior and not the posterior side being the shorter.

Species 3. (Fig. a, b, Mus. Brit.)

MYA CALIFORNICA. *Mya testa compressa, angustè hianti, ova, pallidi rubescens; latere antico inflato, rotundo, umbonibus subretrossis; latere postico subangustato, breviæsculo, ad terminum subtruncato, lamina ligamentifera parvæsculo, sinu pallii impressionis parvæ.*

THE CALIFORNIAN *MYA*. Shell compressed, narrowly gaping, ovate, pale reddish; anterior side inflated, rounded, umboes leaving a little backwards; posterior side a little narrow, rather short, slightly truncated at the end; ligamentiferous plate rather small, sinus of the pallial impression small.

CONRAD —? *Cryptomya*.

Hab. California.

MYA.—PLATE I.

Species 4. (Mus. Sowerby.)

MYA TRUNCATA. *Mya testa oblonga, ventricosa, irregulariter rugata, postice latè hianti; laterè antico valde inflata, obliquè tumida, margine dorsali elevato, mandibulis angustatis, prominentibus, retrovisis, laterè postico angustato; marginè dorsali depresso, marginè terminali truncato.*

THE TRUNCATED MYA. Shell oblong, ventricose,

irregularly wrinkled, posteriorly broadly gaping; anterior side much inflated, obliquely tumid, dorsal margin elevated, umbones angular, prominent, leaning backwards, posterior side narrow; dorsal margin depressed, terminal margin truncated.

LINNEUS. *Systema Naturæ.*

Hab. Coasts of Great Britain.

MYA.

PLATE II.

Species 5. (Fig. a, b. Mus. Brit.)

MYA PHILIPPINARUM. *Mya testa tenui, albâ, inflatâ, inaequilaterali, vix aequivalvi; latere antico levè, ventricosissimo, margine dorsali declivi, margine ventrali inflato; latere postico brevi, striato, sub-compresso, posticè cuneato, subangulato, vix truncato, margine dorsali declivi, margine ventrali sursum aevici, umbonibus rotundati, retrorsis.*

THE PHILIPPINE MYA. Shell thin, white, inflated, in-equalateral, scarcely equivalve; anterior side smooth, very ventricose, dorsal margin sloped, ventral margin much inflated; posterior side short, striated, a little compressed, posteriorly cuneate slightly angular, hardly truncated; dorsal margin sloped downwards, ventral margin sloped upwards; umboes rounded, leaning backwards.

A. ADAMS. MS. Brit. Mus.

Hab. Bay of Manilla.

Belonging to the group known as *Cryptomya*, and like several other species, having one half of its surface striated; the other smooth.

Species 6. (Fig. a, b. Mus. Brit.)

MYA SEMISTRIGATA. *Mya elongato-ovatâ, tenui, albâ, latere antico inflato, levigato; latere postico, usque ad medium tenuiter, posticè valde striato, ad terminum angustato, angulato, post angulum, truncato, levâ.*

THE HALF-STRIATED MYA. Shell elongated, oval, thin, white, anterior side inflated, smooth; posterior side finely striated as far as the middle, strongly behind, narrow at the end, angular, truncated behind the angle, smooth.

HANLEY. Proc. Zool. Soc. 1850, p. 80.

Hab. ——?

One of the *Cryptomya* group described by Mr. Hanley from a single valve in the collection of the late Mr. Cuming.

Species 7. (Mus. Brit.)

MYA PRECISA. *Mya testa oblongo-subquadratâ, brevi altâ, concentricè irregulariter rugatâ, anticè inflatâ, latâ; posticè subangustatâ: latere postico brevi, latè truncato, hianti, margine elevato.*

THE SHORTENED MYA. Shell oblong-subquadrate, short, elevated, concentrically irregularly wrinkled, inflated in front, broad; posteriorly rather angular; posterior side short, broadly truncated, gaping, margin raised.

GOULD. United States Exploring Expedition.

Hab. Sitcha.

Although this shell is broader and shorter than the British *Mya truncata* is generally found, its distinctness from that species is matter of some doubt.

Species 8. (Fig. a, b. Mus. Sowerby.)

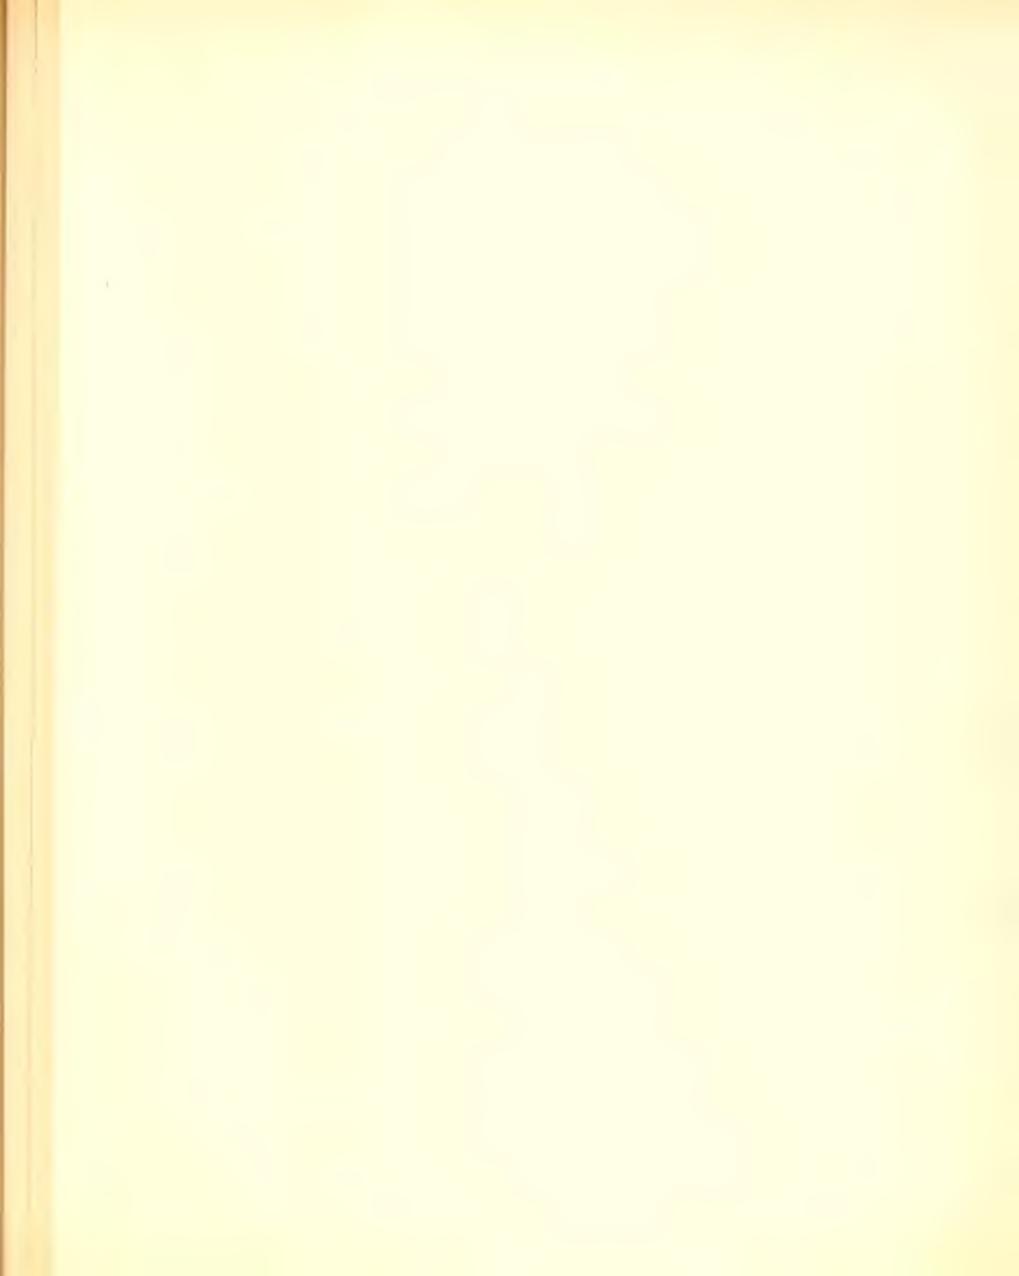

MYA CANCELLOTA. *Mya testa elongatâ, crassissimâ, albidâ rugis concentricis numerosis, minutè undulatis, et striis radiantibus decussatâ; latere postico brevi, cuneato, ad terminum, truncato, circulariter hiant; latere postico inflata, obliquè producta, ad terminum rotundata.*

THE CANCELLED MYA. Shell elongated, rather thick, whitish; decussated with numerous minutely undulated concentric wrinkles and radiating striae, posterior side short, cuneate, truncated and roundly gaping at the end; posterior side inflated, obliquely produced, rounded at the end.

CONRAD. Annals of Natural Science of the Academy of Philadelphia.

Hab. California.

M Y A.

PLATE III.

Species 9. (Fig. a, b.)

MYA MINDORENSIS. *Mya testa compressa, albâ, latâ, levigata, ovata; latere antico subangulata, rotundata, umbonibus parvis, subcordinaria; latere postico angustissimâ, propè marginam dorsalem angulata, post angulum compressa, ad terminum latè truncata, margine dorsali brevi, depresso.*

THE MINDORO MYA. Shell compressed, white, broad, smooth, ovate; anterior side rather inflated, rounded, umboes small, nearly central; posterior side rather narrow, angular near the dorsal margin, compressed behind the angle, broadly truncated at the end, dorsal margin short, depressed.

ADAMS AND REEVE — ? MS. Mus. Cum. in Brit.
Hab. Isl. Mindoro.

A small shell of the *Cryptomya* group, differing from *Mya Californica* chiefly in the broad posterior truncation.

Species 10. (Mus. Brit.)

MYA DIVARICATA. *Mya testa brevi, posticâ latissimâ hincavi, subquadrata, albâ, tenuissimâ striata; latere antico semiroundato; umbonibus elevatis, suberuminatis; latere postico acutâ angulata, perpendiculariter truncato, ante angulum undulatim rugato, divaricatim striato.*

THE DIVERGENT MYA. Shell short, with a wide posterior hiatus, rather square, white, very finely striated; anterior side half-round; umbo elevated, rather acuminate; posterior side acutely angular, perpendicularly truncated, with wavy wrinkles and divergent striae in front of the angle.

A. ADAMS (*Cryptomya*). MS. Cum. Coll. in Brit. Mus.
Hab. Ceylon.

Species 11. (Mus. Brit.)

MYA DECURVATA. *Mya testa ovata, albâ, levigata, antice subtortuosa; margine ventrali concavâ; latere*

postico acutâ arcuatim angulata, angustato, perpendiculariter truncato; margine dorsali depresso, rectissimulo, complanato.

THE SHORTENED MYA. Shell ovate, white, smooth, anteriorly rounded; ventral margin convex; posterior side with an acute curved angle, narrow, perpendicularly truncated; dorsal margin depressed, rather straight, flattened.

A. ADAMS — ? MS. (*Cryptomya*), Cum. Coll. in Brit. Mus.

Hab. Isl. Luzon, Philippines.

Species 12. (Fig. a, b, Mus. Sowerby).

MYA ACUTA. *Mya testa ovata, tenuissimâ scutulata, concentricâ leviter rugata, utrinque latè hincavi; latere antico ventricoso, lato; latere postico cuneado, compresso subrostrato, subacuminato; impressione pallii acutâ sinuata.*

THE ACUTE MYA. Shell ovate, rather thin, pale fulvous, concentrically lightly wrinkled, widely gaping at each end; anterior side ventricose, broad; posterior side cuneate, compressed, rather rounded, rather acuminated; impression of the mantle roundly sinuated.

SAY. Wood's General Conchology.

Mya Japonica, Say (var.) MS. Mus. Sowerby.
Hab. North America; Chupoo, Japan.

The two specimens figured, the smaller Japanese, the larger North American, resemble each other and differ in the same degree from our common *Mya arenaria*. They are much more pointed at the end, and have a more rounded sinus in the pallial impression. These differences, however, may be rather varietal than specific.

MYA.—PLATE III.

Species 13. (Mus. Brit.)

MYA PRINCEPS. *Mya testis alba, tenui, ovata, ventricosâ;*
antè medium, medio et posticè radiatim striatâ;
latere antico inflato, oblongo antice levigato, semi-
ovato; umbonibus inflatis, retrorsis; latere postico
brevi, angusto, obliquè angulato, antè angulum
coarctato, ad terminum truncato; margine dorsali
depresso, declivî.

THE PRINCE MYA. Shell white, thin, ovate, ventricose;

radiately striated from before the middle, and posteriorly; anterior side inflated, oblong, smooth anteriorly, semi-ovate; umbones inflated, recurved; posterior side short, narrow, obliquely angular; narrowed in front of the angle, truncated at the end; dorsal margin depressed, sloped.

A. ADAMS. Ind. (*Cryptomya*) MS. Cum. Coll.
Hab. Philippine Islands.

The largest and finest of the *Cryptomya* group.

MONOGRAPH
OF THE GENUS
C L A U S I L L A.

Nature, great parent!

How mighty, how majestic are thy works!—*Thomson.*

CLAUSILIA.

PLATE I.

Genus CLAUSILIA. Draparnaud.

Testa terrestris, plurimum sinistralis, turreta, fusiformis, aperturā plus minusve auriformi, intus lamina liberā subspiralē testaceā clavat, columellā plurimum biplicata.

Shell terrestrial, generally sinistral, turreted, fusiform, aperture more or less auriform, closed within by a free subspiral shelly plate, columella generally with two plait.

The *Clausium*, shown at fig. 7, can only be seen *in situ*, by breaking the last whorl of the shell. It is of a subspiral form and turns on the edge of the inner part of the columella by means of a cartilaginous hinge. The animal can thereby retreat further within his shell and shut himself up more securely than by means of the ordinary external operculum of other shells. The species of this interesting genus of land shells are found everywhere in Europe, in China, and Chinese and Indian Islands, and generally in temperate districts. We have not been able to identify, among our 165 species taken principally from the British Museum and our own collections, half of the species enumerated by Pfeiffer, whose long and laborious studies, almost entirely confined to the air-breathing molluscs, have enabled him to present so complete a list. Our enumerations, however, include the great bulk of the species likely to be met with, and most of the more interesting and striking forms.

Species 1. (Mus. Sowerby.)

CLAUSSILIA TRIDENS. *Cla. testa pupiformi, medio subincisa, fuscō, profundē perpendiculariter sulcata; anfractibus scuis permanentibus, altis, ultimo elongata, angustata, infē prolongata, profundi rimate, subtortuosa; aperturā magnā, latē, subquadrata, superne elevata, acuminata; marginē albo crassa, expansa; pliā parietali crassā, pliā columellari pareat, elevatā, pliā subcolumellari inconspicua.*

THE THREE-TOOTHED CLAUSSILIA. Shell pupa-shaped, a little inflated below, brown, deeply perpendicularly grooved; whorls six permanent, high, last elongated, narrow, prolonged below, deeply

notched, a little tortuous; aperture large, broad, rather square, raised above, acuminate; margin white, thick, expanded; parietal plait thick, columellar plait small, raised, under-columellar plait inconspicuous.

CHEMSITZ (Turbo). Pfr. Mon. Hcl. II. 396.

Turbo costatus. Wood.

Clausilia labiata. Sowerby.

Hab. Porto Rico.

Species 2. (Mus. Brit.)

CLAUSSILIA BARTLETTI. *Cla. testa subrosea, brevissimā, ventricosissimā, solidā, levī; anfractibus quinā, tribus maximalis, ingatis, ultimo angustato, prolongato; aperturā subauriformi, labio extero supra medium sinuato; pliā parietali magna, pliā columellari subtriangularis.*

BARTLETT'S CLAUSSILIA. Shell somewhat pink, very short, very ventricose, solid, smooth; whorls five, three very large, inflated, last narrowed, prolonged; aperture subauriform, outer lip sinuous above the middle; parietal plait large, columellar plait subtriangular.

A. ADAMS. Proc. Zool. Soc. 1866.

Hab. Eastern Peru.

Species 3. (Mus. Brit.)

CLAUSSILIA BIPICULATA. *Cla. testa fusiformi, ventricosa, pruinosa, tenuissimā striata; anfractibus noveatis, ingatis; aperturā oblonga; marginē albo, labiō interno biplicata.*

THE TWO-PLAITED CLAUSSILIA. Shell fusiform, ventricose, plum-coloured, very finely striated; whorls nine, inflated; aperture oblong; margin white, inner lip two-plaited.

MONTAGU. Brit. Br.

Helix peregrina. Mull.

Clausilia Montagni. Gray.

Hab. Germany, Spain, Great Britain.

Species 4. (Fig. a, b, Mus. Sowerby.)

CLAUSSILIA FORMOSENSIS. *Cla. testa fusiformi, ventricosa, solidā, falcata, vel pruinosa; anfractibus un-*

CLAUSILIA.—PLATE I.

decens, usque ad medium et infra gradatim crescentibus, ultimo rimato; aperturā subauriformi, margine crasso, albo, labio interno triplicato.

THE FORMOSA CLAUSILIA. Shell fusiform, ventricose, solid, fulvous or plum-coloured; whorls eleven, gradually increasing to the middle and below, last notched; aperture somewhat ear-shaped; margin thick, white; inner lip with three plaits. H. ADAMS. Proc. Zool. Soc. 1866, p. 317, t. 33, f. 7.
Hab. Island of Formosa.

Species 5. (Mus. Brit.)

CLAUSILIA PLEUDUSA. *Cla. testā altā, subcylindrica, flavidā, levigatā, ad suturam rubro-lineatā; anfractibus novenis, gradatim crescentibus, altis, obliquis, convexis, ultimo altissimo, longō rimato; aperturā elongato-auriformi, intus nigro marginata, plicā parietali magnā.*

THE PLEUDUSA CLAUSILIA. Shell high, subcylindrical, yellow, smooth, with a red line at the suture; whorls nine, gradually increased, high, oblique, convex, last very high, with a long notch; aperture elongated, ear-shaped, black-edged within, parietal plait large.

A. ADAMS. Proc. Zool. 1872.

Hab. China.

Species 6. (Mus. Brit.)

CLAUSILIA TAYLOREI. *Cla. testā dextrā, albida, pyramidalis, medio paulo inflata, rugosā lirata; anfractibus undecenis, medio et suprā gradatim attenuatis, ultimo altissimo, infra medium carinato, descendentib; subattenuato, profundiē rimato, sublato; aperturā deltoidē, magnā, vix plicatā, margine utrinque latē expansa.*

TAYLOR'S CLAUSILIA. Shell dextral, whitish, pyramidal, a little swelled in the middle, roughly ridged; whorls eleven, gradually attenuated from the middle upwards, last very high, keeled below the middle, descending, slightly attenuated, deeply notched, slightly uncoiled; aperture deltoid, large, scarcely plaited, margin widely expanded on each side.

PFEIFFER. Proc. Zool. Soc. 1861, p. 27, Pl. II.

Hab. —?

A shell of remarkable beauty and singularity of form.

Fig. 7. Species 142. (Mus. Brit.)

CLAUSILIA MACASCARIENSIS. I had figured the species on Plate XV. as *Clausilia Macarana*, not knowing that the latter name was only synonymous with the former. The later figures and description were taken from a specimen in which the back of the last whorl is more strongly and roughly plaited than usual. In the figure on this Plate we have shown a last whorl with the clausium *in situ*.

Species 8. (Mus. —?)

CLAUSILIA EXILIS. *Cla. testā brevi, solidā, fusiformi, pruinosis, medio et infra ventricosā, latā; anfractibus novenis, levibus, inhati, teniā fideā ad suturam marginatis, ultimo leviter rimato, infra angustato; aperturā perpendiculariter oblonga, magnā; marginē albo, crasso, labio externo supra medianū sinuato, tumido, plicā parietali prominenti, plicā columellarī crassā, magnā.*

THE NARROW CLAUSILIA. Shell short, solid, fusiform, plum-coloured, ventricose in the middle and below, broad; whorls nine, smooth, inflated, bordered with a narrow band at the suture; last slightly notched, narrowed below; aperture perpendicularly oblong, large; margin white, thick, outer lip sinuous above the margin, tumid, parietal plait prominent, columellar plate thick, large.

ADAMS. Proc. Zool. Soc. 1866.

Hab. Isle Formosa.

Species 9. (Mus. —?)

CLAUSILIA OBELITA. *Sowerby.*

THE FORGOTTEN CLAUSILIA.

An error has arisen from the first plate remaining undescribed long after its publication. The writer having mislaid his memoranda cannot now identify this shell, but names it provisionally as above.

C L A U S I L I A.

PLATE II.

Species 10. (Mus. —? Copied.)

CLAUSILIA TORTICOLLIS. *Cla. testâ brevi, fusâ, brevis, simâ cylindricâ; anfractibus striatis, rectis, ultima elevata, rimata, saluta; apertura subquadrata, margine interno supra, infra, et medio plicata.*

THE WRY-NECKED CLAUSILIA. Shell short, brown, very shortly cylindrical; whorls few, striated, straight, the last raised, notched, unciled; aperture rather square, with the inner margin plaited above, in the middle and below.

OLIVIER. Sowerby's Genera.
Hab. Syria.

Species 11. (Mus. Sowerby.)

CLAUSILIA ANATOLICA. *Cla. testâ sinistrâ, fusiformi, pallidi griseo-fusê, medio et infra inflata, superiori granulata attenuata; anfractibus concurvatis, obliquis, densâ laminaria costatis; ultimo contracto, rimato, prep' aperturam obliquâ hiscagato; apertura magna, subquadrata, margine expansa, tenu, labio externo intus plicato, margine superiori perpendiculariter uniplicata; plicâ columbariori elevata, obliqua.*

THE ANATOL. CLAUSILIA. Shell sinistral, fusiform, pale greyish-brown, inflated in the middle and below oblique, with close, laminar ribs; last contracted, notched, with two oblique ridges near the mouth; aperture large, rather square, margin expanded, thin, outer lip with an inner plait, upper margin with single perpendicular plait; columellar fold raised, oblique.

ROTH. Küster, p. 233.
Hab. Anatol.

Species 12. (Mus. Sowerby.)

CLAUSILIA ELEGANS. *Cla. testâ subfusiformi, purpureo-fusê; costis aliis, tenuibus, orbis sequuntibus sculptâ; anfractibus 9, concurvisculis, ultimo post aperturam contracto et plicato; apertura albidâ, subauriformi, margine expenso, reflexo,*

labio externo superne incrassato, margine superiori perpendiculariter uniplicato, plicâ columellarî latâ, obliquâ.

THE ELEGANT CLAUSILIA. Shell rather fusiform, purple-brown, sculptured with white, narrow numerous consecutive ribs; whorls nine, rather convex, the last contracted and plaited beyond the aperture; aperture whitish, somewhat auriform, margin expanded, reflected outer lip thickened above, upper margin with a single perpendicular plait, columellar plait broad, oblique.

BULZ. Rossini, Icon. iii, p. 64.

Clavisilia intercedens, A. Schmidt.

Hab. Wallachia.

Species 13. (Mus. Sowerby.)

CLAUSILIA LAMINATA. *Cla. testâ levigatâ, fusiformi, fuscocorvæ, obliquè sinistrâ; anfractibus concurvatis, apertura subauriformi, infra intus plicata; plicâ superiori obliquâ, breviâsculâ; plicâ columellarî obliquâ, late laminatâ; margine apertura angusto, albo.*

THE LAMINATED CLAUSILIA. Shell smooth, fusiform, horny-brown, obliquely sinistral; whorls rather convex; aperture somewhat auriform, plaited within at the lower part; superior plait oblique, rather short; columellar plait oblique, broadly laminar; edge of aperture narrow, white.

MONTAGU. British Shells.

Helix bidenta, Müller.

Clavisilia lamellata, Leach.

Clavisilia dermata, Jeffreys.

Clavisilia lucida, Menke.

Clavisilia granulata, Zeigler.

Clavisilia Transylvanica, Stenzl.

Hab. Great Britain, and Europe generally.

Species 14. (Mus. Sowerby.)

CLAUSILIA EXARATA. *Cla. testâ gracile, fusiformi, griseescens, laminis tenuibus crebris sculptâ; anfractu-*

ultimo elongato, contracto, propè aperturam obliquè birugato, concavo; aperturâ parvâ, subauriformi, fulva, intus plicata, margine expanso, pliis superiori parvî, pliis columellarî elevatâ, arcuatâ.
THE PLOUGHED CLAUSILIA. Shell slenderly fusiform, greyish, sculptured with thin, close laminae; last whorl elongated, contracted, with two oblique wrinkles near the aperture, concave; aperture small, rather auriform, brown, with an inner plait below, margin expanded; upper plait small; columellar plait raised, arched.

ZEIGLER. Pfeiffer Monog. ii. 449.

Clausilia callosa, Montford.

Clausilia denegabalis, Zeigler.

Hab. Dalmatia.

Species 15. (Mus. Sowerby.)

CLAUSILIA LÆVISSIMA. *Cla. fusiformi, cornæ, levigatæ, sinistrali; anfractibus vix concavis, elevatis, ultimo compresso propè aperturam arcuatin rimate; aperturâ magnâ, biplicatâ, margine albo, reflexo, tenui.*

THE VERY SMOOTH CLAUSILIA. Shell fusiform, horny, smooth, sinistral; whorls scarcely convex, elevated, last compressed, with a curved notch close to the aperture; aperture large, with two folds, margin white, reflected, thin.

ZEIGLER. Pfeiffer Monog. ii. p. 439.

Clausilia glabrata, Mühlfeldt.

Clausilia levigata, Mühlfeldt.

Clausilia decorata, Zeigler.

Clausilia superstructa, Parreyss.

Clausilia fulginea, Parreyss.

Hab. Croatia and Dalmatia.

Species 16. (Mus. —? Copied.)

CLAUSILIA MOUHOTI. *Cla. testâ fusiformi, ventricosa, tenui, tenuiter striatâ griseo-fusca, maculis albis fuscois propè suturam notata, maculis albis medio anfractuum asperzâ; anfractibus apicalibus rotundatis, medianis inflatis, penultima elongata, medio contracto, ultimo intus rimate; aperturâ magna, auriformi, pliis superiori parvâ, alba, columellâ biplicatâ, apertura margine reflexo, subexpanso.*

MOUHOT'S CLAUSILIA. Shell fusiform, ventricose, thin, finely striated, grey-brown, marked with white

and brown spots near the suture, sprinkled with white spots in the middle of the whorls; apical whorls rounded, middle ones inflated, the last but one elongated; the last notched; aperture large, auriform, upper plait small, white, columella with two plaits, margin of the aperture reflected, slightly expanded.

PFEIFFER. Proc. Zool. Soc., 1875, p. 275, Pl. 36.

Hab. Loa Mountains, Camboja.

Species 17. (Figs. a, b, Mus. Sowerby and Brit.)

CLAUSILIA LUCASTIGMA. *Cal. testâ fusiformi, angustâ, fusca, vel pallidi cornæ, medio subinflata; anfractibus 9, elevatis, liratis, ad suturam lineâ rubra maculis albis interrupti ornatis; ultimo rimato, contracto; aperturâ albâ, subauriformi, intus contracto, pliis columellarî latâ, margine superiori perpendiculariter unipliata.*

THE WHITE-MARKE CLAUSILIA. Shell fusiform, narrow, brown, or pale horn, a little inflated in the middle; whorls nine, raised, ridged, with a red line at the suture, interrupted by white spots; the last notched, contracted; aperture white, somewhat auriform, contracted within, columella plait broad, upper margin with a single perpendicular plait.

ZEIGLER. Pfeiffer Monog. ii. p. 446.

Clausilia candidilabris, Porro.

Clausilia opalina, Zeigler.

Clausilia latilabris, Mühlfeldt.

Hab. Italy.

Species 18. (Mus. Sowerby.)

CLAUSILIA CYLINDRICA. *Cla. breviuscula, subcylindrica, cornæ, tenuiter lirata; anfractibus altis, rectiusculis, aperturâ perpendiculariter oblonga, margine angusto, rotundo, albo, supernè unipliata, pliis columellarî obliquâ, angustâ, elevata.*

THE CYLINDRICAL CLAUSILIA. Shell rather short, rather cylindrical, horny, finely ridged; whorls elevated, rather straight, aperture perpendicularly oblong, margin narrow, rounded, white, plaited above, columellar plait oblique, narrow, raised.

GRAY. MS. Pfeiffer Monog. iii. p. 591.

Hab. Himalaya Mountains.

CLAUSILIA.

PLATE III.

Species 19. (Mus. Sowerby.)

CLAUSILIA FALLAX. *Cla. testā subventricosā, fusiformi,
līris lamelliformibus rugatā, pallidē fādeō : apertūrā
subquadratā, superē uniplicatā, marginē
externo superē contracta, labio columellarī bā-
callous, plīcā columellarī rectilobulō, infīrā truncato.*

THE FALLACIOUS CLAUSILIA. Shell rather ventricose, fusiform, wrinkled with lamelliform ridges, pale fulvous; aperture rather square, single-plaited above, outer margin contracted above, columnellar lip with two callousities, columellar plait rather straight, truncated below.

ROSSMISLER — ? Pfeiffer, Monog. ii. p. 127.

Clausilia obscura, Parreys.

Clausilia decipiens, Zeigl.

Hab. Transylvania.

Species 20. (Mus. Sowerby.)

CLAUSILIA DISCOLOR. *Cla. testā brevīsuscitā, tenui,
levigatā, medio ventricosā, versus apicem angustissimā,
cornēi, flammis fuscescentibus variegatā, anfractibus
10, concrexiūscendis, tribus apicibus angostissimis :
aperturā lata, plīcā superiori parvā, inferiori super
columnellum obliquē elongatā.*

THE TWO-COLOURED CLAUSILIA. Shell rather short, stout, smooth, ventricose in the middle, narrow towards the apex, horny, varied with brownish flames; whorls 10, rather convex, three apical very narrow; upper plait small, lower obliquely elongated upon the columnella.

PEIFFER. Monographia, ii. p. 416.

Hab. Isl. Cerigo.

Species 21. (Mus. Sowerby.)

CLAUSILIA FARVULA. *Cla. parvā, tenui, fusiformi,
leuci, purpureo-fusca ; anfractibus altis, ultimo
arcuatum rimata ; aperturā subauriformi, intus
infīrā biplicata, marginē tenui, rotundo albo,
marginē superiori uniplicata, plīcā columellarī
elevata, perobliqua, infīrā truncata.*

THE LITTLE CLAUSILIA. Shell small, thin, fusiform, smooth, purple-brown; whorls elevated, the last with a curved notch; aperture rather auriform, with two folds within at the lower part; margin thin, round, white, upper margin with one fold, columellar fold raised, very oblique, truncated below.

SIEBOLD — ? Pfr. Mon. ii. p. 462.

Clausilia minima, Parreys.

Hab. Germany and other parts of Europe.

Species 22. (Mus. Brit.)

CLAUSILIA CYLINDRELLIFORMIS. *Cla. testā fusiformi,
pallidissimā luceō, longē rimata, teriter levata ;
anfractibus apicibus fusca, medianis subinflatās :
ultimo contracto, elongata, longē soluta, ad dorsum
rugis duabus obliquis, elevatis, elongatis quasi
bicarinatā ; aperturā remota, subrotata, plīcā
superiori tenui, plīcā columellarī elevata, tenui,
marginē, expansa, tenui.*

THE CYLINDERELLIFORM CLAUSILIA. Shell fusiform, very pale lilac, with a long notch, slightly ridged; apical whorls brown, middle whorls a little inflated, the last contracted, elongated, with a long portion uncloaked, as it were double-keeled at the back with two oblique elevated wrinkles; aperture distant, rather oval, upper plait thin, columnellar plait raised, thin, margin expanded, thin.

BOURGUIGNAT — ? Pfr. Mon. Hel. iv. p. 720.

Hab. Mount Lebanon, Syria.

Species 23. (Mus. Sowerby.)

CLAUSILIA BIELZI. *Cla. testā dextrorsā, ventricosā,
fusiformi, tenui, cornēi, irregulariter et plerumque
distanter levata ; anfractibus concisis, medianis
inflatis, elevatis, ultimo elongato, prop̄ aperturam
rimata ; aperturā perpendiculariter oblonga, marginē
externo rotunda, levā ; plīcā internis dubiis,
tenuibus, plīcā marginali superiori parvā ; plīcā
columellarī tenui, angustata.*

BIELZI'S CLAUSILIA. Shell dextral, ventricose-fusiform, thin, horny, irregularly and for the most part distantly ridged; whorls convex, the middle ones inflated, raised, the last elongated, notched near the aperture; aperture perpendicularly oblong, outer margin rounded, smooth; internal plaits two, thin, upper marginal plait small, columnellar plait thin, angular.

PARREYS. Pfeiffer Monog. iii. p. 588.

Clausilia tecalis, Parreys.

Clausilia clathrata, Rossmisler.

Hab. Transylvania.

CLAUSILIA.—PLATE III.

Species 24. (Mus. Brit.)

Clausilia Rolphi. *Cla. testā obtuse fusiformi*, corneo fuscā liris crebris sculpā; anfractibus medianis ventricosis, ultimo elevato, infrah contracto, rimato in venicem spiralem ad dorsum desinente; apertura subauriformis, marginē externo superne contracto, labio columellarī plicato, plieis, una superiori, parva, duabus paries submarginitalibus, unū mayn laminatū, obliqui subiunctū.

ROLPHI'S *CLAUSILIA*. Shell obtusely fusiform, hornbrown, sculptured with close ridges; middle whorls ventricose, the last raised, contracted below, notched, ending in a spiral varix at the back; aperture rather auriform, outer margin contracted above; columellar lip plaited, plaits, one above small, two small near the margin, one large, laminated, oblique, partly internal.

LEACH —? Pfeiffer Monog. iv. p. 762.

Clausilia Mortilleti, Dumont.

Clausilia biplicata, Parreys.

Clausilia satelles, A. Schindl.

Hab. Britán, France, &c.

Species 25. (Mus. Brit.?)

Clausilia Swinhonis. *Cla. testā arcuato-rimata, fusiformi*, solidā, subcentricis, castaneā, striatā; anfractibus 10–12, convexiūculis, ultimo infrah turgide; apertura verticali, oblongi oculi, angulo superiori rotundato; lamellis validis, et superiori, duabus columellaribus obliquis, haud elevatis.

SWINHOE'S *CLAUSILIA*. Shell with a curved notch, fusiform, solid, rather ventricose, chestnut striated; whorls ten to twelve convex, the last turgid at the lower part; aperture vertical, oblong, oval, rounded at the upper angle, lamella strong, one upper, two oblique columellar, not raised.

PFEIFFER. Proceedings of the Zoological Society, 1865, p. 830; plate 46, f. 11.

Hab. Isl. of Formosa.

Species 26. (Mus. Sowerby.)

Clausilia Crispula. *Cla. testā brevi, ventricosā fumoso-fusca*, anfractibus 8, maculis magnis albis castaneisque superne prop̄ suturam variegatis, convexis, tenuiter et densè liratis, ultimo prope aperturam rimata, infrah ad dorsum subspiraliter birugata; apertura albā, disjuncta, intus contracta, marginē latō, laminatum expanso, plieis superiori perpendiculari, plieis columellarī elevata.

THE CRISP *CLAUSILIA*. Shell short, ventricose, smoky brown, whorls eight, variegated above near the suture with large white and chestnut spots, convex, finely and closely ridged, the last notched near the aperture, with two subspiral wrinkles below on the back; aperture white, disjoined, contracted within, margin broad, spread in a layer, upper plait perpendicular, columellar plait elevated.

LOWE. Dr. Paiva, Monog. Moll. Madeira.

Hab. Madeira.

Species 27. (Mus. Sowerby.)

Clausilia Gastrolepta. *Cla. testā brevissimula, castaneā, ad suturam albido variegatā, tenuissimē liratā, anfractibus 9, medianis ventricosis, ultimo attenuato, riuato, compresso, infrah birugato; apertura albā, marginē lato, laterē externo supra medium sinuatim incrassato, plieis superiori elongatiūculo, plieis columellarī lato, horizontali*.

THE SMALL-CHESTED *CLAUSILIA*. Shell rather short, chestnut, varied with white at the suture, very finely ridged, whorls nine, the middle ones ventricose, the last attenuated, notched, compressed, with two wrinkles beneath; aperture white, margin broad, outer side sinuously thickened above the middle, upper fold rather lengthened, columellar fold broad, horizontal.

ZEIGLER —? Pfeiffer Monog. ii. p. 448.

Clausilia Freyeri, Küster.

Clausilia tabida, Küster.

Clausilia elongata, Cautraine.

Hab. Dalmatia.

Species 28. (Mus. Sowerby.)

Clausilia Delostoma. *Cla. testā parvā, angustā, fuscā, dense albilitratā; anfractibus 10, convexiūculis; ultimo rimato, obliquū attenuato, infrah birugato; apertura subdeltoidē, biplicato, pareūculo, subdisjuncta*.

THE DELTA-MOUTHED *CLAUSILIA*. Shell small, narrow, brown, with close, white ridges; whorls ten, rather convex; the last notched, obliquely attenuated, with two wrinkles below; aperture somewhat deltoid, with two plaits, rather small, a little disunited.

LOWE —? Pfeiffer Mon. ii. p. 411.

Hab. Porto Santo, Madeira.

CLAUSILIA.

PLATE IV.

Species 29. (Mus. Sowerby.)

Clausilia conspersa. *Cla. testa levigata, cornuta, levigata, medio ventricosa, ad suturas tuberculis minutis albis crenatis; anfractibus 10, ultimo rotundato, ad dorsum albo notato, infra subcavosus; apertura magna, pliis columnari lati, subhorizontali; marginem tenui, albo, levigato.*

THE SPINULED CLAUSILIA. Shell smooth, horny, rather short, ventricose in the middle, crenated at the sutures; whorls ten, the last notched, marked with white at the back, slightly varicose below; aperture large, columnar plait broad, nearly horizontal; margin thin, white, smooth.

PARREYS. Rossmaesler, Icon. iii.

Hab. Bosnia. Corfu. Dalmatia.

Species 30. (Mus. Brit.)

Clausilia plicata. *Cla. testa elongata, fusiformi, rubra-fusca, tenuiter lineata, ad suturas plieis valvulis albis ornata; apertura oblonga, biplicata, infra subacuminata, margine tenuiter rugosa; ultimo angustato rotundato, infra elongata, tumida.*

THE PLAITED CLAUSILIA. Shell elongated, fusiform, reddish brown, finely ridged, ornamented at the sutures with strong white plaits; aperture oblong, with two plaits, somewhat accumulated below, margin thinly reflected; last whorl notched, elongated, tumid below.

DEAPANSAUD (Pupa). Conch. fluv. Pfeiffer Monog. ii. p. 479.

Figure 32.

CLAUSILIA TRIDENS. Species I. Plate I.

Although this is a different variety and worth figuring for the difference, I am now convinced that *Cla. tridenta* of Chemnitz, and *Cla. labiata*, Sowerby, *labiata*, Montfort, are one.

Species 32 is postponed.

Species 33. (Mus. Sowerby.)

Clausilia javana. *Cla. testa gracile, fusiformi, fusca, tenuissime obliquè striata; anfractibus concavissimis, elevatis, obliquis, ultimo infra attenuata, rotunda; apertura magna, auriformi, marginè rugosa, expansa, albido, levigata, plieis superiori, columellaris parvis, albis, approximatius.*

THE JAVA CLAUSILIA. Shell slenderly fusiform, brown, very finely obliquely striated; whorls rather convex, raised, oblique, the last attenuated below, notched; aperture large, auriform, margin reflected, expanded, whitish, smooth, upper and columellar plaits small, white, approximate.

PFEIFFER. Monog. Helic. ii. p. 405.

Hab. Java.

This is an elegantly fusiform species with expanded aperture.

Species 34. (Mus. Sowerby.)

Clausilia ventricosa. *Cla. testa fusiformi-subpyramidalis, tenuissime filostrata, fusca; anfractibus 13,*

CLAUSILIA.—PLATE IV.

obliquis, altis, medio et infid ventricosis; suturā profunda, incisa; ultimo anfractū rimato, anticē tumido; aperturā subquadratā, margine albo; plīcia superiori parvā, plīcia columellari elevata, fīrē horizontali.

THE VENTRICOSE CLAUSILIA. Shell fusiform, somewhat pyramidal, very finely thread-striated, brown; whorls thirteen, oblique, elevated, ventricose in the middle and under; suture deep, incised; last whorl notched, tumid anteriorly; aperture rather square, margin white; upper plait small, columellar plait raised, nearly horizontal.

DEPARNAUD. Con. fluv. Pflr. Mon. ii. p. 465.

Helix perversa, Sturm.

Clausilia latestricta, Parreyss.

Hab. Germany. France, &c.

Species 35. (Mus. Sowerby.)

CLAUSILIA PHILIPPINA. *Cla. testā brevi, fuso-rubescēti, solidi, ventricosissimā, anfractibus 5-6, lati, alti, levigatis, ultimo angustato, juxta aperturam lineatim rimato; aperturā subauriformi, margine expanso; plīcia superiori et columellari validis, approximatis.*

PHILIPPI'S CLAUSILIA. Shell short, reddish-brown, solid, very ventricose, whorls five or six, broad, high, smooth; the last narrow, linearly notched close to the mouth; aperture rather auriform, margin expanded; upper and columellar plaits strong, approximate.

PFEIFFER. Monog. ii.

Hab. Birma.

A peculiarly obese shell of few whorls.

Species 36. (Mus. Sowerby.)

CLAUSILIA LINEOLATA. *Cla. testā fusiformi, elongata, angustā, cornico-fuscā, liris albis tenuibus, cribris sculptā; anfractibus 13, concisis, ultimo angustato, ad dorsum medio compresso, infid tumido; aperturā oblongā, margine externo tenui, supra medium sinuatim subcontracto, plīcia superiori brevissimo, plīcia columellari, elevata, subinterno.*

THE LINEAR CLAUSILIA. Shell fusiform, elongated, narrow, horn-brown, sculptured with white, thin,

close ridges; whorls thirteen; convex, the last narrow, compressed in the middle at the back, tumid below; aperture oblong, outer margin thin, sinusously contracted above the middle; upper plait very short, columellar plait elevated rather internal.

HELD —? Pfeiffer Monog. iv. p. 778.

Hab. Germany. France, &c.

Species 37. (Mus. Sowerby.)

CLAUSILIA OLIVIERI. *Cla. testā carmineo-fuscā, strigis undigae cornēis variegatā, validē inaequaliter litatā, elongata-fusiformi; anfractibus 11, supēriō declivib; suturā profundiā; ultimo anfractū angustato, rimato, ad dorsum medio compresso, infid tumido, validē rugoso; aperturā fulvā, angustē ovata, plīcia superiori parvā, plīcia columellari elevata, intus angulata.*

OLIVIERE'S CLAUSILIA. Shell bluish, variegated with horny stripes and waves, strongly unequally ridged, elongated, fusiform; whorls eleven, sloped above; suture deep, last whorl narrow, notched, compressed in the middle at the back, tumid below, strongly wrinkled; aperture fulvous, narrowly ovate, upper plait small, columellar plait raised, angular within.

ROTH. —? Küster, p. 233. Pfeiffer Mon. ii.

Hab. Rhode Island.

Species 38. (Mus. Sowerby.)

CLAUSILIA LUNULATA. *Cla. testā griseo-fuscā, tenuissimè striatā, subventricosā; anfractibus 8, medianis inflatis, ultimo ad dorsum medio contracto; aperturā subauriformi, margine tenui, expanso, reflexo; plīcia superiori et columellari parvā, approximatis.*

THE LUNULAR CLAUSILIA. Shell grey-brown, very finely striated, rather ventricose; whorls eight, the middle ones inflated, the last contracted in the middle at the back, aperture rather auriform, margin thin, expanded, reflected; upper plait and columellar plait small, approximate.

PFEIFFER. Monograph Helicorum, iii. p. 608.

Hab. Euboga.

C L A U S I L I A.

PLATE V.

Species 39. (Mus. Sowerby.)

CLAUSILIA OETHOSTOMA. *Cla. breviter fasciata*,
purple-brown, levigata; anfractibus 10, convexis, elevatis,
ad suturam crenulatis; ultimo anfractu crenato;
apertura recta, oblonga, margin alba, paulo reflexa,
margina externo prope suturam callitro, plicis
superiori et columnellari tenuibus, approximatis.

THE STRAIGHT-MOUTHED CLAUSILIA. Shell shortly fusiform, purple-brown, smooth; whorls ten, rather convex, crenulated at the suture; last whorl notched; aperture straight, oblong, margin white, a little reflected, outer margin callous near the suture, upper and columnellar plait thin, approximate.

MIXXEL. Synopsis? Pfeiffer Mon. ii. p. 102.

Clavisilia filiformis, Parreyss.

Clavisilia tenuata, Zeigler.

Hab. Germany. Hungary, &c.

Species 40. (Mus. Sowerby.)

CLAUSILIA PLUMBEEA. *Cla. testa levata, ventricosa, purpureo-fusca*, levigata; anfractibus 10, convexis,
superne ad suturam albo tumidos, medianis ventri-
cosis, ultimo profundè rimato, ad dorsum depresso;
infra subcirculari, aperturi alba, lati biplicatis
margine, margine reflexo, expanso.

THE PLUM-COLOURED CLAUSILIA. Shell short, very ventricose, purple-brown, smooth; whorls ten, convex, banded with white above at the suture, middle ones ventricose, last deeply notched, depressed at the back, subcarinated below; aperture white, with two broad plait, rather large, margin reflected, expanded.

RÖMSSLER —? Pfeiffer Mon. ii. p. 101.

Hab. Transylvania.

Species 41. (Mus. Sowerby.)

CLAUSILIA SEMIREGULATA. *Cla. testa griseo-albida, lamel-
lis tenuibus levata*; anfractibus paucis, elevatis,

medio levigatis, ad suturam tenui fuscâ tuberculis
albis interrupta cinctis; ultimo rimato, obliquè an-
gustato, ad dorsum compresso, infra tumido, sub-
carinato; apertura subarcuata, marginâ tenui,
pliis columnellari tenuibus, approximatis.

THE HALF-WINKLED CLAUSILIA. Shell whitish-grey, ridged with thin laevelas; whorls few, raised, smooth in the middle, belted at the suture with a narrow band interrupted by white tubercles, the last notched, obliquely narrowed, flattened at the back, tumid below, partly keeled; aperture rather auriform, margin thin, columnellar plait broad, white.

ZEIGLER. Vert. Claus. p. 29.

Clavisilia pruinalia, Parreyss.

Clavisilia pygmaea, Zeigler.

Clavisilia nitida, Multifeldt.

Species 42. (Mus. Sowerby.)

CLAUSILIA STRANGULATA. *Cla. testa breviæcylindrica*, lami-
nata levata, griseo-fuscâ; anfractibus 8, con-
caviscens, ultimo attenuato, rimato, brevisimè
soluto, ad dorsum concurvato, tumido bimarginato;
apertura oblonga, margin tenui, subpresso.

THE STRANGLING CLAUSILIA. Shell rather short, ridged with laminae, fulvous-grey; whorls eight, rather convex, the last attenuated, notched, very shortly uncalled, pressed in at the back with two tumid wrinkles; aperture oblong, margin thin, rather expanded.

FERRUSSAC —? Pfeiffer Mon. ii. p. 467.

Clavisilia retusa, Parreyss.

Hab. Syria.

This curious little shell is pressed and knotted behind the aperture so as to give the appearance of strangulation.

CLAUSILIA.—PLATE V.

Species 43. (Mus. Sowerby.)

Clausilia vallata. *Clu.* testā brevi, subventricosō, cornulō; anfractibus 8, convexiūsculis; ultimo rimato, ad dorsum compressa, prop̄ aperturam varice albo, plīciformi vallatā; aperturā albā, marginē crasso, plīciā columellarī crassā, plīciā superiori tenui.

THE WALLED CLAUSILIA. Shell short, subventricose, horny; whorls eight, rather convex; the last notched, compressed at the back, walled near the aperture with a white, plait-like varix; aperture white, margin thick, columellar plait thick, upper plait thin.

MOUSSON. Ms. Pfeiffer Monog. 1868, p. 453.

Clausilia veltata, Adams.

Hab. Epirus.

Species 44. (Figs. a, b, Mus. Sowerby.)

Clausilia rugosa. *Clu.* testā parvā, subcentricosō, tonuiter liratā, fuscā, anfractibus 10, convexis, ultimo angustato, aperturā auriformi, marginē plīcisque albīs, plīciā unā brevi superiori, unā inferiori, prop̄ marginē instritā, unā laterali prop̄ marginē externā conspicuā, unā latā, columellarī, cum unā parciā infīra.

THE RUGOSE CLAUSILIA. Shell small, rather ventricose, finely ridged, brown, whorls ten, convex, the last narrow, aperture auriform, margin and plaits white; plaits, one short upper, one placed near the lower margin, one lateral conspicuous near the outer margin, one broad, columellar with one small underneath.

Clausilia Reboudii, Charpentier.

Clausilia pyrenaica, Charpentier.

Clausilia crenulata, Ferrussac.

Clausilia perversa, Moquin.

Hab. France. Northern Italy.

Species 45. (Mus. Sowerby.)

Clausilia Tristami. *Clu.* testā elongato-fusiformi, purpuro-fusca, tenuiter liratā, anfractibus 14, altis, ultimo rimato; aperturā latā, biplicatā, marginē albo, levigato, angusto.

TRISTAM'S CLAUSILIA. Shell elongated fusiform, purple-brown, finely ridged; whorls fourteen, high, the last notched; aperture broad, two plaited, margin white, smooth, narrow.

PFEIFFER. Proc. Zool. Soc. 1860.

Hab. Mount Atlas, Tunctan.

Species 46. (Mus. Sowerby.)

Clausilia Shanghaiensis. *Clu.* testā elongato-fusiformi, levigatā, politā, cornulā; anfractibus 12, convexiūsculis, ultimo vir rimato, obliquē attenuato; aperturā oblonga, biplicatā, marginē crasso, heri, albo, reflexo.

THE SHANGHAI CLAUSILIA. Shell elongated fusiform, smooth, polished, horny; whorls twelve, rather convex; the last hardly notched, obliquely attenuated; aperture oblong, with two plaits: margin thick, smooth, white, reflected.

PFEIFFER. Monograph iii. p. 410.

Hab. Shanghai, near China.

Species 47. (Mus. Sowerby.)

Clausilia Stimpsoni. *Clu.* testā parciā, albida, tenui, gracili, tenuiter liratā; anfractibus 10, ultimo elongato; aperturā parvā, biplicatā, falcā, marginē crassissimo, plīciā columellarī obliquē elevatā, rie, par, excentrica.

STIMPSON'S CLAUSILIA. Shell small, whitish, thin, slender, finely ridged; whorls ten, the last elongated; aperture small, with two folds, fulvous, margin rather thick, columellar plait obliquely raised, scarcely prominent.

A. ADAMS. Mart. Osts. Zool. ii. p. 83.

Hab. Japan.

CLAUSILIA.

PLATE VI.

Species 48. (Mus. Hanley.)

CLAUSSILIA BACILLUM. *Cla. testi fusiformi, pallidi aurantii, lervi; anfractibus 9, concisis, medianis ventricosis, ultimis contractis; aperturâ oblongâ, albâ, superne cuneatâ, plicâ superiori validâ; plicâ columellarâ elongatâ, obliquâ.*

THE WALKING-STICK CLAUSSILIA. Shell fusiform, pale orange, smooth; whorls nine, convex, the middle ones ventricose, the last contracted; aperture oblong, white, covered above, upper plait strong; columellar plait elongated, oblique.

BENSON. MS. Hanley, Conchologia Indica, p. 12.
Hab. Nancrai, Khasi Hills.

There appear to be only two specimens of the species known.

Species 49. (Mus. Brit.)

CLAUSSILIA PARREYSSI. *Cla. testâ subpyramidalâ, minutè interruptione liratâ, fuscо-rubescens, infrâ medium ventricosâ; anfractibus 9, inferioribus altis, ad suturam tenuissimè plicatis; aperturâ magna, biplicatâ, labio externo suprâ medium sinuato; plicâ superiori parva, incurvâ; plicâ columellarâ, altâ, latissimâ.*

PARREYSS' CLAUSSILIA. Shell somewhat pyramidal, minutely interruptedly ridged, reddish brown, ventricose below the middle; whorls nine, the lower ones elevated, very finely plaited at the suture; aperture large, with two plaits; outer lip sinuated above the middle; upper plait small, curved inwards; columellar plait elevated, rather broad.

ZEIGLER. Pfeiffer, Monograph. II. p. 400.

Claußilia marmorata, Parreyss.

Claußilia cerea, Menke.

Hab. Carpathian Mountains.

Species 50. (Mus. Brit.)

CLAUSSILIA ANGUSTATA. *Cla. testâ rimatâ, fusiformi, tenui, levigatâ, conspicuè attenuatâ, apice acuto, suturâ albofilosa; anfractibus 10-11, planulatis, ultimo infrâ gibbo, striato; aperturâ viz obtusâ, oblongo-ovali; plicâ superiori compressa, marginum*

non-attentgenti, inferiori validâ, tortuosa; plicis internis 4, inaequalibus; peristomate continuo soluto, albo, angusta reflexo.

THE NARROW CLAUSSILIA. Shell notched, fusiform, thin, smooth, conspicuously attenuated, with acute apex, suture white-threaded; whorls ten or eleven, flattened, last gibbous below, striated; aperture very slightly oblique; oblong-ovate; upper plait compressed, not touching the margin, lower plait strong, tortuous, inner plaits four, unequal; peristome continuous, detached, white, narrowly reflected.

BIEZT. Pfeiffer.

Hab. Transylvania.

Species 51. (Mus. Benson, Hanley.)

CLAUSSILIA BULBOS. *Cla. testâ pupiformi, ventricosissimâ, castanâ, rimatâ; anfractibus 4, duobus apicalibus parvissimis, tertio magno, alto, valde inflato, ultimo alto, versus aperturam angustato; aperturâ parvâ, auriculiformi, peritreme pallide carnea, crasso, reflexo, columellâ biplicata.*

THE BULB CLAUSSILIA. Shell pupiform, very ventricose, chestnut, notched; whorls four, two apical, rather small, third large, elevated much inflated, last elevated, narrow towards the aperture; aperture small, ear-shaped, peritreme pale flesh, thick, reflected, columella with two folds.

BENSON. Annals of Natural History, 1863.

Hab. Near Moulinein, Birmali.

Resembling *Claußilia Philippiana*, but with the whorls fewer, much more inflated and unequal.

Species 52. (Fig. a, b, Mus. Brit.)

CLAUSSILIA VALIDA. *Cla. testâ subfusiformi, solidâ, pallidâ cornuta, vel flavidâ, medio anfractuum latè unifasciata, tenuiter lirata; anfractibus 8-9 altis, subcylindricis, medianis inflatis, ultimo altissimo, versus aperturam attenuata; aperturâ magna, altissimâ auriformi, plicâ superiori elongatâ, plicis super-columellanâ unâ validâ, elongatâ, alterâ parvâ, in inferiori.*

CLAUSILIA.—PLATE VI.

THE STRONG CLAUSILIA. Shell rather fusiform, solid, pale horny, or yellowish with a broad band in the middle of the whorls, finely ridged; whorls eight to nine, elevated, rather cylindrical, middle ones inflated, last very high, attenuated towards the aperture; aperture large, very high, auriform, upper plate elongated, plait on the columella, one strong, elongated, the other small, lower.

PFEIFFER. Monographia Helicorum III.
Hab. Lieu Kien.

Species 53. (Mus. Hanley.)

CLAUSILIA INSIGNIS. *Cla. testá fusiformi, rimatá, castanei, levigatá, propé suturam fasciá pallidá cincti; anfractibus 9, convexis, gradatim versus terminos attenuatis; ultimo altissimo; aperturá subtrianguli, marginé purpureo crasso; labio externo lato, supérè incrassato, sinuato; plicis superiori et columellari validi.*

THE WONDERFUL CLAUSILIA. Shell fusiform, notched, chestnut, smooth, girt with a pale band near the suture; whorls nine, convex; gradually attenuated towards the end; last very high; aperture nearly trigonal, margin purple, thick, outer lip broad, thickened and sinuated above; upper and columellar plaits strong.

GOULD. Proceedings of the Boston Society of Natural History.

Hab. Tavoy, Birmah.

Species 54. (Mus. Brit.)

CLAUSILIA MARGINATA. *Cla. testá fusiformi, solidá, fuscocornuta, levigatá; anfractibus 10, ad suturam fuso-marginatis, apicalibus 6 contractis, inferioribus ventricosis, ultimo rimato, aperturá contracta, elevata, marginé crasso, labio externo ad medium sinuatus plicato, plicis superiori et columellari crassis, magnis.*

THE FOEDERED CLAUSILIA. Shell fusiform, solid, brown-horn, smooth; whorls ten, thread-bordered at the suture, the six towards the apex contracted, lower ones ventricose, last notched; aperture contracted, elevated, margin thick, outer lip with a sinuous plait in the middle; upper and columellar plaits thick, large.

ZIEGLER.

Clausilia Democtiana, Menke.
Clausilia bilabiata, Fr.
Clausilia vitrea, Bietz.
Hab. Transylvania.

Species 55. (Mus. Brit.)

CLAUSILIA BINOTATA. *Cla. testá breviæscula, subpyramidalis; pallide succinæ; anfractibus 9, breviæsculis ad suturam denticulato-plicatis, apicalibus sensim contractis, medianus convexis, ultimo ad dorsum lineis pallidis semilunaribus duabus notato; aperturá latâ, margine externo supra medium sinuatus plicato, columellâ bicardiata.*

THE TWO-MARKED CLAUSILIA. Shell rather short, rather pyramidal; pale amber; whorls nine, rather short, with tooth-like plaits at the suture, three apical, sensibly contracted; middle convex, last marked at the back with two pale semilunar lines; aperture broad, external margin with a sinuous plait above the middle; columellar with two plates.

ROSMÄLER. Pfeiffer, Monograph. II.

Clausilia consimilans, Zeigler.
Clausilia bipustulata, Küster.
Hab. Istria.

Species 56. (Mus. Brit.)

CLAUSILIA ITALIA. *Cla. testá fusiformi, fuso-plumbatæ, medio ventricosa; anfractibus 9-10, ad suturam denticulato-plicatis, apicalibus sensim contractis, medianis inflatis, ultimo infra angustato, ad dorsum lineis pallidâ flexuoso notato; aperturâ subœcūta, labio externo intus incrassato, plicis superiori et columellari superiori elongatis, inferiori parvæ.*

THE ITALIC CLAUSILIA. Shell fusiform, plum-brown, ventricose in the middle; whorls nine to ten, with tooth-like plaits on the suture, apical sensibly contracted, middle inflated, last narrowed below, marked with a flexuous pale line on the back.

MARTENS. Pfeiffer, Monog. II.

PLATE VII.

Fig. 53 b. (Mus. Benson.)

Clausilia insignis. This shell is figured in Mr. Hanley's work on Indian Shells as a more slender variety of the species figured in Plate VI.

Species 57. (Mus. Brit.)

Clausilia pilariata. *Cla. testā brevi, fulvā, levā, anfractibus 9, brevibus, medianis centricosis, ad suturam minutissimē plicatis; aperturā subquadratā, marginē crasso, labio interno biplicato, labio externo duplicito, suprā medium plicā dentiformi sinuato.*

THE DOUBLE-LIPPED CLAUSILIA. Shell short, fulvous, smooth, whorls 9, short, middle ventricose, very finely plaited at the suture; aperture rather square, margin thick, inner lip with two plaits, outer lip doubled, sinuated with a tooth-like plait above the middle.

WAGNER. Pfeiffer, Mon. II.

Clausilia reflexa, Zeigler.

Clausilia rydzekilabris, Cautraine.

Clausilia labioruosa, Muhlfeldt.

Clausilia phainolobris, Rossnässler.

Hab. Dalmatia.

Remarkable for the thickness and double character of the outer lip.

Species 58. (Mus. Brit.)

Clausilia sandeii. *Cla. testā fusiformi, obscurè rosco-albida, levi, medio ventricosissimā, anfractibus 10-11, apicalibus parvis, medianis inflatis, altis, ultimo rimato, versū aperturam contracto, aperturā magna, marginē crasso; labio columnellā validē biplicato, labio externo suprā medium sinuatim tumido.*

SANDEE'S CLAUSILIA. Shell fusiform, dull rose-white, smooth, very ventricose in the middle; whorls 10-11, apical small, middle inflated, high, last notched, contracted towards the aperture; aperture large, margin thick, columellar lip strongly plaited, outer lip sinuously swelled above the middle.

KÜSTER. Pfeiffer, Mon. II.

Clausilia honorifica, Parreyss.

Clausilia magnifica, Parreyss.

Hab. Dalmatia.

Species 59. (Mus. Brit.)

Clausilia sumatrana. *Cla. testā solidā, brevi, ventricosa, plumbeā et succinid, anfractibus 8, supernē albo-fasciatīs, 6 apicalibus convexis, brevibus, penultimā alto, ventricoso, ultimo alto infrahā contracto; aperturā auriformi, magna, biplicata, labio externo medio tumido, plicā columnellari obliquē tortuosa.*

THE SUMATRA CLAUSILIA. Shell solid, short, ventricose, plum-coloured and amber; whorls 8, white-banded above, 6 apical convex, short, penultimate high, ventricose, last high, contracted below; aperture auriform, large, biplicate, outer lip swelled in the middle, columellar plait obliquely tortuous.

MARTENS. Berlin Akad. Pfeiffer, Mon. VI.

Hab. Island of Sumatra.

Species 60. (Mus. Benson.)

Clausilia ovata. *Cla. testā brevi, ventricosa, fumoso-castanā, levigatā, solidā, anfractibus 6, supernē albo-fasciatīs, duobus apicalibus parvis, brevibus, tribus, medianis altis, inflatis, ultimo altissimo, rimato, versū aperturam subcontracto; aperturā auriformi, marginē purpurascens, crassiūsculo, rotunduolo, plicā superiori parvā, plicā columnellari elevatā, tenui, parva.*

THE OVATE CLAUSILIA. Shell short, ventricose, smoky-chestnut, smooth, solid; whorls 6, white-banded above, two apical small, short, three middle high, inflated, last very high notched, a little contracted towards the aperture; aperture auriform, margin purplish, rather thick, rounded, superior plait small, columellar plait raised, thin, small.

BLANFORD. Journal of Asiatic Society of Bengal, 1872.
Hab. Tonghu, Birmah.

CLAUSILIA.—PLATE VII.

Species 61. (Mus. Benson.)

CLAUSILIA LOXOSTOMA. *Cla. testa fusiformi, fuso-corned, levigata; anfractibus 9, ad suturam plicatis, medianis ventricosis, altis, ultimo alto, infra subangustato, rimato; aperturā magnā, obliquē subtrigonā, margine reflexo, albo, planūsculo, labio externo supernē sinuatim tumido, labio interno biplicato.*

THE OBLIQUE-MOUTHED CLAUSILIA. Shell fusiform, horn-brown, smooth; whorls 9, plaited at the suture, the middle ones ventricose, high, last high, rather narrowed below, notched; aperture large, obliquely subtrigonal, margin reflected, white, rather flat, outer lip sinuously swelled above, inner lip biplicate.

BENSON. Pfeiffer, Mon. II. p. 404.

Clausilia Bengalensis, Busch.

Hab. Bengal.

Species 62. (Mus. Hanley.)

CLAUSILIA FUSIFORMIS. *Cla. testa flavidā, minutē striatā, fusiformi, ventricosa; anfractibus 8, convexis, versus apicem gradatim angustatis, medianis ventricosis, altis, ultimo angustiori, altissimo; aperturā albā, auriformi, margine crasso, labio externo propè suturam sinuatim angustato, medio et infra tumido; labio interno biplicato, plicā columellari alto, planato.*

THE FUSIFORM CLAUSILIA. Shell yellow, minutely striated, fusiform, ventricose; whorls 8, convex, gradually narrowed towards the apex, middle ventricose, high, last narrower, very high; aperture white, auriform, margin thick, outer lip sinuously narrowed near the suture, tumid in the middle and below; inner lip with two plaita.

BLANFORD. Contributions to Indian Malacology, v. 1865, p. 16.

Hab. Arakan Mountains.

Species 63. (Mus. Brit.)

CLAUSILIA CYCLOSTOMA. *Cla. testa fusco-rubescenti, tenuiter lirata, brevi, fusiformi; anfractibus 9, apicalibus parvis, medianis altis ventricosis, ultimo altissimo, rinato, ad dorsum obliquē bivaricoso; aperturā lati, rotundati, margine albo, crasso, lati reflexo, plicis labii interni parvis, acutis.*

THE ROUND-MOUTHED CLAUSILIA. Shell reddish-brown, finely ridged, short, fusiform; whorls 9, apical small, middle high, ventricose; last very high,

notched, with two oblique varices at the back; aperture broad, rounded, margin white, thick, broadly reflected, plaita of the inner lip small, acute.

PFEIFFER. Monographia Heliceorum, IV. p. 784.

Hab. Central America.

Species 64. (Mus. Brit.)

CLAUSILIA CATTAROENSIS. *Cla. testa subpyramidalē, media paulo inflatā, plumbeā et castaneā; anfractibus 11, albo, marginatis, apicalibus 6, parvis, brevibus, medianis latioribus, ad laterē recticulatis, ultimo alto, versus aperturā rīz angustato; aperturā magna, subquadrate, plicis superiori validā, plicā columellari alto, obliquā, plicis internis supernō duabus linearibus, infra columellam, und parvā, obliquā.*

THE CATTARO CLAUSILIA. Shell somewhat pyramidal, a little inflated in the middle, plum-coloured and chestnut; whorls 11, white-bordered, 6 apical small, short, middle wider, rather straight at the sides, last high, scarcely narrowed towards the aperture; aperture large, subquadrate, upper plait strong, columella plait high, oblique, inner plaita two linear above, one small, oblique, below the columella.

ZEIGLER. Pfeiffer, Monog. II. 437.

Clausilia levigata, Muhl.

Clausilia lesinacensis, Parreyss.

Hab. Cattaro.

Species 65. (Mus. Hanley ? copied.)

CLAUSILIA TURRITELLA. *Cla. testa flavidā, angustissimā, elongatā, pyramidalē; anfractibus 14, lente crescentibus, convexisculus, ultimo oblongo; aperturā oblongo-subquadratā, suprā columellam uniplicatā, columellā recta.*

THE TURRITELLA CLAUSILIA. Shell yellow, very narrow, elongated, pyramidal; whorls 14, slowly increasing, rather convex, last oblong; aperture oblong, rather square, with a single plait over the columella, columella straight.

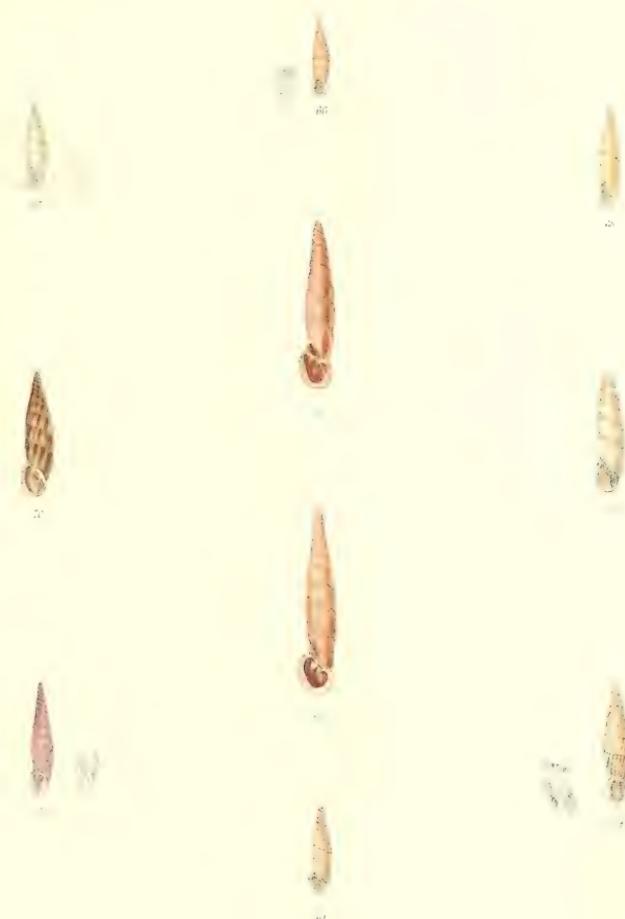

Clausilia cylindrica, Hanley, as of Gray, MS.

Hab. Landour.

This shell seems so different from the type specimens in the Brit. Mus. that after figuring it I have felt compelled to give it a new name.

SOWERBY.

CLAUSILIA.

PLATE VIII.

Species 66. (Mus. Brit.)

Clausilia succinata. *Clu. testā parvā, brevi, subfusiformi, obscurè succinēta, tenuissimè striatā, anfractibus 10, apicibus 5 parvis, attenuatis; medianis ventricosus, ultimo elongatus, ad dorsum plicato; aperturā ovata; plīci superiori subdistanti, plīci columnellari magnā; labio extero supra medium dentiformi, tumido.*

THE AMBER CLAUSILIA. Shell small, short, subfusiform, dull amber, very finely striated, whorls 10; apical small, attenuated, middle ventricose, last plaited at the back; aperture ovate, upper plait rather distant, columellar plait large; outer lip with a tooth-like swelling above the middle.

ZEIGLER. Pfeiffer, Monograph. II.

Clausilia nymphæ, et C. striatocollis, Parreyss.

Hab. Croatia.

Species 67. (Mus. Brit.)

Clausilia fimbriata. *Clu. testā brevi, ventricosā, fusiformi, alludiā, levigati; anfractibus 10, ad suturam fimbriatis, concavis, apicibus sensim attenuatis; medianis magnis, ultimo attūsculo, prop̄ aperturam contracto, ad dorsum prop̄ marginem tumido; aperturā subquadratā, labio extero supra medium sinuum tumido, subdentato; plīci columnellari latā, plīci superiori parvo.*

THE FRINGED CLAUSILIA. Shell short, ventricose, fusiform, whitish, smooth; whorls 10, fringed at the suture, the apical ones notably attenuated, middle large, but rather high, contracted near the aperture, tumid near the margin at the back; aperture rather square, outer lip situated with a tooth-like swelling about the middle, columellar fold broad, upper fold small.

MUHLFELDT. Pfeiffer, Mon. II. p. 399.

Clausilia suturata and *Cl. phalerata*, Zeigler.

Clausilia virens, Mühlfeldt.

Clausilia styraxa, Parreyss.

Hab. Illyria—Croatia.

Species 68. (Mus. Brit.)

Clausilia blanda. *Clu. testā subpyramidalatā, levigatā, pallidè succinēta, semipellucida; anfractibus 10, apicibus tribus parvis, concrectis, alteris subrecteōsis, ad latera rectiāculis; ultimo alto; aperturā subrotundatā, margine albo, tenuisuscō, labio extero propri saturam undentato, labio interno lato, plīci superiori parvo, plīci columellari latā, inferiori parvo, calidē.*

THE BLAND CLAUSILIA. Shell rather pyramidal, smooth, pale amber, semi-pellucid; whorls 10, three at the apex small, convex, the others rather ventricose, rather straight at the sides, last high, aperture rather ovate, margin white, rather thin, outer lip with a tooth near the suture, inner lip broad, upper plait small, columellar plait broad, lower small, strong.

ZEIGLER. Pfeiffer, Mon. II. p. 418.

Clausilia castana, Küster.

Clausilia striata, Mühlfeldt.

Hab. Dalmatia.

Species 69. (Mus. Theobald? copied.)

Clausilia Masoni. *Clu. testā fusiformi, fasci, gracili, anfractibus 10, medianis et inferioribus attis, obliquè ventricosis, prop̄ suturam depresso, ultimo elongato, attenuato, supr̄ aperturam profunde rimate; aperturā maximā, sauvigne effuso, labio interno superiō triplicato.*

MASON'S CLAUSILIA. Shell fusiform, brown, rather slender, whorls 10, middle and lower high, obliquely ventricose, depressed near the suture, last elongated, attenuated, deeply notched above the aperture; aperture very large, margin effuse, inner lip three-plaited above.

THEOBALD. Journal of Asiatic Society of Bengal, v.
Hab. Near Tonghoo mountains, Pegu, and Martaban.

Species 70. (Mus. Crosse? copied.)

Clausilia Sandbergeri. *Clu. testā rimatā, solidā, fusiformi, ventricosā, regulariter tenuissimē liratā,*

CLAUSILIA.—PLATE VIII.

griseo-cornatæ, albo strigatæ; anfractibus 12, apicibus angustis, brevibus, alteris tumidis usque ad ultimum gradatim crescentibus; aperturæ ovatæ, margine tenui, albo, labio interno triplicato, plicæ superiorei validi, plicæ columellaræ superiori latæ, inferiori parvi.

SANBERGER'S CLAUSILIA. Shell notched, solid, greyish-horn, striped with white, whorls 12, the apical ones narrow, short, the others tumid, gradually increasing to the last; aperture ovate, margin thin, white, inner lip with three plait; upper plait strong, upper columellar plait broad, lower small.

MOUSSON. Crosse, Journal de Conchyliologie, 1873.
Hab. Borschom, Russia.

Species 71. (Mus. Crosse? copied.)

CLAUSILIA FUNICULUM. *Cla. testæ subcylindricæ, palli-dissemâ cornæ, tenuiter liratæ; anfractibus 8-9, altis, paulò convexis, gradatim crescentibus, ultimo oblique descendenti; aperturæ pyriformi, labio cætero tenui, labio interno super anfractuum ultimum parvulariter quadruplicato.*

THE LITTLE-CHIMNEY CLAUSILIA. Shell subcylindrical, very pale horn, finely lirated; whorls eight to nine, high, little convex, gradually increasing; last obliquely descending; aperture pyriform, outer lip thin; inner lip with four parallel plait upon the body whorl.

MOUSSON. Crosse, Journ. de Conchyliologie, 1873.
Hab. —?

The four parallel plait on the part of the inner lip where it laps over the body whorl is a peculiar characteristic of this species.

Species 72. (Mus. Hanley.)

CLAUSILIA TURA. *Cla. testæ elongatæ, eleganter fusiformi, tenuiter liratæ; anfractibus 12, obliquis, versus apicem sensim attenuatis, brevibus, medianis altis, ultimo elongato, suprad aperturam obliquè rimato; aperturæ mucinæ, auriformi, margine albo, effuso, expanso, labio interno medio biplicato, plicis validis, approximatæ.*

THE TUBE CLAUSILIA. Shell elongated, elegantly fusiform, finely ridged; whorls twelve, oblique,

sensibly attenuated towards the apex, middle high, last elongated, obliquely notched above the aperture; aperture very large, auriform, margin white, effuse, expanded, inner lip with two plait in the middle, plait strong, approximate.

HANLEY. Proc. Zool. Soc., 1868.
Hab. Shan States.

Species 73. (Mus. Brit.)

CLAUSILIA GRACILICOSTA. *Cla. testæ gracilicostata, fusiformi, tenuiter regulariter liratis laminiformibus sculpta, anfractibus 12, gradatim in medio inflatis, ad latera rectiunculis, ultimo profundiè rimato, ante rimam obliquè carinato, propè aperturam soluto; aperturæ ovata, recta, infrah subacuminata, intus rimata, labio externo supra medium sinuatum tumido, labio interno angusto, plicæ superiori brevi, plicæ columellaræ altæ.*

THE THIN-RIBBED CLAUSILIA. Shell slender, fusiform, regularly sculptured with thin laminated ridges; whorls twelve, gradually inflated in the middle, rather straight at the sides, the last deeply notched, obliquely keeled in front of the notch, uncloaked near the mouth; aperture oval, straight, rather acuminate below, notched within; outer lip sinusously tumid above the middle; inner lip narrow, upper plait short, columella plait high.

ZEIGLER. Plötscher, Monograph. II. 414.
Clausilia ravaida and Clausilia porcata, Zeigler.
Hab. Russian Mountains.

Species 74. (Mus. Brit.)

CLAUSILIA CRASSICOSTATA. *Cla. testæ pallidæ fulvo, brevi, fusiformi, costis solidis subdistans, rectiunculis, liratæ, medio ventricosa; anfractibus paucis, apicibus sensim contractis, medianis altis, ad latera rectiunculis, ultimo altissimis, infrah attenuato, profundè rimato, costis ad doron infrah undatis; aperturæ obliquæ, margine effuso, reflexæ, alba, labio externo crasso, labio interno angusto, plicis columellaræ et superiori validis, approximatæ.*

THE THICK-RIBBED CLAUSILIA. Shell pale fulvous, short, fusiform, ridged with solid, rather distant, rather straight ribs, ventricose in the middle; whorls few, apical ones notably contracted, middle

CLAVUSILIA.—PLATE VIII.

high, rather straight at the sides, last very high, attenuated below, deeply notched, ribs waved at the lower part of the back; aperture oblique, margin effuse, reflected white, outer lip thick, inner lip narrow; columella and upper plait strong, approximate.

BESSEL. Pfeiffer, Monograph. IV. p. 733.

Hab. Sicily.

Species 75. (Mus. Benson, Hanley.)

CLAVUSILIA Jos. *Cla. testă brevi, fusiformi, cornuti,*

hirata, medio inflata; unfractibus medianis altis,

ultimo altissimo rimateo, apertură subtriangulari

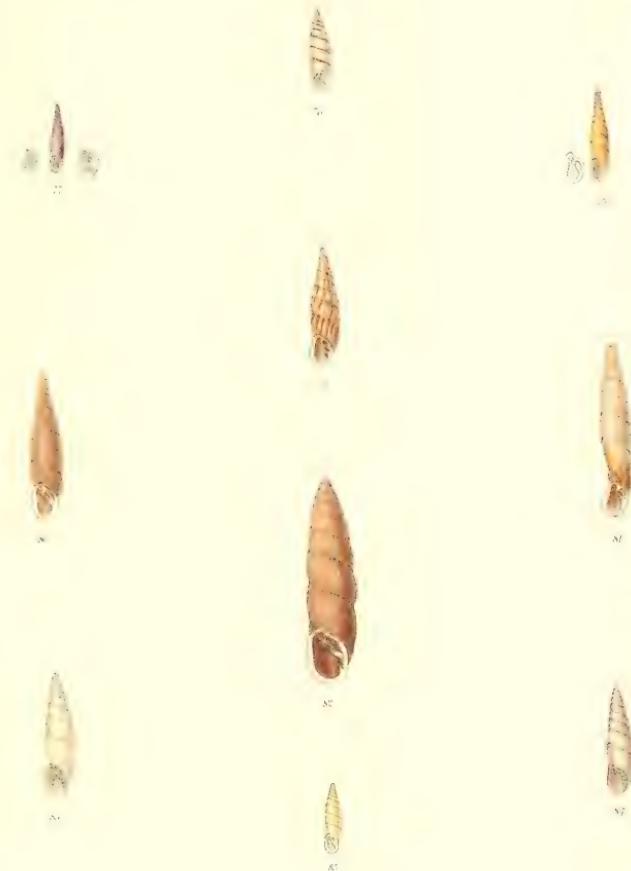

margine albo, tenuiſculo, labio extero propè suturam sinuato supra medium tumido; labio interno hifidato; pliūd superiori distanti, brevi, pliūd columellari obliquā, validi.

The Jos CLAVUSILIA. Shell short, fusiform, horny, ridged, middle inflated; middle whorls high, the last very high, notched, aperture nearly trigonal, margin white, rather thin, outer lip sinuous near the suture, tumid above the middle; inner lip with two folds; upper fold distant, short; columellar fold oblique, strong.

BESSEL. Pfeiffer, Monograph. IV. p. 761.

Hab. Darjiling, Himalayas.

CLAUSILIA.

PLATE IX.

Species 76. (Mus. Brit.)

Clausilia bidens. *Cla. testā parvā, ventricosā, ferō albā, brevi, levigatā; anfractibus 8, medianis ventricosis, ad suturam minutē distanter plicatis, ultimo infrā subcontracto, aperturā latē ovatā intus prop̄ marginam extēnum incrassato, labio interno tenui, plīcā superiori minatā, plīcā columellarī magnā.*

THE TWO-TOOTHED CLAUSILIA. Shell small, ventricose, nearly white, smooth; whorls eight, middle ones ventricose, minutely distantly plaited at the suture, last a little contracted below; aperture broadly ovate, thickened within near the outer margin; inner lip thin, upper plait minute; columellar plait large.

sensim contractis, brevissimis, infidē medium concavis, ventricosis; aperturā albā, marginē externo supra medium tumido, labio interno biplicato, plīca columellarī elevata.

THE ARAKAN CLAUSILIA. Shell fusiform, pyramidal, yellow, smooth; whorls twelve, those above the middle notably contracted; very short below the middle convex, ventricose; aperture white, outer margin tumid above the middle; inner lip with two plaits, columellar plait elevated.

THEOBALD. Journ. Asiatic. Soc. Bengal, 1872.

Hab. Mouliniein, Birmah.

Species 79. (Mus. — ? Copied.)

Clausilia index. *Cla. testā pupaformi, tenuiter striatā, ventricosa, fuscā, castaneo strigatā, anfractibus 10, apicibus 5, laevibus, alteris convervis, attūsculis; aperturā acutā, marginē fulvo, labio interno triplicato, plīcis apudostributib; brevibus.*

THE INDEX CLAUSILIA. Shell pupa-shaped, finely striated, ventricose, brown, striped with chestnut, whorls ten, five apical smooth, the others convex, rather higher; aperture ovate, margin fulvous, inner lip with three equidistant short plaits.

MOUSSON. Crosse, Journ. de Conch., 1873, p. 215.

Hab. Borschom, in Russia.

Species 80. (Mus. Brit.)

Clausilia cecillei. *Cla. testā fusiformi-pyramidalē, solidā, tenuiter striatā; cornico-plumbeā, medio et infrā ventricosa, anfractibus 12, apicibus 7 contractis, brevibus, alteris gradatim latioribus, altis; aperturā oblongā, marginē albo, crasso; prop̄ suturam sinuato, attenuato, labio interno biplicato.*

CECILLE'S CLAUSILIA. Shell fusiform, pyramidal, solid, lightly striated, horny-plum-coloured; ventricose in the middle and under; whorls twelve, apical ones seven, contracted, short, the rest gradually broader, elevated; aperture oblong, margin white, thick, sinuous near the suture, attenuated, inner lip biplicate.

PHILIPPI. Pfeiffer, Novit. Conch., p. 122.

Hab. China.

CLAUSILIA.—PLATE IX.

Species 81. (Mus. Brit.)

CLAUSILIA DORINI. *Cla. testā elongatā, subfusiformi, corneo-rubescēti, infirā castanēā, levigatā; anfractibus circa 10, apicalibus 4 contractis, brevibus, alteris altissimis, moderatē ventricosīs; ultimo elongato, attenuato, suprā aperturam rimato; ultimo obliquā, antē productā, margine crasso, albo, rotundo, labio interno bīplīcata, plicis elongatis; plicis internā uā obliquā conspicuā.*

DOEHN'S CLAUSILIA. Shell elongated, rather fusiform, reddish horn, chestnut below, smooth; whorls about ten, the four apical ones contracted, short, the others very high, moderately ventricose; last elongated, attenuated, notched above the aperture; aperture oblique, produced anteriorly; margin thick, white, rounded, inner lip with two plait, plait elongated; an inner plait oblique, conspicuous.

PFEIFFER. Malak. Bl., 1860, p. 213.

Hab. Venezuela.

Species 82. (Mus. Crosse.)

CLAUSILIA YOKOHAMENSIS. *Cla. testā ventricosā, fusiformi, crassissimā, fuso-cornē, leviter et irregulatē striatā; anfractibus 9-10, altis, moderatē convexis, apicali obtusissimo, penultimā latissimo, ultimo elongato, non rotundato; aperturā violacōd, pyriformi-ovatā, prorsum productā; margine latē reflexo, plicā superiori, labi internē validā, compressā, plicā superiori columellari oblique, inferiori parē.*

THE YOKOHAMA CLAUSILIA. Shell ventricose, fusiform, rather thick, horny-brown, slightly and irregularly striated; whorls nine to ten, high, moderately convex, apical one very obtuse, penultimate very broad, last elongated, not notched; aperture violet, pyriform-ovate, produced forwards; margin broadly reflected; upper plait of the inner lip strong, compressed; upper columellar plait oblique, lower small.

CROSSE. Journal de Conchyliologie, 1873, p. 133.

Hab. Yokohama, Japan.

Species 83. (Mus. —? Copied.)

CLAUSILIA SEMIAMELLATA. *Cla. testā tenui, parvā, albā, levigatā, fusiformi, medio subventricosā; anfractibus 8-9, inferioribus altis, moderatē convexis, ultimo elongato, attenuato, dorso proprie aperturam*

lirato, suprā aperturam rimato; aperturā obliquē productā, ovatā, subsolutā, margine tenui, angustē reflexo, plicā superiori, tabii interni elongatā, columellā, arcuatā, angustā, plicis 5 parvis, parallelibus aquatibus instruētā.

THE HALF-LAMINATED CLAUSILIA. Shell thin, small, white, smooth, fusiform, rather ventricose in the middle; whorls eight or nine, lower ones high, moderately convex, last elongated, attenuated, ridged near the aperture on the back, notched above the aperture; aperture obliquely produced, ovate, rather solid, margin thin, narrowly reflected, upper plait of the inner lip elongated, columella arched, narrow, set with five small, parallel equal plait.

MOUSSÉN —? Crosse Journ. Conch.

Hab. —?

Species 84. (Mus. —? Copied.)

CLAUSILIA SIEVERSI. *Cla. testā albiddā, parvā, subcylindracea, attenuatā levigatā, anfractibus 9-10, vix convexis, ultimo obliquē elongato, suprā aperturam rimato; aperturā pyriformi, plicā superiori labi internē prominenti, columellā angustā, arcuatā, cerebrinē transversē plicata.*

CLAUSILIA SIEVERSI. Shell whitish, small, rather cylindrical, attenuated, smooth, whorls nine or ten, very little convex, the last obliquely elongated, notched above the aperture; aperture pyriform, upper plait of the inner lip prominent, columella narrow, arched, very closely transversely plaited.

PFEIFFER —? Crosse Journ. Conch., 1873, p. 214.

Hab. Lenkoran, Russia.

The granulations, or plait on the arched columella, are much more numerous in this than in the preceding species, and the last whorl has no ridges on the back.

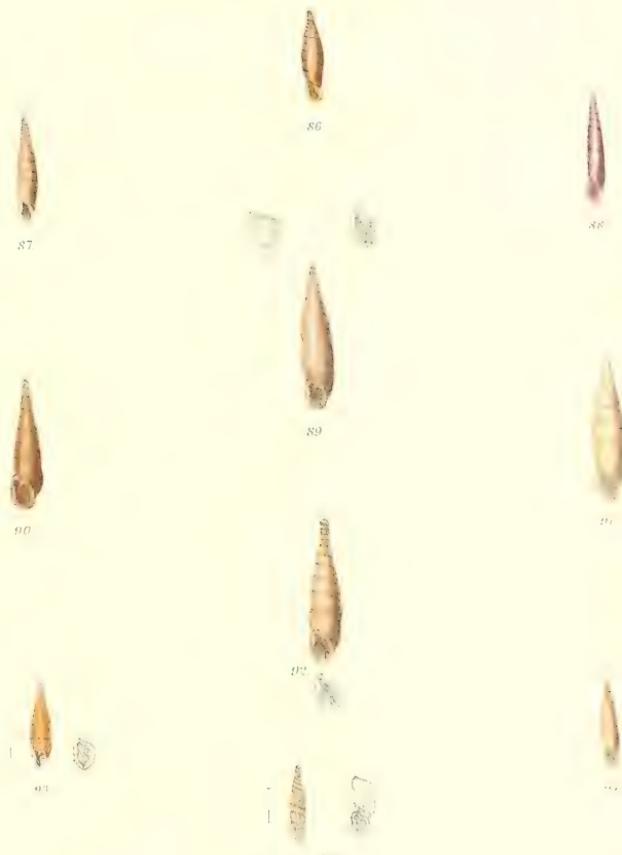

Species 85. (Mus. Brit.)

CLAUSILIA COMMUTATA. *Cla. testā parvā, pallidē cornē, levigatā, fusiformi, anfractibus brevibus, versūs apicē gradatim contractis, medio moderatē inflatis; aperturā ovatā, bīplīcata.*

THE COMMUTED CLAUSILIA. Shell small, pale horny, smooth, fusiform, whorls short, gradually contracted towards the apex, moderately inflated in the middle, aperture ovate, bīplīcata.

ROSSMASSEL Pfeiffer, Monog. Hel. II. p. 401.

Hab. Spain, Sicily, &c.

CLAUSILIA.

PLATE X.

Species 86. (Mus. Brit.)

CLAUSILIA PLICATULA. *Cla. testá fusiformi, rufo-fusca, tenuissimè striatá, versus apicem attenuatá, medio ventricosá; anfractibus duodecenis, ultimo subcontrato; aperturá subquadratá, supernè ad suturam subacuminatá, columella inter laminae dentatæ aperte sita.*

THE PLATED CLAUSILIA. Shell fusiform, reddish-brown, very finely striated, attenuated towards the apex, ventricose in the middle; whorls twelve, the last contracted; aperture rather square, acuminate above at the suture, columella tooth-plated between the folds.

MONTAGU. Pfeiffer, Mon. Hel. VI. p. 498.
Hab. Pyrmont.

Species 87. (Mus. Brit.)

CLAUSILIA MEISNERIANA. *Cla. testá oblongo-fusiformi, pallidè fulca, tenuiter litatá, supernè attenuatá, medio inflata, apice rotundata; anfractibus tridecenis, moderatè convexis; aperturá mediorum, lamina columellaris prominenti, labio externo superne flexuoso, propè suturam incrassata.*

MEISNER'S CLAUSILIA. Shell oblong-fusiform, pale fulvous, finely ridged, attenuated above, inflated in the middle, apex rounded; whorls thirteen, moderately convex; aperture middle-sized, columellar lamina prominent, outer lip flexuous above, thickened near the suture.

SHUTTLEWORTH. Pfeiffer, Mon. Helic. VI. p. 405.
Hab. Corsica, Sardinia, &c.

Species 88. (Mus. Brit.)

CLAUSILIA CUMINGIANA. *Cla. testá levigatá, fuscopurpurá, elongatá, subpyramidalis, versus apicem gradatim attenuatá; anfractibus decenis, albis, perobliquis, ad latera recticulis; aperturá magna, auriformis, laminis columellaribus diabus, approximatim, margine albo, crasso.*

CUMING'S CLAUSILIA. Shell smooth, brown-purple, elongated, subpyramidal, gradually attenuated towards the apex; whorls ten, white, very oblique, rather straight at the sides; aperture

large, ear-shaped, columellar laminae two, approximate, margin white, thick.

PFEIFFER, Mon. Helic. VI. p. 406.

Hab. Philippines.

Species 89. (Mus. Brit.)

CLAUSILIA EXCELLENS. *Cla. testá pallido cornuatá, solidá, tenuiter sulcatá, magná, constricta, subfusiformi; anfractibus undecenis, perobliquis; aperturá magna, auriformis, laminis parietali prominenti, columellaris elevata, pliis tuberculiform trans labrum infra trajecta; labio externo supra medium incrassata.*

THE EXCELLING CLAUSILIA. Shell pale horn, solid, finely sulcated, large, ventricose, rather fusiform; whorls eleven, very oblique; aperture large, auriform, parietal lamina prominent, columellar raised, tubercular plate below crossing the inner lip, outer lip thickened above the middle.

PFEIFFER, Mon. Helic. VI. p. 427.
Hab. Loo Choo.

A fine species, nearly white, with the last whorl more strongly wrinkled than the others.

Species 90. (Mus. Brit.)

CLAUSILIA PLATYPERA. *Cla. testá solidá, subventricosá, solidissimè, pallidè cornuta, pyramidalis, tenuissimè striatá; anfractibus undecenis, gradatim attenuatis; aperturá subauriformis, laminis columellaris angustis, subverticali, margine albo, incrassato, supra medianam labii exteri tonido.*

THE FLAT-SCAPED CLAUSILIA. Shell solid, rather ventricose, pale horny, pyramidal, very finely striated; whorls eleven, gradually attenuated; aperture rather auriform, columellar lamina narrow, nearly vertical, margin white, thick, swelled above the middle of the outer lip.

MARTENS. —?
Hab. Japan.

Species 91. (Mus. Brit.)

CLAUSILIA FLUVIATILIS. *Cla. testá ventricosá, solidá, pyramidalis, medio et infrá inflatá; pallidè fusca,*

CLAUSILIA.—PLATE X.

tenuissimè striatâ; versus apicem attenuatâ; anfractibus undecenis, obliquis, convexis, ultimo infra carinato; aperturâ magnâ; labio interno crenulato, laminâ columellarî angustâ, elevatâ, ferè perpendiculari; labio interno in tuberculum dentiformem desinente.

THE FLEUVIALE CLAUSILIA. Shell ventricose, solid, pyramidal, inflated in the middle and below; pale brown, very finely striated, attenuated towards the apex; whorls eleven, oblique, convex; last keeled below; aperture large, inner lip crenulated, columellar lamina narrow, raised, almost perpendicular; inner lip ending in a tooth-shaped tubercle.

BENSON. —?
Hab. Chusan.

The last whorl is keeled at the bottom. In this and the preceding species the columellar lamina is closely pressed against the edge, and is almost perpendicular.

Species 92. (Mus. Brit.)

CLAUSILIA KOBENSIS. *Cla. testâ solidâ, centricosâ, pyramidatâ, rubro-fusci, tenuissimè liratâ; anfractibus duodecenis, obliquis, versus apicem attenuatis, infra medium convexis, ultimo ad terminum rotundo; aperturâ magnâ, margine albo, crasso, supra medium labii extermi tumido; laminâ columellarî elongatâ, peculiariiter arcuata, plicâ minori infra instructâ.*

THE KOBE CLAUSILIA. Shell solid, ventricose, pyramidal, red-brown, finely ridged; whorls twelve, oblique, attenuated towards the apex, convex below the middle, last rounded at the end; aperture large, margin white, thick, swelled above the middle of the outer lip; columellar lamina elongated, peculiarly arched, with a smaller inserted below.

SMITH. Quarterly Journal of Conchology.
Hab. Kobe, Japan.

Species 93. (Mus. Brit.)

CLAUSILIA VETUSTA. *Cla. testâ brevi, subventricosa, fusca vel albâ, tenuissimè liratâ; anfractibus unde-*

conis, tribus inferioribus valde inflatis; aperturâ parvâ, auriformi; laminâ columellarî prominenti, elevatâ, semilunterâ.

THE ANTIQUATED CLAUSILIA. Shell short, subventricose, brown or white, very finely ridged; whorls eleven, three lower much inflated; aperture small, auriform, columellar lamina prominent, raised, half internal.

ZEIGLER. Pfeiffer. Mon. Helic. VI. 499.
Hab. Illyria.

Species 94. (Mus. Brit.)

CLAUSILIA ACULUS. *Cla. testâ subfusiformi, cornesi, tenuissimè striatâ; anfractibus decensis, superioribus attenuatis, rectiangulari, inferioribus inflatis; aperturâ simplici, margine angustâ incrassato, laminâ columellarî perlevatâ, parvâ.*

THE NEEDLE CLAUSILIA. Shell subfusiform, horny, very finely striated; whorls ten, upper attenuated, rather straight, lower inflated; aperture simple, margin narrowly thickened, columellar lamina much raised, small.

BENSON. Pfeiffer. Mon. Helic. VI. p. 482.
Hab. China.

Species 95. (Mus. Brit.)

CLAUSILIA OLYMPICA. *Cla. testâ parvâ, fusiformi, fulvâ, tenuissimè striatâ; anfractibus duodecenis, superioribus attenuatis, medianis inflatis, ultimo elongato, soluto, tortuo, profundiè rimato; aperturâ auriformi, subquadrato, margine incrassato, laminâ columellarî nullo.*

THE OLYMPIC CLAUSILIA. Shell small, fusiform, fulvous, very finely striated; whorls twelve, upper attenuated, middle inflated, last lengthened, unwound, twisted, deeply notched; aperture ear-shaped, rather square, margin thickened, columellar lamina none.

FRIEOLDT. Pfeiffer. Mon. Hel. VI. p. 514.
Hab. The Olympic Mountain.

A tortuous swelling of the part above the mouth is remarkable in this species.

CLAUSILIA.

PLATE XI.

Species 96. (Mus. Brit.)

CLAUSILIA DACICA. *Cla. testā ventricosā, succinā et plumbeā, levigatā; anfractibus undecenis, ultimo angustato, dorso rugato; aperturā oblongā, posticē angustatā; labio externo superne sinuato, margine supra medium tumido, laminā columellarī, magno, laminis internis inconspicuis.*

THE DACIAN CLAUSILIA. Shell ventricose, amber and plum, smooth; whorls eleven, last narrow, wrinkled at the back; aperture oblong, posteriorly narrowed; outer lip sinuous above, margin tumid above the middle, columellar lamina large, inner lamina inconspicuous.

FEIVALSKY. Pfeiffer. Mon. Hel. VI. p. .
Hab. Serbia.

Species 97. (Mus. Brit.)

CLAUSILIA SULCOSA. *Cla. testā angustatā, subpyramidalē; anfractibus undecenis, obsoletē costellis rectiūculis liratis; ultimo elongato, dorso infra soluto, carinato; aperturā magnā, laminis columellaribus dubiis, superiori obliquā, inferiori brevi, prominenti.*

THE GROOVED CLAUSILIA. Shell narrow, rather pyramidal; whorls eleven, obsoletely ridged with small rather straight ribs, last elongated, back grooved and keeled below; aperture large, columellar lamina two, upper oblique, lower short, prominent.

WAGNER. Pfeiffer. Mon. Helic. VI. p. 499.

Clauilia irregularis. Zeigler.

Hab. Dalmatia.

Species 98. (Mus. Brit.)

CLAUSILIA SOMCHETICA. *Cla. testā brevi, ventricosā, feri levigatā; palliō cornēd; anfractibus undecenis, medianā latē; aperturā subquadratā, latimā columellarī nullā, laminā parietali brevi; labio externo sinuoso.*

THE SOMCHETICA CLAUSILIA. Shell short, ventricose, almost smooth, pale horn; whorls eleven, middle white; aperture subquadrate, columellar lamina

none, parietal lamina short, outer lip sinuous above.

PFEIFFER. Mon. Helic. VI. p. 446.
Hab. ——?

Species 99. (Mus. Brit.)

CLAUSILIA FRAUENFELDTI. *Cla. testā elongato-fusiformi, fuscā, levigatā; anfractibus decenis, medianis et inferioribus ingulis, ad saturam albo angusti fasciatā; ultimo elongato, angustatā; aperturā pyriformi, expansā, cunctā; labio externo supra medium tumido, laminā columellarī lato.*

FRAUENFELDT'S CLAUSILIA. Shell elongate-fusiform, brown, smooth; whorls ten, middle and lower inflated, narrowly banded with white at the suture, last elongated, narrow; aperture pyriform, expanded, chestnut; outer lip tumid above the middle, columellar lamina broad.

ZELEBOR. Pfeiffer. Mon. Helic VI. p. 440.
Hab. Serbia.

Species 100. (Mus. Brit.)

CLAUSILIA PAGANA. *Cla. testā parē, brevi, fusiformi, obscurā fuscā, tenuissimā striatā; anfractibus decenis, apicali rotundo, superioribus attenuatis, inferioribus subrectangulis; aperturā auriformi, margine crasso, labio externo supra medium sinuoso, tumido, laminā columellarī internè extenso.*

THE PAGAN CLAUSILIA. Shell small, short, fusiform, dull brown, very finely striated; whorls ten, apical round, upper attenuated, lower rather ventricose; aperture auriform, margin thick, outer lip sinuous above the middle, tumid, columellar lamina extended within.

ZEIGLER. Pfeiffer. Mon. Helic. VI. p. 505.
Hab. Serbia.

Species 101. (Mus. Brit.)

CLAUSILIA SEMIDENTICULATA. *Cla. testā breviōscula, fusiformi, plumbeā, levigatā, apice succinē; anfractibus undecenis, medianis ventricosis, ultimo ad dorsum elongata, soluto, tortuo, medio sulcato;*

CLAUSILIA.—PLATE XI.

aperturā succinē, labio externo, supernè emarginato, supra medium sinuatio tumido, margine crenulato; columellā infra laminam triplicato.

THE HALF-DENTICULATED CLAUSILIA. Shell rather short, fusiform, plum, smooth, apex amber; whorls eleven, middle ventricose, last elongated at the back, unwound, tortuous, with a groove in the middle; aperture amber, outer lip emarginated, sinuously tumid above the middle, margin crenulated; columella triplicate below the lamina.

PFEIFFER. Mon. Helic. VI. p. 509.

Hab. Turkey; on the banks of the Bosphorus.

Species 102. (Mus. Brit.)

CLAUSILIA FORTUNEL. *Cla. testā elongato-fusiformi, solidā, obscurè plumbeā, tenuissimè striatā; anfractibus quaterdecensis, superioribus attenuatis, medianis et inferioribus ventricosis; ultimo elongato, medio compresso; aperturā magnā, auriformi, succinē, margine albo, crasso, laminā columnari magnā, crassā, margine columnari medio sinuato.*

FORTUNEL'S CLAUSILIA. Shell elongated-fusiform, solid, dull plum, very finely striated; whorls fourteen, upper attenuated, middle and lower ventricose; last elongated, middle compressed; aperture large, ear-shaped, amber, margin white, thick; columellar lamina large, thick, columellar margin sinuous in the middle.

PFEIFFER. Mon. Helic. VI. p. 494.

Hab. Shanghai.

Species 103. (Mus. Brit.)

CLAUSILIA BERGERI. *Cla. testā subfusiformi, fusco-plumbeā, levī; anfractibus undecensis, medianis centricosis, ultimo elongato, birugato; aperturā*

subtrigonā, labio externo suprà infrāque acuminato.

BERGER'S CLAUSILIA. Shell subfusiform, brown-plum, smooth, whorls eleven, middle ventricose, last elongated, with two wrinkles; aperture rather trigonal, outer lip acuminate above and below.

MAYER. Pfeiffer. Mon. Helic. VI. p. 422.

Hab. Bavaria.

Remarkable for the peculiar triangular form of the mouth.

Species 104. (Mus. Brit.)

CLAUSILIA SERICATA. *Cla. testā brevi, fusiformi, ventricosā, levī, fuscoplumbeā; apice et aperturā succinē; aperturā magnā, margine expanso; laminā columnari lato, elevato, laminis internis quaternis.*

THE SILKEN CLAUSILIA. Shell short, fusiform, ventricose, smooth, brown-plum, apex and aperture amber; aperture large, margin expanded; columellar lamina broad, raised, four internal laminae.

PFEIFFER. Mon. Helic. VI. p. 492.

Hab. Eubœa.

Species 105. (Mus. Brit.)

CLAUSILIA LEROSIENSIS. *Cla. testā obscurè plumbeā, acutè et crebre laminatā, subfusiformi, anfractibus undecensis, apicalibus levigatis, medianis ventricosis, ultimo elongato, ad dorsum costis distantiibus lirato; aperturā triplicatā, auriformi.*

THE LEROS CLAUSILIA. Shell dull plum, sharply and closely laminated, rather fusiform; whorls eleven, apical smooth, middle ventricose, last elongated, ridged on the back with distant ribs; aperture with three plaited, auriform.

FERREUSSAC. —?

Hab. Island Leros.

114.

CLAUSILIA.

PRAESES XII.

Species 106. (Mus. Brit.)

CLAUSSILIA EXILIS. *Cla. testâ pupiformi, fuscâ, tenuissimè liratâ; anfractibus novem, medianis subequalibus, ultimo contracto; aperturâ parec, margine externo superne flexuoso tumido, margine interno prope suturam biplicato, plie columnari unilâ, laminis semiinternis intus productis.*

THE NARROW CLAUSSILIA. Shell pupa-shaped, brown, very finely ridged; whorls nine, middle nearly equal, last contracted, aperture small, outer margin with a tumid band above, inner margin with two plaits near the suture, no columellar plait, internal plaits extended within.

LOWE. Proc. Zool. Soc. 1866, p. 307.

Hab. Madeira.

Species 107. (Mus. Brit.)

CLAUSSILIA BELCHERI. *Cla. testâ fusiformi, levigatâ, altâ, fuso-straminé; anfractibus decem, convexis, supra medium attenuatis, medio inflatis, ultimo supra aperturam elongatis; aperturâ subauriformi, superne sinuatâ, plie columnari magis, elevata.*

BELCHER'S CLAUSSILIA. Shell fusiform, smooth, raised, brown-straw; whorls ten, convex, attenuated above the middle, inflated at the middle, last lengthened above the aperture; aperture rather ear-shaped, situated above, columellar fold large, elevated.

PFEIFFER. Mon. Hel. Vol. VI. p. 412.

Hab. Corean Archipelago.

Species 108. (Mus. Brit.)

CLAUSSILIA CLAVIFORMIS. *Cla. testâ breviter fusiformi, brevissimâ, fuso-straminé; anfractibus octonâ, convexis, infâ medium inflatis, ultimo subtortuosis; aperturâ perpendiculariter oblongâ; labio interno biplicato, plieis parvis.*

THE KEY-SHAPED CLAUSSILIA. Shell shortly fusiform, very smooth, brown-straw; whorls eight, convex, inflated below the middle, last rather tortuous; aperture perpendicularly oblong, inner lip with two folds, folds small.

PFEIFFER. Mon. Hel. Vol. VI., p. 412.

Hab. Corean Archipelago.

Much resembling *Clausilia Belcheri*, but shorter and more ventricose.

Species 109. (Mus. Brit.)

CLAUSSILIA RUDIS. *Cla. testâ pallidâ fulvo, fusiformi, laminatum liratâ, liris crassis, subdistantibus; anfractibus undecenâ, supra medianum longè attenuatis, medio et infâ valde inflatis, ultimo infâ subcontracto; aperturâ oblongâ, subquadratâ, plieis labii interni parvis.*

THE ROUGH CLAUSSILIA. Shell pale fulvous, fusiform, laminae thick, ridges thick, rather distant; whorls eleven, attenuated some length above the middle, much inflated at the middle and under, last somewhat contracted below; aperture oblong, rather square, folds of the inner lip small.

PFEIFFER. Proc. Zool. Soc. Lond. 1864.

Hab. Island of Crete.

Species 110. (Mus. Brit.)

CLAUSSILIA PETROSA. *Cla. testâ altâ, leviter liratâ, subfusiformi, corned; anfractibus duodecenis, superioribus brevibus, attenuatis, inferioribus tribus altis, ultimo elongato, tortuo, obliquâ producto; aperturâ auriformi, margine albo, crasso, labio interno radice biplicato, labio externo supra medium tumido.*

THE STONY CLAUSSILIA. Shell high, slightly ridged, subfusiform, horny; whorls twelve, upper short, attenuated, lower three high, last elongated, tortuous, obliquely produced; aperture ear-shaped, margin white, thick, inner lip with two strong folds, outer lip swelled above the middle.

PAREYS. Küster, p. 226.

Hab. Greece.

The aperture is curiously twisted and brought round, so as to project on the right side.

CLAUSILIA.—PLATE XII.

Species 111. (Mus. Brit.)

CLAUSSILIA IDE. *Cla. testá subfusiformi, solidá, latá, pruinosa, laminae fulvis numerosis, rectiunculis, tenuibus liratá; aperturá magna, subquadrata, prope suturam sinuata, tumida, plicá parietali parvá, laminá columellari mediocris.*

THE MOUNT IDA CLAUSSILIA. Shell subfusiform, solid, broad, plum-colour, ridged with fulvous, numerous, rather straight, thin laminae; aperture large, rather square, sinuated and tumid near the suture; parietal plait small, columellar laminae middle-sized.

PFEIFFER. Mon. Vol. VI. p. 498.
Hab. Mount Ida.

Species 112. (Mus. Brit.)

CLAUSSILIA DISTANS. *Cla. testá fusiformi, elongatá, lactea, angustá, distanter liratá; anfractibus quaterdecensis, superioribus attenuatis, medianis et inferioribus latissimis, ultimo breviter rotundato, declivi, aperturá perpendiculariter oblonga, superne attenuata, margine albo, columellá rectiuncula, laminá columellari obliquè dentiformi.*

THE DISTANT CLAUSSILIA. Shell fusiform, elongated, cream-coloured, narrow, distantly ridged; whorls fourteen, upper attenuated, middle and lower rather wide, last shortly notched, sloped down; aperture perpendiculary oblong, attenuated above, margin white, columella rather straight, columellar lamina obliquely tooth-shaped.

PFEIFFER. Proc. Zool. Soc. 1864, p. 605.
Hab. Sudsuro, Crete.

Species 113. (Mus. Brit.)

CLAUSSILIA COMPRESSA. *Cla. testá regulariter fusiformi, lilacea, strigis brevibus, fuscis variegatá, tenuiter laminatim liratá; anfractibus decensis, inferioribus parvis, ultimo elongato; aperturá perpendiculariter oblonga, labio externo prope medium sinuatim tumido, plicá parietali parvá, plicá columellari prominenti.*

THE COMPRESSED CLAUSSILIA. Shell regularly fusiform, lilac, variegated with short brown stripes, ridged with fine laminae; whorls ten, upper

small, last elongated; aperture perpendicularly oblong, outer lip sinuously tumid near the middle, parietal fold small, columellar fold prominent.

PFEIFFER. Mon. Hel. Vol. VI. p. 428.
Hab. Island of Cerigo.

Species 114. (Mus. Brit.)

CLAUSSILIA SCALARIS. *Cla. testá, brevi, latá, fulvá, tenuiter laminatim liratá; anfractibus senis, prope suturam latioribus angulatis, ultimo altius, infra contracta; aperturá auriformi, columellá infra retrosum expansa, labio externo supra medium sinuatim tumido, plicá parietali parvá, plicá columellari mediocris, obliqua.*

THE LADDEE-LIKE CLAUSSILIA. Shell short, broad, fulvous, with fine laminar ridges; whorls six, broader and angular near the suture, last high, contracted below; aperture auriform, columella expanded backwards below, outer lip sinuously tumid above the middle, parietal fold small; columella fold middling, oblique.

PFEIFFER. Mon. Hel. Vol. VI. p. 439.
Hab. Malta.

The whorls are angularly shouldered, so as to give the appearance of steps.

Species 115. (Mus. Brit.)

CLAUSSILIA HAUERI. *Cla. testá brevissimula, pyramidato-subfusiformi, latá, distanter tenuiter liratá, inter lira pruinosa; anfractibus decensis, inferioribus magnis; aperturá auriformi, margine crasso, albo, labio externo supra medium tumido, plicá parietali minuta, plicá columellari altissimá, ferè perpendiculari.*

HAUER'S CLAUSSILIA. Shell rather short, pyramidal subfusiform, broad, distantly finely ridged, plum-coloured between the ridges; whorls ten, lower largo; aperture auriform, margin thick, white, outer lip tumid above the middle, parietal fold minute, columellar fold very high, almost perpendicular.

BIELZ. Pfeiffer, in Novit. Conch. Fasc. XXII. p. 264.
Hab. Transylvania.

CLAUSILIA.

PLATE XIII.

Species 116. (Mus. Brit.)

CLAUSILIA LIVENS. *Cla. testis dextrali, pruinosa-fusca, brevi-scalpula, fusiformi; anfractibus octonis, altis, inferioribus subinflat, ultimo contracto, obliqui; aperturâ auriformi, infra obliquè productâ, marginâ crassa, albo, plieâ columellarâ mucina, plieâ parietali parvâ, labio externo ad medium latè tumido.*

THE LIVID CLAUSILIA. Shell dextral, plum-brown, rather short, fusiform; whorls eight, high, rather inflated, last contracted, oblique; aperture ear-shaped, obliquely produced below; margin thick, white, columellar plait large, parietal plait small, outer lip broadly tumid at the middle.

BIELZ. Pfr. Vol. IV. p. 718.

Clausilia Lisekeana. Bielz.

Hab. Transylvania.

Species 117. (Mus. Brit.)

CLAUSILIA BADIA. *Cla. testis parvâ, brevi-scalpula, subfusiformi, olivaceo-fusca, loci; anfractibus octonis; aperturâ subobliquâ ovali, plieâ columellarâ mucina, elevatâ, plieâ parietali parvâ.*

THE BAY CLAUSILIA. Shell small, rather short, subfusiform, olive-brown, smooth; whorls eight; aperture rather obliquely oval, columellar plait large, raised, parietal plait small.

ZEIGLER. Pfeiffer. Vol. VI. p. 496.

Clausilia fontana. Schmidt.

Clausilia cruda. Schmidt.

Hab. —?

Species 118. (Mus. Brit.)

CLAUSILIA SCHMIDTII. *Cla. testis parvâ, fusiformi, politâ, pruinosa; anfractibus duodecenis, superioribus parvis, medianis et inferioribus subinflat, ultimo infra subcontracto; aperturâ subaurantia, oblongâ, labio externo supra medium sinuatum tumido, plieâ columellarâ productâ, plieâ parietalis diaphanous.*

SCHMIDT'S CLAUSILIA. Shell small, fusiform, polished, plum-coloured; whorls twelve, upper small, middle and lower somewhat inflated, last a

little contracted below; aperture rather orange, oblong, outer lip sinuously tumid, columella plait produced, parietal plaits two.

PFEIFFER. Mon. Hel. Vol. VI. p. 490.
Hab. Carinthia.

Species 119. (Mus. Brit.)

CLAUSILIA PERARATA. *Cla. testis latâ, brevi, fusoso-fusca, longitudinaliter, perobliquè costata; anfractibus sexis, ultimo et penultimo ullisimis, ultimo infra contractâ et prolongatâ; aperturâ depressâ, subrotundâ, auriformi; marginâ ad colummam obliquâ expanso; plieâ parietali pronuncienti; plieâ columellarâ crassa.*

THE PLOUGHED CLAUSILIA. Shell broad, short, smoky-brown, longitudinally very obliquely ribbed; whorls six, last and last but one very high, last contracted below and prolonged; aperture depressed, rather round, ear-shaped; margin obliquely expanded at the columella; parietal plait prominent; columellar plait thick.

MARTINI. —?

Hab. New Granada.

Species 120. (Mus. Brit.)

CLAUSILIA TERES. *Cla. testis angustâ, attissimâ, levigatâ, latae; anfractibus septendecenis, superioribus valde attenuatis, inferioribus altis, subinflat; aperturâ aurantiâ, perpendiculariter oblong, labio externo, supra medium tumidâ; plieâ columellarâ obliquâ, elevatâ, plieâ parietali parvâ, acutâ.*

THE ROLLING-PIN CLAUSILIA. Shell narrow, very high, smooth, latae; whorls seventeen, upper very attenuated, lower high, subinflated; aperture orange, perpendicularily oblong, outer lip tumid above the middle, columellar plait oblique, raised; parietal plait small, sharp.

OLIVIER. (Bulinus.) Pfr. Mon. Hel. Vol. II. p. 414.
Hab. Crete.

Species 121. (Mus. Brit.)

CLAUSILIA SIEboldii. *Cla. testis brevi-scalpula, fusiformi, superne succined, infra pruinosa, lavigata; an-*

CLAUSILIA.—PLATE XIII.

fractilis novensis, superioribus subattenuatis, medianis inflatis; aperturā magnā, auriformi; marginē albo, crasso, labio externo supra medium tumido, plicā parietali brevi, acutā, plicā columellarī prominenti.

SIEBOLD'S CLAUSILIA. Shell rather short, fusiform, amber above, plum-coloured below, smooth; whorls nine, upper rather attenuated, middle inflated; aperture large, ear-shaped; margin white, thick, outer lip tumid above the middle, parietal plait short, sharp; columella plait prominent.

PFEIFFER. Malak. Bl. 1869.
Hab. Japan.

Species 122. (Mus. Brit.)

CLAUSILIA MARONHONENSIS. *Cla. testā brevi, latā, subcylindrica, levigatā, albī et pallidē fulvā; anfractibus senis, altis, ultimo infrah subcontracto, prolongato, profundē et obliquē rimato; aperturā rotundo-auriforme, marginē albo, expanso, superne rimato, plicā parietali prominenti; plicā columellarī parvā, altissimā.*

THE MARANHON CLAUSILIA. Shell short, broad, rather cylindrical, smooth, white and pale fulvous; whorls six, high, last rather contracted below, prolonged, deeply and obliquely notched; aperture roundly-auriform; margin white, expanded, notched above; parietal plait prominent, columellar plait small, very high.

ALDERS. Pfeiffer. Mon. Hel. IV. p. 785.
Hab. River Maranhon, Columbia.

Species 123. (Mus. Brit.)

CLAUSILIA CORTICINA. *Cla. testā altā, subpyramidalatā, levigatā, pruinosa; anfractibus novensis, inferioribus altis, ultimo prolongato; aperturā maximā, superne subacuminatā, prope suturam sinuatim emarginatā; plicā parietali tenua, plicā columellarī altā, parvā, columellā arcuata.*

THE END CLAUSILIA. Shell high, rather pyramidal, smooth, plum-coloured; whorls nine, lower high, last prolonged; aperture very large, rather acuminate above, sinuously emarginated near the suture; parietal plait thin, columellar plait high, small, columella plait curved.

VON BUSCH. Pfr. Mon. Hel. II. p. 404.
Hab. Java.

Species 124. (Mus. Brit.)

CLAUSILIA KUTSCHIGI. *Cla. testā brevi, ventricosissimā, lilacina, levigatā; anfractibus octoais, tribus inferioribus altis, inflatis, ultimo subcontracto, ad dorsum plicato; aperturā magmā, latā, marginē crasso, plicis parietali et columellarī acuminatis, prominentibus.*

KUTSCHIG'S CLAUSILIA. Shell short, very ventricose, lilac, smooth; whorls eight, three lower high, inflated, last a little contracted, plaited at the back; aperture large, broad; margin thick, parietal and columellar plaits acuminate, prominent.

KÜSTER, p. 274.

Clausilia costicolla. Parr.
Clausilia corpulenta. Kutschig.
Hab. Dalmatia.

Species 125. (Mus. Brit.)

CLAUSILIA CASTALIA. *Cla. testā subpyramidalatā, superne attenuatā, medio et infrah inflatā, fuscā, levā, anfractibus novensis, inflatis; aperturā pareū, obliquē subproductū, superne acuminatā; marginē crasso, plicā columellarī altā.*

THE CASTALIA CLAUSILIA. Shell rather pyramidal, attenuated above, inflated in the middle and below; brown, smooth; whorls nine, inflated; aperture small, a little obliquely produced, acuminate above; margin thick, columellar plait high.

ROTH. Rossmäster, Icon. III. p. 54.
Hab. Mount Parnassus.

CLAUSILIA.

PLATE XIV.

Species 126. (Mus. Brit.)

CLAUSILIA CONTAMINATA. *Cla. testâ brevissimâ, latâ, levigatâ, lilacina; aufractibus sexis; apertura latâ, subquadrata, subaurea, plicis nullis.*

THE CONTAMINATED CLAUSILIA. Shell very short, broad, smooth, lilac; whorls six; aperture broad, rather square, rather golden-tinted; no plaits.

ZEIGLER. Pfeiffer. Mon. Hel. II. 436.

Hab. Cephalonia.

Species 127. (Mus. Brit.)

CLAUSILIA MADENSIS. *Cla. testâ dextrali, pyramidata, brevi, corvâ et pruinosa, levî; aufractibus novem, superioribus angustis, inferioribus ventricosis; apertura obliquâ, auriformi, superne angustata; plici columellari prominenti, plici parietali elongata.*

THE MADEN CLAUSILIA. Shell dextral, pyramidal, short, horny, plum-coloured, smooth; whorls nine, upper narrow, lower ventricose; aperture oblique, ear-shaped; narrow above; columellar fold prominent, parietal fold lengthened.

F. ss. X 1000. — — —

Hab. Transylvania.

Species 128. (Mus. Brit.)

CLAUSILIA CANALICULATA. *Cla. testâ brevi, pyramidata, aufractibus octonis, inferioribus latis; apertura latâ, subaurea, subrotundata, prope suturam canaliculata, sinuata, margine crasso, plicâ columellari elevata, latâ.*

THE CHANNELLED CLAUSILIA. Shell short, pyramidal, whorls eight, lower broad; aperture broad, rather golden, rather rounded, channelled near the suture, sinuated, margin thick, columellar plait raised, broad.

PFEIFFER. Mon. Hel. III. 599.

Clausilia Eubaea. Parryes.

Hab. Embœa.

Species 129. (Mus. Sowerby.)

CLAUSILIA REINIANA. *Cla. testâ magnâ, solidâ, subfusiformi, latâ, fusca, tenuissimè striatâ; aufractibus decenâ, apicibus quaternâ brevibus, rotundis, mediotubâ magnâ, inflatis, ultimo maximo, infra contracto; apertura magna, subauriformi, subaurantia; plicâ parietali angusta, plicâ columellarâ parvâ, planata, subdecatâ, plicâ minutâ, infra columellanâ tenui.*

THE REINI CLAUSILIA. Shell large, solid, subfusiform, broad, brown, very finely striated; whorls ten, four apical short, round, middle large, inflated, last very large, contracted below; aperture large, subauriform, rather orange; parietal fold narrow, columellar plait small, flattened, rather raised; minute plait below the columella small.

KOVELLI.

Hab. Japan.

Species 130. (Mus. Brit.)

CLAUSILIA SYRACUSANA. *Cla. testâ subfusiformi, pulchre fulvi, laminae acutæ rectis crebris tirati; aufractibus decenâ, apicibus quaternâ pareis, rotundis, levibus; apertura subovata, marginâ expansa, alba; labio externo, superne tumida, dentato, dente interno continuo, plicâ parietali minuta, plicâ columellari crassâ, elevata; plicâ subdorsâ obliquâ, vel marginem inferiorem desinente.*

THE SYRACUSE CLAUSILIA. Shell subfusiform, pale fulvous, ridged with numerous sharp, straight laminae; whorls ten, four apical small, rounded, smooth; aperture rather ovate, margin white, expanded; outer lip tumid above, toothed, inner lip continuous, parietal plait minute, columellar plait thick, raised; a subinternal oblique plait ending at the lower margin.

PHILIPPI. Pfeiffer Mon. Hel. IV. 739.

Clausilia macrostoma. Cautraine.

Clausilia inflata. Delle Chiaje.

Hab. Sicily.

CLAUSILIA.—PLATE XIV.

Species 131. (Mus. Brit.)

CLAUSILIA SICULA. *Cla. testâ breviâsculâ, pallidâ, latâ, levigatâ, medio et infâ ventricosâ; anfractibus paucis, tenuissimâ striatis, fuso strigatis, ultimo elongato; aperturâ obliquâ, subauriformi, labio externo crasso, infâ subexpanso, columellâ triplicata.*

THE SICILIAN CLAUSILIA. Shell rather short, pale, broad, smooth, ventricose in the middle and below; whorls few, very finely striated, striped with brown, last elongated; aperture oblique, rather auriform, outer lip thick, expanded below, columella three-plaited.

BENGT. —?

Hab. Sicily.

Species 132. (Mus. Brit.)

CLAUSILIA REGULABRIS. *Cla. testâ subfusiformi, brevi, levi, cornetâ et pruinosa; anfractibus apicalibus parvis, rotundis; aperturâ latâ, margine crasso, alto, labio externo superne tumido, sinuato; plâtice parietali acutâ; columellâ biplicata.*

THE ROUGH-LIPPED CLAUSILIA. Shell subfusiform, short, smooth, horny and plum-coloured; apical whorls small, round; aperture broad, margin thick, white, outer lip tumid above, sinuous; parietal fold sharp; columella with two plaits. MOUSSON. Pfeiffer. Mon. Hel. VI. p. 475.

Hab. Near Janina, Greece.

Having a singularly broad and thick-lipped mouth.

Species 133. (Mus. Brit.)

CLAUSILIA STRAMINICOLLIS. *Cla. testâ pruinosa, fusiformi, levi, infra medium subventricosâ; anfractibus novenis, stramineo ad suturam tenuisatis; aperturâ aurantia, oblongâ, posticâ angustatâ et attenuata; labio interno biplicata.*

THE STRAW-NECKED CLAUSILIA. Shell plum-coloured, fusiform, smooth, ventricose below the middle;

whorls nine, with a straw-coloured band at the suture; aperture orange, oblong, posteriorly narrow and attenuated, inner lip with two plaits.

PARRETS. Küster, Claus. p. 341.

Hab. Transylvania.

Species 134. (Mus. Sowerby ?)

CLAUSILIA CALCAREA. *Cla. testâ brevi, fusiformi, levigata, cornetâ; anfractibus undecim, medianis et inferioribus altis, ventricosis; aperturâ magna, margine crasso; plâtice parietali parvâ, plâtice columellarâ elevata, plâtice subinternâ infâ prope columellam curvâ.*

THE CALCAREAN CLAUSILIA. Shell short, fusiform, smooth, horny; whorls eleven, middle and lower high, ventricose; aperture large, margin thick; parietal plait small, columellar plait raised, subinternal plait curved below near the columella.

PHILIPPI. Pfeiffer. Mon. Hel. II. 453.

Clausilia assimilis. Zeigler.

Hab. Sicily.

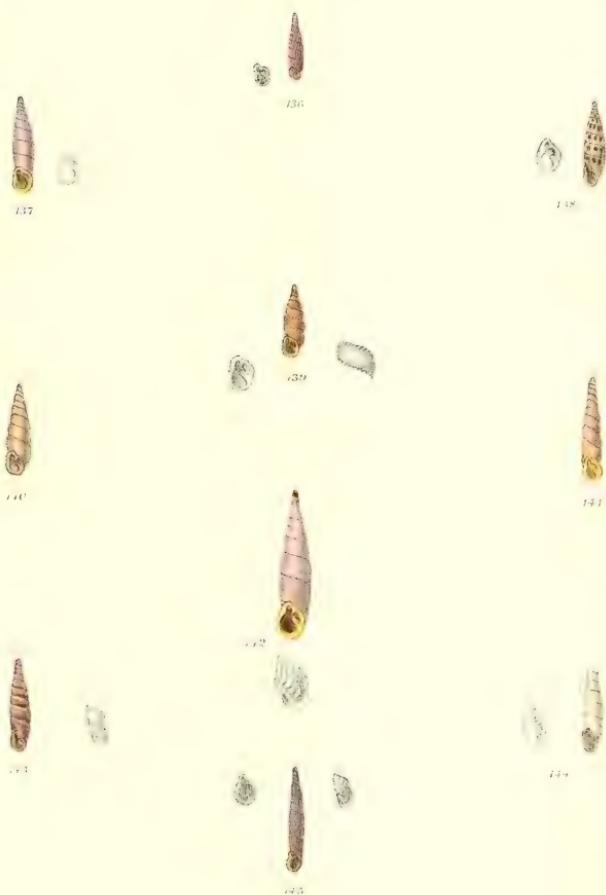

Species 135. (Mus. Brit.)

CLAUSILIA BILABIATA. *Cla. testâ subfusiformi, fulvi, tenuiter striata; anfractibus paucis, inferioribus convexis, ventricosis; aperturâ subovata, prope suturam subacuminatâ; labio externo crasso, supra medium tumido, extâs duplikato; columellâ quadriplicata, plâtice superiori brevi, latâ, plâtice parietali productâ.*

THE DOUBLE-LIPPED CLAUSILIA. Shell subfusiform, fulvous, finely striated; whorls few, lower convex, ventricose; aperture subovate, slightly acuminate near the suture; outer lip thick, tumid above the middle, double outside; columella with four plaits, upper plait short, broad, parietal plait produced.

SMITH. Proc. Zool. Soc.

Hab. Japan.

CLAUSILIA.

PLATE XV.

Species 136. (Mus. Brit.)

CLAUSILIA FILIGRANA. *Cla. testā parvā, fusiformi,
pruinosa, tenuiter lirata, liris filiformibus; aper-
tura pallide aurantia, parvā, columella medio latè
plieata, pliea inferiori minuta, pliea parietali in-
conspicua, labio externo superne acuminata,*
sinuata.

THE THREAD-GRAINED CLAUSILIA. Shell small, fusiform, plum-coloured, finely ridged, ridges thread-like; aperture pale orange, small, columella broadly plaited in the middle, lower plait minute, parietal plait inconspicuous, outer lip acuminate above, sinuous.

ZEIGLER. Pfr. Mon. Hel. II. p. 499.

Clausilia intercupa. —?

Hab. Dalmatia, Austria.

Species 137. (Mus. Brit.)

CLAUSILIA AQUILA. *Cla. testā brevi, latā, levigata,
superne angustata, infra ventricosa, pallide lila-
cina; apertura matrida, aurantia; margine
crasso, pliea columellaris magni, prominenti.*

THE EAGLE CLAUSILIA. Shell short, broad, smooth, narrow above, ventricose below, pale lilac; aperture very large, orange; margin thick, columella large, prominent.

PARREYS. Rossmässler, Icon. III. p. 43.

Hab. Dalmatia.

Species 138. (Mus. Brit.)

CLAUSILIA CAMA. *Cla. testā brevi, ventricosa, fusiformi,
striatā, fuscā, maculis densioribus variegata; au-
fractibus nucens, superioribus attenuatis; aperturi-
a auriformi, pliea parietali ad suturam approximatā,
pliea columellaris latè luminata.*

THE HOARY CLAUSILIA. Shell short, ventricose, fusiform, striated, brown, varied with darker coloured spots; whorls nine, upper attenuated; aperture ear-shaped, parietal plait near the suture, columellar plait broadly laminar.

HELDERMAN. Küst. p. 193.

Clausilia tessellata. Parreys?

Species 139. (Mus. Brit.)

CLAUSILIA STIGMATICA. *Cla. testā brevissimā, ventricosā,
levi; aufractibus medianis et inferioribus inflatis,
ad suturam tuberculis parvis albis ornatis; aper-
tura subquadratā, matrida, labio interno bispicata,
superne interrupta.*

THE STIGMATIC CLAUSILIA. Shell very short, ventricose, smooth, middle and lower whorls inflated, ornamented at the suture with small white tubercles; aperture rather square, large, inner lip two-plaited, interrupted above.

ZEIGLER. Pfr. Mon. Hel. II. 424.

Hab. Dalmatia.

Species 140. (Mus. Brit.)

CLAUSILIA BUSCHI. *Cla. testā brevi, pyramidatā,
pallide cornuta, levā, semipellucidā; aufractibus
nucens, concavis; apertura parvā, auriformis,
pliea parietali et columellaris parvus.*

BUSCHI'S CLAUSILIA. Shell short, pyramidal, pale horny, smooth, semipellucid; whorls nine, convex; aperture small, auriform, parietal and columellar plaits small.

KÜSTER. Martens in Malak. Bl. VII.

Hab. Japan.

Species 141. (Mus. Brit.)

CLAUSILIA BORNEENSIS. *Cla. testā altā, pyramidali,
fuscā; aufractibus decenis, inflatis; apertura
aurantia, auriformi, tortuosum versus latas
decreta proiecta, superne acuminata, margine
crasso, labio interno bispicato.*

THE BORNEAN CLAUSILIA. Shell high, pyramidal, brown; whorls ten, inflated; aperture orange, ear-shaped, tortuously bent back towards the right side, acuminate above, margin thick, inner lip two-plaited.

PFEIFFER. Mon. Hel. IV. 736.

Hab. Borneo.

The mouth is peculiarly bent over towards the right side of the shell.

CLAUSILIA.—PLATE XV.

Species 142. (Mus. Brit.)

Clausilia macasariense. *Cla. testā lilacinā, subventricosā, pyramido-fusiformi; anfractibus decenīs, inferioribus altis, latis, rectilateralibus, ultimo elongato, ad medium dorsi depresso, liris inaequalibus, irregularibus rugato; aperturā aurantiā, magnā, obliquā, subauriformi, superne acuminato, plicā parietali acuto productā, plicā columellari magnā, angulatā productā.*

THE MACASCAR CLAUSILIA. Shell like, subventricose, pyramidal, fusiform; whorls ten, lower high, broad, rectilateral, last elongated, depressed at the middle of the back, wrinkled with unequal irregular ridges; aperture orange, large, parietal plait sharply produced, columellar plait large, angularly produced.

SOWERBY.

Clausilia corrugata. Menke.*Clausilia Macarana*. Zeigler.

Hab. Macascar.

Species 143. (Mns. Sowerby.)

Clausilia delesserti. *Cla. testā fusiformi, pruinosā, levissimā, liratā; anfractibus undecenīs, albo marginatis, obliquis; ultimo prope terminum ad dorsum depresso et subcarinato; aperturā prominenti, subovatā, margine albo, lato, reflexo, plicā columellari magnā, obliquā productā.*

DELESSERT'S CLAUSILIA. Shell fusiform, plum-coloured, finely ridged; whorls eleven, bordered

with white, oblique; last depressed or partly keeled near the end at the back; aperture prominent, subovate, margin white, broad, reflected, columellar plait large, obliquely produced.

BOURGUIGNAT. Mon. Hel. IV. 774.

Hab. Syria.

Figure 144. (Mus. Brit.)

Clausilia funiculum. Already given in Plate VIII. f. 71, and repeated here by error.

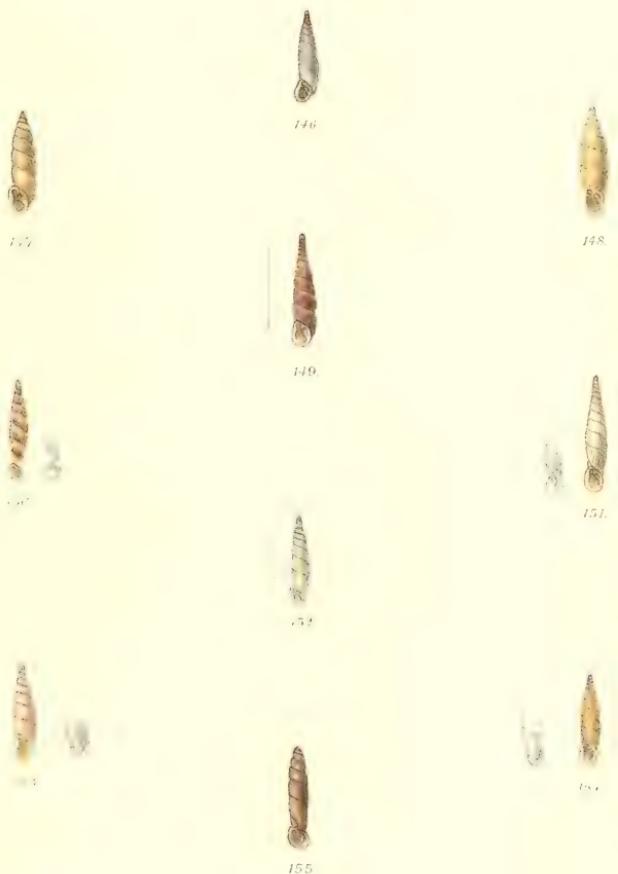

Species 145. (Mus. Brit.)

Clausilia callosa. *Cla. testā pruinosā, laminatum tenuissimè liratā, elongatā, angustissimā medio et infra rectilateralē; anfractibus decenīs, altis, ultimo elongato, ad dorsum infra obliquū sulco impresso; aperturā auriformi, infra productā, marginē crasso, plicā parietali minutā, plicā columellari obliquā acuminatā; altissimā, plicā internā conspicuā.*

THE CALLOUS CLAUSILIA. Shell plum-coloured, with fine laminar ridges, elongated, very narrow, straight-sided in the middle and below; whorls ten, high, last elongated, impressed at the back below with an oblique groove; aperture auriform, produced below, margin thick, parietal plait minute, columellar plait obliquely acuminate, very high; a conspicuous inner plait.

MUHLFELD. Pfr. Mon. Hel. II. 419.

Hab. Dalmatia.

CLAUSILIA.

PLATE XVI.

Species 146. (Mus. Sowerby.)

Clausilia cinerea. *Cla.*, testa brecci, luci, subcornuta, anfractibus octonis, apicalibus quaternis fusco-nigrescentibus, medianis et inferioribus subventricosis, ultimo profunde sinuata, apertura pallide castanea, latit, rotundata, marginem levem, parum reflexa, plicis columellari elevata, lineari, plicis parietali sutura approximatis, acutis.

THE ASHY CLAUSILIA. Shell short, smooth, bluish; whorls eight, four apical blackish brown, middle and lower rather ventricose, last deeply notched; aperture pale chestnut, broad, rounded, margin thin, a little reflected; columellar plait raised, linear parietal plait close to the suture, sharp.

PHILIPPI. A. Schmidt, *Clausilia*, p. 108.

Clausilia cinnamomea. Zoigler.

Clausilia teres. Delle Chiaje.

Hab. Naples.

Species 147. (Mus. Sowerby.)

Clausilia cochin-chinensis. *Cla.*, testa brevifuscula, solidi, fusco-grisea, tenuissima, obliquè lirata; anfractibus novatis, infra latius, altis, concrevissimis, ultimo profunde rimato; apertura arcuiformis, pallide carneus, superne subacuminatus, sinuata; marginem crassu, reflexo, plicis parietali parvi, tenui, plicis columellari magis, pererecatis.

THE COCHIN-CHIN CLAUSILIA. Shell rather short, solid, brownish-grey, very finely obliquely ridged; whorls nine, broad below, high, rather convex, last deeply notched; aperture auriform, pale flesh, rather acuminate above, sinuate; margin thick, reflected, parietal plait small, thin, columellar plait large, much raised.

PFEIFFER. Mon. Hel. VI. p. 443.

Hab. Cochin-China.

Species 148. (Mus. Sowerby.)

Clausilia gouldiana. *Cla.*, testa solidi, pallide fulva, levata, fusiformi, ventricosissima; anfractibus septenatis, inferioribus altis, conveenis, ultimo obliquè contracto, suturam distincti; apertura latit, labio externo albo, crassu, latè reflexo, superne sinuata, subemarginata, plicis parietali prominenti, acutis; plicis columellari obliqui, elevati, lineari.

GOULD'S CLAUSILIA. Shell solid, pale fulvous, smooth,

fusiform, very ventricose; whorls seven, lower high, convex, last obliquely contracted, suture distinct; aperture wide, outer lip white, thick, broadly reflected, sinuous above, subemarginate, parietal plate prominent, sharp; columellar plait oblique, elevated, linear.

PFEIFFER. Novil. Conch. p. 123.

Hab. Burmah.

Species 149. (Mus. Sowerby.)

Clausilia tristrami. *Cla.*, testa pruinosa, fusiformis, tenuissima, lirata; anfractibus tridecim, superioribus levibus, attenuatis, medianis et inferioribus ventricosis, ultimo divergatim impresso; apertura castanea, marginis albo, plicis parietali et columellari tenuibus.

TRISTRAM'S CLAUSILIA. Shell plum-coloured, fusiform, very finely ridged; whorls thirteen, upper smooth, attenuated, middle and lower ventricose, last impressed divergently; aperture chestnut, margin white, parietal and columellar folds thin.

PFEIFFER. Mon. Hel. VI. p. 481.

Hab. Tunis.

The former figure of this species, given in Plate V., was not so characteristic as the present, which, however, is only introduced by inadvertence.

Species 150. (Mus. Sowerby.)

Clausilia raymondi. *Cla.*, testa fulva, inter costas pruinosa, costellis filiformibus lirata, angusti, rectilaterali, altis; anfractibus decenis, medianis et inferioribus altis, ultimo infra contracto, prolongata, laxata, tortuosa, ad dorsum obliquè bicarinata; apertura distanti, producta, auriformis, marginem tenui expanso, plicis parietali et columellari tenuibus, approximatis.

RAYMOND'S CLAUSILIA. Shell fulvous, plum-coloured between the ribs, ridged with filiform ribs, narrow, straight-sided, high; whorls ten, middle and lower high, last contracted, prolonged, uncoiled, tortuous, obliquely bicarinate at the back; aperture distant, produced, ear-shaped, margin thin and expanded, parietal and columellar plaits thin, close together.

BOURGUIGNAT. Pfeiffer. Mon. Hel. VI. p. 513.

Hab. Syria.

CLAUSILIA.—PLATE XVI.

Species 151. (Mus. Sowerby.)

CLAUSILIA BOISSIERI. *Cla. testā subcōrulē, fusiformi, breviūsculā, levigatā; anfractibus decenīs, apicalibus fusco-uigrescentibus, medianis et inferioribus gradatim inflatis, ultimo prolongato, lirato, tortuo, lazato, carinis duabus convergentibus desinente; aperturā latā, fideā, productā, marginē tenui, expanso, supernē sinuato, plicā parietali minutā, plicā columellarī altā, prominenti.*

BOISSIER'S CLAUSILIA. Shell blueish, fusiform, rather short, smooth; whorls ten, apical blackish-brown, middle and lower gradually inflated, last prolonged, ridged, tortuous, uncoiled, ending in two converging keels; aperture broad, fulvous, produced, margin thin, expanded, sinuous above, parietal plait minute, columellar plait high, prominent.

Hab. Mon. Hel. p. 513.

Hab. Syria.

This species has a couple of wrinkled keels converging at the bottom of the last whorl.

Species 152. (Mus. Sowerby.)

CLAUSILIA VARIANS. *Cla. testā pallidē corneā, semi-pellucidā, tenuissimē liratā, tenui, subfusciformi, medio gradatim inflatā; aperturā subcovalā, parvā, margine supernē sinuato, emarginato, plicis parietali et columellarī tenuibus, subappressumatis.*

THE VARYING CLAUSILIA. Shell pale horn, semi-pellucid, very finely ridged, thin, subfusciform, gradually swelled in the middle; aperture sub-ovate, small, margin sinuously notched above, parietal and columellar plaits thin, rather approximate.

ZEIGLER. Pfr. Mon. Hel. II. p. 499.

Hab. Germany.

Species 153. (Mus. Sowerby.)

CLAUSILIA PROXIMA. *Cla. testā brevi, ventricosā, lavi, subcōrulē, apice aperturāque succinneis; anfractibus octonis apicalibus parvis, medianis, inferioribusque lati, altis, inflatis; ultimo profundē rimato, ad dorsum perpendiculariter rugato; aperturā lati, subquadratā, margine tenui, reflexo, plicā parietali parvā, plicā columellarī altā, latā.*

THE NEAR CLAUSILIA. Shell short, ventricose, smooth, bluish, apex and aperture amber; whorls eight, apical small, middle, lower broad, high, inflated; last deeply notched, perpendicularly wrinkled at the back; aperture broad, rather square, margin thin, reflected, parietal plait small, columellar plait high, broad.

WALDERDORFF. Syst. Verz. Call. 1864.

Hab. Cattar.

Species 154. (Mus. Sowerby.)

CLAUSILIA LUNELLARIS. *Cla. testā pareā, fulvā et pruinosa, brevi, tenuissimē striatā; anfractibus novenīs, inferioribus inflatis, altis; ultimo rimato, ad dorsum maculā semilunari notato; aperturi fulvā, margine paulo expanso, supernē sinuato, emarginato, plicis parietali et columellarī minutis, appressumatis.*

THE LUNELLAR CLAUSILIA. Shell small, fulvous and plum-coloured, short, very finely striated; whorls nine, lower inflated, high, last notched, marked at the back with a semilunar spot, aperture fulvous, margin a little expanded; sinuous, emarginated, parietal and columellar plaits minute, near together.

PFEIFFER. Mon. Hel. III. p. 608.

Clausilia lunularis by error, Pl. IV. 38.

Hab. Eubcea.

Species 155. (Mus. Sowerby.)

CLAUSILIA BLANDIANA. *Cla. testā brevi, sordidē pruinosa, tenuissimē striatā, subfusciformi; anfractibus septenis, suturā profundē separatis, convexis, ultimo altissimo, prolongato, profundē rimato, lato, tortuo; aperturā magnā, castaneā, obliquē auriformi, trans latus dextrale extenso, expanso; plicā parietali prominenti, plicā columellarī nullā.*

BLAND'S CLAUSILIA. Shell short, dull plum-colour, very finely striated, rather fusiform; whorls seven, separated by a deep suture, convex, last very high, prolonged, deeply notched, uncoiled, tortuous; aperture large, chestnut, obliquely auriform, extended across the right side, expanded, parietal plait prominent, no columellar plait.

PFEIFFER. Mon. Hel. IV. p. 785.

Hab. Santa de Bogota, Columbia.

CLAUSILIA.

PLATE XVII.

Species 156. (Mus. Sowerby.)

CLAUSILIA CERULEA. *Cla. testā brevi, subcylindricā, levā, fusiformi; anfractibus decem, medianis et inferioribus angustis, apicalibus parvis, nigroscutatis, ultimo infra producto, angustato, rugato, ad dorsum tuberculato; aperturā intus costata, margine auro-fusco, obliquā, marginē teni, recta.*

THE BLUEISH CLAUSILIA. Shell short, bluish, smooth, fusiform; whorls ten, middle and lower inflated, apical small, blackish; last produced below, narrow, wrinkled, with two tubercles; aperture chestnut within, margin golden-brown, oblique, margin thin, reflected.

FERRETTAC. Küster, p. 216.

Clausilia bimaculosa.

Hab. Morea.

Species 157. (Mus. Sowerby.)

CLAUSILIA DALMATICA. *Cla. testā brevissimā, ventrīcīsa, pallidā, fulvā, tenuissimè striatā; anfractibus octonib, brevibus, ultimo alto, infra angustato, post marginem apertura nivengato, dorso albo notato; aperturā latā, margine albo, expanso, plīcis columellari latā.*

THE DALMATIAN CLAUSILIA. Shell very short, ventri-cose, pale fulvous, very finely striated; whorls eight, short, last high, marrow below, with a wrinkle behind the margin of the mouth; marked with white at the back, aperture broad, margin white, expanded, columnellar plait broad.

PARTSCH. Pfeiffer. Mon. Hel. II. 432.

Clousilia marmorata. Zeigler.

Clousilia epiphorica. Kutsch.

Hab. Dalmatia.

Species 158. (Mus. Brit.)

CLAUSILIA CRITICA. *Cla. testā parvā, tenuiter liratā, stramineā, fusiformi; aperturā subovata, superne sinuata, plīcis parietali suturā approximatā, columellā biplicatā, labio extero supra medium sinuata.*

THE CRITICAL CLAUSILIA. Shell small, finely ridged, straw-coloured, fusiform; aperture subovate, sinuous above, parietal plait near the suture,

columella two-plaited, outer lip situated above the middle.

BIELTZ. Küster, p. 263.

Hab. Transylvania.

Species 159. (Mus. Brit.)

CLAUSILIA DUBOISII. *Cla. testā parvā, fida, fusiformi, tenuiter laminatum liratā; aperturā ovata, labio extero supra medium tumido, sinuata; columella infra plīcis crenulatā, plīcis parietali et columellari ad terminus approximatā, plīci parvū intermedii.*

DUBOIS'S CLAUSILIA. Shell small, fulvous, fusiform, finely lamellately ridged; aperture ovate, outer lip tumid and sinuous above the middle, columella crenulated below the plait, parietal and columnellar plaits approximated at the ends with a small intermediate plait.

CHARPENTIER. Küster, p. 270.

Hab. ——?

Species 160. (Mus. Sowerby.)

CLAUSILIA DISTANTIARUM. *Cla. testā brevi, subpyramidalē, solidā, latā, costis distantiis, crassi-ūsculis liratā, inter costas pruinosa, anfractibus novenib, apicalibus parvis, rotundis, fuscis, levibus, alteris ad suturam subscutatis, aperturā subaerantia, plīci parietali parvā, plīci columellari nullā.*

THE DISTANT-RIDGED CLAUSILIA. Shell short, pyramidal, solid, broad, ridged with distant, rather thick ribs, plum-coloured between the ribs; whorls nine, apical small, round, brown, smooth, others with slight steps at the suture; aperture slightly orange, parietal plait small, columnellar plait none.

SOWERBY

Hab. ——?

Species 161. (Mus. Sowerby.)

CLAUSILIA KÜSTERI. *Cla. testā tenui, cornē, sulfosulfatī, levā, anfractibus duodecenis, apicali turbato, ultimo infra subattenuato; aperturā oblonga, ad suturam elevata, plīci columellari magnā.*

CLAUSILIA.—PLATE XVII.

KÜSTER'S CLAUSILIA. Shell thin, horny, subfusciform, smooth, whorls twelve, apical turbinated, last attenuated below; aperture oblong, raised at the suture; columellar plait large.

ROSSMÄSLER. Pfeiffer. Mon. Hel. II. 399.

Clausilia substrigata. Küster?

Hab. Sardinia, Corsica.

Species 162. (Mus. Brit.)

CLAUSILIA SEPTEMPPLICATA. *Cla. testâ fuscâ, levî, fusiformi, medio ventricosâ; anfractibus novenâs, ad suturam minute albo tuberculatis, ultimo prolungato, ad dorsum stigmatis albo elongato flexuoso rotato; aperturâ magnâ, margine albo, plicâ parietali minuta, plicâ columellari elongato, plicis internâs et subinternâs quinque.*

THE SEVEN-PLAITED CLAUSILIA. Shell brown, smooth, fusiform, middle ventricose; whorls nine, with minute white tubercles at the suture, last prolonged, marked at the back with a white, long, flexuous stigma; aperture large, margin white, parietal plait minute, columellar plait elongated, interior and subinterior plait five.

PHILIPPI. Plffr. Mon. Hel. II. p. 452.

Clausilia prasinâ. Benson.

Clausilia subdorsis. Zeigler.

Clausilia sericina. Rossmäsler.

Hab. Sicily.

Species 163. (Mus. Sowerby.)

CLAUSILIA MONTANA. *Cla. testâ parvâ, pruinosa, tenuissimè striatâ, fusiformi; anfractu ultimo ad dorsum infâ subcarinato, ante aperturam tumido, tum corrugato, aperturâ falcâ, oblongâ, plicâ interne perpendiculare, columellâ biplicatâ.*

THE MOUNTAIN CLAUSILIA. Shell small, plum-

coloured, very finely striated, fusiform; last whorl with a keel at the back below, tumid before the aperture, then drawn in; aperture fulvous, oblong, with a perpendicular internal plait; columella two-plaited.

MOUSSON. —?

Hab. Mountains in Europe.

Species 164. (Mus. Sowerby.)

CLAUSILIA LOWEI. *Cla. testâ parvâ, pruinosa, subdistincte liratâ, lîris filiformibus; anfractibus decoloratis, medianis inferioribus convexis; apertura subangulâ, multiplicatâ.*

LOWE'S CLAUSILIA. Shell small, plum-coloured, rather distantly ridged, ridges filiform; whorls ten, middle and lower convex; aperture pale orange, many-plaited.

ALDEES. Küster, p. 177.

Clausilia deltostoma. De Paiva.

Hab. Madeira.

Species 165. (Mus. Sowerby.)

CLAUSILIA VIREX. *Cla. testâ brevi, ventricosâ, pallide pruinosa; anfractibus novenâs, ad suturam minutissimè plicatis, ultimo profundè rimato, infâ subcarinato; aperturâ magnâ, margine tenui, expanso, plicis parietali et columellari crassis; labio externo superne incrassato.*

THE BRUISE-MARK CLAUSILIA. Shell short, ventricose, pale plum-colour; whorls nine, very finely plaited at the suture, last deeply notched, with a slight keel below; aperture large, margin thin, expanded, parietal and columella thick, outer lip thickened above.

ROSSMÄSLER. Pfeiffer. Mon. Hel. II. p. 455.

Clausilia diplana. Heutz.

Hab. Central Croatia.

MONOGRAPH
OF THE GENUS
CYLINDRELLA.

O Lord of heaven, and earth, and sea,
To Thee all praise and glory be;
How shall we show our love to Thee,
Who givest all?

Bishop Christopher Wordsworth.

CYLINDRELLA.

PLATE I.

Genus CYLINDRELLA, Pfeiffer.

Testa terrestris, elongato-turrata, plerimque dextralis; anfractibus numerosis, apicalibus, deciduis; apertura plerumque ovata, margine continua.
 Shell terrestrial, elongate-turreted, generally dextral; whorls numerous, apical, deciduous; aperture usually ovate, with continuous margin.

The *Cylindrelles* are much more variable in form than the *Clavellae*, and are without the internal plate or *clausum* which distinguish that genus. The first-formed whorls generally fall off when the shell is advanced in growth. In many species the aperture is brought round suddenly, so as to form a sort of crease (*rima*) with the coiled part of the body-whorl. In others the last whorl is distorted or uncoiled (*solutus*), so as to place the aperture at a distance from the body of the shell. In a very few, the margin of the aperture is interrupted by the ventral bulge of the whorl. Considerably more than one-third of the reported species are from the island of Cuba, one-fifth from Jamaica; another fifth would be made up between Haiti and Mexico; leaving very few for a dozen other isolated localities, including Great Britain, which produces four or five.

Species 1. (Mus. Brit.)

CYLINDRELLA ASPERA. *Cyl. testa solidâ, pupiformi, albido vel roseâ, striatâ, versus apicem pyramidatâ; medio et infrâ cylindricâ; anfractibus sedecim, apicalibus inclusis, ultimo rimato; apertura subrotundâ, margine crasso, columellâ intus plicata.*

THE ROUGH CYLINDRELLA. Shell solid, pupiform, whitish or rose, striated, pyramidal towards the apex, cylindrical in the middle and below; whorls sixteen (including apical), last notched; aperture rather round, margin thick, columella plaited within.

APAMS. Pfeiffer, Mon. III. p. 564.

Hab. Jamaica.

Species 2. (Mus. Brit.)

CYLINDRELLA SPECIOSA. *Cyl. testa magnâ, solidâ, cylindrico-subpyramidalâ, obliquè striatâ, olivaceâ,*

ventricosâ; anfractibus permanentibus undecim, paulo concrecâ, ad suturam crenatis, quinque inferioribus subangulis, ultimo angulato, contracto, longè rimato, supra aperturam arcato; apertura auriformis, margine superiori subflexuoso, columellâ rix plicata.

THE SPECIES CYLINDRELLA. Shell large, rather solid, cylindrico-subpyramidal, obliquely striated, olive, ventricose; permanent whorls eleven, a little convex, crenated at the suture, five lower nearly equal, last angular, contracted, with a long crease, arched above the aperture; aperture auriform, upper margin rather flexuous, columella hardly plaited.

DUSKEK. Pfeiffer, Mon. IV. p. 695.

Hab. Columbia.

This handsome species loses its primary whorls far down from the apex, so as to make a broadly-truncated break.

Species 3. (Mus. Brit.)

CYLINDRELLA SPLENDIDA. *Cyl. testa ventricosâ, solidâ, isculptâ, obliquè costatâ, cornuo-violacea; anfractibus permanentibus octonâ, medianis inflatis, ultimo contracto, longè rimato, supra marginem apertura arcuato; apertura auriformis, columellâ leotri biplicata.*

THE SPLENDID CYLINDRELLA. Shell ventricose, rather solid, obliquely ribbed, fleshy violet; permanent whorls eight, middle inflated, last contracted, with a long notch, arched above the margin of the aperture; aperture auriform, columella slightly biplicated.

PFEIFFER. Proc. Zool. Soc. 1860, p. 139.

Hab. Mexico.

Species 4. (Mus. Brit.)

CYLINDRELLA GRANDIS. *Cyl. testa magnâ, cylindricâ, latâ, tenuisculâ, tenuiter striatâ, fuscо-rubescens, suturâ albido-marginatâ; anfractibus permanentibus octonâ, ultis, quaternis inferioribus subequalibus, ultimo contracto, angulato, profunde rimato; apertura magnâ, latâ suboculatâ; columellâ rectiuncula.*

CYLINDRELLA.—PLATE I.

THE LARGE CYLINDRELLA. Shell large, cylindrical, broad, finely striated, reddish-brown, suture bordered with whitish; permanent whorls eight, high, the four lower nearly equal, last contracted, angular, deeply notched; aperture large, broadly subovate; columella rather straight.

PFEIFFER. Proc. Zool. Soc. 1860, p. 139.

Hab. Mexico.

Much more cylindrical than the preceding, and more finely sculptured.

Species 5. (Mus. Brit.)

CYLINDRELLA ARISTIPICA. *Cyl. testi solidā, subpyramidalē, infra medianū tumidā, fuscō-olivaceā, fuscō-rubescēti strigatā, regulariter striatā, superne contractā, medio et infrā subventricosā; anfractibus permanentibus sexdecenīs, depresso, ultimo contracto, rimato; aperturā subrotundā, marginē crasso, rotundo, columellā subplicatā.*

THE CORN-SPIKE CYLINDRELLA. Shell solid, rather pyramidal, tumid below the middle, olive-brown, striped with reddish-brown, regularly striated, contracted above, rather ventricose in the middle and below; permanent whorls sixteen, depressed, last contracted, notched; aperture roundish, margin thick, round, columella slightly plaited.

PFEIFFER. ? MS. Mus. Brit.

Hab. ——?

Species 6. (Mus. Brit.)

CYLINDRELLA EXIMIA. *Cyl. testi solidā, cylindrica, rectigona, levigatā, griseā, supra suturam fascia-*

fulvā, maculis rubris articulatā, infra suturam fascia-fidei, immaculatā, ornatā; anfractibus permanentibus octonīs, ultimo angulato, subconstricto; aperturā subtrapezoidā.

THE EXQUISITE CYLINDRELLA. Shell solid, cylindrical, straight-sided, smooth, grey, ornamented above the suture with a fulvous band articulated with red spots, and under the suture with a spotless fulvous band; permanent whorls eight, last angular, rather contracted; aperture subtrapezoidal.

PFEIFFER. Proc. Zool. Soc. 1858, p. 23.

Hab. Haiti.

Species 7. (Mus. Brit.)

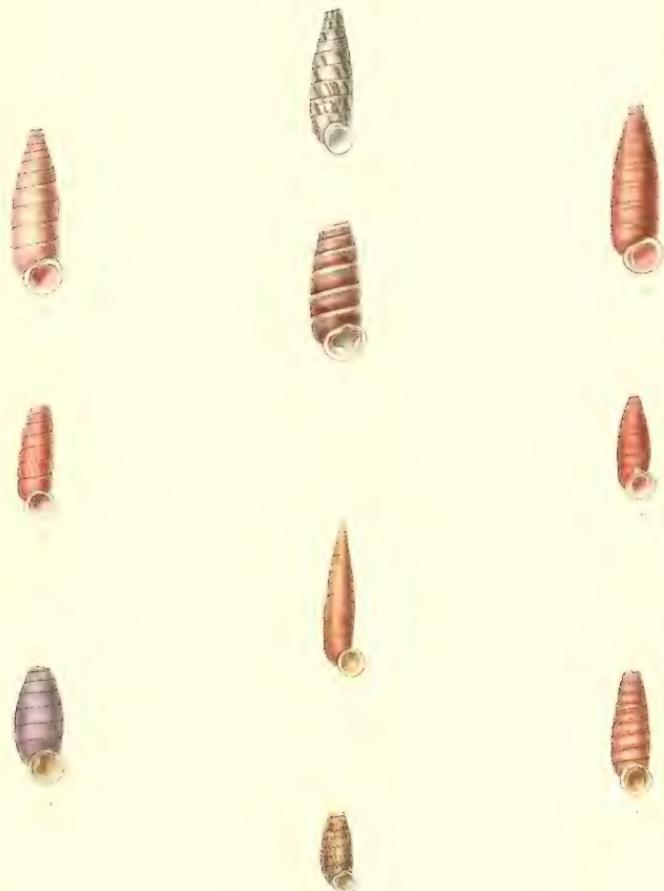

CYLINDRELLA GHEISBRECHTI. *Cyl. testi magni, solidā, famoso-fuscā, medio et infra latā, bulbosā, supernē contractā; sulcis irregulariter undatis rugatā; anfractibus permanentibus sexdecenīs, superioribus seuis angustis, alteris gradatim crescentibus, ultimo infra contracto, angulato, rimato, supra marginem superiorem apertura fornicate; columellā unipliata.*

GHEISBRECHT'S CYLINDRELLA. Shell large, solid, smoky-brown, broad and bulbous in the middle and below, contracted above, wrinkled with irregular, wavy grooves; permanent whorls sixteen, upper six narrow, others gradually increased, last contracted below, angular, notched, vaulted above the upper margin of the aperture; columella single-plaited.

PFEIFFER. Mon. IV. p. 694.

Hab. Chiapa, Mexico.

A large shell of remarkably bulbous form and wrinkled texture.

C Y L I N D R E L L A.

PLATE II.

Species 8. (Mus. Brit.)

CYLINDELLA FLAMMULATA. *Cyl. testā pupaformi, solidā, griseā, fusco-corneo-flammulatā, levigatā; anfractibus rectiūsculis, ultimo contracto, angusto, 5 medianis subequalibus, deinde versus apicem contracto; labio integro subrotundato, simplici.*

THE FLAMED CYLINDRELLA. Shell pupa-shaped, solid, grey with horn-brown flames, smooth; whorls rather straight, the last contracted, narrow, five middle nearly equal, thence towards the apex contracted; lip entire, rather round, simple.

PFEIFFER. Monograph ii.

Cylindrella planilota, Pfeiffer.

Hab. Hayti—St. Domingo.

Species 9. (Fig. a, b, Mus. Brit.)

CYLINDELLA CYLINDRUS. *Cyl. testā pupaformi, tenuiter striatā, rosā, purpureā vel albida, anfractibus rectiūsculis, ultimo 5 subequalibus, deinde versus apicem contractis; apertura productā, labio simplici, columellā intus planā.*

THE CYLINDER CYLINDRELLA. Shell pupa-shaped, finely striated; pink, purple, or white whorls rather straight, five last nearly equal, thence towards the apex contracted; aperture produced; lip simple; columella flattened within.

CHEMNITZ. Conchological Cabinet.

Cylindrella purpurea, Gray.

Pupa rosea, Adams.

Cylindrella rubella, Adams.

Cylindrella procerata, Adams.

Hab. Jamaica.

Species 10. (Mus. Brit.)

CYLINDELLA ZONATA. *Cyl. testā pupaformi, tenuiter striatā, purpureā, purpureo-nigrescenti latè zonatā; anfractibus latis, altis, 5 ultimis subequalibus,*

deinde gradatim contractis; apertura subproductā, subauriformi, intus flexuosa, labio rotundo.

THE BANDED CYLINDRELLA. Shell pupa-shaped, finely striated, purple, broadly banded with blackish-purple; whorls broad, elevated, five last nearly equal, then gradually contracted; aperture rather produced, rather auriform, flexuous within, lip rounded at the margin.

C. B. ADAMS. Pfeiffer's Monograph.

Hab. Jamaica.

Species 11. (Mus. Brit.)

CYLINDELLA ROSEA. *Cyl. testā angustā, cylindricā, acutē tenuiter striatā, roseā, anfractibus rectiūsculis: 5 ultimis subequalibus, ultimo infirmi contracto: apertura rix solutā, apertura subquadratā; columellā intus latā.*

THE PINK CYLINDRELLA. Shell narrow, cylindrical, sharply and finely striated, pink, whorls rather straight; five last whorls rather equal, last contracted below; aperture scarcely uncoiled, aperture rather square; columella broad within.

CHEMNITZ. Conch. tab. 2, f. 31, 32.

Hab. Jamaica.

In this species, as in *C. aspera*, the striae are sharp and fine.

Species 12. (Mus. Brit.)

CYLINDELLA SANGUINEA. *Cyl. testā subpupaformi, sanguineā, tenuiter striatā, medio subinflatā, versus apicem contractā; anfractibus depresso, numerosis; apertura subquadratā, labio incrassato.*

THE SANGUINEOUS CYLINDRELLA. Shell rather pupa-shaped, blood-coloured, finely striated, a little inflated in the middle, contracted towards the apex; whorls depressed, numerous; aperture rather square, lip thickened.

CHEMNITZ. Conch. 7, t. 1, figs. 18–20.

Cylindrella cornuta, Adams.

Hab. Jamaica.

CYLINDRELLA.—PLATE II.

Species 13. (Mus. Brit.)

CYLINDELLA OVIEDOIANA. *Cyl. testā elongato-cylindricā, versū apicem gradatim attenuatū, cornēs, medio rubrā, striis rectilīneis tenuiter liratā; ultimo anfractu alto; aperturā lateraliter producta, rotundā, margine integro, rotundo.*

THE OVIEDO CYLINDELLA. Shell elongated-cylindrical, gradually attenuated towards the apex, horny, red in the middle, finely ridged with rather straight striae; last whorl elevated; aperture laterally produced, rounded, margin entire, rounded.

D'ORBIGNY. Mollusca of the Isl. of Cuba, tab. 12, f. 15-17.

Hab. Cuba.

Species 14. (Mus. Brit.)

CYLINDELLA PROCERA. *Cyl. testā ventricosā, pupariformi, tenuissimè striatā; anfractibus 4 ultimis subæqualibus, altis, latis, deinde alteris gradatim angustioribus; aperturā rotundo-subquadratā; columellā leviter plicatā, labio crasso, rotundo.*

THE ELEVATED CYLINDELLA. Shell ventricose, pupa-shaped, very finely striated; four last whorls nearly equal, elevated, broad, thence others gradually narrowing; aperture roundly-subquadrate; columella lightly plaited, lip thick, round.

C. B. ADAMS. Shells of Jamaica.

Hab. Jamaica.

Species 15. (Mus. Brit.)

CYLINDELLA AMETHYSTINA. *Cyl. testā cylindrica, rectilīnialā levigatā, rubro-purpureā; anfractibus superne fusco fuscata; aperturā magnā, subrotundā, labio subexpanso, profundū incrassato.*

THE AMETHYSTINE CYLINDELLA. Shell cylindrical, rather straight, smooth, purplish-red; whorls banded above with brown; aperture large, rather rounded, lip somewhat expanded, deeply thickened.

CHITTY. Pfeiffer's Monograph I.

Hab. Jamaica.

A more straight-sided shell than others of the same group.

Species 16. (Mus. Brit.)

CYLINDELLA ADAMSIANA. *Cyl. testā breviter cylindrica, tenui, laci, corneo variegatā, ad suturam fusco alboque articulatā; aperturā obliquā, lateraliter subprodicata, labio rotundo.*

THE ADAMSIAN CYLINDELLA. Shell shortly cylindrical, thin, smooth, variegated with horn-colour, articulated with brown and white at the suture; aperture oblique, a little produced laterally; lip rounded.

PFEIFFER. Monographia Heliceorum, I.

Hab. Hayti.

Species 17. (Mus. Brit.)

CYLINDELLA VENTRICOSA. *Cyl. testū brevi, ventricosā, medio inflatā, suprī intrāque angustatā, anfractibas purpurco alboque strigatis, ultimā brevi, angusto, post columellam excavato; aperturā parrū, rotundā.*

THE VENTRICOSE CYLINDELLA. Shell short, ventricose, inflated in the middle, narrowed above and below, whorls striped with purple and white, last short, narrow, hollowed behind the columella; aperture small, round.

GÜNTHER. Pfr. Novit. Conch. p. 250.

Hab. Cuba.

Species 18. (Mus. Brit.)

CYLINDELLA GRAVESI. *Cyl. testū brevi, subcylindricā, infisi fusco, suprī albido, anfractibus rectiūsculis, ultimā subaequalibus, dicinde versūs apicem subito contractis; ultimo rimato, breviter solido; aperturā lateralerū subproductō, rotundā, marginē rotundo.*

GRAVE'S CYLINDELLA. Shell short, subcylindrical, brown below, whitish above, whorls rather straight, the last nearly equal, thence towards the apex suddenly contracted; last notched, shortly loosened; aperture rather produced laterally, rounded, with rounded edge.

ADAMS. Pfeiffer, Monographia Heliceorum, iii. 570.
Hab. Jamaica.

Species 19. (Mus. Brit.)

CYLINDELLA SUTURALIS. *Cyl. testū brevi, pupiformi, rīsū rimata, tenuiscula, obliquū minutissimā striatā, nitens, cornū, medio ventricosa, apice attenuata, aucto, suturā castaneo marginata; anfractibus 12, concretae, ultimo rīsū solido, aperturā obliquā, subexcavata, marginē tenui, breviter expanso.*

THE SUTURED CYLINDELLA. Shell short, pupa-shaped, scarcely notched, rather thin, obliquely very minutely striated, shining, horn-coloured, ventri-

ce in the middle, apex attenuated, sharp, suture bordered with chestnut; whorls twelve, rather convex, last very slightly loosened; aperture oblique, rather circular, with thin edge, slightly expanded.

WEINLAND. Mal. Bl. ix. 1862, p. 194.
Hab. Haiti.

Species 20. (Mus. Brit.)

CYLINDELLA SOWERBYANA. *Cyl. testū subpyramidalē, griso-fusco, subrimatā, anfractibus rīsū convexis, eleganter obliquē liratis, versūs apicem gradatim attenuata, ultimo infisi subexcavato; aperturā subrotundā; columellā intus laminatim plicato.*

SOWERBY'S CYLINDELLA. Shell subpyramidal, brown-grey, slightly notched; whorls scarcely convex, elegantly obliquely ridged, gradually attenuated towards the apex, the last slightly keeled below; aperture rather rounded; columella with a laminar plait within.

PFEIFFER. Monographia Heliceorum, iii. 372.
Hab. Isl. of Cuba.

Species 21. (Mus. Brit.)

CYLINDELLA CÆRLANS. *Cyl. testū angustatā, elongatā, subcervicata, fusco-grisō undulatim strigata, versūs apicem attenuata, medio rīsū inflato, anfractibus concretae, numerosis, ultimo contracto, aperturā subobliquā, intus uniplicata, marginē tenui.*

THE ELISH CYLINDELLA. Shell narrow, elongated, bluish, with undulating greyish-brown stripes, attenuated towards the apex, slightly inflated in the middle; whorls rather convex, numerous, last contracted; aperture rather oblique, single-plaited within, margin thin.

POEY. Pfeiffer, Mon. Hel. iv. 700.
Hab. Cuba.

CYLINDRELLA.—PLATE III.

Species 22. (Mus. Brit.)

CYLINDRELLA DENTICULATA. *Cyl. testā angustā, attenuatā, elongatā, fusco strigatā, ad suturam denticulatā, versū spiram contractā, suprā medium et infīrā rectīsculo, cylindraceo; aperturā subobliquā productā.*

THE DENTICULATED CYLINDRELLA. Shell narrow, attenuated, elongated, striped with brown, denticulated at the suture, contracted towards the spire, rather straight and cylindrical above the middle and below, aperture rather obliquely produced.

PFEIFFER. Chem. p. 65.
Hab. Mexico.

The suture is denticulated with little white points.

Species 23. (Mus. Brit.)

CYLINDRELLA SHUTTLEWORTHIANA. *Cyl. testā elongatā, angustatā, cylindracea, subyellowish, pallidē fulvā; anfractibus sublistantib; obliquē liratis, superioribus contractis, medianis et inferioribus subequalibus, rectīsculis; ultimo elongato, infīrā subcarinato, soluto; aperturā subtriangularis, obliquā producta.*

SHUTTLEWORTH'S CYLINDRELLA. Shell elongated, narrow, cylindrical; rather pale, pale fulvous, whorls rather distantly obliquely ridged, the upper ones contracted, middle and lower ones rather equal, rather straight, last elongated, slightly keeled below, loosened; aperture subtriangular, obliquely produced.

POEY. Chemnitz, p. 18.
Hab. Cuba.

Species 24. (Mus. Brit.)

CYLINDRELLA PUNCTURATA. *Cyl. testā pupiformi, brevi, suprā subrosea, infīrā albida, medio inflato, versū apicem gradatim contracto; suturā articulatū punctatā; anfractibus rectīsculis, ultimo subcontracto; aperturā magnā, subcontractā, marginē rotundo.*

THE PUNCTURED CYLINDRELLA. Shell pupa-shaped, short, rather pink above, whitish below, inflated in the middle, gradually contracted towards the apex, suture marked with articulated spots; whorls rather straight, the last a little contracted; aperture large, somewhat contracted, margin rounded.

PFEIFFER. Proc. Zool. Soc., 1852.

Hab. St. Domingo.

Species 25. (Mus. Brit.)

CYLINDRELLA HUMBOLDTIANA. *Cyl. testā sinistrorsā, subcylindricā, pallidē fulvā, tenuissimē striatā; anfractibus rectīsculis versū spiram angustatis; ultimo elongato; aperturā obliquā, columellā uniplicata.*

HUMBOLDT'S CYLINDRELLA. Shell sinistral, subcylindrical, pale fulvous, very finely striated; whorls rather straight, narrowed towards the spire, last elongated; aperture oblique, with one plait on the columella.

PFEIFFER. Chem. p. 14, t. 2, f. 20, 24.

Helix columella, Ferr.

Hab. Cuba.

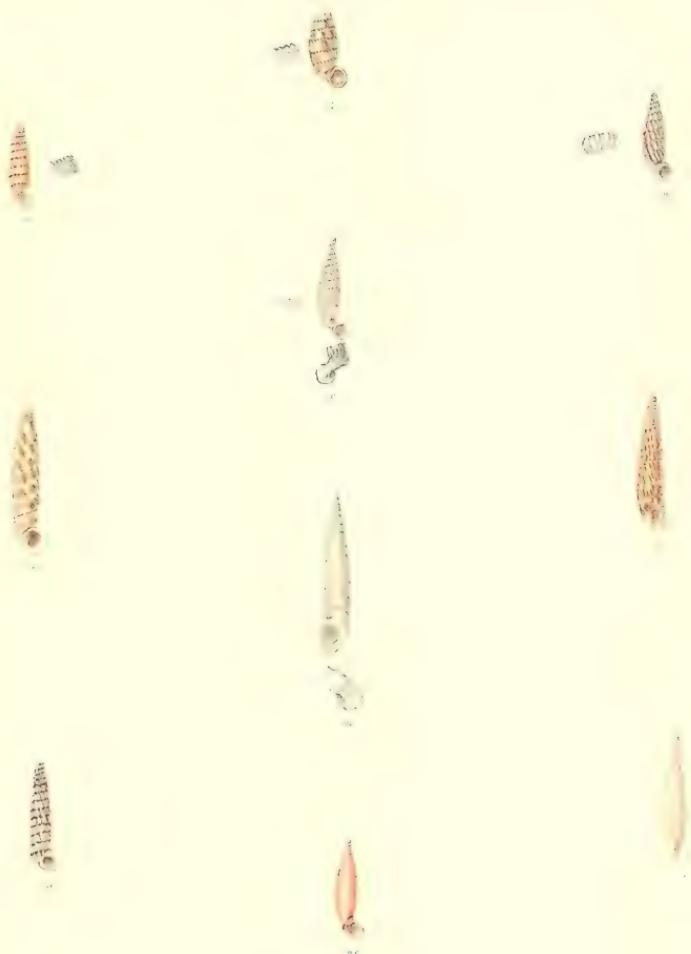

Species 26. (Mus. Brit.)

CYLINDRELLA MACROSTOMA. *Cyl. testā levī, profundē rimatā, solidā, confertē striatā, spirā sursum attenuatā, medio et infīrā subconicost; anfractibus vix convexis, ultimo infīrā subattenuato, basi corinato; aperturā ovatā, labio albo, incrassato, expanso.*

THE LARGE-MOUTHED CYLINDRELLA. Shell short, deeply notched, solid, closely striated, spire attenuated above, rather ventricose above and below; whorls scarcely convex, the last a little lengthened below, keeled at the base, aperture ovate, lip white, thickened, expanded.

PFEIFFER. Chemn. p. 73.

Hab. Jamaica.

CYLINDRELLA.

PLATE IV.

Species 27. (Mus. Brit.)

CYLINDELLA ALBO-CRENATA. *Cyl. testa brevi, subventricosa, solidula, obliquè striata, cornu et albito variegata; spiræ medio subinflatæ, versæ apicem attenuatæ, anfractibus supernis ad suturam nodulis albis crenatis, ultimo angustato, subsoluto, infra carinato; aperturæ obliquæ subtrotundæ, columellæ uniplacatae.*

THE WHITE-CRENNATED CYLINDELLA. Shell small, rather ventricose, rather solid, obliquely striated, variegated with horn-colour and white; spire a little inflated in the middle, attenuated towards the apex; whorls crenated above at the suture with white nodules, last narrow and somewhat uncoiled, keeled at the bottom; aperture obliquely somewhat rounded; columella single-plaited.

GUNBLACH. Pfeiffer, Malak. Bl. xi. 1863, p. 7.
Hab. Isl. Cuba.

Species 28. (Mus. Brit.)

CYLINDELLA OBLIQUA. *Cyl. testa angustâ, subcylindrica, fulvo alboque nubilatâ, fuscо-grisecenti hinc-illuc striatâ, obliquè liratâ, ad suturam crenulatâ, anfractibus rectusculis angustis, penultimate et supra quinque subaequalibus, spiræ versæ apicem attenuatæ; aperturæ perobliquæ ovatæ, labio externo productæ.*

THE OBLIQUE CYLINDELLA. Shell narrow, subcylindrical, clouded with brown and white, striped here and there with greyish brown, obliquely ridged, crenulated at the suture, whorls rather straight, narrow, the penultimate and five above nearly equal; spire attenuated towards the apex; aperture very obliquely oval, outer lip produced.

PFEIFFER. Malak. Bl. xi. 1863.
Hab. Isl. of Cuba.

Species 29. (Mus. Brit.)

CYLINDELLA PERPLICATA. *Cyl. testa subfusiformis, angustâ, cornea, anfractibus convexis plicatis apicalibus angustatis, medianis inflatis, ultimo coarctato, longè levata, plicis anfractuum obliquis, distantibus, prominentibus, media depressionis; aperturæ remotâ, subtrotundâ, margine rotundo, columellæ haud plicatae.*

THE WILL-PLAITED CYLINDELLA. Shell rather fusiform, narrow, horny; whorls convex, plaited, the apical ones narrow, middle ones inflated, last contracted, much uncoiled, plaits of the whorls oblique, distant, prominent, depressed in the middle; aperture remote, a little rounded, margin round, columella not plaited.

FERRUSAC. Pfeiffer, Mon. Helic. ii.

Hab. West Indies.

Species 30. (Mus. Brit.)

CYLINDELLA PALLIDA. *Cyl. testa parvâ, pallidâ, fusiformis, versæ apicem attenuatâ, medio inflata; anfractibus rie coarctatis, ultimo infra angustato, longè levata, plicis anfractuum arcuatis, acutis subdistansibus; aperturæ remotâ, rotundâ; columellæ haud plicatae.*

THE PALE CYLINDELLA. Shell small, pale, fusiform, attenuated towards the apex, inflated in the middle; whorls scarcely convex, the last narrow beneath, a long portion unrolled; plaits of the whorls curved, sharp, rather distant; aperture remote, rounded, columella not plaited.

GULDING. Bland in Adams's Contributions to Conchology.

Brunhippus costatus, Gray.

Cylindrella costulosa, Adams.
Hab. Porto Rico, Isl. St. Thomas.

Species 31. (Mus. Brit.)

CYLINDELLA PRUINOSA. *Cyl. testa pallide purpureâ, elongatâ, angustatâ, supra medium paulò inflatâ, anfractibus distanter fuscо striatâ, plicis eleganter arcuatis, tenibus numerosis lyrate, ultimo clavato, paulò obliquè soluto; aperturæ obliquæ, ovatæ, columellæ uniplacatae.*

THE PLUM-COLOURED CYLINDELLA. Shell pale purple, elongated, narrow, a little inflated above the middle, whorls distantly striped with brown, ridged with elegantly curved, thin, numerous plaits; the last elongated, a little obliquely loosened; aperture oblique, oval.

MORELET. In Chemnitz, p. 39.

Hab. Isl. of Pines, near Cuba.

CYLINDRELLA.—PLATE IV.

Species 32. (Mus. Brit.)

CYLINDRELLA IRERORATA. *Cyl. testā cylindricā, angustā, rectā, elongatā, strigis undulatis parvis, interrupsis variegatā, anfractibus rectis, altis, versū apicem contractis; aperturā magnā, auriformi, obliquā, labio externo anticē productō, supernē depresso; columellā uniplicatā.*

THE SPINKLED CYLINDRELLA. Shell cylindrical, narrow, straight, elongated, varied with undulating, small, interrupted stripes; whorls straight, elevated, contracted towards the apex; aperture large, auriform, oblique, outer lip produced anteriorly, depressed above; columella with one plait.

GUNDLACH. Chem. p. 64.

Hab. Cuba.

Species 33. (Mus. Brit.)

CYLINDRELLA ELONGATA. *Cyl. testā sinistrā, albā, tenuiter striatā, gracilē, fusiformi; anfractibus 14, convexis, altis, versū apicem contractis, infī medium inflatis, ultimo brevi, infī validē carinato; aperturā magnā, ovata, infī subacuminatā, labio externo expanso, infī vix plicata.*

THE ELONGATED CYLINDRELLA. Shell sinistral, white, finely striated, slender, fusiform; whorls fourteen, convex, elevated, contracted towards the apex; inflated towards the middle, the last short, with a strong keel below; aperture large, oval, rather acuminate below, inner lip expanded, with a very slight plait below.

CHEMNITZ. Conech. Cab. p. 58.

Helix Chonitziana, Férussac.

Pupa gracilis, Sowerby.

Cylindrella Cuvieri, Adams.

Hab. Jamaica.

Species 34. (Mus. Brit.)

CYLINDRELLA FASTIGIATA. *Cyl. testā breviter rotundatā, subulatā, solidulā, sublistanter validē costatā, griseo-albidā; inter costas purpuro; spirā gracile, longe productā, anfractibus brevibus, numerosis, rotundis, ultimo infī validē compresso, carinato, infī carinam striatā, breviter soluto; aperturā subtriangularis, lateraliter breviter productā, columellā vix plicata.*

THE BOUND CYLINDRELLA. Shell shortly notched, subulate, rather solid, rather distantly strongly ribbed, greyish white, purple between the ribs; spire slender, much produced, whorls short, numerous, rounded; last much compressed beneath, keeled, striated below the keel, shortly uncold; aperture subtriangular, laterally shortly produced; columella very slightly plaited.

GUNDLACH. MS. Pfeiffer in Malak. Bl. viii. 1860,
p. 20.

Hab. Baracoa, Cuba.

Species 35. (Mus. Brit.)

CYLINDRELLA GOSSEL. *Cyl. testā pallidē fulvā; tenuiter acutē striatā, subpyramidalatā, versū apicem gradatim attenuatā, infī medium vix inflatā; anfractibus rectiāculis, ultimo infī carinato, subcontracto, infī carinam subexcavato; aperturā magnā, ovata, columellā plicatā.*

GOSSE'S CYLINDRELLA. Shell pale fulvous; finely acutely striated, subpyramidal, gradually attenuated towards the apex, very little inflated below the middle; whorls rather straight, the last keeled below, slightly contracted, somewhat excavated below the keel; aperture large, ovate, columella plaited.

PFEIFFER. Chem. p. 70.

Hab. Jamaica.

Species 36. (Mus. Brit.)

CYLINDRELLA ELEGANS. *Cyl. testā subfusciformi, rubrofulvā, levā, medio subinflatā; anfractibus brevibus, paulo concavis, ultimo oblique soluto, declivis; aperturā obliquē ovatā, margine incrassato, expanso, columellā intus leviter plientā.*

THE ELEGANT CYLINDRELLA. Shell subfusciform, reddish brown, smooth, slightly inflated in the middle, whorls short, a little convex, the last obliquely uncoiled, sloped downwards; aperture obliquely ovate, margin thickened, expanded; columella very slightly plaited within.

PFEIFFER. Chem. p. 23.

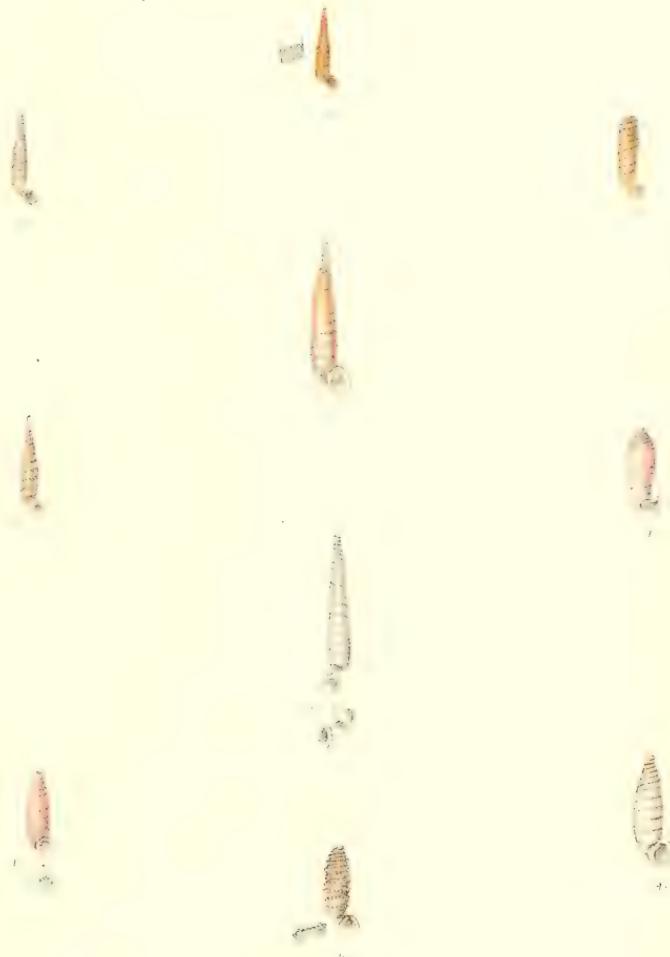

Pupa oblonga, Menke.

Pupa lituus, Gould.

Pupa Auberiana, Orbigny.

Cylindrella nobilis, Steutz.

Hab. Western part of Cuba.

PLATE V.

Species 37. (Mus. Brit.)

CYLINDELLA HANLEYI. *Cyl. testi parvū, tenui, fusci, subpyramidalis, angustatō, nō in iōc iāplati, versū apicē contractā; anfractibus angustis, numerosis, rectilängulis, liris tenuis, arcuatis sculptis; ultimo carinato, infīr acutē carinato, versū aperturam longē soluto; apertura remota, subquadrata, declivē.*

HANLEY'S CYLINDELLA. Shell small, thin, brown, rather pyramidal, narrow, scarcely inflated in the middle, contracted towards the apex; whorls narrow, numerous, rather straight, sculptured with fine curved ridges; the last rather convex, sharply keeled below, much uncoiled; aperture remote, rather square, sloped downwards.

PFEIFFER. Chemnitz, p. 42, Monog. iv. 152.
Hab. Venezuela, New Grenada.

A neatly sculptured little shell.

Species 38. (Mus. Brit.)

CYLINDELLA CHORDATA. *Cyl. testi parvū, albā, tenui, subfusiformi, angustā, nō in iōc iāplati; anfractibus 14, liris oblique subarcuatis distantiis valdē sculptis, ultimo longē soluto, infīr valde carinato, versū aperturam declivē; apertura antīc biangulata, superne recto.*

THE CORDED CYLINDELLA. Shell small, white, thin, rather fusiform, narrow, inflated in the middle; whorls fourteen, sculptured with obliquely rather arched, distant, strong ridges; the last much uncoiled, sloped downwards towards the aperture; aperture anteriorly biangular, straight above.

PFEIFFER. Chem. p. 48, Monog. 1866, No. 202.
Hab. Isl. St. Croix.

An exquisitely beautiful little white species.

Species 39. (Mus. Brit.)

CYLINDELLA CRISPULA. *Cyl. testi pīperforatā, fusci, regulariter liratā, suprā medium inflatā, infīr iōc ad ultimam anfractum gradatim attenuatā; ultimo anfractu parvā, paulō soluto; apertura obliquē oblonga, quadrangulata.*

THE LITTLE CRISP CYLINDELLA. Shell fusiform, brown, regularly ridged, inflated above the middle; thene gradually attenuated towards the last whorl; last whorl small, slightly uncoiled; aperture obliquely oblong, with four angles.

PFEIFFER. Monograph ii. 377.
Hab. Cuba.

Species 40. (Mus. Brit.)

CYLINDELLA SALLEANA. *Cyl. testi elongatā, subpyramidalis, fusco-cornatā, tenuiter oblique striatā; anfractibus angustis 18, quārum 6 apicibus altis, contractis, nō diuersis concavisculis, alteris versū aperturam rīz angustatis; ultimo contracto, sub-soluto, infīr carinato; apertura productā, magis, labio expanso, infīr biangulata.*

SALLI'S CYLINDELLA. Shell elongated, subpyramidal, horny-brown; finely obliquely striated; whorls narrow, eighteen, of which the six apical are white and narrowed, rather convex, the middle ones a little convex, the others slightly narrowed towards the aperture; aperture produced, large, with expanded lip, biangular below.

PFEIFFER. Chem. p. 38.
Hab. Haiti.

Species 41. (Mus. Brit.)

CYLINDELLA TRINITATICA. *Cyl. testi succineo-cornatā, tenui, gracili, subdiaphana, nō in iōc iāplati, superne attenuatā; anfractibus, angustis, convexis, tenuiter liratis; ultimo basi acutē carinato, infīr carinata concava, antīcē longē soluto, obliquē deflexo; apertura remota obliquē ovoida, antīcē biangulata.*

THE TRINITY ISLAND CYLINDELLA. Shell amber-horn, thin, slender, rather diaphanous, slightly inflated in the middle, attenuated above, whorls narrow, convex, finely ridged; the last sharply keeled at the base, concave below the keel, anteriorly much uncoiled, obliquely bent downwards.

PFEIFFER. In Malak. Bl. vii. 1860.
Hab. Trinity Island.

CYLINDRELLA.—PLATE V.

Species 42. (Mus. Brit.)

CYLINDRELLA MICROSTOMA. *Cyl. testā subperforatā, pupaformi, cretaceā; suprē medium inflati, iudicē versū ultimum anfractum gradatū attenuatā; anfractibus angustis, numerosis, ultimo contracto, infid excavato; aperturā parvā, verticali, subtriangulari.*

THE SMALL-MOUTHED CYLINDRELLA. Shell slightly perforated, pupa-shaped, chalky; inflated above the middle, thence gradually attenuated towards the last whorl; whorls narrow, numerous, the last contracted, excavated below; aperture small, vertical, subtriangular.

PFEIFFER. Proc. Zool. Soc. 1861, p. 27.

Hab. ——?

A curious little pupaform shell, which has the greatest inflation above the middle of its length.

Species 43. (Mus. Brit.)

CYLINDRELLA AGNESIANA. *Cyl. testā elongatā, cylindrica, angustā, albida, tenuiter striatā; anfractibus 18, sinistroris, convexisculis; ultimā rectō, infid carinato, infid carinam excavato, versū aperturā longē soluto, bicarinato, valde deflexo, aperturā remotā, obliquē subquadratā, marginē interno rotundo, labio externo biangulato.*

THE AGNESIAN CYLINDRELLA. Shell elongated, cylindrical, narrow, whitish, finely striated; whorls eighteen, sinistral, rather convex; the last straight, keeled below, excavated below the keel, uncoiled some length towards the aperture, much bent downwards; aperture remote, obliquely subquadrate, inner margin round, outer lip biangular.

ADAMS, C. B. Chem. p. 38.

Hab. Jamaica.

A graceful white shell.

Species 44. (Mus. Brit.)

CYLINDRELLA MONTANA. *Cyl. testā brevi, rectiscula, rosca, tenuiter striatā; ultimo anfractu angustato,*

rotundato, lateraliter soluto; aperturā subrotundā, subrenata, marginē crassissimulo, rotunda.

THE MOUNTAIN CYLINDRELLA. Shell short, rather straight, pink, finely striated; last whorl narrow, rounded, laterally uncoiled; aperture rather round, rather distant, margin rather thick, round.

C. B. ADAMS. Chem. p. 29.

Cylindrella rosea, var., Pfeiffer.

Hab. Jamaica.

Species 45. (Mus. Brit.)

CYLINDRELLA TERES. *Cyl. testā crassissimula, herigatā, subpyramidalatā, albā, supernē fasciā, attenuatā; anfractibus convexisculis, ultimo paulo angustato, infid subcarinato, infid carinam excavato; aperturā proximā magnā, subrotundā; columellā supernē subcavata.*

THE TAPER CYLINDRELLA. Shell rather thick, smooth, rather pyramidal, white; brown above, attenuated; whorls rather convex, the last a little narrowed, slightly keeled beneath, hollowed beneath the keel; aperture approximate, large, rather rounded; columella with a slight callus above.

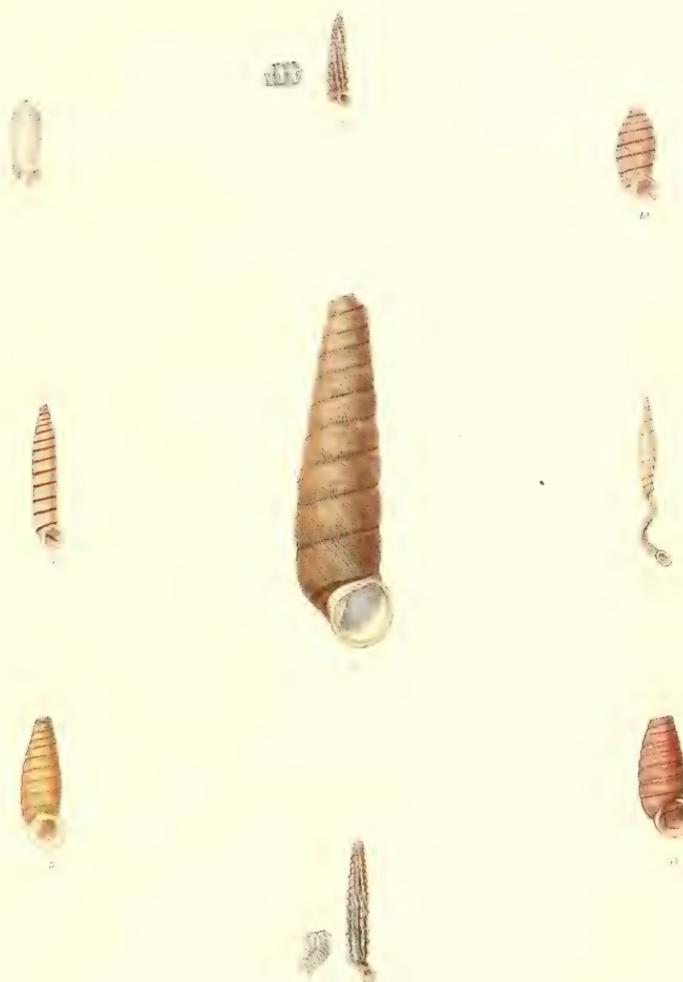

MENKE. (Holospira) Chem. p. 56.

Hab. Cuba.

Species 46. (Mus. Brit.)

CYLINDRELLA SEMINUDA. *Cyl. testā purpura, gradataturitā, pupaformi; anfractibus scalariformibus supernē angulari; ad angularia prominentia noduloso-squamatis; ultimo infid angustato, lateraliter longē soluto; aperturā remotā, latere columellari rotundā, latere externo angulatim acuminato.*

THE HALF-NUDE CYLINDRELLA. Shell small, pupa-shaped; whorls angular above, prominently nodosely squamose at the angle; the last narrowed below, laterally much uncoiled; aperture remote, rounded on the columellar side, angularly acuminate at the inner side.

CYLINDRELLA.

PLATE VI.

Species 47. (Fig. a, b, Mus. Sowerby.)

CYLINDELLA ELLIOTTI. *Cyl. testā angustissimō cylindricā, purpureo-fusca, tubulis albī angulatis suprā medium anfractibus prominentibus continuis ornatā; anfractibus numerosis, angustis; ultimo lateraliiter obliquè soluta; aperturā remotā, parē, subrotundatā.*

ELLIOT'S CYLINDRELLA. Shell very narrowly cylindrical, purple-brown, ornamented with white angular tubes, prominent above the middle of the whorls; whorls numerous, narrow; last laterally obliquely uncold; aperture remote, small, rather round.

POEY. Mem. Cuba.

Hab. Cuba.

The tubes or hollow varices continued from whorl to whorl up the spire of this shell make it a remarkably interesting species.

Species 48. (Mus. Sowerby.)

CYLINDELLA PILOCELI. *Cyl. testā subcervico-albd, tenuiter liratā, pupiformis, medio et infī rectā, suprā medium inflatā, int̄ versū apicem contractā, anfractibus numerosis, angustis, ultimo parvo, infī angulato, infī angulum levigato, medio rimato; aperturā proximā, magiscula, superne subquadrata.*

PILOCELI'S CYLINDRELLA. Shell bluish-white, finely ridged, pupa-shaped, straight at the middle and below; inflated above the middle, thence contracted towards the apex; whorls numerous, narrow; the last small, angular below, smooth below the angle, notched in the middle; aperture near, rather large, rather square above.

PFEIFFER. Chem. p. 64, Mon. ii. 382.

Hab. Mexico.

Species 49. (Mus. Sowerby.)

CYLINDELLA ARICATA. *Cyl. testā brevi, ventricosā, liris tenibus, sublistantibus, eleganter arenatis*

ornatā suprā medium inflatā; anfractibus 8, vix concavis; sutura profundè excavata; ultimo anfractu angusto, crenulatum carinato, infī carinam concavā, medio rimato; aperturā subquadrata, marginē expansa.

THE ARCHED CYLINDRELLA. Shell short, ventricose, ornamented with thin, rather distant elegantly curved ridges; inflated above the middle; whorls eight, scarcely convex, with deeply excavated suture; last whorl narrow, crenulated, keeled, concave below the keel, notched in the middle; aperture rather square, with expanded margin.

WEINLAND AND MARTENS. Malak. Bl. vi. 1859.

Hab. Haïti.

Species 50. (Mus. Sowerby.)

CYLINDELLA SAUVALLIANA. *Cyl. testā levigatā, fuscocorona, angustè cylindrica, prop̄ apicem pyramidatā; anfractibus altis, infī lineā rubra angulata; aperturā proxiā, magiscula, marginē tenui, expansa.*

SAUVALLI'S CYLINDRELLA. Shell smooth, horny-brown, narrowly cylindrical, pyramidal near the apex; whorls elevated, belted below with a red line; aperture near, large, margin thin, expanded.

GUNDLACH. Chem. p. 64, Plfr. Monog. iv. 710.

Hab. Cuba.

A smooth elevated species with a pretty red line at the bottom of the whorls partly hidden by the suture.

Species 51. (Mus. Sowerby.)

CYLINDELLA WALPOLEI. *Cyl. testā magnā, epidermis olivaceo-fusca indutā, cylindracco-subpyramidalatā, tenuiter obliquè striata, anfractibus altis paulo convexis; ultimo declivē, versū axem angustatā, post aperturam profundiè rimato; aperturā paulo laxatā, perpendiculariter ovata, columellā uniplacatā.*

WALPOLE'S CYLINDRELLA. Shell large, covered with an olive-brown epidermis, cylindrically subpyrami-

CYLINDRELLA.—PLATE VI.

dial, finely obliquely striated; whorls elevated, a little convex; last sloped, narrowed towards the axis, deeply notched behind the aperture; aperture a little uncoiled, perpendicularly ovate; columella with a plait.

SOWERBY.

Hab. ——?

Species 52. (Mus. Sowerby.)

CYLINDELLA BROOKESIANA. *Cyl. fusiformis, tenui, gracili, cornē, obliquē tenuiter striatā; anfractibus convexiūsculis, ultimo longissimē soluto, carinato, flexuoso, subspiraliter descendantē; aperturā longē remota, subcirculari, margine expanso.*

THE BROOKESIAN CYLINDRELLA. Shell fusiform, thin, slender, horny, obliquely finely striated; whorls rather convex, the last uncoiled a great length, keeled, flexuous, rather spirally descending; aperture very remote, rather rounded, with expanded margin.

GUNDLACH. MS. Pfeiffer in Malak. Bl. vi. 1859.

Hab. Monte Libano, Isl. of Cuba.

Species 53. (Mus. Sowerby.)

CYLINDELLA NOBILIOR. *Cyl. testō cylindrica, tenuiter striatā, cornico-subroseā; anfractibus vix convexis,*

superne ad suturam rubro tenuiatis; anfractus ultimo brevi, infidē rimato, breviter soluto; aperturā producēt, fulvi, ad marginem subexpansā, columellā interne latit, subpliata.

THE NOBLER CYLINDRELLA. Shell cylindrical, finely striated, horny-pinkish; whorls scarcely convex, banded with pink above at the suture; last whorl short, notched below, shortly uncoiled; aperture produced, fulvous, a little expanded at the margin, columella broad within, with a slight plait.

ADAMS. Chem. p. 9.

Cylindrella Biuneyana, Pfeiffer.

Hab. Jamaica.

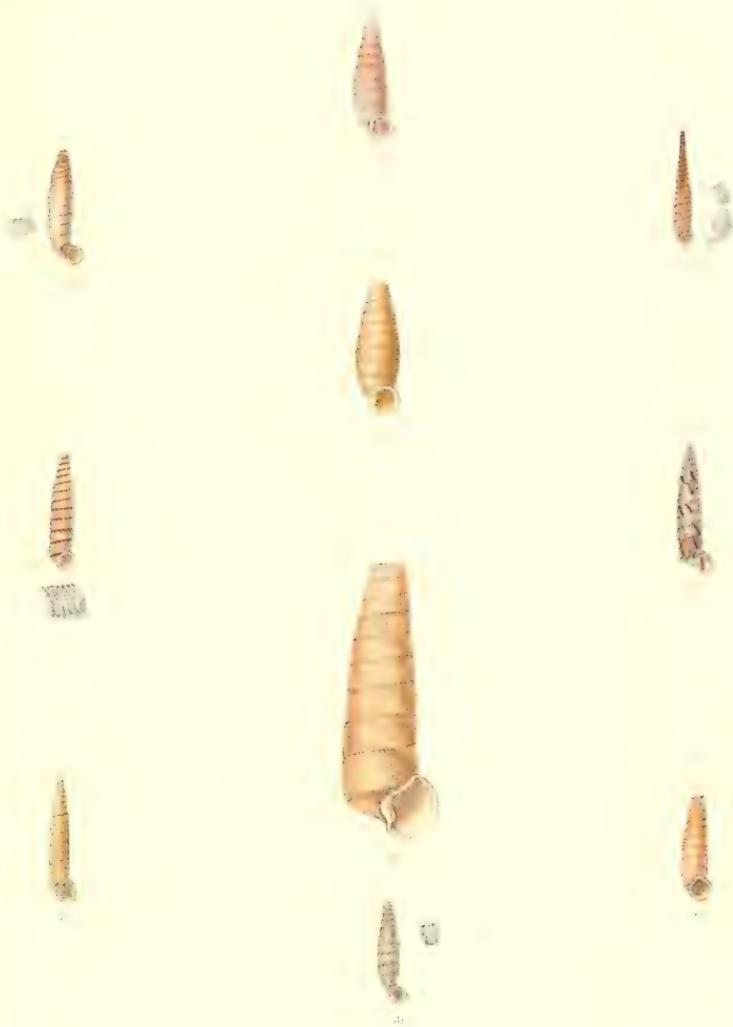

Species 54. (Mus. Sowerby.)

CYLINDELLA MEGACHEILA. *Cyl. testō roseo-cornicē, cylindrica, ventricosa, tenuissimē striatā; anfractibus brevibus, superne ad suturam rubro tenuiatis, ultimo profundiē rimato; aperturā annexā, magnā, superne subquadratā; margine rotundo, expanso.*

THE LARGE-THEATED CYLINDRELLA. Shell horny-rose, cylindrical, ventricose, very finely striated; whorls short, with a red band above at the suture; last whorl deeply notched; aperture annexed, large, rather square above, margin rounded, expanded.

CHITTY. Shells of Jamaica.

Hab. Jamaica.

37

CYLINDELLA.

PLATE VII.

Species 55. (Mus. Brit.)

CYLINDELLA STRIATELLA. *Cyl. testi rimata, pyramidalis-cylindracea, solida, tenuissime obliquè striata, levata, cornuta, medio rubescens, usque ad medium subcylindrica, deinde ad apicem testa attenuata, anfractibus brevissimis; rectissimis; apertura subrotunda, intus subrosea; columella vix plicata.*

THE FINELY STRIATED CYLINDELLA. Shell notched, pyramidal, cylindrical, rather solid, very finely obliquely striated, smooth, horny, a little red in the middle; cylindrical up to the middle, afterwards slowly attenuated; whorls rather short, rather straight; aperture rather rounded, a little rosy within; columella scarcely plaited.

WRIGHT. MS. Pfeiffer, Malak. Bl. xi. p. 246.
Hab. The western part of the Isl. of Cuba.

Species 56. (Mus. Sowerby.)

CYLINDELLA LAVALLIANA. *Cyl. testi fulvo-cornuta, tenui, semipellucida, angusta, elongata, cylindrica, rimata; anfractibus brevibus, numerosis, convexis; ultimo rotundo, contracto, soluto; apertura subremota, columella rectissima.*

LAVALLE'S CYLINDELLA. Shell fulvous horn, thin, semi-pellucid, narrow, elongated, cylindrical, notched; whorls short, numerous, rather convex; the last rounded, contracted, uncoiled; aperture rather distant, columella rather straight.

OREIGNY. Shells of the Isl. of Cuba.
Hab. Cuba.

The whorls of this cylindrical little species are peculiarly short.

Species 57. (Mus. Sowerby.)

CYLINDELLA POLYGYRA. *Cyl. testa purpurea, fuscata, elongata, angustissima, versus apicem fuscata, graduata attenuata, medio paulo inflata, anfractibus 20, brevibus, liris arcuatis ornata, ultimo rimata, longe soluta; apertura subtriangularis, remota, marginis recta.*

THE MANY-WHORLED CYLINDELLA. Shell small, elongated, very narrow, gradually attenuated towards the apex, a little inflated in the middle; whorls twenty, short, ornamented with curved ridges; last notched, with a long portion uncoiled; aperture rather trigonal, remote, margin straight above.

PFEIFFER. Monog. iv. p. 206.
Hab. Cordova, Mexico.

Species 58. (Mus. Sowerby.)

CYLINDELLA LATA. *Cyl. testa rimata, cylindrica, ventricosa, cornuo-rubescens, tenuiter obliquè tenuata; anfractibus brevissimis, tanquam rubra superne ad suturam circinis, ultimo soluto, infra cornutum; apertura disjuncta, producita, falcata, columella uniplacata, marginis rotundè reflexo, expansa.*

THE BROAD CYLINDELLA. Shell notched, cylindrical, ventricle, reddish-horn, finely obliquely ridged; whorls rather short, belted above at the suture with a red band, last uncoiled, keeled below; aperture disconnected, produced, fulvous, columella single-plaited, margin roundly reflected, expanded.

A. B. ADAMS. Chemn. 22. Pflr. Monog. iii. 567.
Hab. Jamaica.

Resembling *Cylindrella Binneyana* and others in general appearance, but with the mouth detached and produced.

Species 59. (Mus. Brit.)

CYLINDELLA MORELETI. *Cyl. testa elongato-cylindrica, angusta, vix rimata, cornuo-rubescens, pallide variegata, tenuiter undulata rugata, anfractibus subcrevatis, concavissimis, infra lineam rubram teniatis, ad suturam crevatis; apertura obliqua; columella multiplicata.*

MORELET'S CYLINDELLA. Shell elongate-cylindrical, narrow, scarcely notched, reddish-horn, pale-variegated, finely wavy wrinkled, whorls rather raised, rather narrow, banded at the lower part

CYLINDRELLA.—PLATE VII.

with a red line, crenated at the suture; aperture oblique, columella single-plaited.

PFEIFFER. Chemn. p. 16. Monograph iii. 566.

Hab. —?

Species 60. (Mus. Brit.)

CYLINDELLA VIOLEACEA. *Cyl. testā solidūsculā, subcylindricā, angustā, purpuro-variegatā, filo-liratā, infrà rimatā, anfractibus connexis, distinctis; ultimō obliquē soluto; aperturā semicirculari, margine interno rectūsculo; columellā leviter uniplicatā.*

THE VIOLET CYLINDRELLA. Shell rather solid, rather cylindrical, narrow, variegated with purple, with thread-like ridges; notched below, whorls convex, distinct; the last obliquely uncoiled; aperture semicircular; inner margin nearly straight; columella with a slight plait.

WRIGHT. MS. Pfeiffer, Malak. Bl. xi. 1864, p. 128.

Hab. West Cuba.

Species 61. (Mus. Brit.)

CYLINDELLA MEXICANA. *Cyl. testā magnā, cylindrico-subpyramidalē, straminea, ventricosa, tenuiter striata; anfractibus rectidsculis, paulò convexis, ultimō infrà subcarinato, infrà carinam levigato; aperturā subauriformi, infrà cuneatā, columellā tortuō, plicatā.*

THE MEXICAN CYLINDRELLA. Shell large, cylindrical, subpyramidal, straw-coloured, ventricose, finely ridged; whorls rather straight, a little convex, the last keeled below, smooth below the keel; aperture somewhat auriform, cuneate below, columella tortuous, plicated.

CUMING. MS. Pfeiffer. Proc. Zool. Soc. 1860.

Hab. Mexico.

Species 62. (Mus. Brit.)

CYLINDELLA ACUS. *Cyl. testā cornatā, semipellucida, angustē cylindrica, versis apicem pyramidatā, laccigata; anfractibus superioribus lavissimis inferiori-*

bus filo-liratis; ultimo infrà validē carinato, infrà carinam rimato, excavato; aperturā subquadrata infrà labiis externum cuneato, columellā leviter uniplicatā.

THE SPEAR CYLINDRELLA. Shell horned, semipellucid, narrowly cylindrical, pyramidal towards the apex, smooth, upper whorls very smooth, lower with thread-like ridges; last strongly keeled below, notched below the keel, excavated; aperture rather square, outer lip cuneate below, columella with a slight plait.

PFEIFFER. Monograph ii. No. 383.

Hab. Cuba.

Species 63. (Mus. Brit.)

CYLINDELLA AUGUSTE. *Cyl. testā cylindrica, angustā, subrosea, tenuissimō striata, aufractibus rectilsculis, infrà angustē tanitatis; aperturā conneatā, margine albido, rotundo.*

AUGUSTA'S CYLINDRELLA. Shell cylindrical, narrow, rather rose-coloured, very finely striated, whorls rather narrow, with a narrow band below; aperture connected, margin white, rounded.

C. B. ADAMS. Plfr. Monog. iii.

Hab. Jamaica.

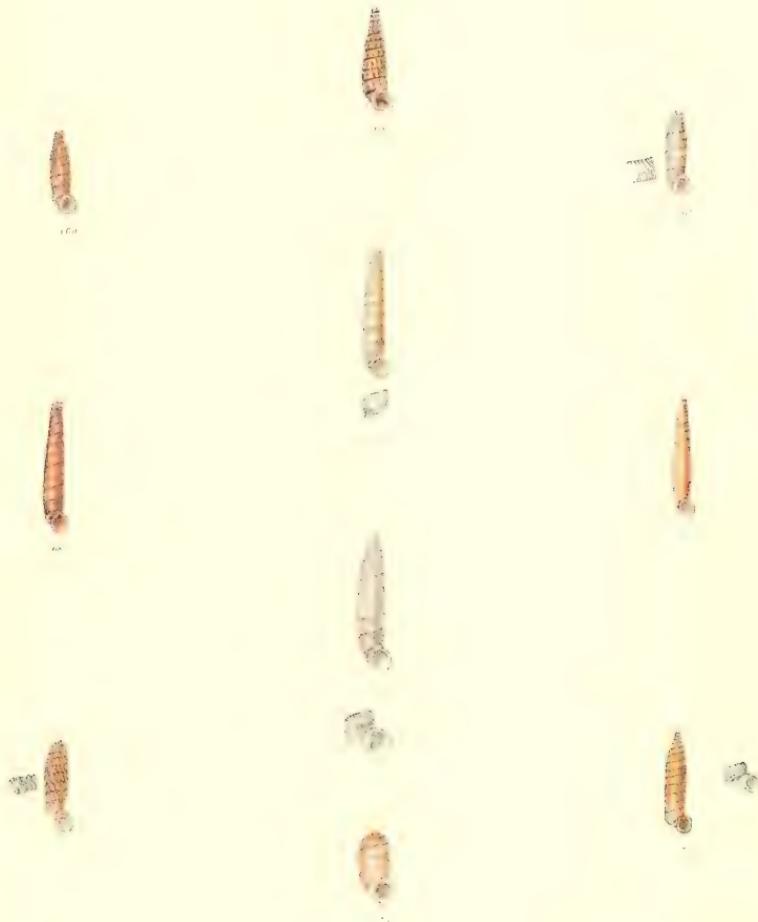

Species 64. (Mus. Brit.)

CYLINDELLA INTUSMALLEATA. *Cyl. testā sulcisiformi, alba, angusta, elongatā, medio paulò ventricosā; anfractibus brevibus, distanter validē costatis, costis subdistantibus, medio anfractuum malleatis; ultimō anfractuā infrà carinato, subrinato, obliquē soluto; aperturā remotā, obliquē ovata, margine rotundo.*

THE HAMMERED CYLINDRELLA. Shell somewhat fusiform, white, elongated, a little ventricose in the middle; whorls short, distantly strongly ribbed; ribs rather distant, flattened in the middle of the whorls; last whorl keeled below, with a slight notch; aperture removed, obliquely ovate with rounded margin.

GUNDLACHER—Pfeiffer, Monog. iv. 705.

Hab. Cuba.

CYLINDRELLA.

PLATE VIII.

Species 65. (Mus. Sowerby.)

CYLINDELLA TUMIDORA. *Cyl. testā tenuī, fulvā, fusco-corneo variegatā, subpyramidalē; anfractibus brevibus, concavis, ad suturam leviter crenatis, infrah angustissimā rubro tenacitatis, ultimo rimato; aperturā annularē, antice productā, expansā, supra medium subconstrictā.*

THE MORE TUMID CYLINDRELLA. Shell thin, fulvous, variegated with horny brown, rather pyramidal; whorls short, rather convex, slightly crenated at the suture, with a very narrow red band below, the last notched; aperture connected, anteriorly produced, expanded, a little contracted above the middle.

SOWERBY.

Hab. Cuba.

The whorls are much shorter and more convex than in *Cylindrella irrorata*.

Species 66. (Fig. a, b, Mus. Brit.)

CYLINDELLA GARCIANA. *Cyl. testā brevi, cylindrici, minutū lirato, fulvā vel albā; anfractibus rectissimis, mediis vix inflatis, ultimo infrah valide carinato, infrah carinam excavato, vix rimato, brevissimā soluto; aperturā magna, ovatā, subdisjectā, columellā simplici.*

GARCIA'S CYLINDRELLA. Shell short, cylindrical, minutely ridged, fawn-coloured or white; whorls rather straight, the middle ones very little inflated in the middle, the last strongly keeled, hollowed below the keel, scarcely notched, very shortly uncoiled; aperture large, oval, a little disjoined, columella simple.

WRIGHT. MS. Plir. Mal. Bl. xiii.

Hab. Isl. of Cuba.

Species 67. (Mus. Brit.)

CYLINDELLA CARINATA. *Cyl. testā angustā, elongatā, subcylindrica, cornuo-rubescens, laevigatā; anfractibus elevatis, rectissimis, tenue striatis, ultimo breviter soluto, infrah subcontracto, validē carinato, infrah carinam excavato, rimato; aperturā obliquā ovatā, productā.*

THE KEELLED CYLINDRELLA. Shell narrow, elongated, subcylindrical, reddish-horn, smooth; whorls elevated, rather straight, finely striated, the last shortly uncoiled, a little contracted below, with a strong keel, excavated, notched; aperture obliquely ovate, produced.

PFEIFFER. Monographia Helicorum, iii. p. 574.

Hab. — ?

The last whorl is rather rounded, then contracted and terminated by a very strong keel, between which and the inner edge of the aperture there is a narrow excavation.

Species 68. (Mus. Brit.)

CYLINDELLA CYLINDRUS. *Cyl. testā angustatā, elongatā, rubrā, supra medium testissimā attenuatā; anfractibus elevatis, levibus, ad laterā rectissimis, ultimo concurvando, infrah carinam excavato; aperturā perpendiculariter rotatā.*

THE CYLINDER CYLINDRELLA. Shell narrow, elongated, red, very slowly attenuated; whorls raised, smooth, very straight, the last rather convex, keeled below, excavated under the keel, aperture perpendicularly ovate.

CHEMNITZ. New Ed. p. 6. Pfeiffer Monog. ii. p. 6.

Pupa cylindrica, purpurea, Gray.

Pupa rubella, rosea, C. B. Adams.

Cylindrella provera, C. B. Adams.

Hab. Jamaica.

A narrow shell with straighter whorls than *Cylindrella carinata*, with the keel on the last whorl less prominent.

Species 69. (Mus. Brit.)

CYLINDELLA DUNKERIANA. *Cyl. testā angustissimā, elongatā, cornuo-rubescens, levigatā, medio vix inflata; anfractibus elevatis, ad laterā rectissimis, ultimo elevatissimo, ad latera concavo, subcontracto, infrah angulato; aperturā conexa, obliquā ovatā, antice subproductā, subacuminatā.*

CYLINDRELLA.—PLATE VIII.

DUNKEE'S CYLINDRELLA. Shell very narrow, elongated, reddish-horn, smooth, very little inflated in the middle; whorls elevated, rather straight at the sides, the last very elevated, concave at the sides, a little contracted, angular below; aperture connected, obliquely ovate, anteriorly a little produced and acuminate.

DUNKER. Chemn. p. 67.
Hab. Jamaica.

Species 70. (Mus. Brit.)

CYLINDRELLA FABREANA. *Cyl. testa albâ, diaphanâ, subpupaformi, medio subinflatâ, anfractibus convexâculis, lîris tenuibus obliquâ arcuatis, distantiâbus, ornatis, ultimo elevato, subcontracto, subrotundo, rimato, breviter soluto, tenuiter unicarinato; aperturâ subrectâ, obliquâ producto, margine unilobâ expanso, columellâ obliquâ uniplicatâ.*

FABRE'S CYLINDRELLA. Shell white, transparent, rather pupaform, a little inflated in the middle; whorls convex, ornamented with thin, obliquely curved, distant ridges; last elevated, a little contracted, a little rounded, notched, shortly uncloiled, with a thin keel; aperture a little removed, obliquely produced, margin expanded all round, columella with an oblique fold.

POEY. MS. Pfeiffer, Malak. Bl. vi. 1859.
Hab. "Leborucal de San Antonio." Cuba.

Species 71. (Mus. Brit.)

CYLINDRELLA INTERRUPTA. *Cyl. testa fusca, cylindrica, subpupaformi, suprâ medianâ subinflatâ, infra paulò contractâ, anfractibus brevibus, convexâculis, costis distantiâbus prominentibus, medio anfractuum interruptis sculptis; ultimo anfractu parvo, rimato, obliquâ longâ soluto; suturâ profundiâ; aperturâ obliquâ ovata, parvâ, marginâ subexpansa.*

THE INTERRUPTED CYLINDRELLA. Shell brown, cylindrical, slightly pupa-shaped, a little inflated above

the middle; a little contracted below; whorls short, rather convex sculptured with distant prominent ribs interrupted in the middle of the whorls, last whorl small, notched, with a large part obliquely uncloiled; suture deep, aperture obliquely ovate, small, with expanded margin.

GUNDLACH. Chemn. p. 29, Pfeiffer. Mon. iv. 705.
Hab. Cuba.

The rib is nearly, if not quite obliterated in the middle of each whorl.

Species 72. (Mus. Brit.)

CYLINDRELLA GONOSTOMA. *Cyl. testa, pupiformi, elongata, cornicâ, tenitor, distanter et obliquâ filosiriatâ; suprâ mediana paulò inflatâ; apice obtuso, infid subattenuatâ; anfractibus convexâculis, brevibus, ultimo rimato, soluto; aperturâ subtriangularis, superne biangulata; marginâ angusto, rotundo.*

THE ANGLE-MOUTHED CYLINDRELLA. Shell pupa-shaped, long, horny, with fine, distant, oblique thread-like striae, a little inflated above the middle; apex obtuse, a little attenuated beneath; whorls a little convex, short, the last notched, uncloiled; aperture rather trigonal, with two angles above; margin narrow, rounded.

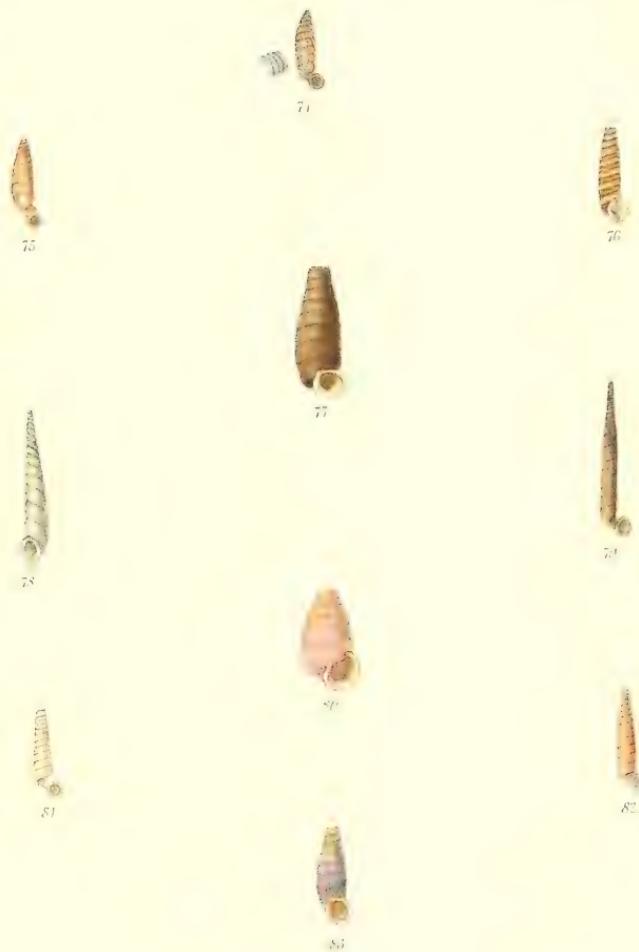

PFEIFFER. Chemn. p. 63. Monog. iv. p. 740.

Species 73. (Mus. Brit.)

CYLINDRELLA OBESA. *Cyl. testa brevi, ventricosa, solidâculâ, rubro-succinâ, tenitor striatâ, anfractibus 5, convexâculis; aperturâ magnâ, rotundâ, connectâ marginâ crasso, rotundo.*

THE STOUT CYLINDRELLA. Shell short, ventricose, rather solid, reddish-amber, finely striated, whorls five, rather convex; aperture large, rounded, connected with thick, rounded margin.

WEINLAND AND MARTENS. Malak. Bl. vi. 1859, p. 55.
Hab. Haiti.

CYLINDRELLA.

PLATE IX.

Species 74. (Mus. Sowerby.)

CYLINDELLA SCALARINA. *Cyl. testi pallidè fulvi,*
papiformis; anfractibus 12, costis obliquis, crassis,
approximatis nonulis, superioribus parvis, medi-
anis latius, inflatis, inferioribus angustis; ultimo
longè latato; aperturā subtransversa, marginē
crasso, rotundo.

THE SCALARIFORM CYLINDRELLA. Shell pale fulvous,
pupa-shaped; whorls 12, provided with oblique,
thick, approximate ribs, superior small, middle
broad, inflated, lower narrow; last much unequaled;
aperture subtransverse, margin thick, rounded.

SHUTTLEWORTH. Pfrr. Mon. VI., No. 299.

Hab. Cuba.

Species 75. (Mus. Sowerby.)

CYLINDELLA SOLITA. *Cyl. testi fusiformis, solidissi-*
cult, minuti striatæ, pallidè cornutæ; anfractibus
11, concreciscens; ultimo infra angustato, longè
latato, aperturā obliqui, circulari, margine sub-
expanso.

THE UNCOILED CYLINDRELLA. Shell fusiform, rather
solid, finely striated, pale horn; whorls 11,
rather convex; last narrowed below, uncoiled
some length, aperture oblique, circular, margin
slightly expanded.

PFEIFFER. Malak. Vol. XL, 1863.

Hab. West Cuba.

Species 76. (Mus. Breit.)

CYLINDELLA HOLLANDI. *Cyl. testi rectiūscendit, sub-*
cylindricit, pallidè fulvi, media anfractuosa fuscò
fasciatæ; anfractibus permanentibus decem, alti-
sculis, rectilateribus; aperturā approximata,
perpendicularly oblonga.

HOLLAND'S CYLINDRELLA. Shell rather straight,
rather cylindrical, pale fulvous, banded with
brown in the middle of the whorls; permanent
whorls ten, rather high, straight-sided; aperture
approximate, perpendicularly oblique.

ADAMS, C. B. Pfrr. Mon. VI., p. 369.

Hab. Jamaica.

Species 77. (Mus. Sowerby.)

CYLINDELLA TRANSAPERTA. *Cyl. testi lati, subcylin-*
dricis, subfuscæ, tenuissimæ striatæ; anfractibus
permanentibus 9-10, rectilateribus, superioreibus
angustatis; ultimo subquadrate, longè rimato;
aperturā transversa oblongata; labio interno con-
tingenti, crenis, albo.

THE CROSS-MOUTHED CYLINDRELLA. Shell broad, sub-
cylindrical, brownish, very finely striated; per-
manent whorls 9 or 10, straight-sided, upper
narrow; last rather square, with a long notch;
aperture transversely oblong; inner lip touching,
thick, white.

SOWERBY.

Hab. ——?

The inner margin of the mouth touches the middle
of the last whorl, across which it is extended.

Species 78. (Mus. Sowerby.)

CYLINDELLA GRACILIS. *Cyl. testi sinistrali, albæ, al-*
tissimæ, elongatæ, subfusciformis, tenuissimæ striatæ;
anfractibus 18, obliquis, convexis, gradatim cres-
centibus; ultimo subcarinato; aperturæ magne,
erectæ, columellæ plicatae.

THE SLENDER CYLINDRELLA. Shell sinistral, white,
very high, elongated, subfusciform, very finely
striated; whorls 18, oblique, convex, gradually
increasing; last slightly keeled; aperture large,
ovate, columella plicated.

WOOR. Pfrr. Monog. VI., p. 383.

Hab. Jamaica.

Mentioned at No. 33 as a var. of Cy. oblonga; but
it is much more elongated.

Species 79. (Mus. Sowerby.)

CYLINDELLA MULTISPINALIS. *Cyl. testi elongatissimæ,*
angustæ, falcæ; anfractibus 24, rectiūsculis; ul-
terius longè latato; aperturæ distantæ, subcavatae.

THE MULTISPINAL CYLINDRELLA. Shell very long,

CYLINDRELLA.—PLATE IX.

narrow, fawn; whorls 24, rather straight; last loosened some length; aperture distant, subovate.

SOWERBY?

Hab. ——?

The writer has the name with the shell in MS., but does not find it in Pfeiffer's Monograph.

Species 80. (Mus. Sowerby.)

CYLINDELLA TROCHLEFORMIS. *Cyl. testá brevi, latá, deusi striatá, rosá, spírä subconicá; anfractibus permanentibus 7, tribus inferioribus latissimis; ultimo longè rimato; aperturá magná, obliquá, labio interno producto.*

THE TROCHLEFORM CYLINDRELLA. Shell short, broad, closely striated, pink, spire subconical; permanent whorls 7, three lower very broad; last with a long notch; aperture large, oblique, inner lip produced.

SOWERBY.

Hab. ——?

Species 81. (Mus. Sowerby.)

CYLINDELLA ALABASTRINA. *Cyl. testá albá, cylindricá, semipellucidá, gradatim attenuatá; anfractibus permanentibus 12, recilaterib; ultimo infrá angulato, longè laxato; aperturá magná, subrotundá, distanti, margine rotundo.*

THE ALABASTER CYLINDRELLA. Shell white, cylindrical, semipellucid, gradually attenuated; permanent whorls 12, straight-sided; last angular be-

low, with a long notch; aperture large, rather rounded, distant, margin rounded.

PFEIFFER Monog. VI, p. 375.

Hab. Jamaica.

Species 82. (Mus. Sowerby.)

CYLINDELLA CLARA. *Cyl. testá fulvá, levigatá, subfusiformi, versus apicem attenuatá; anfractibus medio et infra subergentibus, convexisculis; ultimo costulato breviter laevo, longè rimato; aperturá obliquá, majusculella; margine rotundo, columellá lamellata.*

THE CLEAR CYLINDRELLA. Shell fulvous, smooth, subfusiform, attenuated towards the apex; whorls nearly equal at the middle and under, rather convex; last ribbed, shortly uncloined, with a long notch; aperture oblique, rather large; margin rounded, columella lamellated.

WRIGHT. Pfeiffer Mon. VI, p. 363.

Hab. Cuba.

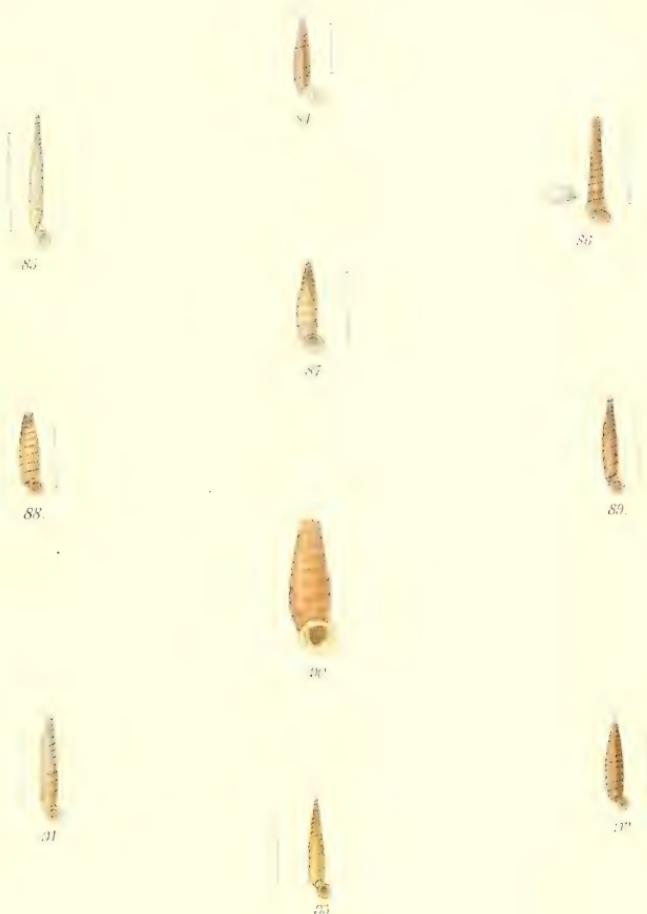

Species 83. (Mus. Sowerby.)

CYLINDELLA VIGNALIENSIS. *Cyl. testá breviæscula, subcentricoid, carneo-cerulá, sursum subattenuatá, obliquè costellatá; anfractibus permanentibus septem, altis; ultimo ingrà contracto; aperturá magná, subquadratá; margine tenui.*

VIGNAL'S CYLINDRELLA. Shell rather short, rather ventricose, ashy-flesh, slightly attenuated upwards, obliquely ribbed; permanent whorls seven, raised; last contracted below; aperture large, rather square; margin thin.

WRIGHT. Pfeiffer Monog. VI, p. 367.

Hab. Cuba.

CYLINDRELLA.

PLATE X.

Species 84. (Mus. Sowerby.)

CYLINDRELLA TENERIENSIS. *Cyl. testá subvariegatá,*
seu albá, solidiscula, conformatum arcuato-costulatum,
spirál supra medium et infra igitur; anfractibus
permanentibus 11, angustatis, ad suturam crenula-
tis; ultimo angustato, obliquè rimato, longè
soluto; aperturā distanti, obliquè suboblongo.

THE TENERIAN CYLINDRELLA. Shell rather variegated, or white, rather solid, closely nerve-ribbed, spire inflated above the middle and below; permanent whorls 11, narrow, crenulated at the suture; last narrow, obliquely notched, with long part uncoiled; aperture distant, obliquely rather oblong.
 WRIGHT. Pfr. in Malak. Bl. Monog. VI., p. 387.
Hab. La Teneria, West Cuba.

Species 85. (Mus. Sowerby.)

CYLINDRELLA WRIGHTII. *Cyl. testá altá, attenuatá,*
subfusiformi, obliquè leviter striatá; anfractibus
20, superioribus angustissimis, mediis convexi-
sculis; ultimo elongato, infra angustato, longè
soluto; aperturā distanti, rotundá, magno; mar-
ginē crassiācendo.

WRIGHT'S CYLINDRELLA. Shell high, attenuated, subfusiform, obliquely slightly striated; whorls 20, upper very narrow, middle rather convex; last elongated, narrow below, with a lengthened unclosed portion; aperture distant, rounded, large; margin rather thick.
 PFEIFFER. Malak. Bl. 1862, p. 132.
Hab. Cayo del Ray, Cuba.

Species 86. (Mus. Sowerby.)

CYLINDRELLA LATERADII. *Cyl. testá elongatá, sordidí-*
fusca; anfractibus permanentibus 14, angustis,
tenuiter striatis; ultimo subterpunctato; infra angu-
lato; aperturā subtriangulari; margine tenui.

LATERAD'S CYLINDRELLA. Shell elongated, dull brown; permanent whorls 14, narrow, finely striated; last rather expanded, angular below; aperture subtriangular; margin thin.

GRATELOUP (Clausilia). Pfr. Mon. III., p. 574.

Hab. Haiti.

Species 87. (Mus. Sowerby.)

CYLINDRELLA ILLAMELLATA. *Cyl. testá subfusciformi,*
diaphaná, pallidé cornuta, obliquè striatá; anfrac-
tibus permanentibus 10, mediis et inferioribus
inflatís; ultimo parvó contracto; aperturā obliqua-
ovatá; margine crassiācendo; columellá intus
simplici.

THE UNMELLATED CYLINDRELLA. Shell subfusciform, diaphanous, pale horn, obliquely striated; permanent whorls 10, middle and lower inflated; last a little contracted; aperture obliquely ovate, margin rather thick; columella simple within.
 WRIGHT. Pfeiffer Mon. Vol. VI., p. 373.
Hab. La Palma, West Cuba.

Species 88. (Mus. Sowerby.)

CYLINDRELLA PEELATA. *Cyl. testá brevi, cylindracea,*
albidá, tenui, semipellucidá; anfractibus perma-
nentibus novem ad decem rectilateris, suturā
crenulatā; ultimo angustata subcontracta, rotunda;
aperturā majuscula, obliquè subovata.

THE BROAD CYLINDRELLA. Shell short, cylindrical, whitish, thin, semipellucid; permanent whorls nine or ten, straight-sided, suture crenulated; last whorl subcontracted, notched; aperture rather large, obliquely semirotate.
 GUNDLACH. Pfeiffer Malak. Bl. VI., 1859.
Hab. Yateras, Cuba.

Species 89. (Mus. Sowerby.)

CYLINDRELLA PRODICTA. *Cyl. testá subfusciformi, fuscó-*
coronata, levigata; anfractibus permanentibus 13,
medio et infra subangulis, convexiācens, superi-
oribus angustis; ultimo leviter solido; aperturā
majuscula, subdistata.

THE PRODUCED CYLINDRELLA. Shell rather fusiform, brownish horn, smooth; permanent whorls 13,

CYLINDRELLA.—PLATE X.

middle and lower nearly equal, rather convex, upper narrow; last slightly unwound; aperture rather large, distant.

GUNDLACH. Pfeiffer Mon. Vol. VI., p. 361.
Hab. Cuba.

Species 90. (Mus. Sowerby.)

CYLINDRELLA NORILO. Adams. Species 53. var.
C. Binneyana, Adams.

Species 91. (Mus. Sowerby.)

CYLINDRELLA INTERMEDIA. *Cyl. testá cylindricá, altá, angustá, fuscá, versus apicem contractá; anfractibus permanentibus undecim, striatis, rectilísculis; aperturá paulo disiectá, magná, obliquè ovatá; margine crasso.*

THE INTERMEDIATE CYLINDRELLA. Shell cylindrical, high, narrow, brown, contracted towards the apex; permanent whorls eleven, striated, rather straight; aperture a little disjoined, large, obliquely ovate; margin thick.

SOWERBY?
Hab. —?

The writer is obliged to adopt the name, not having the authority.

Species 92. (Mus. Sowerby.)

CYLINDRELLA BRUNNESCENS. *Cyl. testá subfusiformis, fuscá, tenuiter striatá, solidíscula; anfractibus permanentibus 14, angustis, convexiāsculis; ultimo rimato, ad aperturam leviter soluto.*

THE BROWNISH CYLINDRELLA. Shell subfusiform, brown, finely striated, rather solid; permanent whorls 14, narrow, rather convex; last notched, slightly unwound at the aperture.

GUNDLACH. Pfr. Mon. Vol. VI., p. 376.
Hab. Cuba.

Species 93. (Mus. Sowerby.)

CYLINDRELLA INTEGRA. *Cyl. testá levigatá, altá, attenuatá, fulvo-corneá; anfractibus sexdecim, convexis, obliquis, ultimo soluto; aperturá majuscula, distata; margine crasso.*

THE ENTIRE CYLINDRELLA. Shell smooth, raised, attenuated, fulvous-horny; whorls sixteen, convex, oblique; last unwound; aperture rather large, distant; margin thick.

PFEIFFER. Mon. Vol. VI., p. 379.
Hab. Cuba.

CYLINDRELLA.

PLATE XI.

Species 94. (Mus. Sowerby.)

CYLINDRELLA RUSEL. *Cyl. testā aculeatā, cornēt, sursum attenuatā, mediore infrā rectilobā; anfractibus superioribus septenī, angustis, inferioribus septenī subequalibus, obliqui costatis; costis ad suturam tuberculatis; anfractu apicale papilloso, ultimo infra angulato, soluto; aperturā superne subquadrati, infra obliqui subacuminatū.*

RUSE'S CYLINDRELLA. Shell aculeated, horny, attenuated above, straight-sided at the middle and under; upper whorls seven, narrow, lower seven nearly equal, obliquely ribbed; ribs tuberculated at the suture; apical whorl papillary, last angular below, unwound; aperture squared above, obliquely acuminated below.

PFEIFFER. Mon. III. p. 378.

Hab. Porto Rico.

Species 95. (Mus. Sowerby.)

CYLINDRELLA COLLARIS. *Cyl. testā fuscā, subfusciformi, obliqui densi costati; anfractibus permanentibus 15, concretae, medianā latissimis, ultimo longi soluto; aperturā rotundā, margine crasso, rotundo.*

THE NICKED CYLINDRELLA. Shell brown, subfusciform, obliquely closely ribbed; permanent whorls 15, convex, middle rather broad, last with a long uncloaked piece; aperture round, margin thick, round.

FERRERAS. Pfr. Mon. II. 375.

Cylindrella antiperversa. Pfeiffer.

Pupa truncatula. Sowerby.

Hab. Guadeloupe.

Species 96. (Mus. Sowerby.)

CYLINDRELLA HILLERI. *Cyl. testā cornēt, fusciō fusciō semilunariis variegatā, tenuiter striatā, fusiformi, gracili; anfractibus permanentibus quindecim, superioribus angustissimis, rectilobis, medianis subangulatis; ultimo parco, longissimē soluto; aperturā rotunda, distanti, margine subexpanso.*

HILLER'S CYLINDRELLA. Shell horny, variegated with brown semilunar bands, finely striated, fusiform, slender; permanent whorls fifteen, upper very

narrow, rather straight, middle rather inflated, last small, with very long portion unwound; aperture round, distant, margin a little expanded.

PFEIFFER. Malak. Bl. IX. 1862, p. 132.

Hab. Cuba.

Species 97. (Mus. Sowerby.)

CYLINDRELLA ANGUSTIOR. *Cyl. testā subcylindrica, brevissimā, cornēt, anfractibus 19, rectilobularibus, superioribus contractis, medianis inferioribusque altis, subangulatis, ultimo infra rotundato; aperturā angulata, margine rotunda.*

THE NARROWER CYLINDRELLA. Shell subcylindrical, rather short, horny; whorls 19, straight-sided, upper contracted, middle and lower high, nearly equal, last notched below, angular; aperture large, margin rounded,

WRIGHT. Pfeiffer. Mon. Vol. VI. p. 384.

Hab. Cayo de San Felipe, Cuba.

Species 98. (Mus. Sowerby.)

CYLINDRELLA ASPERA. *Cyl. testā falcata, fusiformi, superne contracta, medio inflata, infra subangulata; anfractibus quindecim, obliqui densi striatis, ultimo paulo soluto; aperturā obliqui oblonga, subalbistrata, margine rotunda.*

THE ROUGH CYLINDRELLA. Shell fulvous, fusiform, contracted above, inflated in the middle, a little narrowed below; whorls 15, obliquely densely striated, last a little unwound; aperture obliquely oblong, rather distant, margin rounded.

ADAMS. Shells of Jamaica. Pfeiffer. Mon. Vol. VI. p. 359.

Hab. Jamaica.

Species 99. (Mus. Sowerby.)

CYLINDRELLA INORNATA. *Cyl. testā brevi cylindrica, peroblique striatā; anfractibus novem, rectilobaribus, tribus superioribus subangulatis, alteris subequalibus, ultimo rotundato; aperturā apposita, magna, rotunda, margine rotunda.*

THE PLAIN CYLINDRELLA. Shell short, cylindrical, very obliquely striated; whorls nine, straight-sided, three upper rather narrow, others nearly

CYLINDRELLA.—PLATE XI.

equal, last notched; aperture approximate, large, rounded, margin round.

ADAMS. Sh. of Jamaica. Pfeiffer. Mon. Vol. VI. p. 377.
Hab. Jamaica.

Species 100. (Mus. Sowerby.)

CYLINDRELLA PORRECTA. *Cyl. testá fulvá, gracili, fusiformi, levigatá; anfractibus 17, superioribus senis angustissimis, pellucidis, alteris subangulatis, ultimo subcontracto, longi soluto; aperturá obliquá distans, rotunda.*

THE UPRIGHT CYLINDRELLA. Shell fulvous, slender, fusiform, smooth, whorls 17, upper 6 very narrow, pellucid, others a little inflated, last rather contracted, unwound some length; aperture oblique, distant, round.

GOULD. Pfeiffer. Mon. Vol. VI. p. 384.
Hab. Cuba.

Species 101. (Mus. Sowerby.)

CYLINDRELLA TENELLA. *Cyl. testá fulvá, levigatá, cylindricá, superne subattenuatá; anfractibus permaneentibus duodecim, rectilateralibus, lentisimè crescentibus, ultimo alto; aperturá magná, approximantá, obliquá subquadratá.*

THE THIN LITTLE CYLINDRELLA. Shell fulvous, smooth, cylindrical, rather narrowed above; permanent whorls twelve, straight-sided, slowly increased, last high; aperture large, approximate, almost obliquely square.

ADAMS. Pfeiffer. Mon. Vol. VI. 359.
Hab. Jamaica.

Species 102. (Mus. Sowerby.)

CYLINDRELLA NOTATA. *Cyl. testá gracillimá, fusiformi, pellucídá, sublevigatá, cornéa; anfractibus 17, angustis, convexis, superioribus contractis, apicali rotundo, ultimo viz soluto; aperturá obliquá; margine rotundo.*

THE MARKED CYLINDRELLA. Shell very slender, fusiform, pellucid, rather smooth, horny; whorls 17, narrow, convex, upper contracted, apical round, last hardly unwound; aperture oblique; margin round.

GUNDLACH, MS. Pfeiffer in Malak. Bl. XI. 1863, p. 10.
Hab. —— ‘Sierra de Gueira.’ Cuba.

The spiral band above the suture, spoken of in the description, and whence the species derives its name, is not visible in the specimen in our hands.

Species 103. (Mus. Sowerby.)

CYLINDRELLA BULBIFORMIS. *Cyl. testá breviter fusiformi, roséa, tenuissimè striatá, ventricosus; anfractibus apicalibus contractis, medianis convexis, inflatis, ultimo angustato, rimato, viz soluto; aperturá magná subrotundá; margine rotundo.*

THE BULB-SHAPED CYLINDRELLA. Shell shortly fusiform, pink, very finely striated, ventricose; apical whorls contracted, middle convex, inflated, last narrow, notched, hardly unwound; aperture large, rather round; margin round.

CYLINDRELLA.

PLATE XII.

Species 104. (Mus. Sowerby.)

CYLINDRELLA COSTULATA. *Cyl. testis brevi, pyramidalis, validis distanter costatâ, albida; anfractibus non venis, aquilater crescentibus, concisis; ultimo longissimâ soluto et producto; aperturâ distantâ, subquadrigulari.*

THE SMALL-RIBBED CYLINDRELLA. Shell short, pyramidal, strongly distantly ribbed, whitish; whorls 9, equally increasing, convex; aperture distant, subquadrigular.

ADAMS. Sh. of Jamaica. Pfeiffer. Mon. Vol. VI. p. 381.
Hab. Cuba.

Species 105. (Mus. Sowerby.)

CYLINDRELLA PLICATA. *Cyl. testis brevi, albida, pyramidalis-fusiformis, leviter crenatâ costatâ; anfractibus superioribus calidi attenuatis, medianis et inferioribus ventricosis, ultimo subangustato, soluto; aperturâ distantâ, rotundata.*

THE PLIATED CYLINDRELLA. Shell short, whitish, pyramidal-fusiform, finely closely ribbed; upper whorls much attenuated, middle and lower ventricose, last rather narrow, unwound; aperture distant, rounded.

PFEIFFER. Mon. Vol. VI. p. 389.
Hab. Cuba.

Species 106. (Mus. Sowerby.)

CYLINDRELLA ARTEMESIA. *Cyl. testis roseo-fulvâ, subfusiformis, solidiscula, obliquâ striata; anfractibus permanentibus decensis, subrectilobatis, ultimo subcontracto, breviter soluto; aperturâ subapplanata, rotundata, margin rotunda.*

THE ARTEMESIAN CYLINDRELLA. Shell pinky-fulvous, rather fusiform, rather solid, obliquely striated; permanent whorls ten, nearly straight-sided, last a little contracted, with a short long; aperture rather near, round, margin round.

GÜNTHER. Pfeiffer. Mon. Vol. VI. p. 380.
Hab. Artemesia, Cuba.

Species 107. (Mus. Sowerby.)

CYLINDRELLA FILICOSATA. *Cyl. testis fusiformis, purpureo-fusca, ventricosa, costis filiformibus frequentibus alios ornata; anfractibus permanentibus 19, superioribus angustatis, medianis subangustatis, ultimo rotato, latato; aperturâ pyriformi, superne acuminita.*

THE THREE-RIBBED CYLINDRELLA. Shell fusiform, purple-brown, ventricose, ornamented with numerous filiform ribs; permanent whorls 19, upper narrow, middle rather inflated, last notched, unwound; aperture pyriform, acuminate above.

SHUTTLEWORTH. Pfeiffer. Mon. Vol. VI. p. 378.
Hab. Mexico.

Species 108. (Mus. Sowerby.)

CYLINDRELLA CORONATA. *Cyl. testis sinistrali, subcylindrica, albida, solidiscula, costulis levibus, subremote sculpta; anfractibus permanentibus decensis, superioribus angustatis, ultimo rotato; aperturâ approximatâ, rotundâ, margin rotunda.*

THE CORONATED CYLINDRELLA. Shell sinistral, subcylindrical, whitish, rather solid, sculptured with thin rather remote ribs; permanent whorls ten, superior narrow, last notched; aperture approximate, rounded, margin rounded.

ARANGO. Pfeiffer. Mon. Vol. VI. p. 379.
Hab. Near Havanna, Cuba.

Species 109. (Mus. Sowerby.)

CYLINDRELLA COSTATA. *Cyl. testis brevi, straminea, subcylindrica, sursum subattenuata; anfractibus permanentibus novem, subrecte striatis, subrectilobatis, ultimo longe rotato; aperturâ suboblique producta.*

THE RIBBED CYLINDRELLA. Shell short, straw, subcylindrical, attenuated upwards; permanent whorls nine, with rather straight striae, nearly straight-sided, last with a long notch; aperture rather obliquely produced.

GULDING. Pfeiffer. Mon. Vol. VI. 381.
Hab. —?

CYLINDRELLA.—PLATE XII.

Species 110. (Mus. Brit.)

CYLINDRELLA HYALINA. *Cyl. testā pupiformi, ventricosū, albida, semipellucida; anfractibus permanentibus decem, suboblique costatis, tribus superioribus sensim contractis, alterius subequalibus, ultimo contracto, longè rimato, breviter soluto; aperturā anguit, superne subacuminata.*

THE HYALINE CYLINDRELLA. Shell pupa-shaped, ventricose, whitish, semipellucid; permanent whorls ten, rather obliquely ribbed, three upper sensibly contracted, the others nearly equal, last contracted with a long notch, shortly unwound; aperture large, ovate, subacuminated above.

PFEIFFER. Mon. Hel. Vol. VI. p. 359.

Hab. Mexico.

Species 111. (Mus. Sowerby.)

CYLINDRELLA ROBERTSI. *Cyl. testā brevi, cylindracea, fuscā, striatā; anfractibus permanentibus septem, subequalibus, superioribus rīz angustatis, ultimo infrā angulato, longè soluto; aperturā distanti, subtriangulari, superne lato, infre subacuminata.*

ROBERT'S CYLINDRELLA. Shell short, cylindrical, brown, striated; permanent whorls seven, nearly equal, upper scarcely narrowed, last angular below, unwound for a long part; aperture distant, subtriangular, broad above, rather acuminated below.

ADAMS. Pfeiffer. Mon. Vol. VI. p. 383.

Hab. Jamaica.

Species 112. (Mus. Sowerby.)

CYLINDRELLA ORNATA. *Cyl. testā cylindried, grisea, sparsim tenue costata, costis ad suturam in tuberculas regularibus terminatis; anfractibus permanentibus decem, superioribus tribus contractis, alterius subequalibus, ultimo alto, rimato, breviter soluto; aperturā subdistans obliquē producta.*

THE ADORNED CYLINDRELLA. Shell cylindrical, grey, sparsely thin-ribbed, ribs terminating at the suture in regular tubercles; permanent whorls ten, upper three contracted, others nearly equal, last high, notched, shortly uncoiled; aperture rather distantly obliquely produced.

GUNDLACH. Pfeiffer. Mon. Vol. VI. p. 382.

Hab. Yateras, Cuba.

Species 113. (Mus. Sowerby.)

CYLINDRELLA CONCRETA. *Cyl. testā brevi, subfusciformi, levā, albida, semipellucida, medio ventricosā, infrā paulo contractā; anfractibus decem, ultimo subangustato, rimato; aperturā approximatā, subrotundata.*

THE CONCRETE CYLINDRELLA. Shell short, subfusciform, smooth, whitish, semipellucid, ventricose in the middle, a little contracted below; whorls 10, last rather narrow, notched; aperture near, rather rounded.

GUNDLACH. Pfeiffer. Mon. Vol. VI. p. 363.

Hab. Cuba.

CYLINDRELLA.

PLATE XIII.

Species 114. (Mus. Brit.)

CYLINDRELLA PETEVERIANA. *Cyl. testū brevibisendū, solidū, cylindricū, albū; anfractibus permanentibus septenis, levissimè crescentibus, undulatim costatis; inter costas angulatim et undulatim irregulariter sculptis; ultimā subangustatā, rimato, aperturā obliquā subovatā, marginē duplicita.*

PETEVER'S CYLINDRELLA. Shell rather short, solid, cylindrical, whitish; permanent whorls seven, very slowly increased, with wavy ribs, angularly and wavy sculptured between the ribs; last rather angular, notched; aperture obliquely subovate, margin double.

FERRASSAC. Pfeiffer. Mon. Vol. VI. p. 391.
Hab. Antilles.

Species 115. (Fig. a, b, Mus. Brit.)

CYLINDRELLA CLAVA. *Cyl. testū suecico-fusōidē seu albidū, tenū, attissimū, graciliformē, supra medium gradatim attenuatā; anfractibus depresso-decūtis, tenuissimē striatā, permanentibus rugatā, deciduis decensis, ultimo infī angulatā, longē rimato, soluto; aperturā subdistrictā, obliquā oratā, supernē subacuminatā.*

THE KEY CYLINDRELLA. Shell amber brown or whitish, thin, much raised, slender, gradually attenuated above the middle; whorls depressed, very finely striated, twenty permanent, ten deciduous, last angular below, with a long notch; aperture rather distant, obliquely ovate, slightly acuminated above.

PFEIFFER. Mon. Vol. VI. p. 365.
Hab. Chiappa, Mexico.

Species 116. (Mus. Brit.)

CYLINDRELLA LEIBMANNI. *Cyl. testū solidū, ventricosissimū, levigatō, flavidō-caffēt, prope suturas densioris; anfractibus permanentibus octōvis, convexis, medio latissimis; supernē infī gradatim angustioribus, ultimo rimato ad aperturam paulo soluto; aperturā obliquā pyriformē, supernē subacuminatā.*

LEIBMANN'S CYLINDRELLA. Shell solid, very ventricose, smooth, yellowish-coffee, more dense at the sutures; permanent whorls eight, convex, very wide in the middle, gradually narrower above and below; last notched at the aperture, a little univentral; aperture obliquely pyriform, slightly acuminated above.

PFEIFFER. Mon. II. p. 370.
Hab. Mexico.

Species 117. (Mus. Brit.)

CYLINDRELLA TURRIS. *Cyl. testū altū, ventricosū, supernē attenuatū, cōfēt, tenuilatē striatū; anfractibus circa trīgintā, infī roribus docevis suborqualibus rectilatēcalibus, latīs; ultimo truncatō, rimato; aperturā approximatā, subobliquā, latā, columellā latā, infī coniculatā.*

THE TOWER CYLINDRELLA. Shell high, ventricose, attenuated above, coffee-coloured, finely striated: whorls about thirty, lower twelve rather equal, straight-sided, broad; last truncated, notched; aperture near, rather oblique, broad, columnella broad, with a channel below.

PFEIFFER. Mon. IV. p. 606.
Hab. Chiappa, Mexico.

Species 118. (Mus. Brit.)

CYLINDRELLA BOUCARDI. *Cyl. testū altū, cylindricū, subequaliter ventricosū, straminosū; anfractibus permanentibus novāvis, altis, rectilatēcalibus, ultimo infī contractā, rimato, supra marginem aperturā arcuatā; aperturā obliquā subpyriformē, supernē subacuminatā.*

BOUCAUD'S CYLINDRELLA. Shell high, cylindrical, rather equally ventricose, straw; permanent whorls nine, high, rectilateral, last contracted below, notched, arched above the margin of the aperture; aperture obliquely subpyriform, slightly acuminated above.

SALMÉ. Proc. Zool. Soc. 1853, T. XXXIII. f. 1.
Hab. Cordova and Orizaba, Mexico.

CYLINDRELLA.—PLATE XIII.

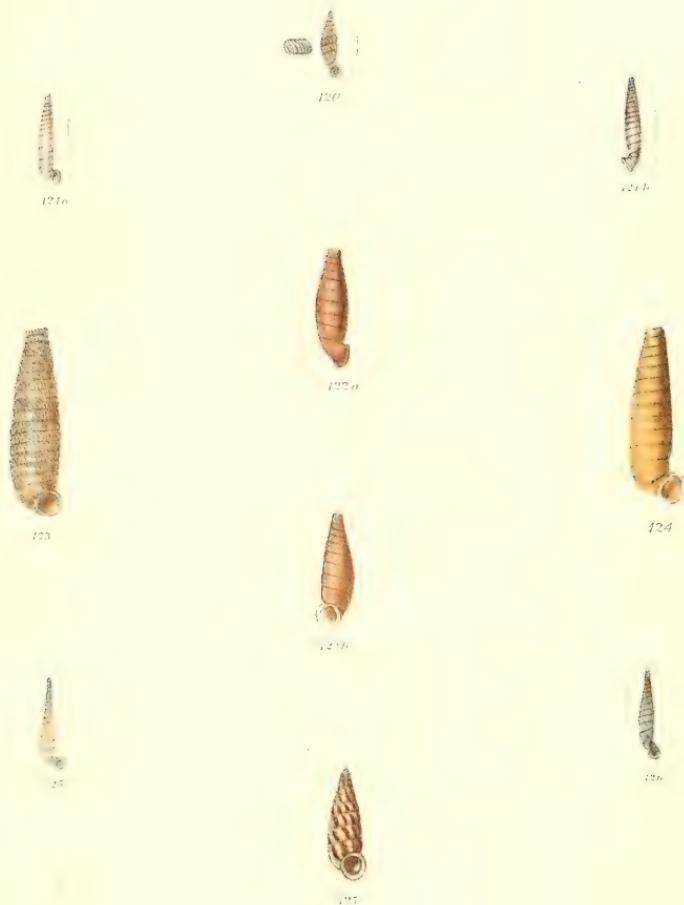

Species 119. (Mus. Brit.).

CYLINDELLA RECTICOSTA. *Cyl. testū albidi, costis solidis, rectis, distantibus sculpti, medio infrāque cylindricō, superē sensim contracti; anfractibus permanentibus tredecim, septenis inferioribus subequalibus, vix concavis; suturā profundi, ultimo rotundo; apertura approximata, latā, margine crasso.*

THE STRAIGHT-RIBBED CYLINDRELLA. Shell whitish, sculptured with solid, straight, distant ribs, cylindrical in the middle and below, sensibly contracted above; permanent whorls thirteen, seven lower nearly equal, hardly convex; suture deep, last notched; aperture approximate, broad, margin thick.

PFEIFFER. Mon. II. p. 369.

Hab. Oajaca, Mexico.

CYLINDRELLA.

PLATE XIV.

Species 120. (Mus. Sowb.)

CYLINDELLA DOMINICENSIS. *Cyl. testi brevi, fulcā, subfusiformi; anfractibus novem, subelevatis, ultimo longè soluto; apertura distant, parvæ, obliquè subovatæ, margin rotundæ.*

THE DOMINICAN CYLINDRELLA. Shell short, fulvous, subfusiform; whorls nine, rather convex, last with long part unwound; aperture distant, small, obliquely subovate, margin rounded.

PFEIFFER, Mon. III, p. 574.

Hab. Haiti, Peru.

Species 121. (Fig. a, b, Mus. Brit.)

CYLINDELLA VOLVULIS. *Cyl. testi alti, fulvæ, semi-pellucidæ, angustæ cylindricæ, levigatæ, altitati; anfractibus octodecim, intercarinæ decens sub-approximatib; rectilateralis; ultimo soluto, obliquè ad aperturam declivæ; apertura obliquè ovata.*

THE VOLUBLE CYLINDRELLA. Shell high, fulvous, semipellucid, narrowly cylindrical, smooth, shining; whorls eighteen, lower ten nearly equal, straight-sided; last unwound, sloped down obliquely towards the aperture; aperture obliquely ovate.

MORELET, Pfeiffer, Mon. III, p. 576.

Cylindrella siccicostata. Poey.

Hab. Cuba.

Species 122. (Fig. a, b, Mus. Brit.)

CYLINDELLA SCEVA. *Cyl. testi sinistrali, pupariformi, tenuissimè striatæ, cœfæ; anfractibus paucimenterius decens, carinatissimæ, superioribus contractis, medianis ingratæ, inferioribus subrugosatis; apertura subdistanti, latæ.*

THE LEFT-HANDED CYLINDRELLA. Shell sinistral, pupa-shaped, very finely striated, coffee-coloured; permanent whorls ten, rather convex, upper contracted, middle inflated, lower rather narrowed; aperture a little distant, broad.

GUNDLACH, Pfeiffer, Malak. Bl. 1863.

Hab. Near Matanzas, Cuba.

Species 123. (Mus. Brit.)

CYLINDELLA ARCTISPICA. *Cyl. testi alti, solidæ, albidæ, cylindricæ, medio subangulo; anfractibus permanentibus quindecim, compressæ, calidæ concavæ, costis calidis, arcuatis, ecarbris, sculptis; ultimo rimbato; apertura magnæ, rotundæ, margin crassa.*

THE BOW-SPIRED CYLINDRELLA. Shell raised, solid, white, cylindrical, middle rather inflated; permanent whorls fifteen, compressed, very convex, sculptured with strong, arched, numerous ribs; last notched; aperture large, rounded, margin thick.

MORELET, Proc. Zool. Soc. 1860, p. 139.

Hab. Jiquila, Mexico.

Species 124. (Mus. Brit.)

CYLINDELLA TOMACELLA. *Cyl. testi alti, subcylindricæ, tenuissimæ striatæ, succinico-enbeschenti; anfractibus permanentibus duodecim, octauis inferioris sub-approximatib; rectilateralis; ultimo subcontracto; rotundato, soluto; apertura obliquè subpyramidalis, distata, superim subbenignata.*

THE LONG-PUNCHED CYLINDRELLA. Shell high, sub-cylindrical, very finely striated, reddish amber; permanent whorls twelve, eight lower nearly equal, rectilateral, last a little contracted; notched, uncoiled; aperture obliquely subpyramidal, distant, attenuated above.

MORELET, Pfeiffer, Mon. III, p. 568.

Cylindrella Moreletti. Deshayes.

Hab. Guatemala.

Species 125. (Mus. Brit.)

CYLINDELLA SUETILIS. *Cyl. testi gracili, alti, subfusiformi, griseo-fuscæ, levigatæ, superim longè contractæ, infra medium subcentrica; anfractibus rigidi, inferioribus quinque senis, superioribus quindecim angustissimis, ultimo infra attenuato, soluto; apertura magnæculæ, ovali, distant, margin regula.*

CYLINDRELLA.—PLATE XIV.

THE SUBTLE CYLINDRELLA. Shell slender, high, rather fusiform, grey-brown, smooth, with a long part contracted above, rather ventricose below the middle; whorls twenty, lower five full, upper fifteen extremely narrow, last attenuated below, un wound; aperture rather large, oval, distant, margin reflected.

MORELET. Pfeiffer. Mon. III. p. 577.

Hab. Guatemala.

— — — — —

the middle, contracted, lengthened, much un wound; aperture rounded, distant, sloped.

PFEIFFER. Mon. III. p. 578.

Hab. Cuba.

Species 127. (Mus. Brit.)

CYLINDRELLA ZEBRINA. *Cyl. testis solidissimula, subventricosa, subpyramidalis, fulca, fasciis perpendicularibus liribus fuscis picta; aufractibus permanentibus noreniis, levigatis, concisis; aperturâ ovatâ, marginis crasso.*

THE ZEBRA CYLINDRELLA. Shell rather solid, rather ventricose, subpyramidal, fulvous, painted with perpendicular brown bands; permanent whorls nine, smooth, convex; aperture ovate, margin thick.

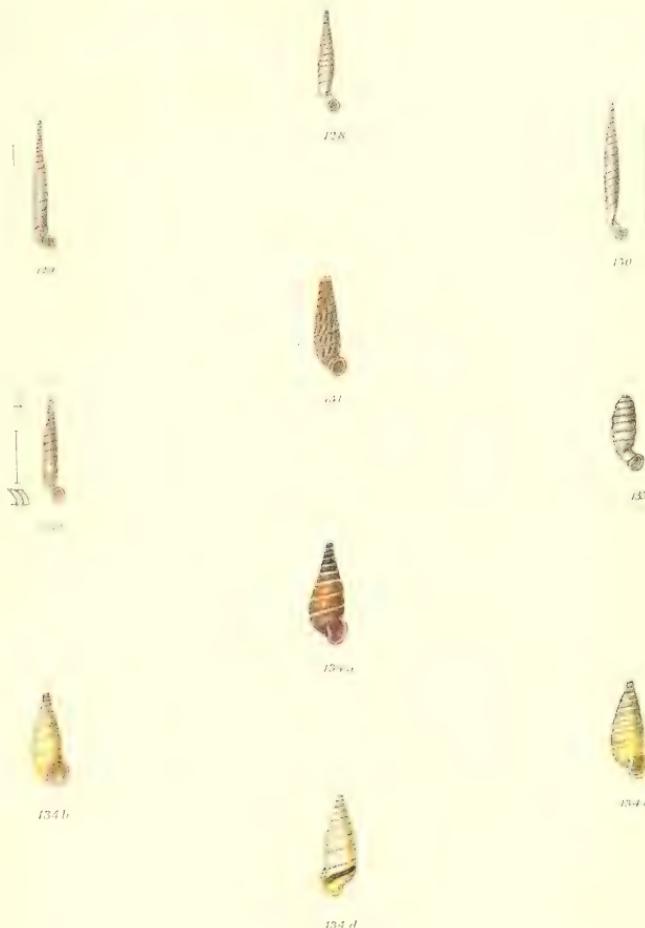

PFEIFFER. Mon. III. p. 584.

Hab. Jamaica.

Species 126. (Mus. Brit.)

CYLINDELLA CINEREA. *Cyl. testis fusiformis, altis, griseis, obliquè costata, ultimo aufractu medio torto, contracto, elongato, longè soluto; aperturâ rotundâ, distanti, declivi.*

THE CINEEEOUS CYLINDELLA. Shell fusiform, high, grey, obliquely ribbed, last whorl tortuous in

C Y L I N D R E L L A.

PLATE XV.

Species 128. (Mus. Brit.)

CYLINDELLA SEXDECIMALIS. *Cyl. testā gracillimā, fusiformē, fulvā, tenui, semipeltucida, loricatā; anfractibus sexdecenīs, convexis; apicali globoso, sequentibus series attenuatis, medianis iugatis, ultimo longissimū obliquè soluto, striato; aperturā distanti, rotundā, margine crasso.*

THE SIXTEEN-WHORLED CYLINDRELLA. Shell very narrow, fusiform, fulvous, thin, semipellucid, smooth; whorls sixteen, convex; apical subglobose, six following attenuated, middle inflated, last with a long piece uncoiled, striated; aperture distant, rounded, margin thick.

JIMENO. MS. Pitr. Mon. Vol. VI. p. 384.

Hab. Bermeja vieja, Cuba.

The variegation spoken of in the original description is not perceptible in the British Museum specimens.

Species 129. (Mus. Brit.)

CYLINDELLA APISTOMA. *Cyl. testā gracillimā, subcylindrica, fulvā; anfractibus octodecenīs, supra medium attenuatis, infra subequalibus, ultimo distorto, striato, soluto; aperturā subdistanti, subtriangulari, superne latā, infra subcontracta.*

THE DESCENDING-MOUTHED CYLINDRELLA. Shell very slender, subcylindrical, fulvous; whorls eighteen, attenuated above the middle, nearly equal, last distorted, striated, uncoiled; aperture rather distant, subtriangular, broad above, rather contracted below.

PFEIFFER. Mon. IV. p. 703.

Hab. Cordova, Mexico.

Species 130. (Mus. Brit.)

CYLINDELLA GRACILLIMA. *Cyl. testā gracillimā, fulvā, prope apicem contractū, supra medium subangustata, medio et infra subcontracta; ultimo anfracta elongata, infra attenuata, perobliquè soluto; aperturā latā, margine subexpanso.*

THE VERY SLENDER CYLINDRELLA. Shell very thin, fulvous, contracted near the apex, somewhat inflated above the middle, rather contracted at

and below the middle; last whorl elongated, attenuated below, very obliquely unwound; aperture broad, margin a little expanded.

POEY. Pfeiffer, Mon. III. p. 576.

Hab. Cuba.

The swelled portion of this narrow shell is above the middle of the lengthened spire.

Species 131. (Mus. Brit.)

CYLINDELLA VARIEGATA. *Cyl. testā breviensculā, latiseculā, cylindrica, leviter liratā, fulvā et subrosea, obliquè fasciis fusca variegata; anfractibus permanentibus novus, moderately convex, supra medium gradatim attenuatis, ultimo riusto, locutus: aperturā subdistanti, ovata, obliqua, margine subrotundo.*

THE VARIEGATED CYLINDRELLA. Shell rather short, rather broad, cylindrical, finely ridged, fulvous and pinky, variegated with oblique brown bands; permanent whorls nine, moderately convex, gradually attenuated above the middle, last notched, shortly uncoiled; aperture rather distant, ovate, oblique, margin rather rounded.

PFEIFFER. Mon. II. p. 374.

Hab. Cuba, Florida.

Species 132. (Mus. Brit.)

CYLINDELLA PHILIPPINA. *Cyl. testā gowili, fusiformi, fulvā, regulariter, subdistanti, leviter costata; anfractibus octodecenīs, apicalibus iugatis, globosis, sequentibus septem angustis, medianis subiugatis, ultimo subcontracto, longè soluto; aperturā obliquè ovata, margine crasso.*

PHILIPPI'S CYLINDRELLA. Shell slender, fusiform, fulvous, regularly, rather distantly, finely ribbed; whorls eighteen, apical inflated, globose, seven following narrow, middle rather inflated, last rather narrowed, with long unwinding; aperture obliquely ovate, margin thick.

PFEIFFER. Mon. II. p. 378.

Cylindrella aculeata. Morelet.

Hab. Cuba.

CYLINDRELLA.—PLATE XV.

Species 133. (Mus. Brit.)

CYLINDRELLA CUMINGIANA. *Cyl. testá brevi, pupaformi, becigatá, versus apicem inflatá, infri attenuatá; anfractibus octonis, ultimo contracto, rimato, longe soluto; aperturá auriformi, supernè subacuminato,*

CUMING'S CYLINDRELLA. Shell short, pupa-shaped, smooth, inflated towards the apex, attenuated below; whorls eight, last contracted, notched, with lengthened portion unwound; aperture ear-shaped, rather emarginated.

PFEIFFER. Mon. II. p. 385.

Hab. Philippine Islands.

Species 134. (Fig. a, b, c, d, Mus. Brit.)

CYLINDRELLA MAUGERI. *Cyl. testá pyramidatá, leví-*

gatá, albá, vel flavidá, ad aperturam rosá, vel fuscoc-nigrescenti, ad suturam albo fasciatá, medio paudó inglatá; anfractibus circa deconis, ultimo contracto; aperturá subovatá, margine reflexo, interrupto, columellá flexuosa.

MAUGER'S CYLINDRELLA. Shell pyramidal, smooth, white or yellowish-pink at the aperture, or blackish-brown, with white banded suture, a little inflated in the middle; whorls about ten, last contracted; aperture subovate, margin reflected, interrupted, columella flexuous.

Wood (Helix). Index Testaceologicus.

Pupa splendens. Menke.

Helix ignifera. Ferrussac.

Pupa fusiformis. Adams.

Hab. Jamaica.

CYLINDRELLA.

PLATE XVI.

Species 135. (Mus. Brit.)

CYLINDRELLA LUCENS. *Cyl. testā subpyramidalatā, angustā; albida, semipellucidā, unfractibus duodecenis, gradatim crescentibus, convexis, ultimo angustissimā, paulo soluto; aperturā subrotundā, superne depresso, cuneatā.*

THE LUCID CYLINDRELLA. Shell subpyramidal, narrow, whitish, semipellucid, whorls twelve, gradually increased, convex, last rather narrow, a little unwound; aperture rather round, depressed above, cuneate.

WEIGHT. MS. Brit. Mus.

Hab. Cuba.

Species 136. (Mus. Brit.)

CYLINDRELLA MORINI. *Cyl. testā fusca, pyramidalatā, subfusiformi; unfractibus quindecenīs, brevibus, perobliquū liratis, superioribus attenuatis, inferioribus paulo magis ventricosis, ultimo longi soluto, subtorto; aperturā distanti, transversē oblonga, utrinque subcunimata.*

MORINI'S CYLINDRELLA. Shell brown, pyramidal-fusiform; whorls fifteen, short, very obliquely ridged, upper attenuated, lower a little more ventricose; last with a long unwinding, a little twisted; aperture distant, transversely oblong, slightly acuminate on each side.

MOELET. Pfeiffer, Mon. Helic. VI. p. 388.

Hab. Verapaz, Guatemala.

Species 137. (Mus. Brit.)

CYLINDRELLA PLANOSPIRA. *Cyl. testā angusta, cylindrica, semipellucidā, pallide succineo-corneā; unfractibus permanentibus, undecenīs brevibus, convexisculis; aperturā distanti, superne infrāque angulatā.*

THE PLAINSPIRED CYLINDRELLA. Shell narrow, cylindrical, semipellucid, pale horny amber; permanent whorls eleven, rather short, a little convex; aperture distant, angular above and below.

PFEIFFER. Mon. Helic. p. 371.

Hab. Monte Cuzco, Cuba.

Species 138. (Mus. Brit.)

CYLINDRELLA MALLEATA. *Cyl. testā solidā, albida, fuscā, distanter striatā, irregulariter rugiā punctulatis angulatis sagittatā, ventricosā, melio inflatā; unfractibus octonīs, latīs, brevissimis; ultimo infra subangustato, curvato; aperturā irregulariter subquadrate, margine crasso, rotundo, inaequali.*

THE HAMMERED CYLINDRELLA. Shell solid, whitish, distantly striped with brown, irregularly shaded with punctured angular wrinkles, ventricose, inflated in the middle; whorls eight, broad, rather short, last a little narrowed and keeled below; aperture irregularly subquadrate, margin thick, round, unequal.

PFEIFFER. Mon. Helic. VI. p. 363.

Hab. St. Domingo.

Species 139. (Mus. Brit.)

CYLINDRELLA CAMOENSIS. *Cyl. testā fusiformi, attenuata, attissimā, fuscō-castaneā, unfractibus rigitā, brevibus, medio subangulis, laminis crebris ad suturam suprā infidigatā prominentibus, medio obsoletis, scalytis; ultimo angustato, soluto; aperturā rotundā.*

CAMOENS' CYLINDRELLA. Shell fusiform, attenuated, much elevated, smoky chestnut, whorls twenty, short, a little inflated in the middle, sculptured with numerous laminae, prominent above and below, and obsolete in the middle; last narrow, unwound; aperture rounded.

PFEIFFER. Mon. Helic. VI. p. 388.

Hab. Cuba.

The fine laminated ridges form rounded scales at the top and bottom of each whorl, and are almost lost in the middle.

Species 140. (Mus. Brit.)

CYLINDRELLA BEARSBLEYANA. *Cyl. testā pallidē fuscā, tenuiter liratā, subpyramidalatā; unfractibus novenīs, subconcrecis, gradatim crescentibus, liris frequentibus, curvis, interstitiis latioribus.*

CYLINDRELLA.—PLATE XVI.

BEARDSLEY'S CYLINDRELLA. Shell pale brown, finely ridged, somewhat pyramidal; whorls nine, rather convex, gradually increased, ridges numerous, curved, interstices wider.

C. B. ADAMS. —?

Hab. Jamaica.

Species 141. (Mus. Brit.)

CYLINDRELLA TURKASIANA. *Cyl. testā fusiformi, angustā, semipellucida, lavi, pallidē succinatā; anfractibus septendecim, superioribus inferioribus quo attenuatis, medianis subinflatā, ultimo longissimā soluto, declīci, rugato, tortuoso; aperturā parvā, distantiissimā.*

THE TURKASIAN CYLINDRELLA. Shell fusiform, narrow, semipellucid, smooth, pale amber; whorls seventeen, upper and lower attenuated, middle a little inflated, last with a long piece unwound, sloped downward, wrinkled, twisted; aperture small, very distant.

GUNDLACH. Pfeiffer. Mon. Helic. VI. p. 385.
Lescalléi. Gundlach?
Hab. Monte Toro, Cuba.

Species 142. (Mus. Brit.)

CYLINDRELLA RUGELIANA. *Cyl. testā parvō, angustē pyramidatā, opacā, fulvā, distanter strigatā; anfractibus quaterdecim, tenuiter acutē liratis, brevissimis ultimo longi soluto, tortuoso; aperturā parvā, distantiā; apice attenuato, acuminato.*

RUGEL'S CYLINDRELLA. Shell small, narrowly pyramidal, opaque, fulvous, distantly striped; whorls fourteen, finely, acutely ridged, very short, last with long portion unwound, twisted; aperture small, distant, apex attenuated, acuminate.

SHUTTLEWORTH. Pfeiffer. Mon. Hel. VI. p. 368.
Hab. Cuba.

Species 143. (Mus. Brit.)

CYLINDRELLA PUPEFORMIS. *Cyl. testā brevi, levī, cylindrica, semipellucida, albida, vel castanea; anfractibus permanentibus senis, brevibus, convexis; ultimo breviter soluto, aperturā subdistans, magnā, margine crasso, subrotunda.*

THE PUPA-SHADED CYLINDRELLA. Shell short, smooth, cylindrical, semipellucid, white or chestnut; permanent whorls six, short, convex; last with short unwinding; aperture rather distant, large, margin thick, rather rounded.

C. B. ADAMS. Pfeiffer, Mon. Helic. VI. p. 370.
Hab. Jamaica.

Species 144. (Mus. Brit.)

CYLINDRELLA UNCATA. *Cyl. testā cylindricā, solidissimā, latissimā, pallidē cornatā, media paulo inflata; anfractibus undecim, brevibus, subdistans liratis; ultimo subangustato, soluto, versus aperturā contracto; liris anfractuum ad suturam suprā infrafū quasi uncinatis, aperturā distanti, subferruginea.*

THE HOOKED CYLINDRELLA. Shell cylindrical, very solid, rather broad, pale horn; a little inflated in the middle; whorls eleven, short, rather distantly ridged, last rather narrow, unwound, contracted towards the aperture; ridges of the whorls, as it were, hooked at the suture above and below; aperture distant, subtriangular.

GUNDLACH. Pfeiffer. Mon. Helic. VI. p. 382.
Hab. Yateras, Cuba.

The tubercles formed at the sutures on the ridges have the appearance of little hooks.

MONOGRAPH

OF THE GENUS

PUPA.

Things that were not, at Thy command,
In perfect form before Thee stand;
And all to their Creator raise
A wondrous harmony of praise

P U P A.

PLATE I.

Genus PUPA. Drapersand.

*Testa terrestris, cylindrica, rima, plicisque dextoralis
monogrammata sinistralis plerumque chrysalidiformis
multispiralis, apice obtuso. Apertura frequenter
pliata et dentata, margine reflexo, continuo.
Operculum nullum.*

SHELL TERRESTRIAL. Cylindrical, creased, generally chrysalis-shaped, with many whorls and obtuse apex. Aperture frequently plaited and toothed, margin reflected, continuous. Operculum none.

In the following monograph, which cannot be made absolutely complete in this work, the genera *GIBBUS*, *ENNEA*, and *VERTIGO* are included with the undisputed *Pupa*. The species are found on most European continents and islands, particularly the more southern parts, and are also abundant in the East and West Indies, South Sea Islands, and other localities too numerous to mention. They are only wanting or rare in the colder climates. The *rima* in this and other genera of pupa-shaped land shells is a crease formed by an abnormal doubling as it were of the last whorl, bringing the mouth by a somewhat sudden turn to the front.

Species 1. (Mus. Sowerby.)

PUPA BRYANTI. *Pup. testa leviter cylindrica, breviter
rimata, albida, castaneo-maculata; anfractibus
octo, ploris solidis, subdistantibus, rectangulis
multis; aperturæ acutæ, margine rotundo, reflexa,
columellâ biplicata.*

BRYANT'S PUPA. Shell shortly cylindrical, shortly creased, whitish, mottled with chestnut; whorls eight, strengthened with solid, rather distant, rather straight ribs; aperture ovate, margin rounded, reflected; columella with two plaits.

PFEIFFER. Mon. Hel. VI. p. 92.

Hab. South Magna, Bahamas.

From its form and mottled colouring, this species would seem to resemble *Pupa Chrysalis* with its whorls vertically depressed, but with the addition of two plaits on the columella.

Species 2. (Fig. a, b. Mus. Brit.)

PUPA GLASS. *Pup. testa obesa, chrysalidiformis, solidâ,
subcrenata, monogrammata castaneo variegata;
versus apicem acuminata; anfractibus decensis,
costis validis multis; aperturâ intus castanea,
margine aureo, columellâ crassâ, validâ biplicata.*

THE ACORN PUPA. Shell obese, chrysalis-shaped, solid, bluish, sometimes varied with chestnut, acuminated towards the apex; whorls ten, strengthened with strong ribs; aperture chestnut within, margin golden, columella thick, strongly biplicate.

KÜSTER. Pfeiffer, Mon. Hel.

Hab. New Providence, Bahamas.

Species 3. (Fig. a, b. Mus. Brit.)

PUPA MUMIA. *Pup. testa oblongo-chrysalidiformis, sub-
cavata, monogrammata castaneo variegata, versus
apicem acuminata, subcrenata costata; aperturâ
aurata, marginis crissimata, columellâ validâ biplicata,
inter ploris profundâ sinuata.*

THE MUMMIE PUPA. Shell oblong-chrysalis-shaped, bluish, sometimes mottled with chestnut, acuminated towards the apex, rather lightly ribbed; aperture golden; margin very thick, columella with two strong plaits, deeply sinuated between the plaits.

BRUGUÈRE. Enc. Met.

Pupa sculpta, Pupa (var.)

Pupa mucinosa? Pfeiffer.

Herb. Cuba.

Species 4. (Mus. Brit.)

PUPA PROTEUS. *Pup. testa latissima, breviter cylindrica, subtruncata, crenata, solidâ; anfractibus deorsum, superioribus depresso, alteris costis crassis
subdistantibus multis; aperturâ lata, intus aurea,
marginis crasso, albido, supra columellâ impa-
plicata.*

PUPA.—PLATE I.

THE PROTEUS PUPA. Shell very wide, shortly cylindrical, somewhat truncated, bluish, solid; whorls ten, upper depressed, others strengthened with slightly distant strong ribs; aperture broad golden within, margin thick, whitish, with a plait above the columella.

GUNDLACH MS. Pfcr. VI. p. 291.
Pupa dimidiata, Pfeifer (*olim*).
Hab. Cuba.

Species 5. (Mus. Brit.)

PUPA CHRYSALIS. *Pup. testā elongato-chrysalidiformi, fulvō castaneo-marmoratā; costis distantibus, rulatis; spirā obtusā; unfractibus undecenis, inferioribus altis, rectilateribus; aperture marginē auriformi, albo, rotundo, columellā edentulā.*

THE CHRYSALIS PUPA. Shell elongated, chrysallis-shaped, fulvous, marbled with chestnut; ribs distant, strong; spire obtuse; whorls eleven, lower high, straight-sided; margin of aperture ear-shaped, white, rounded; columella without teeth.

BECK, *Pfeiffer*, Mon. II. p. 314.
Hab. Cuba.

Of a more straight and lengthened cylindrical form than *Pupa Mumia* and without plaits on the columella.

Species 6. (Mus. Brit.)

PUPA INCRASSATA. *Pup. testā obesā, cylindricā, subtruncatā, subcæruleā; costis suboblique, distantibus, levibus; aperturā auriformi, flexuosa; marginē albido, crassissimo; labio externo superne flexuoso, labio interno validē biplicato.*

THE THICKENED PUPA. Shell obese, cylindrical, slightly truncated, bluish; ribs rather oblique, distant, smooth; aperture auriform, flexuous; margin whitish, very thick; outer lip flexuous above, inner lip with two strong folds.

SOWFREY.
Hab. Cuba.

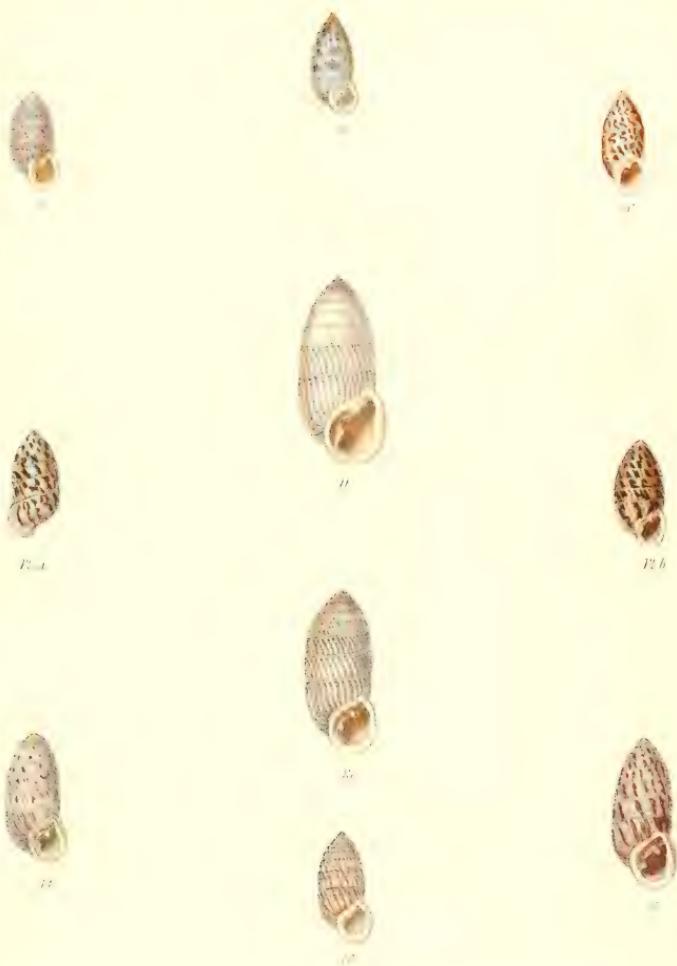

The writer having figured this shell under the name of *P. tumida*, and finding that name already used for another species, is obliged to re-name it. It resembles *P. proteus*, but its chief peculiarity is a much thickened and flexuous margin.

Species 7. (Mus. Brit.)

PUPA UVA. *Pup. testā chrysalidiformi, cærulea, crassicostata; unfractibus undecenus, rectilateribus; aperturā subovatā, aurea, margine interno eix plicato.*

THE GRAPE PUPA. Shell chrysalis-shaped, bluish, thick-ribbed; whorls eleven, straight sided; aperture subovate, golden, inner margin scarcely plaited.

LINNEUS. Syst. Nat.
Hab. Guadalupe.

PUPA.

PLATE II

Species 8. (Mus. Brit.)

PUPA MICROSTOMA. *Pup. testi brevi, acuminate, tenuiter lirata, grisea, fuscō nebulae; apice attenuato, flavido; aperturā parvā, intus castanā, margine crasso, rotundo, plicā superiori crasso, plicā columellarī parvā.*

THE SMALL-MOUTHED PUPA. Shell short, acuminate, finely ridged, grey, clouded with brown; apex attenuated, yellowish; aperture small, chestnut within, margin thick, rounded; upper plait thick, columellar plait small.

PFEIFFER. Monographia Helicocorum, vol. iv. p. 659.
Hab. Haïti.—Porto Rico.—Cuba.

Species 9. (Mus. Sowerby.)

PUPA ANTONI. *Pup. testi profundè rimata, umbilicata, brevi, obtusa, tenuiter lirata griseo-rubescēti marmorata; aperturā majuscēta, intus castanā, margine albo, subcylindrica, plicis duas parvis armata.*

ANTON'S PUPA. Shell deeply notched, umbilicated, short, obtuse, finely ridged, marbled with reddish-grey; aperture rather large, chestnut within, margin white, rather expanded, armed with two small plait.

KÜSTER. Pfeiffer, Mon. III. p. 539.
Hab. Berlitz.

Species 10. (Mus. Sowerby.)

PUPA MARMORATA. *Pup. testi brevi, levigata, angustè rimata fulvo, flammis undisque albidi variegata; apice pyramidalis; aperturā magnā, supra columellam nuplicata.*

THE MARLED PUPA. Shell short, smooth, narrowly notched; fulvous, variegated with white flames and waves; apex pyramidal; aperture large, with a single plait above the columella.

PFEIFFER. Monograph. III. 323.

Hab. Cuba.—Bahamas.

Very beautifully ornamented with enamelled white markings over a pinky-fawn ground.

Species 11. (Mus. Sowerby.)

PUPA INFANDA. *Pup. testi cylindrici, profundè rimata; umbilicata, solidi, albâ, latâ; anfractibus superioribus foræ levigatis, ultimi costis regularibus, subdistantibus, sculptis; aperturâ magna, intus fulva, supra columellam plicâ dentiformi parvo minuta.*

THE UNDESCRIPTED PUPA. Shell cylindric, deeply notched, umbilicated, solid, white, broad; upper whorls almost smooth; the last sculptured with regular ribs; aperture large, fulvous within; provided with tooth-like plait above the columella.

SHUTTLEWORTH. Pfeiffer, Mon. VI. vol. vi. p. 288.
Pupa decumana, Poey.
Hab. Cuba.

This shell differs from *Pupa maura* in the first whorls being partially denuded of ribs.

Species 12. (Fig. a, b, Mus. Brit.)

PUPA ZEBRA. *Pup. brevisimul, rimata, tenuilirata, fulvescenti, striis undulatis fuscis longitudinaliter ornata; spirâ versis apicem pyramidatâ, aperturâ parvâ, labio interno angusto, uniplicata, columellâ obliquâ uniplicata.*

THE ZEBRA PUPA. Shell very short, notched, finely ridged, rather fulvous, longitudinally ornamented with undulated brown stripes; spire pyramidal towards the apex, aperture small, inner lip

PUPA.—PLATE II.

narrow, with one plait, columella obliquely one-plaited.

WEINLAND. MS. Brit. Mus.

Hab. Bahamas.

Species 13. (Mus. Brit.)

PUPA MULTICOSTATA. *Pup. testā oblongā, albo-griseo-scenti, rimatā, liris valdū, crebris, longitudinaliter sculptā; aperturā subquadratā, marginē crasso, intus castaneo, columellā latā, obliquè uniplicatā, labio interno suprā columellam uniplicato.*

THE MANY-RIBBED PUPA. Shell oblong, greyish-white, notched, sculptured longitudinally with strong close ridges; aperture rather square, margin thick, chestnut within, columella broad, obliquely single-plaited, inner lip with one plait above the columella.

KÜSTER. Pfeiffer, Mon. II. p. 323.

Hab. Cuba.

Species 14. (Mus. Brit.)

PUPA CRASSILABRIS. *Pup. testā subcylindricā, obtusa, rosco-albida, fuscō nebulata, tenuiter liratā; aperturā subauriformi, biplicato, margine duplice.*

THE THICK-LIPPED PUPA. Shell subcylindrical, obtuse, pinky-whitish, clouded with brown, finely ribbed; aperture somewhat auriform, two-plaited, margin doubled.

SHUTTLEWORTH — ?

Hab. India.

Species 15. (Mus. Brit.)

PUPA MARTENSI. *Pup. testā cylindrica, rimatā, tenuissime lirata, albida, fuscō nebulata; apice obtuso; aperturā magis, auriformi, biplicata, margine crasso.*

MARTEN'S PUPA. Shell cylindrical, notched, very finely ridged, whitish, clouded with brown; apex obtuse; aperture large, ear-shaped, with two plaits, margin thick.

WEINLAND. Malak. Bl. ix. 1862.

Hab. Bahamas.

Species 16. (Mus. Sowerby.)

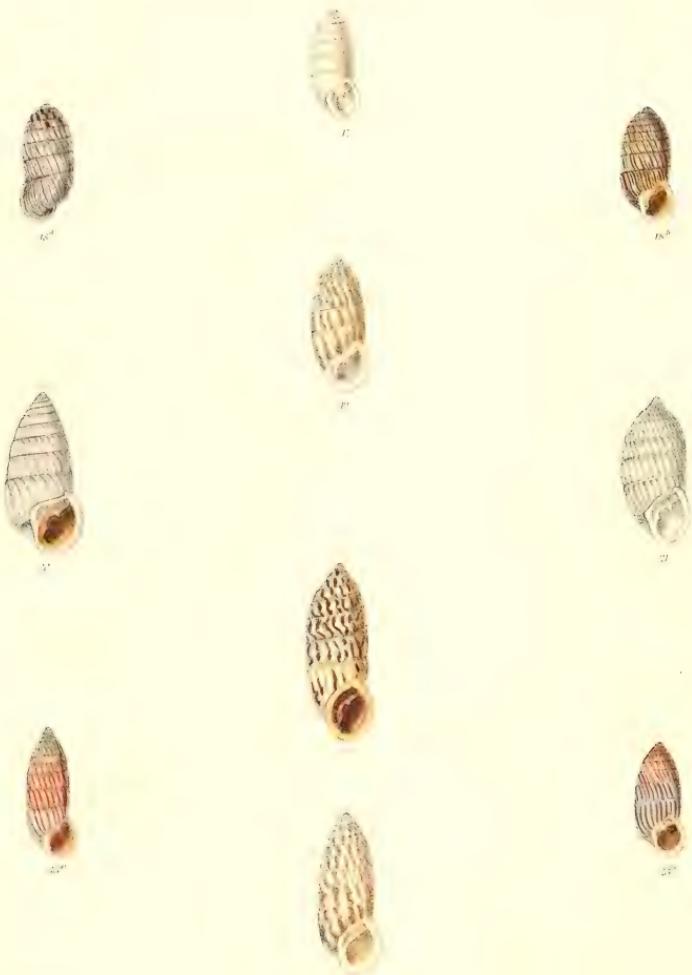

PUPA MARTINIANA. *Pup. testā brevissimā, obscuri roseā, breviter profundē rimatā, subpyramidalē liris distantibus, subarcuatā, propè suturam nodulosis sculptā; aperturā subauriformi, margine crasso, superne angulato, labio interno ad anfractum ultimum uniplicato, columellā vix plicata.*

MARTIN'S PUPA. Shell very short, dull rose, shortly, deeply notched, subpyramidal; sculptured with distant ridges, nodulous near the suture; aperture rather auriform, margin thick, angular above, inner lip with a plait on the last whorl, columella scarcely plaited.

KÜSTER. Pfeiffer, Mon. II. p. 317.

Hab. — ?

This shell is remarkable for having a little knob on the top of each rib at the suture.

PUPA.

PLATE III.

Species 17. (Mus. Brit.)

PUPA DETRITA. *Pup.* testa levigata, tenui, cylindrica, profundè rimata; apice obtuso, fuscous-rubescens; apertura anteriori obliquè producta; labio interno tenui, plicè minutè munito, columella rectissima.

THE WORK PUPA. Shell smooth, thin, cylindrical, deeply notched, pale; apex obtuse, yellowish; aperture anteriorly obliquely produced; inner lip thin, provided with a very small plait, columella rather straight.

SHUTTLEWORTH. Pfeiffer Mon. VI. as *incana* var.
Hab. Florida.

Species 18. (Fig. a. b. Mus. Sowerby.)

PUPA STRIATELLA. *Pup.* testa brevi, pallidè griseo-cresti et subsoeva, fuscous-rubescens variegata; tenuior et regulariter rotata, profundè rimata; labio interno plicè dentiformè validè munito, columella profundè brevi, uniplacata.

THE SMALL-STRIDED PUPA. Shell short, pale greyish or slightly pink, variegated with reddish brown, finely and regularly ridged; deeply notched; inner lip provided with a strong tooth-like plait, columella deep, short, with one fold.

FEUERBACH. Pfeiffer Mon. VI. p. 292.
Hab. Cuba, Haiti, Porto Rico, &c.

Species 19. (Mus. Sowerby.)

PUPA SAGRAIANA. *Pup.* testa breviuscula, sublevigata, griseo-rubescens, rubro-fuscescenti marmorata, profundè rimata; apertura auriformis, magis, marginè crasso, labio interno et columella uniplacatis.

SAGRA'S PUPA. Shell rather short, rather smooth, greyish-red marbled with brownish-red, deeply

notched; aperture auriform, large, margin thick, inner lip and columella with one plait each.

PFEIFFER. Monographia Helicorum II. p. 322.
Hab. Cuba.

Species 20. (Mus. Sowerby.)

PUPA MARITIMA. *Pup.* testa pallidè corollata, subpyramidalis, distanter, leviter costata, inter costas planulata, longè rimata, profundè umbilicata; apertura intus griseo-fusca, profundè, subtrigonoid, marginè crasso, latè reflexo, columella profundissimè, intus leviter plicata, labio interno tenuilè uniplacata.

THE MARITIME PUPA. Shell pale blueish, rather pyramidal, distantly, lightly ribbed, flattened between the ribs; with a long notch, and deep umbilicus; aperture fulvous grey within, deep, almost trigonal, margin thick, broadly reflected, columella very deep, slightly plaited within; inner lip with a thin plait.

PFEIFFER. Monographia II. p. 322.
Hab. Cuba.

Species 21. (Mus. Sowerby.)

PUPA RUDIS. *Pup.* testa obesa, albida, tenui, costellis acutis, distansibus irregulatè, obliquè rimata; apertura magis, supra infusoque acuminata, marginè angusto, reflexo, labio interno plicè elongata & validè munito; columella vix plicata.

THE ROUGH PUPA. Shell obese, whitish, thin, ridged with sharp, distant riblets, obliquely notched; aperture large, acuminate above and below, margin narrow, reflected, inner lip provided with an elongated strong plait, columella scarcely plaited.

PFEIFFER. Monographia Helicorum IV. 657.
Hab. — ?

PUPA.—PLATE III.

Species 22. (Mus. Brit.)

PUPA IOSTOMA. *Pup. testā cylindricā, latā, distanter leviter liratā, corruco-albida, rubro-purpurascenti marmorata et strigata, aufRACTIBUS alliis, rectis, apice acuminato, aperturā crassā violacea, biplicata.*

THE PURPLE-MOUTHED PUPA. Shell cylindrical, broad, distantly lightly ridged, bluish-white marbled or striped with reddish-purple, whorls elevated, straight, apex acuminate, aperture thick, violet, two-plaited.

PFEIFFER. Monographia Heliceorum IV. p. 656.
Hab. Cuba.

The violet colour of the interior of the month is very peculiar.

Species 23. (Fig. a, b, Mus. Brit.)

PUPA ALVEARIA. *Pup. testā subcylindrica, angustā, griseo-rosescenti, vel purpureo inter costas, versus apicem attenuatā, acuminatā, costis crassiunculis numerosis; aperturā brevi, subrotundā, labio interno acutā et minime unipliata.*

THE BEEHIVE PUPA. Shell cylindrical, narrow, grey-

ish-pink or purple between the ribs, attenuated towards the apex, acuminate, with rather thick, numerous ribs, aperture short, rather round, inner lip with a sharp, small plait.

DILWYN (Turbo). Pfeiffer II. 315.

Bulinus fusus, Bruguière.

Pupa fusus, Lamarck.

Pupa rubicunda, Menge.

Hab. Bahamas.

Species 24. (Mus. Brit. and Sowerby.)

PUPA WEINLANDI. *Pup. testā elevatā, cylindrica, transversiter liratā, pallidè rubescenti, fuscō strigata; apice attenuata, aufRACTU ultimo obliquā breviter rotata; aperturā magnā, int̄a fuscā, labio interno vix pliata.*

WEINLAND'S PUPA. Shell elevated, cylindrical, finely ridged, pale reddish, striped with brown, apex attenuated; last whorl obliquely, shortly notched; aperture large, brown within, inner lip scarcely plaited.

KÜHR, MS. Pfeiffer, Mon. VI. p. 290.
Hab. Crooked Island, Bahamas.

PUPA.

PLATE IV.

Species 25. (Mus. Brit.)

PUPA SCHELLE. *Pup. testū parvū, levū, subcylindricā, versō apicē attenuatā, cornutā, vel fuso-purpureo-rascenti, obliquè rimatā; aperturā subquadratā; marginē interno quinquepliata.*

THE EYE PUPA. Shell small, thin, subcylindrical, attenuated towards the apex, horny or purplish-brown, obliquely notched; aperture rather square, inner margin five-plaited.

DUMASIAUD, Mol. Flvr. et Ter.

Pupa juniperi, Fleming.

Helix cylindrica, Städler.

Hab. Europe.

Species 26. (Mus. Theobald.)

PUPA TURTICOIDES. *Pup. testū parvū, pallidū, cylindricū, tenue liratū, suprā medium tanudisculpū, rimatū, aperturā subauriformā; labio inferno unipliata, labio extero suprā medium sinuatum contractu.*

THE FURTIVE PUPA. Shell small, pale, cylindrical, finely ridged, rather more tumid above the middle, notched, aperture somewhat auriform; inner lip single-plaited, outer lip sinuously contracted above the middle.

THEOBALD, Journ. Asiat. Soc. Beng. 1870.

Hab. Shan Provinces.

A little like *P. Blanfordi*, but not so tapering downwards, and quite different in the plaits of the mouth.

Species 27. (Mus. Sievers.)

PUPA PHASIANUS. *Pup. testū albū, parvū, brevi, levū, latū rimatū, versō apicem subattenuatū; aperturā trituberculata quinque, ultimo magno; aperturā subquadrata, marginē interno labiis sexpliata.*

THE PHEASANT PUPA. Shell white, small, short,

smooth, broad, a little attenuated towards the apex; whorls five, the last large, notched; aperture rather square, inner margin of the lips with six plaits.

DUMAS, Journ. de Conch. 1873.

Hab. Central Russia.

Species 28. (Mus. Gassies.)

PUPA LIFOUANA. *Pup. testū minutū, latū, umbilicatū, tenuisimū et regulariter striatū, nitentū, cornutū, ultimo anfractu ad medium fuso unifasciatu; suturā minutissimā crenulatū, anfractibus 6, superiores loculibus, inferioribus altis; aperturā obliquā, quadriplicatā, plieis parietalibus, uno superiori maiori, altero parvī; plieis columellarī et labiali parvī.*

THE LIFOU PUPA. Shell minute, broad, broadly umbilicated, very finely and regularly striated, shiny, horny, and with a brown band in the middle of the last whorl; suture very finely crenulated; whorls 6, upper ones short, lower ones high; aperture oblique, with four plaits; parietal plait, one superior, very large, the other small; columellar and labial plait small.

GASSIES, Fauna Caledonica, Pt. 2, p. 98. 1871.

Hab. LIFOU, of the Loyalty Group.

Species 29. (Mus. Sievers.)

PUPA SIEVERSI. *Pup. testū cylindricā, angustū, pallidissimā falcis, anfractibus 7, ultimo alto, rimato, subperforato, medianis subacylinalibus; apice obtusa; aperturā trigonā, tripliata.*

SIEVERS' PUPA. Shell cylindrical, narrow, very pale fulvous, whorls 7, the last high, notched. Slightly perforated, middle ones nearly equal; apex obtuse; aperture trigonal, three-plaited.

MOUSSON, Journ. de Conchyliologie, Pl. VII, f. 6.

Hab. Alluvial sands of Asia.

PUPA.—PLATE IV.

Species 30. (Mus. Hanley.)

PUPA BLANFORDI. *Pup. testū cylindricō, albidiō, rīmatā, prope apicem evaginatā, infra attenuatā, tenue liratā, anfractibus 8, ultimo angustatō; aper-turā subquadratā, plīcis parietali, columellarī et labiali mediorubris.*

BLANFORD'S PUPA. Shell cylindrical, whitish, notched, ventricose near the apex, attenuated below, finely ridged, whorls 8, the last narrow; aperture rather square, parietal, columellar and labial plaits middle-sized.

GODWIN AUSTIN. Proc. Zool. 1872.

Hab. Khasi Hills.

Species 31. (Fig. a, b, Mus. Crosse.)

PUPA MARIEI. *Pup. testū minutā, fuscocorona, brevi, inglatis, tenui; anfractibus 4, ultimo subumbilicato, supra medium subcontracto; aperturā obliquā, marginē reflexa, tenui, supra medium sinuatum con-tracto, plīcis parietalibus duabus, parcīs.*

MARIE'S PUPA. Shell minute, brown-horny, short, inflated, thin; whorls 4, last slightly umbilicated, a little contracted above the middle: aperture oblique, margin reflected, thin, sinuously contracted above the middle, parietal plait two, small.

CROSSE. Journ. Conch. 1871, p. 202.

Hab. Environs of Neumea.

Species 32. (Mus. Hutton.)

PUPA LAPIDARIA. *Pup. testū parvā, cornuti, albi, rimati, cylindrica, leviter striata, anfractibus 7, inferioribus altis, rectis, subcylindrica, apice obtuso; aperturā subovata, obliqua, antice producta, plīcis 4, parietali elongata, valvula, columellarī et labiali superiori parvis, inferiori elongata.*

THE STONY PUPA. Shell small, horny, high, notched, cylindrical, smoothly striated, whorls 7, lower

ones high, straight, nearly equal, apex obtuse; aperture rather oval, oblique, anteriorly produced, plaits 4, parietal one elongated, strong, columellar and upper labial small, lower elongated.

HUTTON. Asiatic Society of Bengal, 1870, p. 400.

Hab. Afghanistan.

Species 33. (Mus. Hanley.)

PUPA BATHYODON. *Pupa testū nūculā, levigatā, fuscā, brevihisculā, subpyramidalē, spīre versēs apicem attenuatā, anfractibus 5; rotundis, ultimo rotundis, aperturā obliquā, subovata, marginē rubro, plīcis una parietali, duabus columellaribus, duabus labialis; columellā obliquā.*

THE DEEP-TOOCHED PUPA. Shell minute, smooth, brown, rather short, rather pyramidal, spire attenuated towards the apex, whorls 5, rounded, last notched, aperture oblique, rather ovate, margin red, plait one parietal, two columellar, two labial; columella oblique.

BENSON. Annals of Natural History. 1848.

Hab. Nerbudda.

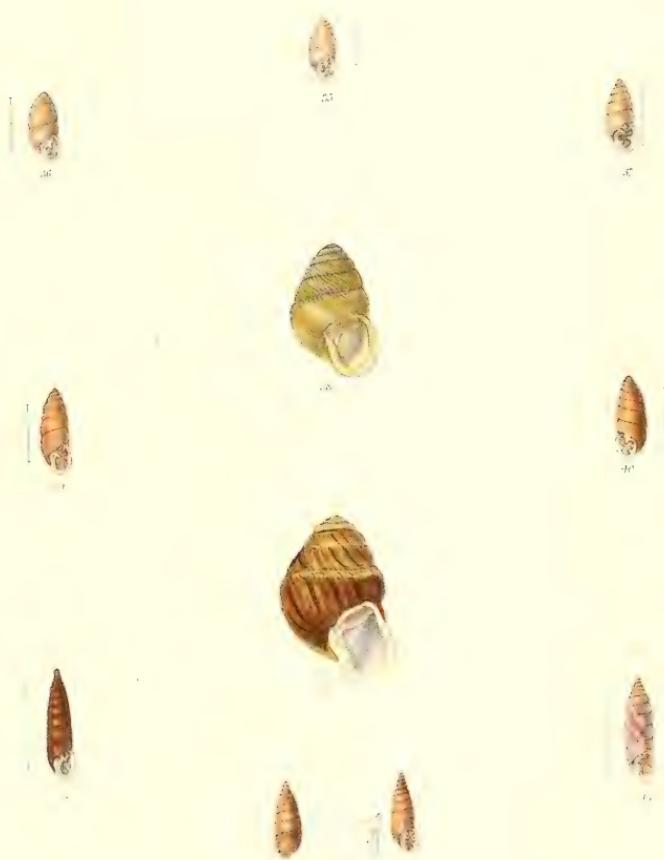

Species 34. (Mus. Gassies.)

PUPA OBSTRUCTA. *Pup. testū albidi, minuta, subovata, laevi, legiter umbilicata, anfractibus 5, convexis, ultimo ingleto, alto; apice pyramidalē, obtuso; aperturā subtriangularē, plīci parietali, rugosā, per-pendiculari, calido.*

THE OBSTRUCTED PUPA. Shell whitish, minute, sub-ovate, smooth, slightly umbilicated, whorls 5, convex, last inflated, high; apex pyramidal, obtuse; aperture subtriangular, parietal plait large, perpendicular, strong.

GASSIES. Fauna Caledonica, 1871, p. 97.

Hab. Environs of Nonmea and Conception.

PUPA.

PLATE V.

Species 35. (Mus. Hanley.)

PUPA MICROTEAGUS. *Pupa testi brevi, post labium arcuatum rimata, cornuta, tenui, semi-pellucida; ultimo anfractu elevato; apertura alba, labus contractus; labio subplanulato; dentibus superè columella nona, perpendiculari, aente; and ad columellam sursum aerei, non ad marginem internum labii externalis planulata.*

THE BRAID-NET PUPA. Shell short, notched in a curve behind the lip, horny, thin, semi-pellucid; last whorl elevated; aperture white, contracted within; lip rather flattened; teeth, one above the columella perpendicular, acute; one on the columella sloped upwards; one on the inner margin of the outer lip, broadly flattened.

PRAESES (Bulinus). Pfr. Bl. Malak. 12, 1865.
Hab. Greece.

Species 36. (Mus. Hanley.)

PUPA TRICUSPIS. *Pupa testi arcuata, crenata, levigata, brevi, anfractibus sex, ultimo subelevata, apertura latissima, marginis levata, alba, de dilatis tribus cuspideis armata.*

THE THREE-SPEAR PUPA. Shell thin, horny, shortly notched, short, whorls six, the last rather raised, aperture rather broad, margin thin, white, armed with three conspicuous teeth.

ROSENÄSLER (Bulinus). Pfr. Mon. Heliceorum — 1868, p. 68.
Hab. Asia Minor.

This species has been placed with *Pupa Bergerii*, as a variety, but is much shorter, with fewer whorls and a thinner peristome.

Species 37. (Mus. Hanley.)

PUPA BERGERII. *Pupa testi clavata, subcentrica, alba vel purpurea, levicula crenata, anfractibus 8, gradatim crescendis; apertura alba, aniformis, superè crenulata, marginis crassa, dentibus tridens crassis acutis armata.*

BERGEN'S PUPA. Shell elevated, rather ventricose, white or purple, shortly notched, whorls 8, gradually increasing; aperture white, ear-shaped, pointed above, margin thick, armed with three thick and sharp teeth.

ROTHMAN (Bulinus). Pfeiffer, Monographia Heliceorum, 1868, p. 68.

Chondrus Bergerii. Mousson.
Hab. Southern Europe.

See observation on the preceding species.

Species 38. (Mus. Hanley.)

PUPA SULCATA. *Pupa testi ventricosa, crassissimata, cornuta; spira obtusa, trochiformis, aufructibus aquilonibus crescentibus, obliquè irata, suture praefundata; ultimo anfractu planissimo, transversè rimata, apertura obliquè producta; superè subquadrata, marginis crassa, reflexa; columella levata.*

THE GROOVED PUPA. Shell ventricose, rather thick, horny; spire obtuse, trochiform, whorls equally increasing, obliquely ridged, suture deep; last whorl rather smooth, transversely notched, aperture obliquely produced, rather square above, margin thick, reflexed; columella rather straight.

BRUGGE'S (Bulinus). Enc. Mel.
Gibbos Globiferinus. Adams.
Hab. Mauritius.

Species 39. (Mus. Hanley.)

PUPA ELATA. *Pupa testi subfusiformis, purpureo-cornata; spira elevata, anfractibus 7, lente crescentibus, convexissimata, ultimo clavata, vix rimata; apertura subovata, marginis albido, crassissimata, subplanulata, dentibus duabus, parvis, uno supra columellam levata, uno ad marginem internum labii externalis elevata; columella crenulata.*

THE ELEVATED PUPA. Shell subfusciform, purplish-horny; spire elevated, whorls 7, slowly increasing, rather convex, the last raised, scarcely notched; aperture rather oval, margin whitish, rather thick, rather flattened, teeth two, small, one above the columella, sharp; one on the inner margin of the outer lip, elevated; columella without teeth.

SCHMIDT. —? MS.
Hab. Corinthia.

This species belongs to the 'Chondrus' group.

PUPA.—PLATE V.

Species 40. (Mus. Hanley.)

PUPA QUADEIDENS. *Pup. testá cláhi, subcylindricá, purpureo-fuscá, tenui, angusti, sinistrá; spíre elevatá, anfractibus 8, rectiangularis, lete crescentibus; aperturá brevi, subtriangularis; margine albo, planulato; dentibus labii extérii uno, anfractis ultimi uno, columellae duobus.*

THE FOUR-TOOTHED PUPA. Shell raised, subcylindrical, purple-brown, thin, narrow, sinistral; spire raised, whorls 8, rather straight, slowly increasing; aperture short, rather trigonal; margin white, flattened; teeth, one on the body whorl, one on the outer lip, and two on the columella.

MÜLLER (Pupa). Pfr. (Bulimus), Mon. Hel. 1868, p. 69. Genus "chondrula."

Hab. Southern Europe.

Species 41. (Mus. Hanley.)

PUPA PAGODA. *Pup. testá solidissimam, vóbis fusco-purpúrea, castaneo-lineatá, tenuiter liratá, ventricosá, lati; spíre trochiformis; ultimo anfractu ad sartum gibbos, tum declivit, infra profundi, longe et transversè rimato; aperturá albá, obliquè producti, subquadrata, margine incrassato, edentula.*

THE PAGODA PUPA. Shell rather solid, greenish-brown, with chestnut lines, finely ridged, ventricose, broad; spire trochiform; last whorl gibbous at the suture, then sloped downwards, with a deep, long, and transverse notch below; aperture white, obliquely produced, rather square, margin thickened, toothless.

FEERISSAC (Helix), Pfr. (Pupa), Mon. Hel. 1868, p. 287.

Helix concolorata, Wood.

Pupa Idaea. Mentre.

Hab. Mauritius.

Belonging to the "Gibbus" or "Gonidomus" section.

Species 42. (Mus. Hanley.)

PUPA VARIABILIS. *Pup. testá elongato-cylindricá, purpureo-fasciá, solidissimam, spíre elevatissimam, anfractibus 13, rectiangularis, lete crescentibus, ultimo transversè rimato; aperturá magiá; margine albo, subincassato, labio externo supra medium tumido, plícis anfractis ultimi minuti, plícis columellaribus duabus, minutis, plícis interíus duabus, lamelliformibus.*

THE VARIABLE PUPA. Shell elongated-cylindrical, purple-brown, rather solid, spire much raised, whorls 13, rather straight, slowly increasing, the last transversely notched; aperture large; margin white, rather thickened, outer lip tumid above the middle, fold of the body whorl minute, columellar folds two, small, internal folds two, lamelliform.

DEAPARNAUD. Coq. Fluv. et Terr.

Helix multitalis. Ferrussac.

Pupa undulatula. Olivier.

Hab. France, Spain, Greece.

Species 43. (Mus. Hanley.)

PUPA QUISQUELATA. *Pup. testá subfusiformi, elongatá, grisea, fusco-variegatá, levigatá; spíre elevatissimam, medio subangulatá, anfractibus 10, convexissimis; ultimo obliquè rimato; aperturá ovali, plícis interíus tribus, plícid columellari and, plícid anfractis ultimi parvá, margine tenui.*

THE FIVE-TOOTHED PUPA. Shell rather fusiform, elongated, grey, variegated with brown, smooth; with elevated spire; a little inflated in the middle; whorls ten, rather convex; the last obliquely notched; aperture ovate, interior folds three, columellar fold one, fold on the body-whorl small; margin thin.

BOEN. —— Pfr. Mon. Hel.

Bulinus similis. Bruguière.

Jannina quisquelaflata. Rissö.

Hab. Southern Europe.

Species 44. (Mus. Hanley.)

PUPA FRUMENTUM. *Pup. testá parvá, subfusiformi, fuscá, levigatá; spíre elevatá, medio subangulatá; anfractibus 11, lete crescentibus; ultimo longe rimato; aperturá latissimam, columellá profunda, latissimam, intus bilobatá; deinde anfractis ultimi parvo, plícis interíus quatuor, lamelliformibus, ad dorem apparentibus.*

THE CORN PUPA. Shell small, rather fusiform, brown, smooth; spire elevated, a little inflated in the middle; whorls 11, slowly increasing; the last with a long notch; aperture rather broad, columella deep, very broad, with two interior teeth; tooth of the body whorl small, internal folds four, lamelliform.

DEAPARNAUD. Coq. Fluv. et Ter.

Pupa curta. Potiez et Michaud.

Hab. Southern Europe.

PUPA.

PLATE VI.

Species 45. (Mus. Hanley.)

Pupa septendentata. *Pup.* testi brevi, ventricosus, albus, levigatus; spira brevissima, anfractibus 4, rapidè crescentibus, angustis, concavis; ultima rectangulo, clato, post labium internum ciliis breviter rotundato; aperturæ brevi, subovata, margine interno septendentata, margine externo acuta.

THE SEVEN-TOOTHED PUPA. Shell short, ventricose, white, smooth; spire very short, whorls 4, quickly increased, narrow, rather convex; the last rather straight, elevated, with a short oblique notch behind the inner lip; aperture short, rather ovate; inner margin seven-toothed, outer margin sharp.

ROTHMAN. ——? Pfr. (*Bulinus*). Mon. Hel. 1868, p. 70.

Hab. Syria.

Belongs to the 'Chondrus' group of species.

Species 46. (Mus. Hanley.)

Pupa cylindrica. *Pup.* testi parvæ, fusiæ, levigata, cylindrica; spira obtusa, elongata, anfractibus 7, medianis ex crescentibus; ultima profundi ciliato, aperturæ brevi, angustata, labio exterior intus incrassato, columellæ uniplicata, anfractus ultimus supra columellanæ pliò elongata munito.

THE THROAT PUPA. Shell small, brown, smooth, cylindrical; spire obtuse, elongated, whorls 7, middle ones scarcely increasing; last deeply notched; aperture short, narrow, outer lip thickened within, columella with one plait; last whorl provided with one plait above the columella.

RÖSSMÄSLER. Pfr. Mon. Hel. 1868, vol. 6, p. 305.

Hab. Transylvania, &c.

Species 47. (Mus. Hanley.)

Pupa tridens. *Pup.* testi subovata, pallidissimæ rubescens, spira elevata, anfractibus 6, superioribus 5 angustis, subangulis, ultima elevata, breviter rotundata; aperturæ subovata, margine reflexa, subplanata, intus tridecata.

THE THREE-TOOTHED PUPA. Shell subovate; very pale reddish, spire raised, whorls 6, upper 5 narrow, rather inflated, last raised, with a short notch; aperture rather oval, margin reflected, rather flattened, three-toothed within.

MÜLLER (*Helix*), Pfr. (*Bulinus*). Mon. Hel. 1868, vol. 6, p. 69.

Hab. Central Europe.

Belongs to the 'Chondrus' group.

Species 48. (Mus. Hanley.)

Pupa palanga. *Pup.* testi elongatae-oblita, epidermis corneo indutæ, solidæ, regulariter obliquè levigata; spira elevata, obtusissima; anfractibus 7, medianis levè crescentibus, ultima elongata, breviter rotundata; aperturæ subquadrata; perifovea continua, marginè rotunda, super anfractum obliquum uniplicata.

THE CLUB PUPA. Shell elongated, cylindrical, covered with horny epidermis, solid, regularly obliquely ridged; spire elevated, very obtuse; whorls 7, the middle ones slowly increasing, last elongated, shortly notched; aperture rather square; peristome continuous, margin rounded with a single tooth upon the last whorl.

LESSON. ——? Pfr. Mon. Hel. 1868, vol. 6, p. 293.

Pupa fusus, Potiez et Mich.

Hab. Isle of France.

Species 49. (Mus. Hanley.)

Pupa quinquefida. *Pup.* testi pallidè fulvis, subœutatæ, levigata; spira elevata, pupiformi, inflata; anfractibus 7, levè crescentibus, ultima longè rotundata; aperturæ subtriangularis, marginè alba, continua, ceausa reflexa, ad suturam callosa; plieis dentiformibus quinque munito.

THE FIVE-TOOTHED PUPA. Shell pale fulvous, subovate, smooth; spire elevated, pupa-shaped, inflated; whorls 7, slowly increasing, the last with a long notch; aperture subtriangular, margin white, continuous, thick, reflected, callous at the suture, provided with five tooth-shaped plaits.

MÜHLEFELDT.—Pfr. Mon. Hel. 1868, vol. 6. (*Bulinus*). p. 68.

PUPA.—PLATE VI.

Pupa quinqueplicata. Potiez et Michaud.

Hab. Dalmatia.

A species of the 'Chondrus' or 'Chondrula' group, resembling *Pupa tricuspis*, but having a second small plait on the body whorl, and the same on the columella, making, with the large one on the outer lip, five tooth-like projections.

Species 50. (Mus. Hanley.)

PUPA SPreta. *Pup. testā ovalē-acuminatā, pallidē fulvā, tenuiter striatā; spira elevatā, anfractibus 6, concrecūseculis, tribus apicalibus rapidē crescentibus, medianis subequalibus, ultimo alto breviter rotundato; aperturā brevīsculā, subauriformi, margine albo, crasso, reflexo, lato, subplanato, int̄a tridentato.*

THE SLIGHTED PUPA. Shell ovati-acuminated, pale fulvous, finely striated; spire elevated, whorls 6, rather convex, the three of the apex quickly enlarging, the middle nearly equal, the last high, with a short notch; aperture rather short; rather auriform, margin white, thick, reflected, broad, rather flattened, three-toothed within.

REEVE (*Bulimus spreitus*). Conch. Icon. Monog. Bulimus.

It was not observed, till after figuring this shell, that it had been admitted among the Bulimi. It belongs to the 'Chondrus' group.

Species 51. (Mus. Hanley.)

PUPA NEWTONI. *Pup. testā obliquē elongato-ovatā, obliquē costatā, pallidē latit̄; spira subtrochiformi, suture profunda, anfractibus 6, concrecūseculis, ultimo profundiō rotundato, anticē ascendentē; aperturā obliquē oblongā, margine breviter expanso, tenuiter rotundo, pr̄ callum super anfractum ultimo continuo, columellā obliquā.*

NEWTON'S PUPA. Shell obliquely elongated ovate, obliquely ribbed, pale yellowish; spire rather trochiform with a deep suture; whorls 6, rather convex, the last with a deep notch, anteriorly ascending; aperture obliquely oblong, margin shortly expanded, thinly rounded, continued by a callus on the last whorl, columella oblique.

H. ADAMS (*Gibbus*). Proc. Zool. Soc. 1867, p. 305.
Hab. Stag's Cave in the Mauritius.

Thinner, narrower, and more finely sculptured than *Pupa sulcata*.

Species 52. (Mus. Hanley.)

PUPA DEALDATA. *Pup. testā oblongā, obtusissimè cylindricā, albā, tenuissimō striatā; spira truncatā, anfractibus 5, superioribus inflatis; ultimo profundiō rimato, subangustato; aperturā subquadratā, latā, anticē rotunda, posticē subtruncatā.*

THE WHITENED PUPA. Shell oblong, very obtusely cylindrical, white, very finely striated; spire truncated, whorls 5, the upper ones inflated, last with a deep notch, rather narrow; aperture subquadrate, broad, anteriorly rounded, posterior rather truncated.

WEBBS. Pr. Mon. Hel. 1868, vol. 6, p. 287.

Hab. Canary Islands.

Differing from 'P. modiolus' (Sp. 54) in the enlargement of the upper whorls.

Species 53. (Mus. Hanley.)

PUPA SEDUCTILIS. *Pup. testā sinistrorsī pallidē, fulcā, cylindricā, levī, spira elevatā, anfractibus 8, medianis lentē crescentibus subequalibus, ultimo indistincte rotundato; aperturā brevi, margine crasso, int̄a valvulā tridentatā.*

THE SEDUCTIVE PUPA. Shell pale fulvous, cylindrical, smooth, spire elevated, whorls 8, middle ones slowly increasing, nearly equal, last with an indistinct notch; aperture short, margin thick, strong, with three strong teeth within.

ZEIGLER.—Pr. Mon. Hel. (*Bulimus*), 1868, vol. 6 (*Bulimus*), p. 69.

Bulimus Niso, Pfeiffer. Olim.

Hab. Central Europe.

Of the 'Chondrus' group.

Species 54. (Mus. Hanley.)

PUPA MODIOLUS. *Pup. testā breviter cylindricā, albida, tenuiter obliquē striatā, spira versis apicem paulo attenuatā, anfractibus 6, apicalibus obtusis, ultimo profundiō rotundato; aperturā anticē ascendentē subquadratā, margine albo, subcuspido, levī.*

THE BUCKEL PUPA. Shell shortly cylindrical, whitish, finely obliquely striated, spire a little tapering towards the apex, whorls 6, apical ones obtuse, the last deeply notched; aperture raised in front, rather square, margin white, rather expanded, smooth.

FERRUSSAC.—Pr. Mon. Hel. 1868, vol. 6, p. 293.
Hab. Isle of France (Bourbon).

Of the 'Gibbus' group, much shorter than 'Pupa palanga.'

PLATE VII.

Species 55. (Mus. Hanley.)

PUPA POLIUM. *Pup. testū carnis, tenūlē oblique striatā, cylindricā, elatā; anfractibus decem, depresso, medianis subequalibus, superioribus subito contractis, ultima longe rimata, spira obtusa; apertura super ultimum anfractum elevata, marginē alba; columellā biplicata, ultima asperata prope labium extrema uniplicata.*

THE TEX PUPA. Shell horny, finely obliquely striated, cylindrical, raised; whorls ten, depressed, middle nearly equal, the upper ones suddenly contracted, the last with a long notch, spire obtuse, aperture raised on the last whorl, margin white; columella two-plaited, last whorl with a single plait near the outer lip.

DRAPARNAUD. Mol. Terest. et Fluv.

Hub. Spain. France. Germany.

Species 56. (Mus. Hanley.)

PUPA MUSCERIA. *Pup. testū fuscovenusta, levigata, albida, subcylindrica; anfractibus quinque, ultima profunde cincta, penultima inflata, superioribus gradatim attenuatis, apex obtusa; apertura subquadrata, plies tridens, nisi ad medium labii interiore, nisi ad medianam columellarē, non latius apertura locata.*

THE MUSCERIA PUPA. Shell horny-brown, rather smooth, elevated, subcylindrical; whorls five, last deeply notched, penultimate inflated, upper gradually attenuated, apex obtuse; aperture subquadrate, plies three, one placed at the middle of the inner lip, one at the middle of the columella, and one within the aperture.

BENSON, v. Hanley's Indian Shells.

Hub. Ceylon.

Species 57. (Mus. Hanley.)

PUPA PLANGUNICULA. *Pup. testū albū, politā, pellucido, albū, cylindrica; anfractibus quinque, evolutioribus, primo obtusissimā compresso, ultimo obliquè rimato, umbilicato; suturi profundis; apertura contracta, plies columellarī crassis, quasi*

duplicatis, callo labii interiore marciata, labio externo concavā marginata, medio sinistrim contracta, intus arcuata, plies medianā elongatā, arcuata.

THE FIFER PUPA. Shell white, polished, pellucid, elevated, cylindrical: whorls five, straight-sided, the first very obtusely compressed, the last obliquely notched, umbilicated; suture deep; aperture contracted, columellar fold thick, as it were duplicated, callus of the inner lip very large, outer lip neatly bordered, sinuously contracted in the middle, with three plaits inside, the middle plait elongated, acute.

BENSON, v. Hanley's Ind. Shells.

Hub. Kurnam Hills.

Species 58. (Mus. Hanley.)

PUPA SCULPTA. *Pup. testū angustā, attenuatā, albida; anfractibus octo, apicibus horripilatis, medianis et inferioribus conicis et cibris plicatis, ad suturam excurrentibus; ultimo rimato, aperturā latissimā, plies rotundatā maximā, plies columellarī lamelliformi, plies interiore rotundā.*

THE SCULPTURE PUPA. Shell narrow, attenuated, whitish; whorls eight, those at the apex smooth, middle and lower neatly and closely plaited, crenulated at the suture; the last notched; aperture rather broad, sutural plait very large, columellar plait lamelliform, inner plait strong.

BENSON, v. Hanley's Ind. Shells.

Hub. —? India.

Species 59. (Mus. Hanley.)

PUPA TILSA. *Pup. parvū, fuscō-albuscenti; anfractibus quinque, tribus ingulis, rapido crescentibus, floscosstriatis, ultimo breviōscendo, breviter rimato; aperturā auriformi, quinqueplicata.*

THE THREADED PUPA. Shell small, blackish brown: whorls four, three inflated, rapidly increased, with thread-like striae, the last rather short, shortly notched; aperture ear-shaped, five-plaited.

THEOBALD, Hanley's Indian Shells.

Hub. India.

PUPA.—PLATE VII.

Species 60. (Mus. Hanley.)

PUPA ATANICA. *Pup. pellucid, parv, lev, subcylindric; anfractibus quinque, depressis, rotundis, convexissimis; ultimo breviter rimato, adscendentis; aperturā latiōculat, callo crasso, magno, lūfido, parietale prope suturam anfractis ultimi, columellā biplicatā; labio extero albo, lato; plīcis palatalib⁹ tribus.*

THE AVA PUPA. Shell pellucid, small, smooth, subcylindrical; whorls five, rather depressed, round, very convex; the last shortly notched, ascending; aperture rather broad, with a thick, large, divided parietal callus near the suture of the last whorl, columella with two plaits, outer lip white, broad; palatal plaits three.

BENSON, Ann. and Mag. of Nat. Hist. Dec. 1863,
p. 424.

Hab. Ava. Blanford.

Species 61. (Mus. Hanley.)

PUPA MIMULA. *Pup. testā minūtā, ventrīcosā, subviridi-cornēa, tenuiter striatā, anfractibus quatuor, convexis, apicālē obtusissimā, ultimo vix adscendit, brevissimā rimato; aperturā subquadratā, dentissimā quinque-dentata.*

THE MIMIC PUPA. Shell minute, ventricose, greenish-horn, finely striated, whorls 4, convex, the apical one very obtuse, the last scarcely raised, very shortly notched, very sharply five-toothed.

BENSON, Hanley's Indian Shells.

Hab. Ceylon.

The five tooth-like plaits, one on the body-whorl, two on the columella, and two on the outer lip, nearly meet in the middle.

Species 62. (Mus. —? Copied.)

PUPA SALEMANENSIS. *Pup. testā minutissimā, conicā, costellatā, anfractibus quinque, gradatim crescentibus, ultimo profundè rimato; aperturā aniriformē, plus dentiformibus, dudum parietalibus, unde medio labi⁹ exteri⁹ prominenti armata.*

SALEMAN'S PUPA. Shell very minute, conical, finely ribbed, whorls five, gradually increasing, the last deeply notched; aperture ear-shaped, armed with

tooth-like plaits, two parietal, one prominent on the outer lip.

BLANFORD (Ennea). Contributions to Ind. Mal. No. 2, 1861, p. 13, t. 2, f. 8.

Hab. India.

Species 63. (Mus. Brit.)

PUPA INDICA. *Pupi testā parv, subcylindricā, cornēa, semipellucidā, anfractibus quinque, levīsensilis, tribus superioribus rapidē crescentibus, rotundis, penultimā et ultimā rectilōculatā, ultimo sublongata, breviter rimato; aperturā subquadratā, mucrone crasso, reflexo, quadridentata.*

THE INDIAN PUPA. Shell small, subcylindrical, horny, semipellucid, whorls five, rather smooth, the three upper ones quickly increased, rounded, the penultimate and last rather straight, the last rather long, with a short notch; aperture rather square, with thick, reflected four-toothed margin.

PFEIFFER, Mon. Helic. IV. 679.

Hab. Barrakpore, India.

Species 64. (Mus. —? Copied.)

PUPA CYLINDRELOIDEA. *Pup. testā parvā, attenuatā, albid, apice obtuso, medio ventrīcosā, basi subcontracta; anfractibus 10, concavēculis, profundi subtortis; primis tribus levigatis, hyaliniis, ceteris confertim costulatis, ultimo insrā subcarinato, obliqui soluti, pauli descendenti; aperturā paulo obliqui, ovals-subrotundā, suprā prop̄ angulum posteriore lamellā obliquā, crassissimā, valde contractata, labio extero superne prope angulum unicolorata.*

THE CYLINDERELLA-SHAPED PUPA. Shell small, attenuated, white, apex obtuse, middle ventricose, rather contracted at the base; whorls ten, rather convex, with a deep suture; the three first smooth, glassy, the rest closely ribbed, the last slightly keeled below, obliquely separated, a little descending; aperture a little oblique, ovate-rounded, with an oblique, very thick, strongly curved lamina above, near the posterior angle, outer lip with a single tooth on the outer lip above near the angle.

STOLICZKA, Journ. As. Soc. Bengal. Vol. XL. Pt. II. 1871.

Hab. Mouhnein, India.

PLATE VIII.

Species 65. (Mus. Hanley.)

Pupa Kokielii. *Pap.*, testa alba, semipellucida, levigata, pyramidalis, brevis; angustitibus septem, rotundis, brevibus, primo obtuso depresso, ultimo ventricoso, profundi crenatim undulatior; aperturae cable ascendente, parvæ, plieis deundem non exer, superficie ultimum denticulata ad columellarum nodi, ad marginem interiorum labiorum exteriorum levibus angustiora, et circa interradiorum pectus.

KOKEIL'S PUPA. Shell white, semipellucid, smooth, pyramidal, short; whorls seven, rounded, short, the first obtusely depressed; last ventricose, deeply notched and umbilicated, aperture strongly ascending, small, with two tooth-like plaita on the body whorl, one at the columella, three larger on the inner edge of the outer lip, and others small, intermediate.

ROSMASLER. Pleiöller, Mon. Hel. II, 353.
Helix Murexaudii, Fer.
Hab. Dalmatia.

A curious little shell, with the aperture turned up towards the suture of the last whorl.

Species 65. (Mus. Hanley.)

Pupa procera. *Pap.*, testa parva, cylindrica, fusa, levigata; apex obtuso, angustitibus subundulatis, medianis subaequalibus, rectilobatis, ultimo rotunda; aperturae, parvæ, subquadrate, plieis deundem non columellaris, non super angustitatem ultimum producta, bifida.

THE PROMINENT PUPA. Shell small, cylindrical, brown, rather smooth; apex obtuse, whorls six, rather rounded, the middle ones rather equal, straight-sided, the last notched; aperture small, rather square, tooth-like plaita, one columellar, one on the last whorl produced, double-pointed.

GOLDI. Boiten, Journ. IV, 3, p. 359.

Pupa rapido von Pfr.

Pupa crenulata, Gould.

Hab. Baltimore, U. S.

Species 67. (Mus. Hanley.)

Pupa contracta. *Pap.*, parva, alba, pellucida, brevis, pyramidalis; angustitibus quinque, gradatim crescentibus, rotundis, ultimo longe rotundo, aperturae subtriangulari, parvæ, plieis, non super angustitatem ultimum prope sotaram maxima, bivalvata, tribus interradiorum lumenatis.

THE CONTRACTED PUPA. Shell small, white, pellucid, short, pyramidal; whorls five, gradually increased, rounded, the last with a long notch, aperture subtriangular, small plaita, one on the last whorl near the suture, very large, laminar, three internal, laminar.

GULMAN. Pleiöller, Mon. Hel.
Hab. Vermont.

Species 68. (Mus. Hanley.)

Pupa Muhlfeldti. *Pap.*, fuscocinnamato, pyramidata, levigata, apex obtuso; angustitibus sex rotundis, gradatim crescentibus, oblique tenuiter rotundis, ultimo compresso-ventricosa, profundi crenatior; aperturae subtriangulari, inservienti, plieis super angustitatem ellipticae non conspicuae, duabus et columellaribus, duabus intus marginum exterarum elongatis.

MUHLFELDT'S PUPA. Shell blackish brown, pyramidal, rather thin, apex obtuse; whorls six, rounded, gradually increasing, obliquely finely ridged; the last compressed-ventricose, deeply notched; aperture subtriangular, raised, one conspicuous plaita on the last whorl, two on the columella, three lengthened within the outer lip.

KÜSTER. Pleiöller, Mon. Hel.

Pupa quinque-plieida j Muhlfeldt.

Pupa crenata

Hab. Dalmatia.

Species 69. (Mus. Hanley.)

Pupa Philippi. *Pap.*, testa parva, fusa, elongata, cylindrica, versus apicem attenuata, tenuissime striata; angustitibus quinque moderate concavis;

PUPA.—PLATE VIII.

aperturā ovatā, angustā, plīcis parietalibus super anfractum ultimum duobus, plīcē palatali infra medium ad labii extēni marginē extēnum extēnsa.

PHILIPPI'S PUPA. Shell small, brown, elongated, cylindrical, attenuated towards the apex, very finely striated; whorls five, moderately convex; aperture ovate, narrow, with two parietal plait upon the body whorl, a palatal plait below the middle extended to the outer margin of the lip.
CANTRAYNE. Pfeiffer, Mon. Hel. II. 350.

Pupa exigua (var.) Mousson.

Hab. Italy—Dalmatia—Isl. Corfu.

Species 70. (Mus. Hanley.)

PUPA ATENACEA. *Pup. testā elati, fuscā, attenuatā, anfractibus sex, moderatō convexus; aperturā ovatā, callo suturali validō, plīcis super ultimum anfractum unā, ad columellam duobus, iatis marginē internum labii extēni tribus lamelliformib⁹ aper- turam intratibus.*

THE WHEAT PUPA. Shell raised, brown, attenuated; whorls six, moderately convex; aperture ovate, sutural callus strong, plates on the last whorl one, two on the columnella, three within the inner margin of the outer lip, lamelliform, entering the mouth.

BUCQUÉEIN. Pfeiffer, Mon. Hel. II. 347.

Pupa avena, Draparnaud.

Pupa hordeum, Ferrassac.

Hab. Germany, Austria, Spain, France, &c.

Species 71. (Mus. —? Copied.)

PUPA METARLATA. *Pup. testā brevēnsulē, tenuiter costellatā, pallidō fulvā, cylindrica, spirē obtusā, anfractibus sex, ultimā profundiā rimato; aperturā dentulatā, vix obliquā, ovato-pyriformi; columellā subboliqū, labio extēno vix reflexo.*

THE ELENT-POINTED PUPA. Shell rather short, finely ribbed, pale fulvous, cylindrical, spire obtuse, whorls six, the last deeply notched; aperture without teeth, scarcely oblique, ovate-pyriform; columnella rather oblique; outer lip scarcely reflected.

CROSS (Gonospira), Journal de Couchyliologie, 1874, p. 224. Pl. VIII. f. 5.

Gonospira Dupontiana. Crosse (olim).

Hab. Isl. Rodriguez.

Shorter and more ventricose than *P. modiolus*, with larger aperture and a slight obliquity.

Species 72. (Mus. —? Copied.)

PUPA RODRIGUEZENSIS. *Pup. testā profundiā rimata; albā, subcylindrica, tenui, translucida, leviter striata, apice conico; anfractibus quinque, duobus ultimis cylindricis; aperturā subquadratā, edentulata; labio extēno tenui.*

THE RODRIGUEZ PUPA. Shell deeply notched, white, rather cylindrical, thin, translucent, finely striated; apex conical; whorls five, the two last cylindrical; aperture rather square, toothless, outer lip thin.

CROSSE. Journ. de Conch. 1874, p. 224, Pl. VIII. Fig. 4.

Hab. Isl. Rodriguez.

A likeness in miniature of the preceding, but much shorter and thinner, with the mouth straighter.

Species 73. (Mus. —? Copied.)

PUPA CHLOIS. *Pup. testā glauvida, versus apicem rubescens, brevi, cylindrica; apice conico, obtuso; anfractibus quinque, densi costellatis; aperturā obliqua, subquadrata, edentula.*

THE GOLDEN PUPA. Shell yellow, becoming red towards the apex, short, cylindrical; apex conical, obtuse; whorls five, closely ribbed; aperture oblique, rather square, without teeth.

CROSSE (Gonospira), Journ. de Conch. 1874, f. 7.

Hab. Isl. Rodriguez.

Shorter and more solidly ribbed than the two preceding, with the aperture more oblique.

Species 74. (Mus. —? Copied.)

PUPA SINUATA. *Pup. minitissimā fulvo-cornē, lori, brevi, ventricosā; anfractibus quatuor, rotundis, apicibus duobus rapidē crescentibus, ultimis duobus inflatis, ultimo rimato; aperturā subquadrata, dentibus sex contracta et siuata.*

THE SINUATED PUPA. Shell very minutely fulvous-horny, smooth, short, ventricose; whorls four, rounded, the two apical quickly enlarged, the last two inflated, the last with a notch; aperture rather square, contracted and sinuated with six teeth.

MOUSSOX (Vertigo), Crosse, Journ. de Conch. Pl. VIII. Fig. 10.

Hab. Araxis.

PUPA.

PLATE IX.

Species 75. (Mus. Hanley.)

Pupa ruficola. *Pup. testi parei, alludi, elati, seorsim pellucidi, brevi; anfractibus quinque, rotundis, cerasus apice attenuatis, suture profundi separatis, ultimo eis rotundo; apertura subtriangularis, platis quatuor, und super anfractum ultimum, uno edentulari, duabus latero ad latum exterum transversim.*

THE STONE-DWELLING PUPA. Shell small, whitish, raised, semi-pellucid, smooth; whorls five, rounded, attenuated towards the apex, separated towards the apex; the last scarcely notched; aperture rather trigonal, plait four, one on the body whorl, one columellar, two internal, terminating at the outer lip.

SAY, Pfr. Mon. Hel. II. 358.

Pupa carinata, Gould.

Pupa rupestris, Gould.

Hab. Florida, Baltimore, U.S.

Species 76. (Mus. Hanley.)

Pupa simplex. *Pup. testi parei, brevissimis, obdusi, fuso; apice obtuso; anfractibus sex, leviter striatis; ultimo infrae pauci concreto, profundius rotundato; apertura subtriangularis, callus suturali angustus, lameliformis, arcuata, platis edentulae horizonte duabus elongatis, uno super anfractum ultimum intendit, duabus palatalibus elongatis; labio externo super medium siue inchoato incassato.*

THE SIMPLE PUPA. Shell small, rather short, obtuse, brown, apex obtuse; whorls six, finely striated, a little contracted below, deeply notched; aperture rather trigonal, sutural callus large, lameliform, arched, two columellar plait elongated, one on last whorl internal; two palatal, elongated; outer lip sinuously thickened.

GOULD (Vertigo), Pfr. Mon. Hel. II. 302.

Hab. Massachusetts.

Species 77. (Mus. Sowb.)

Pupa mesorum. *Pup. testi parei, cylindrici, brevi, levigata; apice obtusissimo, anfractibus 6, ro-*

tundis, suturi profundi separatis, ad apicem rapido crescentibus, ceteris subequalibus, ultimo breviter rotundo; apertura paulo adscendentia, dentata, apicali vel edentula, labio externo ad marginem leviter, post marginem incassata, extremitate alba.

THE FLY'S PUPA. Shell small, cylindrical, short, smooth; apex very obtuse, whorls 6, rounded, separated by a deep suture, rapidly increasing at the apex, others nearly equal, last shortly notched; aperture a little raised, with tooth-like plait or without teeth; outer lip thin at the margin, thickened and white behind the margin outside.

Species 78.

Species 78. (Mus. Sowb.)

Pupa callipera. *Pup. testi brevi, pyramidalis, oblique costata, obtusa; anfractibus quinque, tribus apicalibus rapido crescentibus, ultimo profundi rotundato; apertura oblongisensibilis, infrae rotundata; supra subquadrata, callus suturali super anfractum ultimum conspicuus; marginis apertura subcuspatis, reflexa.*

THE CALLIPS-BEARING PUPA. Shell short, pyramidal, slightly ribbed, obtuse; whorls five, three apical, rapidly increasing, last deeply notched; aperture rather oblong, rounded below, rather square above, with a conspicuous sutural callus upon the last whorl; margin of the aperture somewhat expanded, reflected.

MORELET, Sev. Conch. ii. 1860.

Hab. Mauritius.

Species 79. (Mus. Sowb.)

Pupa versipellis. *Pup. testi oblongi cylindracei, albi, obliquè costellata; apice obtusissimo; anfractibus 6, tribus primis rotundis nippid crescentibus, tribus ceteris subequalibus, convexisculis, ultimo paulo*

PUPA.—PLATE IX.

*majori, profundè umbilico-rimato; aperturā sub-
rotundā, callo prope suturā inconspicuo; mar-
gine expanso, reflexo, ferō luteo.*

THE CHANGEABLE PUPA. Shell oblong, cylindrical, white, obliquely costellated; apex very obtuse, whorls six, three first rounded, rapidly increased, the three others with a deeply notched umbilicus; aperture rather rounded, with an inconspicuous callus near the suture; margin expanded, reflected, almost entire.

FERRASSAC (*Versipolis*), Plfr. Mon. Hel. II. 319.
Hab. Isle of Bourbon.

Species 89. (Mus. Sowb.)

PUPA FACILLIS. *Pup. testū cylindrico-subpyramidalis,
superē rubor, infū glaciid; anfractibus sex, ob-
lique, tenuiter costatis, superioribus paucō attenu-
atis; ultimo brevi, profunde rotundō; aperturā
descendentē obliquā, inextine reflexa, subcrepauo,
callo suturali prope suturam valido.*

THE STAFF PUPA. Shell cylindrical-subpyramidal, red above, yellowish below; whorls six, obliquely finely ribbed, the upper a little attenuated, the last short, deeply notched; aperture raised, oblique, margin reflected, slightly expanded, sutural callus near the suture strong.

PFEIFFER. Mon. Hel. IV. 661.
Hab. Mauritius.

Species 81. (Mus. Sowb.)

PUPA LYONETI. *Pup. testū latē pyramidalis, floridā,
costatā; apice obtuso, anfractibus superioribus
quaque gradatim crescentibus, rectiōculis; ultimo
lateraliter expanso, latere sinistro gibbosō, infū
riōd elongatō duplicito; aperturā obliquā aurifor-
mā, valde adcedentē, marginē inextinso reflexa.*

LYONETI'S PUPA. Shell broadly pyramidal, yellowish, ribbed; apex obtuse, five upper whorls gradually increasing, rather straight, the last laterally expanded, gibbose at the left side, doubled below, with a long slit; aperture obliquely auriform, much raised; margin thickened, reflected.

MONSTRELET (*Lyoneti*).
Gibbus Lyonetiatus, Pfeiffer.
Hab. Isl. Bourbon.

This species sometimes occurs reversed.

Species 82. (Mus. Sowb.)

PUPA CLAVATULA. *Pup. testū tenui, costatā, cylindrica,
superē mediana inflata; anfractibus 10, costatissimis,
versus apicem latissimis infū contractis, ultimo
rimato; aperturā parcā subquadratā, adscen-
denti, callo suturali unguo.*

THE CLUB PUPA. Shell thin, ribbed, cylindrical, inflated above the middle; whorls ten, ribbed, very broad towards the apex, contracted below, the last notched; aperture small, rather square, ascending, sutural callus large.

LAMARCK. Anna. S. Vert.
Hab. Isl. Bourbon.

Species 83. (Mus. Sowb.)

PUPA HOLOSTOMA. *Pup. testū tenui, costatā, albā, cy-
lindrica, superē mediana paulo inflata; anfrac-
tibus numerosis, inferioribus subattenuatis; ultimo
angustō, rotundō; aperturā parcā, subquadratā,
callo suturali marinita.*

THE SPIKE-MOUTHED PUPA. Shell thin, ribbed, white, cylindrical, a little inflated above the middle; whorls numerous, the lower ones partly attenuated; the last narrow, notched; aperture small, subquadrate, sutural callus very large.

MOELET. Sev. Conch. II. 1860.
Hab. Mauritius.

Narrower than the preceding, and with the upper whorls less inflated.

Species 84. (Mus. Sowb.)

PUPA DUSSEMERII. *Pup. testū ventricosā, albā, epī-
dermā cornē subcicatridi; anfractibus 6, sub-
depressis, ultimo magno infū attenuato, profundē
rimato; aperturā ovato, pyriformi; margīnū
reflexa.*

DUSSEMER'S PUPA. Shell ventricose, white, with a greenish horny epidermis; whorls six, rather depressed, the last large, attenuated below, deeply notched; aperture ovate, pyriform; margin reflected.

REEVE. (*Bulinus*), Conch. Icon. Vol. V.
Hab. Mauritius.

PUPA.

PLATE X.

Species 85. (Mus. —? Copied.)

PUPA FARREANA. *Pup. testi minutâ, fusco-ornatâ, sinistrali, oblongo-ovali; spira obtusa; usque ad ultimâ 5, concreta, regulariter crescentibus; ultima cîrca rotunda, versus aperturam valde contracta; apertura auriformis, ferè verticali, plieâ tribus, non columnellaris, non parietali, non intus marginata; labii extremitate producti, labii extremitate ad medianum contracta.*

FARRE'S PUPA. Shell minute, horn-brown, sinistral, oblong-ovate, spine obtuse; whorls five, convex, regularly increased, the last scarcely notched, strongly contracted towards the aperture, aperture auriform, almost vertical, plaits three, one columnellar, one parietal, one produced within the margin of the outer lip; outer lip contracted.

CROSSE. Journ. de Conch. Vol. XX. p. 359, 1872.
Hab. New Caledonia.

Species 86. (Mus. Hanley.)

PUPA SAULCEI. *Pup. testi sinistrali, levî, pallidâ fuligineo-ventricosa; spira obtusa conica; medio subangustata; ultima angusta; infelix oblique rotunda, doce ante aperturam contracta; apertura suborbitalis, marginae albo latâ reflexa, latâ exserticula; plieâ acutis, medio approximatâ; vallo suturali rufido, elongato.*

SAULCEY'S PUPA. Shell sinistral, smooth, pale, fulvous, ovate-ventricose; spine obtusely conical, slightly inflated in the middle; last whorl obliquely notched, the back contracted before the aperture; aperture subovate, margin white, broadly reflexed, with six plaits within, acute, approaching in the middle; sutural callus strong, elongated.

BOUCAVINVILLE. Pfir. Mon. IV. p. 684.

Hab. Southern Europe.

Species 87. (Mus. Hanley.)

PUPA SCAPUS. *Pup. testi sinistrali, elongato-cylindrica, solidâ, pallidâ, spirâ supercî conicâ, medio cylindrica, angustibus 8, 9, superioribus rotundis,*

capite crescentibus, medianis subsqualidius, ultimo rotundato; apertura parvâ, subovata, labio interno supra medianam angustato.

THE STALK PUPA. Shell sinistral, elongated, cylindrical, solid, pale, whorls 8 or 9, the upper ones rounded, rapidly increased, the middle ones rather equal, the last with a very slight notch; aperture small, rather ovate, inner lip with a single plait above the middle.

PARRY'S. Pfeiffer (Chondrula), Mon. VI.

Papa Raymondi, Bourgainville.

Bulimus bicollus ? Triv.

Hab. Asia Minor.

Species 88. (Mus. —? Copied.)

PUPA PAITIENSIS. *Pup. testi minutâ, sinistrali, subcylindrica, levî, levî, levî, levî, cylindrica; usque ad ultimâ quatinus gradatim crescentibus, spira obtusa; apertura subovata, columella reflexa, labio interno angustato.*

PAITIAN PUPA. Shell minute, sinistral, greenish brown, short, thin, shortly cylindrical; whorls 4, gradually increased, last deeply notched, spine obtuse, aperture subovate, columella reflected, inner lip single-plaited.

CROSSE. Journ. de Conch. 1874, p. 331., Pl. 12.
Fig. 5.

Hab. Païti, Peru.

Species 89. (Mus. Sievers.)

PUPA SIGNATA. *Pup. testi parvâ, albâ, perforati, cylindrica, levigata, supra medianam inflata, infra subattenuata; apice obtuso; angustibus septem, medianis rectibasculis, ultimo ad basim obscurissime cristata, impressione signata, apertura parva, marginis crassa, rotunda, labio interno horizontali, medio acuto angustato.*

THE MARKED PUPA. Shell small, white, perforated, cylindrical, smooth, inflated above the middle, rather attenuated below, whorls 7, middle ones rather straight, the last very obscurely crested and marked with an impression; aperture small, margin thick, inner lip horizontal, with a sharp tooth in the middle.

PUPA.—PLATE X.

Mousson. Journ. de Conch. 1873, p. 211. Pl. VIII.

Fig. 7.

Hab. Araxis.

Species 90. (Mus. Sievers.)

Pupa epifilaris. *Pup.* testă parvă, fusă, cylindrică, levigată, apice obtuso; anfractibus septem, medianis rectilobul, ultimo arcu rimate; apertura lată, margini labii reflexa, columellă lată, bijugata, labio interno prope medium uniplicata.

The DOUBLE-THREADED PUPA. Shell small, brown, cylindrical, smooth, apex obtuse; whorls 7, middle rather straight, the last with a curved notch; aperture broad, with broadly reflexed margin, columella broad, two-threaded, inner lip with a single plait near the middle.

Mousson. Journ. de Conch. 1873, p. 210. Pl. VIII.

Fig. 8.

Hab. Gorkische.

Species 91. (Mrs. Crosse.)

Pupa desmazieri. *Pup.* testă parvă, făcută, brevitoră, cylindrică; apice obtusissimum; anfractibus septem, concavobul; ultimo profundě rimate, apertura subtriangularis, interne uniplicata; labio interno acutě uniplicato, columellă uentre uniplicata; labio externo tenui.

DESMAZIERE'S PUPA. Shell small, fulvous, shortly cylindrical, apex very obtuse; whorls seven, rather convex; the last deeply notched; aperture rather auriform, with one interior plait, inner lip with one sharp plait, columella with one sharp plait; outer lip thin.

Crosse. Journ. de Conch. 1874, p. 227, Pl. VIII, f. 3.
Hab. Isl. Rodriguez.

Species 92. (Mus. Hanley.)

Pupa polyodon. *Pup.* testă făcută, cylindrico-fusiformă, levantă lată, altă, angustă, anfractibus nornă, concavobul, medianis subquadratus, suturi profundě separatis; ultimo profundě rimate; apertura parcată, ovală, plăcă numerosis intratibus iuxquidibus contracta.

The MANT-TOOTHED PUPINA. Shell fulvous, cylindrically fusiform, finely ridged, raised, narrow, whorls nine, rather convex, the middle ones nearly equal, separated by a deep suture; the

last deeply notched; aperture small, oval, contracted by numerous entering unequal plaits.

DRAFAEXAUD. Moll. Ter. et Fluv.

Pupa ringicula, Michaud.

Hab. Southern Europe.

Species 93. (Mus. Hanley.)

Pupa necifraga. *Pup.* testă subovată, pallide fulvă, levă, canular străiată; apice obtuso; anfractibus quinque, superiores quadrato, brevibus, rapidē crescentibus, convexis, ultimo alto, rectilobul, latè et profundě rimate; apertura ad suturam elevata, callosă, plăcă tribus magnis et dubius minoribus contracta, marginę proprie suturam sinuata.

The NUTCRACKER PUPA. Shell rather oval, pale fulvous, short, finely striated; apex obtuse; whorls five, the four upper ones short, rapidly increasing, convex, the last elevated, rather straight, with a broad and deep notch; aperture raised at the suture, with a small sutural callus, contracted by three large and three smaller plaits, and a sinus near the suture.

PARRY'S. Pfr. Mon. Hel. Bulimus (Chondrula), Vol. VI, p. 22.

Hab. Isl. Cyprus.

Species 94. (Mus. —? Copied)

PATA LIENARDIANA. *Pup.* testă parvă, făcută, elevată, subcylindrică, levigată; anfractibus duobus, pars apicalis, tum trilobata, altis inflato-cylindricis; ultimo profundě rimate; apertura obliquă oblongo-subquadrata; dentibus vid. parietali, und columellarī, prodromis acutis dubius marginalibus infra mediana labii extremitate.

LIENARD'S PUPA. Shell small, horny brown, elevated, subcylindrical, smooth; whorls two, small apical, then three elevated, inflated, cylindrical; the last with a deep notch; aperture oblique, oblong-subquadrata, with one parietal and one columellar tooth produced, sharp, two marginal, placed below the middle of the outer lip.

Crosse. Journ. de Conch. 1874, p. 228, Pl. VIII, f. 4.
Hab. Coral Point, Isl. Rodriguez.

This is said to bear some resemblance to a little shell named *carycium mauritanum* by Mr. H. Adams.

P U P A.

PLATE XI.

Species 95. (Mus. — :)

PUPA CASCIA. *Pup. testi nivalis, fuscata, breviter cylindricata, apice obtusissimo; anfractibus 5, concretae, ultimo arcuatum rotundato; apertura marginata, subquadrata, plicis parietali acutis, margine externo tenui, columella obliqua.*

THE CASCIA PUPA. Shell minute, brown, smooth, shortly cylindrical, apex very obtuse; whorls five, rather convex, the last with an arched notch; aperture rather large, rather square, parietal plait sharp, outer margin thin, columella oblique.

PFEIFFER, Malak., Bl. 1871, Vol. XVIII.

Hab. Lenkoran, Transcaucasia.

Species 96. (Mus. — ?)

PUPA LONGIOR. *Pup. testi nivalis, fuscata, levigata, elongata, angustata, subcylindrico-pyramidalis; apice obtuso; anfractibus quinque, concretae, ultimo cylindracea, elongata, arcuatum rotundato; apertura subquadrata, marginis intescentia, expanso, cylindrica; plicis parietali et columellaris proniventibus, acutis, plicis internis tribus.*

THE TALL PUPA. Shell minute, brown, smooth, elongated, narrow; whorls five, rather convex, last cylindrical-pyramidal; apex obtuse; whorls five, rather convex, the last cylindrical, elongated, with a curved slit; aperture rather tending to square, margin yellowish, expanded, reflected; a prominent sharp parietal, and a columellar plait; internal plaits three.

CROSSE, Journ. de Conch., 1873, Pl. I. f. 2.

Hab. Curaçao, Antilles.

Species 97. (Mus. Hanley.)

PUPA ARGONIS. *Pup. testi angusti, prepurpureo-fusca, subfusciformis; anfractibus 8, granulatis crescentibus; ultimo profundè rotundato; apertura parva, falcata, elevata, angusta, obtusa, intus biplicata, callo suturali albo, conspicuo, plicis parietali intortu, columellæ latâ, elevata, uniplicata, labio externo crassissimo.*

THE ARGO PUPA. Shell narrow, purple-brown, subfusciform; whorls 8, gradually increased, the last deeply notched; aperture small, fulvous, raised, narrowly ovate, with two interior plaits, sutural callus white, conspicuous, parietal plate entering, columella broad, raised, single-plaited; outer lip rather thick.

ROSSMÄSSLER, Icon. III. 17, p. 105, t. 85, f. 936.

Pup. neopachilus, Albers.

Hab. Valentia.

Species 98. (Mus. Hanley.)

PUPA PAGODULA. *Pup. testi fulvo-cornicis, inflato-cylindrica, brevi, obliquè lirata; apice obtuso; anfractibus septem, depresso, concavis, medianis inflatis, ultimo profundi et longè rotundato, infra medium contracto; apertura ad suturam anfractus ultimi elevata, prope suturam sinuata, columella prope medium callosa, labio externo supra medium tumida.*

THE LITTLE PAGODA PUPA. Shell horny-fulvous, inflated-cylindrical, short, obliquely ridged; apex obtuse; whorls seven, depressed, convex; the middle ones inflated, the last with a deep and lengthened slit, contracted below the middle; aperture raised to the suture of the last whorl, sinuated near the suture, columella callous near the middle, outer lip tumid above the middle.

DESMARET, Plfr. Mon. Hel. II. 310.

Hab. South Europe.

Species 99. (Mus. Hanley.)

PUPA VILLA. *Pup. testi cylindrica, fuscata, polita, apice obtusissimo, anfractibus ad apicem rapidè crescentibus, tum tumidis, medianis rectilobatis, altis, ultimo profundi et latè rotundato; apertura angusta, paulum elevata, obliqua, marginis angusto, labio externo supra medianum sinuato; labio interno prope suturam callo pliociforme minute, columella obliqua, edentata.*

VILLA'S PUPA. Shell cylindrical, brown, polished, apex very obtuse, whorls rapidly increased at the

PUPA.—PLATE XI.

apex, then tumid, middle ones rather straight, elevated, the last deeply and broadly notched; aperture narrow, a little raised, oblique, margin narrow, outer lip situated above the middle, inner lip provided with a plait-like callus near the suture, columella oblique, toothless.

CHARPENTIER. Pfeiffer. Mon. Hel. II, 330.

Hab. Spain.

Species 100. (Mus. Hanley.)

PUPA STRANGEI. *Pup. testá sinistráli, cylindricá, tenuí, semipellucídá, cornuá, anfractibús 4, apicali ru-*
tundo, duobus medianis concavisculis, ultimo
altissendo, infrá profundi rímato; aperturá sub-
trigoná, margine albo, reflexo; labio interno plicis
dentiformibus duabus infra medianam armato, colum-
nellá plicis prominenti et alterá paréa, et labio
interno plicis parietali duplicita munito.

STEANGE'S PUPA. Shell sinistral, cylindrical, thin, semipellucid, horny, whorls 4, the apical one rounded, the two middle ones rather convex, the last rather raised, deeply notched below; aperture subtriangular, margin white, reflected; inner lip armed with two tooth-like plaits, columella provided with a prominent plait and another small one, and the inner lip with a doubled parietal plait.

PFEIFFER. Mon. VI, 336.

Hab. Port Jackson.

Species 101. (Mus. Hanley.)

PUPA CONICA. *Pup. testá fusá, subpyramidalis, filoso-*
strialis; apice acutissculo; anfractibús novem,
depressis, versus apicem attenuatis, ultimo lato,
profundè et longè rímato; aperturá versus suturam
ultimo anfractiū elevati, columellá perobliquá,
intus spiráliter biplicata, labio extero intus infra
medium uniplicata.

THE CONICAL PUPA. Shell brown, rather pyramidal, with thread-like striae; apex rather acute; whorls nine, depressed, the last broad, with a deep and long slit; aperture raised towards the suture of the last whorl, columella very oblique, with two spiral plaits, outer lip with a plait inside, below the middle.

ROSSMASLER. Pfeiffer, Mon. Hel. II, 325.

Hab. Styria.

Species 102. (Mus. Hanley.)

PUPA DOLIOLUM. *Pup. testá cylindricá, fusá, tenuíter*
liratd, prop apicem tumidá, infrá subattenuatá;
anfractibus plenū; convexisculis, ultimo arcuatum
rimato; aperturá latá, albá; labio externo prope
suturam sinuato, labio interno plicat parietali
muñito.

THE LITTLE TUS PUPA. Shell cylindrical, brown, finely ridged, tumid near the apex, a little attenuated below; whorls seven; rather convex, the last with a curved notch; aperture broad, white; outer lip situated near the suture, inner lip provided with a parietal plait.

BRUGELIER. Louk. Anim. sans Vert.

Helix coronata, Stüder.

Helix spinosa, Ferrussac.

Helix critica, Zellius.

Helix villosula, Kockel.

Hab. South Europe.

Species 103. (Mus. Hanley.)

PUPA RUSTICUS. *Pup. testá pyramidatá, fuso-pur-*
picei; apice acuminato; anfractibús quinque,
concavis, rapidè crescentibus, obliquè tenuiter liratis,
ultimo majuscule, rímato; aperturá paréa, margine
ferè continua, plicis nullis.

THE ROCK PUPA. Shell pyramidal, purple-brown; apex acuminate; whorls five, convex, rapidly increased, obliquely, finely ridged; the last rather large, notched; aperture small, margin almost continuous, without plaits.

PHILIPPI. Pfeiffer II, 314.

Hab. Sicily.

Species 104. (Mus. Hanley.)

PUPA LINCOLNENSIS. *Pup. testá sinistráli, albá vel*
fusá, tenuíter striatá, breviter cylindricá, apice
obtuso, ultimo anfractu infrá breviter rímato;
aperturá paréa, margine reflexo, labio interno
angustato.

THE PORT LINCOLN PUPA. Shell sinistral, white or brown, finely striated, shortly cylindrical, apex obtuse, last whorl with a short notch below; aperture small, margin reflected, inner lip with one fold.

COX. Proc. Geol. Soc. 1867.

Hab. Port Lincoln, S. Australia.

P U P A.

PLATE XII.

Species 105. (Mus. Lewis.)

PUPA GOULDII. *Pup. testâ minutiâ, fuscocornuta, levigata, breviter subcylindrica; anfractibus quatuor, tribus ingulis, rotundis, ultimo late rimato; apertura subconica, plieis internis lamelliformibus tribus, plieis peritabili labio interno acuto producta; plieis columnaribus duabus.*

Gould's PUPA. Shell minute, horny-brown, smooth, shortly sub-cylindrical; whorls four, three inflated, rounded, the last broadly notched; aperture rather auriform, with three interior lamellar form plaits, parietal plait of the inner lip sharply produced; columnellar plaits two.

BIXXVI. Pfeiffer. Mon. Hel. II. 358.
Hab. Arctic America.

Species 106. (Mus. Hanley.)

PUPA CORTICARIA. *Pup. testâ patê, albâ, pellucida, in partibus cortice subgranulata obiecta, breviter cylindrica, apice obtuso; anfractibus quatuor rotundis, ultimo sinuato; apertura auriformis; labio interno plieis magnis et alteri parci sanguinis, plieis columnellari paucis.*

The BIRD-COVERED PUPA. Shell small, white, pellucid, covered in parts by a slightly granular crust or rind, shortly cylindrical, apex obtuse; whorls four, rounded, the last notched; aperture auriform, inner lip provided with a large plait and a small one, columnellar plait small.

Sav. Pfeiffer. Mon. Hel. II. 328.
Hab. Pennsylvania.

Species 107. (Mus. Hanley.)

PUPA ALTIOLA. *Pup. testâ fuscâ, cylindrica, brevissimâ, levâ, apice obtuso, anfractibus septem, concrexisculis, ultimo infra contracto, horizontaliter rimato; apertura subquadrata, margine intus paula incrassato, plieis nullis.*

The ALFINE PUPA. Shell brown, cylindrical, rather short, smooth, apex obtuse, whorls seven, rather convex, the last contracted below, with an horizontal notch; aperture rather square, margin a little thickened within, no plaits.

CHARPENTIER. Pfeiffer. Mon. Hel. II. 305.
Hab. Spain.

Species 108. (Mus. Hanley.)

PUPA ANCONSIOMA. *Pup. testâ subcylindrica, fuscâ, anfractibus sex brevibus, vix concavâ, ultimo rotundata, subumbilicata; apertura subtriangularis, infra subangulata, superius prope suturam angulata, marginis infra angulum tumidissimâ.*

The ANGLE-MOUTHED PUPA. Shell greenish-brown, cylindrical, whorls six, short, very slightly convex, the last notched, rather umbilicated; aperture rather trigonal, slightly acuminate below, angular above near the suture, margin a little swelled below the angle.

LOWE. Pfeiffer II. 314.
Pup. umbilicata var. De Paiva.
Pupa Flandensis, Lowe.
Hab. Madeira.

Species 109. (Mus. Hanley.)

PUPA CHARPENTIERI. *Pup. testâ parvâ, breviâ, inglatâ, fuscâ, semipellucida, anfractibus quatuor, tribus rotundatis, rapidè crescentibus, ultimo magno, infra parvo contracto, profunde rimato; apertura subtriangularis, labio externo prope suturam sinuato, undibâ et infra intus incrassato; plieis dentiformibus, parietali usq. columnellari dualibus magnis et usq. parvâ, labii exteri dualibus.*

CHARPENTIER'S PUPA. Shell small, short, inflated, brown, semipellucid, whorls four, three round, rapidly increasing, the last large; a little contracted below, with a deep notch; aperture sub-

PUPA.—PLATE XII.

trigonal, outer lip sinuated near the suture, thickened at and below the middle, tooth-like plaits, one parietal, columella two large and one small, and two on the outer lip.

SHUTTLEWORTH. Pfeiffer. Mon. III. p. 555.

Pupa Moulinsiana, Dupuy.

Pupa (vertigo) ventrosa, Heynem.

Hab. Spain, France, Germany.

Species 110. (Mus. Hanley.)

PUPA FELLUCIPA. *Pup. testā elatā, subpyramidalē, fusiō, levī, semipellucidā, anfractibus sex, inflatis, ultimō breviter rimato; aperturā ovatā, plīcis dentiformibus tribus aut quinque, plīcis ultimā anfractū non continuā ad terminū duplicitā.*

THE FELLUCID PUPA. Shell raised, rather pyramidal, brown, smooth, semipellucid, whorls six, inflated, the last with a short notch; aperture small, tooth-like plaits three to five, the plait of the body whorl sometimes doubled at the end.

PFEIFFER. Mon. Hel. II. 360.

Pupa serpilis, Gould.

Pupa Rüzei, Adams.

Hab. Cuba, Jamaica, St. Thomas, Porto Rico.

Species 111. (Mus. Hanley.)

PUPA TACHYGASTRA. *Pup. testā elatā, cornuē, tenuiē liratā, subfusiforme, versus apicem attenuatā, medio cylindrico; anfractibus decem rectifissēs, ultimō infūrā acuminatō, longō et obliquō rimato; aperturā ovatā, adscendenti, margine albo, reflexo, subcuspido, callo subnudō laminautiō continuo, plīcis ultimā anfractū unā et columella quatuor, lamelliformis, labio extero paulo elevato, leviter reflexo; columnellā profundiā biplicatā, plīcis internis tribus elongatis.*

THE THICKENED PUPA. Shell raised, horny, finely ridged, rather fusiform, attenuated towards the apex, cylindrical in the middle; whorls ten, rather straight; the last acuminate below, with a long oblique notch, aperture ovate, raised, margin white, reflected, rather expanded, sutural callus continued in layers, plaits of the last whorl one, and of the columella four, lamelliform, of the outer lip four, laminiform, continued within.

ZEIGLER. Pfeiffer. Mon. Hel. II. 337.

Pupa oblongata, Rossmässler.

Pupa frenata var? Adams.

Hab. Dalmatia.

Species 112. (Mus. Hanley.)

PUPA VARIABILIS. *Pup. testā elatā, cornuē, tenuiē liratā, versus apicem attenuatā, medio inflatā, anfractibus decem, convexis scissis, ultimō infūrā acuminatō, longō et obliquō rimato; aperturā ovatā, latā, adscendenti, margine albo, reflexo, expanso; callo suturali intus continuo, plīcis laminiformibus intus continuis, convergentibus.*

THE VARIABLE PUPA. Shell raised, horny, finely ridged, attenuated towards the apex, inflated in the middle, whorls ten, rather convex, the last acuminate below, with a long, oblique notch, aperture ovate, broad, raised, margin white, reflected, expanded; sutural callus continued within, lamelliform plaits continued within, converging.

DRAPARNAUD. Pfeiffer. Mon. Hel. II. 349.

Helix mutabilis, Ferrussac.

Pupa multidentata, Oliv.

Hab. France, Switzerland, Spain.

Species 113. (Mus. Hanley.)

PUPA LUSITANICA. *Pup. testā subpyramidalē, purpureo-fusē, versus apicem attenuatā, obliquē liratā, medio paulo inflatā; anfractibus septem, concavis, ultimō infūrā, obliquē breviter rimato; aperturā pallidē fulvā, labio extero paulo elevato, leviter reflexo; columnellā profundā biplicatā, plīcis internis tribus elongatis.*

THE LUSITANIAN PUPA. Shell rather pyramidal, purple-brown, attenuated towards the apex; obliquely ridged, a little inflated in the middle; whorls seven, convex, the last rather large, with a short oblique notch; aperture pale fulvous, outer lip a little raised, slightly reflected; columnella deep, two-plaited, three internal elongated plaits.

ROSSMÄSSLER. Pfeiffer. Mon. Hel. II. 347.

Hab. Lusitania.

Species 114. (Mus. Hanley.)

PUPA MODESTA. *Pup. testā minutā, fusiō, brevi, inflatiā, semipellucidā, anfractibus quatuor, rotundis; ultimō umbilicato; aperturā parvā, brevi, plīcis dentiformibus acutis placinis contracto.*

THE MODEST PUPA. Shell minute, brown, short, inflated, semipellucid; whorls four, rounded, the last umbilicated; aperture small, short, constricted by several sharp tooth-like plaits.

A. ADAMS. Proc. Zool. Soc.

Hab. Mauritius.

PUPA.

PLATE XIII.

Species 115. (Mus. Hanley.)

PUPA RHOMBA. *Pup. testū angustā, albā, pyramidābā, fusēd, tenuissimē liratā; apicē obtuso; anfractibus sex, superioribus quatuor attenuatis, subrotundis, penultimō ventricosō, ultimō umbilicato; apertura porrectā, angustā, antice acuminatā, intus dentibus prominentibus quinque contractā.*

THE RHODE PUPA. Shell narrow, high, pyramidal, brown, very finely ridged; apex obtuse; whorls six, upper four attenuated, rather rounded, last but one ventricose, last umbilicated; aperture small, narrow, anteriorly acuminate, contracted within by five prominent teeth.

ROTHWELL. Pfeiffer, Monograph V. p. 318.

Pupa acutula. Parreys.

Hab. Rhode, Dalmatia.

Species 116. (Mus. Hanley.)

PUPA CUVULA. *Pup. testū clavatā, albā, costellis rectis rotundis sculptā; apicē obtuso; anfractibus superioribus ventricosō, duobus ultimis subcylindricis, pauli contractis, ultima longē rimato; apertura recta, posticē subquadrata, antice producta, rotundā, propè suturam pliō parietali uniatā.*

THE UVELE PUPA. Shell club-shaped, whitish, sculptured with rounded, straight little ribs; apex obtuse; upper whorls ventricose, two last rather cylindrical, a little contracted, last with a long notch; aperture straight, posteriorly rather square, anteriorly produced, rounded, provided with a parietal plait.

DESHAYES. Conchologie de l'île de la Réunion.

Hab. Isl. Bourbon.

Species 117. (Mus. Hanley.)

PUPA OVALARIS. *Pup. testū ovatā, brevi, ventricosā, loci, fuscocornuta; apicē obtuso; anfractibus quatuor, tribus superioribus brevibus, ultimō mayao,*

breviter rotundo; apertura albā, semiovata, intus dentibus quinque prominentibus contractā, marginē subexpanso.

THE EGG-SHAPED PUPA. Shell ovate, short, ventricose, smooth, brownish-horny; apex obtuse; whorls four, three upper short, last large, with a short notch; aperture white, semiovate, contracted within by five prominent teeth, margin rather expanded.

OLIVIER. Pfeiffer (Bulimus), Mon. 1868, p. 7.

Hab. Syria.

Species 118. (Fig. a, b. Mus. Hanley.)

PUPA SEPTEMDENTATA. *Pup. testū oblongo-ovatā, fuscopurpurea vel albiā, levī, altā, apicē obtusissimā; anfractibus sex, tribus superioribus brevissimis, penultimō ventricosā, ultimā longē et arcuata rimato; apertura ovalē, albā, dentibus septem lamelliformibus intus valde contractā, marginē latē expanso, ad dorsum contracto.*

THE SEVEN-TOOTHED PUPA. Shell oblong-ovate, purple-brown or white, smooth, high; apex rather obtuse; whorls six, three upper rather short, last ventricose, with a long curved notch; aperture oval, white, strongly contracted within by seven lamelliform teeth, margin broadly expanded, contracted at the back.

ROTHWELL. Pfeiffer (Bulimus), Mon. 1868, p. 70.

Hab. Syria.

Species 119. (Mus. Hanley.)

PUPA PRODUCTA. *Pup. testū altissimā, cylindrica, albā, densē liratā; anfractibus septem, tribus superioribus brevibus, rotundis, tribus medianis rectis, ad suturam compressis, ultime minime umbilicato; apertura majuscule, propè suturam unidentata, marginē subincurvata, lateralerū pauli producta.*

THE PRODUCED PUPA. Shell very tall, cylindrical, white, closely ridged; whorls seven, three upper

PUPA.—PLATE XIII.

short, rounded, three middle straight, compressed at the suture, last with a small umbilicus; aperture rather large, with a tooth near the suture, margin rather thickened, a little produced laterally.

ADAMS. Proc. Zool. Soc.
Hab. Mauritius.

Species 120. (Mus. Hanley.)

PUPA PAMPHORODON. *Pup. testā sinistrali, fuscā, ovato-oblongā, subcanticōsi, tenuī obliquā liratā; apicē obtuso; anfractibus novem, brevissimis, ultimo longe et latè rimato, ab dorsum aperturā contracti; aperturā albā, obliquā productā, int̄ angustissimā dentibus laminatis prominentibus contractā, marginē late, tenui, producto.*

THE PEAK-TOOTHED PUPA. Shell sinistral, brown, ovate-oblong, rather ventricose, finely obliquely ridged; apex obtuse; whorls nine, very short, last with a long and broad notch, contracted at the back of the aperture; aperture white, obliquely produced, contracted within very narrowly by laminated prominent teeth, margin broad, thin, produced.

BENSON. Ann. and. Mag. Nat. Hist. 3rd series, June 1864.

Hab. Near Simon's-Town, Cape of Good Hope.

Species 121. (Mus. Hanley.)

PUPA CALATHISCUS. *Pup. testā parvā, fuscā, brevi, ventricosā, costis validis, distantib; prominentibus, rotundis liratā, medio anfractuum fuso nufuscūtā; apicē obtuso; anfractibus septem, apicalibus parvis, levigatis, medianis tunidis, latis, ultimo medio infrāque contracto, breviter rimato; aperturā brevi, pliò suturali ruginā, columellari parvā, lobio externo int̄a triplicata.*

THE LITTLE-BACKED PUPA. Shell small, brown, short, ventricose, ridged with strong, distant, prominent, rounded ribs, with a brown band in the

middle of the whorls; apex obtuse; whorls seven, apical, small, smooth, middle tumid, broad, last contracted in the middle and under, with a short notch; aperture short, sutural plait large.

LOWE. Pfeiffer, Mon. 1868.
Hab. Porto Santo, Madeira.

Species 122. (Mus. Hanley.)

PUPA CYLINDRELLUS. *Pup. testā albā, tenui, semipellucidā, levigatā, clavatā; apicē obtuso; anfractibus orde, superioribus brevissimis, rapide crescentib; medianis et inferioribus gradatim attenuatis, altissimis, convervīcūtis, ultimo profundè rimato, infra contracto; aperturā subovatā, pliò suturali rugosā.*

THE LITTLE-CYLINDER PUPA. Shell white, thin, semi-pellucid, smooth, club-shaped; apex obtuse; whorls eight, upper very short, rapidly increasing, middle and lower gradually attenuated, rather high, rather convex, last deeply notched, contracted below; aperture rather oval, with large sutural plait.

A. ADAMS. Proc. Zool. Soc.
Hab. Isl. Bourbon.

Species 123. (Mus. Hanley.)

PUPA STRIATICOSTATA. *Pup. testā albā, solidūsculā, subpyramidalitātē, densē obliquā costellatā, costellis elevatis, levibus, incisis; ultimo anfractū umbilicato et breviter rimato; aperturā majūsculā, subquadratā, edentulā; columellā int̄a medio latidūsculā.*

THE STRIA-RIBBED PUPA. Shell white, rather solid, subpyramidal, closely obliquely ribbed, ribs raised, smooth, incised; last whorl umbilicated and shortly notched; aperture rather large, rather square, toothless; columella rather tumid within at the middle.

MORELET. Rev. et Mag. Zool. XVIII., 1866.
Hab. Mauritius.

Species 124. (Mus. Hanley.)

PUPA ROSSMASLERI. *Pup. testi ventricosa, conica, pallide cornuta, tenuiter obliquè costellata; anfractibus sex, brevibus, rapido latitudine crescentibus, ultimo longè rotundata; apertura parva, ad medium ultimi anfractus elevata, intus marginata septemdentata.*

ROSSMASLER'S PUPA. Shell short, ventricose, conical, pale horned, finely obliquely ribbed; whorls six, short, rapidly widening, last with a long notch; aperture small, raised to the middle of the last whorl, with seven teeth within the margin.

SCHMIDT. Pfeiffer, Monog. 1868, p. 323.
Hab. Illyria.

Species 125. (Mus. Hanley.)

PUPA STENOPHYLIS. *Pup. testi parva, albâ, semipellucida, costata, pupiformis, brevi; anfractibus sex, apicalibus duobus parvis, levigatis, medianis ventricosis, inferioribus gradatim attenuatis, ultimo infra angustato, longè rotundata; apertura parva, angustata, prope suturam ultima anfractus elevata, labio externo supra medium valde sinuata, undulata, pliis suturali marimata, descendenti.*

THE NARROW-LEAFED PUPA. Shell small, white, semi-pellucid, ribbed, chrysallis-shaped, short; whorls six, two apical small, smooth, middle ventricose, lower gradually attenuated, last narrow below, with a long notch; aperture small, narrow, raised to near the suture of the last whorl, outer lip with a strong bend above the middle, with one tooth, sutural plait very large, descending.

BENSON. Fid. Hanley.
Hab. Khasi.

Species 126. (Mus. Hanley.)

PUPA NOVAZELANDICA. *Pup. testi cylindrica, fuscâ rufâ costata; anfractibus sex, apicalibus subcomplanata-*

tis, ultimo umbilicato; apertura parvissimata, simplici.

THE NEW ZEALAND PUPA. Shell cylindrical, brown, coarsely ribbed; whorls six, apical rather flattened, last umbilicated; aperture rather small, simple.

PFEIFFER. (Vertigo) Mon. 1868, p. 299.
Hab. New Zealand.

Species 127. (Mus. Hanley.)

PUPA MONDRAMI. *Pup. testi solidissimata, albâ, breviter cylindrata, tenuiter costata; anfractibus septem, apicalibus rapidè crescentibus, brevissimis, duabus medianis contractis, rotundis, ultimo alto, infra umbilicata; apertura subquadrata, edentata, elevata, marginè simplici anguste reflexa.*

MONDRAMI'S PUPA. Shell rather solid, white, shortly cylindrical, finely ribbed; whorls seven, apical, quickly increasing, very short, two middle ventricose, rounded, last high, umbilicated below; aperture rather square, toothless, raised, margin simple, narrowly reflected.

ADAMS. Proc. Zool. Soc.
Hab. Mauritius.

Species 128. (Mus. late Deshayes.)

PUPA BOURGUIGNATI. *Pup. testi crassiissimata, albâ, irregulariter striata, breviter subpyramidalis; ultimo anfractu breviter rotundata; apertura subobliquè quadrata, ad anfractum ultimum medio undulata, marginè medio subdepresso.*

BOURGUIGNATI PUPA. Shell rather thick, white, irregularly striated, short, subpyramidal; last whorl shortly notched; aperture rather obliquely square, with a single tooth at the last whorl, in the middle, margin rather depressed in the middle.

DESHAYES. Conch. île. Réunion, Pl. XXXVII, Fig. 27, 28.

Hab. Isl. Bourbon.

PUPA.—PLATE XIV.

Species 129. (Mus. late Deshayes.)

PUPA INTERSECTA. *Pup. testā crassiūscuā, albida, subpyramidalē, prope apicem tumidiūscuā; anfractibus octo, tribus superiorib⁹ levibus, ceteris lentē crescentibus, liris iūequalibus irregularibus, distantibus, obliquis sculptis; aperturā subquadratā, supernē quindecimtā.*

THE INTERSECTED PUPA. Shell rather thick, rather white, rather pyramidal, a little swelled near the apex; whorls eight, three upper smooth, the others slowly increased, sculptured with unequal, irregular, distant oblique ridges; aperture rather square, with a single tooth above.

DESHAYES. Conch. de l'ile de la Réunion. Pl. XXVIII.

Fig. 1.

Hab. Isl. Bourbon.

Species 130. (Mus. Hanley.)

PUPA FERRARI. *Pup. testā cylindrica, altā, fusca, crebricostatā; anfractibus octo, superiorib⁹ brevissimis, ultimo alto, recto, infra latē umbilicato, carinā desinenti; aperturā parvā, angustā, plicis duobus, prominentibus, acutis, subinternis ad columellam et anfractum ultimum armatis, labio externo, supernē sinuato, luna dente magno incrassato.*

FERRARI'S PUPA. Shell cylindrical, high, brown, close-ribbed; whorls eight, upper very short, last high, straight, broadly umbilicated below, ending in a keel; aperture small, narrow, armed with two prominent short subinternal teeth at the columella and last whorl, outer lip sinuated above, then thickened with a large tooth.

PORRO. Pfeiffer, Mon. 1868, p. 309.

Pupa biplicata, Rossmässler.

Pupa guttula, Porro.

Hab. Upper Italy.

Species 131. (Mus. Hanley.)

PUPA VENTRICOSA. *Pup. testā parvā, brevissimā, subglobosa, tenui, fuscocornea; anfractibus quatuor, apicalibus pyramidatis, ultimo subgloboso; apertura rotundā, supernē unidentata.*

THE VENTRICOSE PUPA. Shell small, very short, rather globose, thin, horny brown; whorls four, apical pyramidal, last rather globose; aperture rounded, with a single tooth above.

ADAMS. Proc. Zool. Soc.

Hab. Mauritius.

Species 132. (Mus. Hanley.)

PUPA PUPULA. *Pup. testā minuta, cornea, levī, cylindrica; apice obtuso; ultimo anfractu breviter rotato; aperturā brevi subquadratā, intus tridentata, columellā obliqua.*

THE PUPUL PUPA. Shell minute, horny, smooth, cylindrical; apex obtuse; last whorl shortly notched; aperture short, rather square, tridental within, columella oblique.

DESHAYES. Conch. de l'ile de la Réunion. Pl. XXXVIII., Fig. 2.

Hab. Isl. Bourbon.

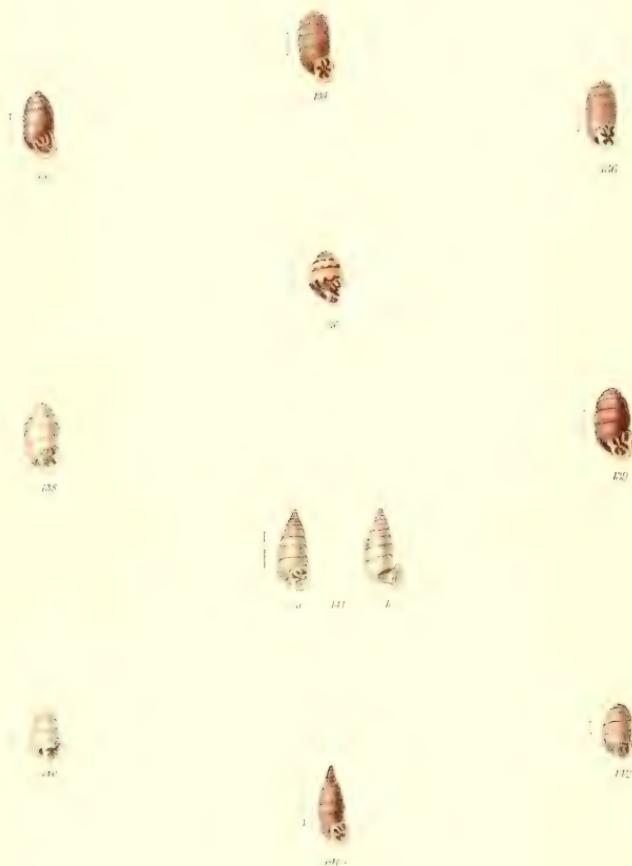

Species 133. (Mus. late Deshayes.)

PUPA TURGIDULA. *Pup. testā brevissimā, parvā, obtusa, breviter rotata, dense lirata, ventricosissimā; aperturā edentulā, brevi, subobliquā, supernē quadratā, infra rotunda.*

THE TURGID PUPA. Shell very short, small, obtuse, with a short notch, closely ridged, very ventricose; aperture toothless, short, rather oblique, square above, rounded below.

DESHAYES. Conch. de l'ile de la Réunion.

Hab. Isl. Bourbon.

P U P A.

PLATE XV.

Species 134. (Mus. Hanley.)

PUPA FERRARIA. *Pup.* testū parvū, altā, cylindrici, ferrugīnō; apicē obtuso; anfractibus sex, concoris, tenuissimō costulatis, ultimā rimato; aperturā subquadrati, int̄s quinquepliati, superō prop̄ suturam unidentata.

THE IRON PUPA. Shell small, high, cylindrical, ferruginous; apex obtuse; whorls six, convex, very finely ribbed, last notched; aperture subquadrate, with five plaits inside; one tooth above, near the suture.

LOWE. Pfeiffer, Mon. 1868.

Hab. Porto Santo.

Species 135. (Mus. Hanley.)

PUPA VINCTA. *Pup.* testū subpyramidalis, fuscocornēa, pulchri; apicē obtusa; ultimo anfractu late, longe rimato; aperturā parvā, subquadrati, columellā pliis altis, tenui, elongatā, ultimo anfractu pliis duabus inaequalibus, arcuatā, superiori elongatissimā, instructa labio exterō superō sinuato, unidentata; lamina interna filiformis.

THE BOUND PUPA. Shell rather pyramidal, horny brown, polished; apex obtuse; last whorl broad, with a long notch; aperture small, rather square, columella set with a white thin long plait, last whorl with two unequal, arched, the upper very long; outer lip sinuous above, with a tooth; internal lamina filiform.

LOWE. Pfeiffer, Mon. 1868, p. 21.

Hab. Madeira.

Species 136. (Mus. Hanley.)

PUPA SPHINCTOSTOMA. *Pup.* testū alti, cornēa, tenui, inaequaliter litratā; ultimo anfractu rimato et umbilicato, ad dorsum medium per lamina interna contracto, ad aperturam pliis parvā, et pliis

suturali elongatissimē extenso munito, columellā uniplicatā, labio exterō superō sinuato et unidentata.

THE SPHINX-MOUTHED PUPA. Shell high, horny, thin, unequally ridged; last whorl notched and umbilicated, contracted at the middle of the back by the internal lamina, furnished at the aperture with a small plait and a very far extended sutural plait; columella with one plait, outer lip with a sinus and a tooth above.

LOWE. Pfeiffer, Mon. 1868.

Hab. Madeira.

Species 137. (Mus. Hanley.)

PUPA CASSIDA. *Pup.* testū brevi, cedriōosi, rubrofusca, dividitidem albosinuatu, leviter litratā, liris rectōsculis; apicē obtusa, anfractibus septem, brevisimis; ultimo brevi, usque ad medium albosinuato, infra mediam inacuminato, levigato; aperturā subtriangulari, infra acuminato, per plios alias, validis, contracta.

THE HELMET PUPA. Shell short, ventricose, red-brown, half white-spotted, finely ridged, ridges rather straight; apex obtuse; whorls seven, very short; last short, white-spotted as far as the middle; not spotted below the middle; smooth; aperture rather trigonal, acuminate below, contracted by white strong plaits.

LOWE. Pfeiffer, Mon. 1868, p. 373.

Hab. Madeira.

Species 138. (Mus. Hanley.)

PUPA ARMIFERA. *Pup.* testū pallidū, cornēa, semipellucidā, brevi, obtusa; anfractibus sex, bicusibus, medianis igitur, ultimo umbilicato; aperturā elevatā, brevi, int̄s quadriplicata.

THE ARM-BEARING PUPA. Shell pale, horny, semi-pellucid, short, obtuse; whorls six, short; middle inflated, last umbilicated; aperture raised, short, four-plaited within.

PUPA.—PLATE XV.

SAY. Pfeiffer, Mon. 1868, p. 29.
Hab. N. America.

Species 139. (Mus. Hanley.)

PUPA CONCINNA. *Pup. testá fuscá, tenuissimū striatā, brevi; apice obtuso; anfractibus sex, brevibus, medianis ventricosis, ultimo longè rimato; aperturā elevatā, plícis quinque principalius, ceteris minutis, suturali latissimè expansa, deacecenti.*

THE NEAT PUPA. Shell brown, very finely striated, short; apex obtuse, whorls six, short, middle ventricose, last with a long notch; aperture raised, five principal plaita, others minute, sutural very broadly expanded, descending.

LOWE. Pfeiffer, Mon. 1868, p. 310.

Hab. Madeira.

Species 140. (Mus. Hanley.)

PUPA PENTODOS. *Pup. minutā, cornē levigatā, brevi, ventricosā; anfractibus tribus rotundis, aperturā brevi, latissimul, dentibus quinque, ad anfractum ultimum uno, ad columellam uno, ad marginem internum labii externalis tribus, mediano longè producto.*

THE FIVE-TOOTHED PUPA. Shell minute, horny, smooth, short, ventricose; whorls five, one on the last whorl, one on the columella, three on the inner edge of the outer lip, middle long, produced.

SAY. Binney, Terrestrial Mollusca, p. 143.

P. coridens, Gould.

P. Tappaniana, Ward.

Hab. North America.

Species 141. (Fig. a, b. Mus. Hanley.)

PUPA LAYARDI. *Pup. testá levigatā, fuscā, vel albiviratā; altā, pyramidatā, versus apicem attenuatā, medio subcircularis; anfractibus novem, convexissimis, ultimo angustissimis, longè rimato, ante aperturam subsolido, producto, coarctato; aperturā subovata, margine externo tenuissimo, interno quia puplicato, plícis laminatis, productis, medio approximatius.*

LAYARD'S PUPA. Shell smooth, brown, or glassy white; high, pyramidal, attenuated towards the apex, rather ventricose in the middle; whorls nine, rather convex, last rather narrow, with a long notch, a little uncoiled before the aperture, produced, narrowed; aperture ovate, outer edge very thin, inner five-plaited, plaita laminar, produced, nearly meeting in the middle.

BENSON. Ann. and Mag. Nat. Hist., 3 Ser. XIII. June, 1864.

Hab. Cape Bredasdorp.

Species 142. (Mus. Hanley.)

PUPA SHUTTLEWORTHI. *Pup. testá nianutā, fuscā, levī, brevi, ventricosā; anfractibus quinque, ventricosis, ultimo longè rimato; aperturā parvā, brevi, ad anfractum ultimum uniplicata.*

SHUTTLEWORTH'S PUPA. Shell minute, brown, smooth, short, ventricose; whorls five, ventricose, last with a long notch; aperture small, short, with a single plait on the body whorl.

ALBERS. Pfeiffer (Bulimus), Mon. 1868.

Hab. Columbia.

PLATE XVI.

Species 143. (Mus. Hanley.)

PUPA PIREEL. *Pup.* testa albâ, altâ, levicata; aufractibus septem, tribus superioribus brevibus, rotundis, politis, quatuor inferioribus rectilateribus, striatis, altis, ad suturam subangustatis, ultimo infra subangustato, rimato; apertura recta, perpendiculariter oblonga, callo suturali conspicuo, magno.

PIREEL'S PUPA. Shell white, high, smooth; whorls seven, three upper short, round, polished, four lower straight-sided, striated, high, with a slight angle at the suture, the last angular below, notched; aperture straight, perpendicularly oblong, with a conspicuous large, sutural callus.

PFEIFFER. (Eunnea.) Proc. Zool. Soc. 1854, p. 295.

Hab. Koondah Mountains, near Calicut.

Species 144. (Mus. Hanley.)

PUPA VARA. *Pup.* testa albâ, fusiformis, regulariter costata; aufractibus septem, superioribus duabus rotundis levissimis, mediotris inflatis, convexis, ultimo contracto, tortuoso; apertura elevata, auriformis, labio externo supra medium validissimum sinuatum plicato.

THE VARA PUPA. Shell white, fusiform, regularly ribbed; whorls seven, upper two rounded, very smooth; middle inflated, convex, last contracted, tortuous; aperture raised, ear-shaped, outer lip very strongly sinuously plaited.

BENSON. (Eunnea.) Ann. Nat. Hist. 1859.

Hab. Khasi Hills.

Species 145. (Mus. Hanley.)

PUPA CEYLANICA. *Pup.* testa albâ, levigata, semipellucida; aufractibus sex, breviseulis, prominentibus; apertura elevata, obliquè retrorsum, triplicata, callo suturali conspicuo, margine represso.

THE CEYLON PUPA. Shell white, smooth, semipellucid; whorls six, rather short, prominent; aperture raised, obliquely bent backwards, with three plaita, sutural callus conspicuous, margin reflected.

PFEIFFER. (Eunnea.) Proc. Zool. Soc. 1855.

Hab. Ceylon.

Species 146. (Mus. Sir D. Barclay.)

PUPA BARCLAYI. *Pup.* testa levata, obtusa, subcylindrica, albâ, obliquè costata; aufractibus quinque, rectilateribus, ultimo alto, infra umbilicato et rimato; apertura magna, perpendiculariter oblonga, antice obliquè producta, plicè medianè aufractis ultimo magno, columella elevata, profunda. BARCLAY'S PUPA. Shell short, obtuse, subcylindrical, white, obliquely ribbed; whorls five, rectilateral, last high, umbilicated and notched below; aperture large, perpendicularly oblong, anteriorly obliquely produced, median plait of the last whorl large, columella toothless, deep.

H. ADAMS. Proc. Zool. Soc. 1868, Pl. IV.

Hab. Manritins.

Species 147. (Mus. Hanley.)

PUPA LAPIDARIA. *Pup.* testa, albâ, cornuta, levata, versus apicem subpyramidalata, apice obtusa, supra medianum et infra cylindrica; aufractibus septem, rectilateribus, ultimo alto, profundè rimato; apertura ovata, albâ, prominenter triplicata, labio exterior supra medium tumido.

THE LAPIDARY PUPA. Shell raised, horny, smooth, rather pyramidal towards the apex, apex obtuse, cylindrical above the middle and below; whorls seven, straight-sided, last high, deeply notched; aperture ovate, white, with three prominent plates, outer lip tumid above the middle.

HUTTON. Journ. As. Soc. Beng. 1849.

Hab. Afghanistan.

Species 148. (Mus. Hanley.)

PUPA BICOLOR. *Pup.* testa altissima, hyalina, albâ; aufractibus septem, apicalibus tumidis, alteris subquadratis, ultimo alto, infra subcontracto, rimato; apertura subauriformis, conspicue triplicata, labio exterior supra medium profundè sinuato, callo suturali conspicuo.

THE TWO-COLOURED PUPA. Shell very high, glassy, white; whorls seven, apical tumid, others rather square, last high, a little contracted below,

PUPA.—PLATE XVI.

notched; aperture rather auriform, conspicuously three-plaited, outer lip with a deep sinus above the middle, sutural callus conspicuous.

HUTTON. Journ. As. Soc. Beng. 1834.

Pupa mellita, Gould.

Hab. Mirzapore, Tavoy, Ceylon.

Species 149. (Mus. Sir D. Barclay.)

PUPA CERNICA. *Pup. testâ brevi, apicâ, sordidè albâ, crebrè liratâ, cylindrâ; apice obtuso; anfractibus sex, superioribus brevissimis, alteris latis, ultimo profundè rinato et umbilicato; apertura ad ultimum anfractum uniplaedita.*

THE MAURITIAN. Shell short, opaque, dull white, closely ridged, cylindrical; apex obtuse; whorls six, upper very short, others wide, last deeply notched and umbilicated; aperture with a single plait on the last whorl.

A. ADAMS. Proc. Zool. Soc. 1868, Pl. IV.

Hab. Mauritius.

Species 150. (Mus. Hanley.)

PUPA SALWINIANA. *Pup. testâ latâ pyramidalitâ, brevi, cornutâ, apice acuminato, anfractibus sex, rapidi crescentibus, ultimo longè rinato; apertura ferè ad suturam ultimi anfractus elevata, subauriformis, antec' obliquè producta, proximâ quadriplicata, margine albo, labio externo supra medianâ sinuata.*

SALWIN'S PUPA. Shell broadly pyramidal, short, horny, apex acuminate; whorls six, rapidly increasing, last with a long notch; aperture raised almost to the suture of the last whorl, rather

auriform, anteriorly obliquely produced, with four prominent plaits, margin white, outer lip sinuous above the middle.

THEOBALD. Journ. As. Soc. Beng. 1870.

Hab. Shan States.

Species 151. (Mus. Hanley.)

PUPA PLICIDES. *Pup. testâ brevi, latâ, cornuo-subcirculari, levâ, spirâ pyramidatâ, apice obtuso; anfractibus quatuor rotundâ prominentibus, ultimo angulo, infre subangustatâ, longè rinato; apertura obliquè subauriformis, calidè dentata-plicata.*

THE TOOTHPLATED PUPA. Shell short, broad, greenish-horny, smooth, spire pyramidal, apex obtuse: whorls four, roundly prominent, last large, rather narrow below with a long notch; aperture obliquely rather auriform, with strong tooth-plaits.

BENSON. Ann. Nat. Hist. 1849.

Hab. Himalaya.

Species 152. (Mus. Hanley.)

PUPA RATHYODON. *Pup. testâ parvâ, pyramidatâ, levâ, fusciâ, apice acuminato; anfractibus quinque, rotundis, ultimo profundè rinato; apertura auriculâ, quinquplicata, antec' obliquè producta.*

THE DEEP-TOOTHED PUPA. Shell small, pyramidal, smooth, brown, apex acuminate; whorls five, rounded, last deeply notched; aperture orange, five-plaited, anteriorly obliquely produced.

BENSON. Ann. Nat. Hist. 1863.

THE SCALARIFORM PUPA. Shell brown, fusiform, deeply notched; spire acuminated; whorls five, angular, plaited, last contracted in the middle; aperture ear-shaped, with three plait's, outer lip sinuously contracted above the middle.

GUNDLACH. Pfeiffer, Malak. Bl. 1860.
Hab. Sicily (?), Cuba.

Species 154. (Mus. Hanley.)

PUPA XITIDA. *Pup. testā parvā, brevi, subcentricōdā, brevi, r. sōdā; anfractibus quinque, rotundis, brevis, suturā profundā; aperturā brevi, edentulā.*

THE SHINING PUPA. Shell small, short, rather ventricose, smooth, brown; whorls five, round, short, suture deep; aperture short, without teeth.

ANTONELLI. Pflr. Mon. II. p. 335.
Hab. Greece.

Species 155. (Mus. Hanley.)

PUPA BOREALIS. *Pup. testā minutā, subdiaphanā, sucrinādā; anfractibus quinque ad sex, altissimis, subcentricōdā, ultimo rimato; aperturā brevi, dentibus minutissimis.*

THE BOREAL PUPA. Shell minute, a little transparent, amber; whorls five or six, rather high, rather ventricose, the last notched; aperture short, with very minute teeth.

MORELET. Journ. Conch. VII. 1858.
Hab. Kamtschatka.

Species 156. (Mus. Hanley.)

PUPA GRANUM. *Pup. testā elongato-fusiformā, fusōdā, altā, angustā; anfractibus octo, altissimis, super-*

oribus versus apicem attenuatis, ultimo brevi, longi-
rimato; aperturā parvā, plicis circā quinque.

THE GRANUM PUPA. Shell elongate, fusiform, brown, high, narrow; whorls eight, rather raised, upper attenuated towards the apex, last short with a long notch; aperture small, plait's about five.

DEFAINCNAUD. Conch. Terrest. et Fluv.
Hab. France, Spain, Greece, Italy, &c.

Species 157. (Mus. Hanley.)

PUPA FARINESI. *Pup. testā pyramidatā, altā, puerpare-*
fusā, brevi; anfractibus sex, gradatim crescentibus,
concretiōseulis, ultimo rotundis, ventricoso, longi-
rimato; aperturā ovalē, edentulā, marginē tenui.

FARINE'S PUPA. Shell pyramidal, raised, purple-brown, smooth; whorls six, gradually increased, rather convex, last large, ventricose, with long notch; aperture ovate, without teeth, margin thin.

DESMARET. Rev. et Mag. Zool. XV. 1862.
Hab. Pyrenees.

Species 158. (Mus. Hanley.)

PUPA TRUNCATELLA. *Pup. testā altidā, cylindrica,*
recte breviā; anfractibus sex, inferioribus trībus
subsequulis, duobus apicēibus minutis, ultimo
alto, cylindrica, breviter rimato et umbilicata.

THE TRUNCATELLA PUPA. Shell whitish, cylindrical, straightly ridged; whorls six, lower three nearly equal, two apical minute, last raised, cylindrical; shortly notched and umbilicated.

PFEIFFER. Mon. Vol. IV. 1868.
Hab. Transylvania, Turkey.

Species 159. (Mus. Hanley.)

PUPA BIGANATA. *Pup. testā eglindriē, minutā, brevi,*
falcē, brevi; anfractibus septem, medianis suber-
quibus; ultimo breviter rimato; aperturā parvā,
margine profundē incrassato, ultimo anfractu
nudicanto.

PUPA.—PLATE XVII.

THE TWO-GRAINED PUPA. Shell cylindrical, minute, short; whorls seven, middle ones nearly equal, last shortly notched; aperture small, margin deeply thickened, last whorl with a single tooth.

ROSSMASLER. Pfr. Mon. II. p. 354.
Hab. Germany.

Species 160. (Mus. Hanley.)

PUPA ROWELLII. *Pup. testū minutā, fusēa, politā, ventricosā; anfractibus quatuor, ultimō et penultimō ventricosā, altis, ultimō longè rimato; aperturā subtriangularē, plieis dentiformibus tribus vel quatuor.*

ROWELL'S PUPA. Shell minute, brown, smooth, ventricose; whorls four, last and last but one ventricose, high, last with a long notch; aperture subtriangular, with three or four tooth-like plait.

NEWCOMB. Ann. Lyc. New York, VII. 1861.
Hab. Oakland, California.

Species 161. (Mus. Hanley.)

PUPA CUPA. *Pup. testū breviter cylindrica, cornēa, apice obtuso; anfractibus quinque, brevibus, tribus inferioribus latis, levibus, ultimō profundē rimato,*

ad aperturam unidentata; aperturā parvā, subrotundā, margine profunde incrassato.

THE BUTT PUPA. Shell shortly cylindrical, horny, apex obtuse; whorls five, short, three lower broad, smooth, last deeply notched, with a single tooth at the aperture; aperture small, rather round, margin deeply thickened.

KÜSTER. Fide Hanley.
Hab. Switzerland.

Species 162. (Mus. Hanley.)

PUPA SUTENS. *Pup. testū parvā, pallidē cornēa, subpyramidalē, apice obtuso; anfractibus quatuor, decolorib; ultimō magno, profunde rimato; suturā profunda; aperturā parvā, subquadratā, plieis quatuor, una an anfractum ultimum productā, bifida, una columellarī, duabus iugis labium externum insinuatim parvis, rotundis.*

THE SHINING PUPA. Shell small, pale, horny, rather pyramidal, apex obtuse; whorls four, sloped, last large, deeply notched; suture deep, aperture small, rather square, with four plait, one at the last whorl, produced, bifid, one columellar, two small, round, placed within the outer lip.

PEASE. Proc. Zool. Soc. 1860, p. 439.
Hab. Isl. Ebon, Marshall's Group.

PUPA.

PLATE XVIII.

Species 163. (Mus. Sowb.)

PUPA MINUTISSIMA. *Pup. testa minuta, fuscæ, cylindricæ, levæ, apice obtuso; anfractibus quinque, rotundis, tribus inferioribus subequalibus, ultimo profundi rimate; apertura parvæ, subovalis, ad anfractum ultimum unidentata.*

THE VERY SMALL PUPA. Shell minute, brown, cylindrical, smooth, with obtuse apex; whorls five, rounded, three lower nearly equal, last with a deep notch; aperture small, rather oval, with a single tooth on the last whorl.

HARTMANN. Pfeiffer, Mon. 1868, p. 391.

Hab. Central Europe.

Species 164. (Mus. Hanley.)

PUPA MILLUM. *Pup. testa minuta, cornuta, subduplicata, polita, cylindrica, apice obtuso; anfractibus quatuor, inferioribus subequalibus; apertura parvæ, quinqueplaitata.*

THE MILLET PUPA. Shell minute, horny, rather transparent, polished, cylindrical, apex obtuse; whorls four, the lower ones nearly equal; aperture small, five-plaited.

GOULD. Pfeiffer, Mon. 1868, p. 335.

Hab. North America.

Species 165. (Mus. Hanley.)

PUPA DECORA. *Pup. testa minuta, pallidæ, cornuta, subcylindrica, subduplicata, levæ; anfractibus quinque, apicalibus subattenuatis, ultimo breviter rotundata; apertura parvæ, quadridentata.*

THE DECOROUS PUPA. Shell minute, pale horny, subcylindrical, a little transparent, smooth; whorls five, apical ones rather attenuated, last shortly notched; aperture small, four-toothed.

GOULD. Otia Conchologica, p. 202.

Hab. North America.

Species 166. (Mus. Hanley.)

PUPA POTTEBERGENSIS. *Pup. testa sinistrorsæ, pallidissimæ roseæ, subcylindrica, subcentrica, levæ,*

apice obtuso, fuscæ; anfractibus novem, superioribus subattenuatis, alteris subequalibus, ultimo longè rotundato, profundè umbilicato; apertura ad anfractum ultimum elevata, prope marginem quinqueplaitata, marginæ levata.

THE POTTEBERG PUPA. Shell sinistral, very pale rose, rather cylindrical, rather ventricose, smooth, apex obtuse, brown; whorls nine, upper rather attenuated, the others nearly equal, last with a long notch, deeply umbilicated; aperture raised on the last whorl, five-plaited near the margin, margin thin.

KRAUSS. Pfeiffer, Mon. 1868, p. 297.

Hab. Cape of Good Hope.

Species 167. (Mus. Hanley.)

PUPA RECTA. *Pup. testa elongatæ, cylindrica, angustæ, levæ, cornuta, fuscæ-rubescens, triplipectata, apice obtuso; anfractibus septem, duobus apicalibus parvis, alteris subequalibus, rectis, ultimo longè rotundata; apertura parvæ, uniforæ, ploris ad anfractum ultimum duabus, ad columellam usq; intus usq; elongatæ, labio externo supra nodum sinistræ incrassata.*

THE STRAIGHT PUPA. Shell elongated, cylindrical, narrow, smooth, horny, three-banded with reddish-brown, apex obtuse; whorls seven, two apical small, others nearly equal, straight, last with a long notch; aperture small, ear-shaped, plaits on the last whorl two, on the columella one, inside one elongated, outer lip sinuously thickened above the centre.

LOWE. Pfirr. Mon. 1868, p. 399.

Hab. Madeira.

The whorls are banded with a vinous brown.

Species 168. (Mus. Hanley.)

PUPA MONTICOLA. *Pup. testa levæ, cylindrica, crebrilioria, media anfractuum et ad suturem retro fuscata; anfractibus sex, apicalibus duobus obscurissimè compressis, alteris subequalibus, ultimo ad medullam subcompresso, longissime rotundata; ap-*

PUPA.—PLATE XVIII.

turbā angustā, subovatā, ad anfractum ultimum intus uniplicatā, ad marginem prope suturam pliis callosi supra infrāque extensā instructā, labio externo intus biplicata.

THE MOUNTAIN PUPA. Shell short, cylindrical, closely ribbed, banded with red in the middle and at the suture of the whorls; whorls six, two apical very bluntly flattened, the others nearly equal, last rather compressed in the middle, with a very long notch; aperture narrow, subovate, with a single plait within on the body whorl, near the suture at the margin set with a callous plait extended over and under, outer lip with two inner plaits.

LOWE. Pfr. Mon. 1868, p. 311.
Hab. Porto Santo, Madeira.

Species 169. (Mus. Hanley.)

PUPA PLANTI. *Pup. testā ventricosā, tenui, subdianaphani, albida, tenuerit obliquè liratā, apice obtuso; anfractibus septem, lati, convexifusculis, ultimo breviter rimato; aperture laterores subcompresso; aperturā brevi, latā, callo suturali acuto, pliis columellarī internā latā, laminatā.*

PLANT'S PUPA. Shell very ventricose, thin, subdianaphanous, whitish, finely obliquely ridged, apex obtuse; whorls seven, broad, rather convex, last shortly notched, rather flattened on the side of the aperture; aperture short, broad, sutural callus sharp, columellar plait broad, laminated.

PFEIFFER. Proc. Zool. Soc.
Hab. Port Natal.

Species 170. (Mus. Hanley.)

PUPA SAXICOLA. *Pup. testā minutā, subviridē cornēa, subcylindrica, nitens, subdianaphani, apice obtuso; anfractibus quatuor, ultimo magno, longè rimato; aperture subovata, pliis ad anfractum ultimum duabus, columellarī undā, intus dualus parris, margine angusto, albo.*

THE ROCK-INHABITING PUPA. Shell minute, greenish-

horny, subcylindrical, shining, rather transparent, apex obtuse; whorls four, the last large, with a long notch; aperture rather oval, with two plaits on the last whorl, one columellar and two small within, margin narrow, white.

LOWE. Pfr. Mon. 1868, p. 321.

Hab. Madeira.

Species 171. (Mus. Hanley.)

PUPA IRRIGATA. *Pup. testā fuscocornēa, levigatā, subcylindrica, supernè subattenuatā; anfractibus septem, suturā profundiā separatis, ultimo longè rimato; aperturā subauriformi, supernè cuneatā, supra medium contractā, callo suturali et pliis ultimi anfractū valde elongatis, pliis internā rotundā, pliis columellarī elongatā, declici.*

THE BROOK PUPA. Shell brown-horn, smooth, rather cylindrical, rather attenuated above; whorls seven, separated by a deep suture, last with a long notch; aperture partly auriform, cuneate above, contracted above the middle, sutural callus and plait of the last whorl much elongated, internal plait strong, columellar plait elongated, sloped downwards.

LOWE. Pfr. Mon. 1868, p. 321.

Hab. Madeira.

The plaits in the mouth seem to fill it up by their great extension.

Species 172. (Mus. Hanley.)

PUPA EDENTULA. *Pup. testā parvā, cornēa, brevi, pallida, semipellucidā, spirā versus apicem paulò attenuatā; anfractibus septem, rotundis, ultimo breviter rimato; aperturā brevi, edentulā, margine tenui.*

THE TOOTHLESS PUPA. Shell small, horny, short, polished, semipellucid, spire a little attenuated towards the apex; whorls seven, rounded, last shortly notched; aperture short, without teeth, margin thin.

DEAFAENNAUD. Moll. Terr. et Fluv.
Hab. Europe.

P U P A.

PLATE XIX.

Species 173. (Mus. Hanley.)

PUPA FANTILLA. *Pup. testā minuta, ventricosā, fuscā, bocēi; anfractibus quatuor, brevibus, ventricosis, rotundis, ultimo majoribus, infra umbilicato; aperturā obliquā, subauriformā, quadrangularatā, labio exterio supra medianū transīto, sinuato.*

THE TINY PUPA. Shell minute, ventricose, brown, short; whorls four, short, ventricose, round, last rather large, umbilicated below; aperture oblique, rather auriform, four-toothed, outer lip tumid and sinuated above the middle.

GOLD. (Vertigo) Pfr. Mon. III.

Hab. Tahiti.

Species 174. (Mus. Hanley.)

PUPA ELEGANTULA. *Pup. testā albā, pellucidā, clavatā, superne obtusā, ventricosā, infra gradatim attenuatā; anfractibus sex, apicis planiblō, ultimo rotundis, contracto; aperturā subtriangularis, callo suturali conspicua.*

THE ELEGANT LITTLE PUPA. Shell white, pellucid, club-shaped, obtuse above, ventricose, gradually attenuated below; whorls six, apical flattened, last notched, contracted; aperture subtriangular with conspicuous sutural callus.

PFEIFFER. Proc. Zool. Soc. 1846, p. 185.
Hab. Liberia.

A curiously formed little shell, very thick towards the apex, and gradually tapering downwards.

Species 175. (Mus. Hanley.)

PUPA ANGUSTIUS. *Pup. testā minuta, sinistrorsā, fulvo; anfractibus quinque, concrecis, ultimo breviter umbilicato; aperturā parē, lata, triplicata, labio exterio supra medianū sinuato et dentato-plicata.*

THE NARROW PUPA. Shell minute, sinistral, fulvous; whorls five, convex, last shortly umbilicated; aperture small, broad, three-plaited, outer lip sinuous above the middle, with a tooth plait.

JEFFREYS. (Vertigo) Pfr. Mon. 1868, p. 336.

Vertigo Venetii, Charpentier.

Vertigo hamata, Held.

Hab. Britain, France, Germany, Spain, &c.

Species 176. (Mus. Hanley.)

PUPA MEXICANA. *Pup. testā breviuscula, albida, tenuiter et regulariter rotata, ventricosa, apice obtusa; anfractibus septem, medium ventricosum, ultimo longe sinuato, infra contracto, dorso post apertura marginem contracto et profundè fordato; aperturā subquadratā, latuus et prope marginem latè et profundi pliatus, matrigine reflexo, expanso.*

MENKE'S PUPA. Shell rather short, whitish, finely and regularly ridged, ventricose, apex obtuse; whorls seven, middle ventricose, last with a long notch, contracted below, contracted and deeply pitted at the back, behind the margin of the aperture; aperture subquadrate, within and near the margin broadly and deeply plaited, margin reflected, expanded.

PFEIFFER. (Azeca) Mon. 1868, p. 255.

Hab. Central Europe.

In the later monographs, Pfeiffer seems to have mixed up this shell with the well-known European *Azeca tridentata*, with which it has little affinity.

Species 177. (Mus. Hanley.)

PUPA CAPITATA. *Pup. testā albida, semipellucida, cylindrica, bocēi, prope apicem inflata; anfractibus quinque, obliquè tenue rotatis, ultimo obliquè profundè rimato, infra rimam tumido et subauriforme; aperturā subauriforme, rotunda contracta, intus dentato-plicata, pliis suturali magno, expansa, matrigine reflexo et expansa.*

THE HEADED PUPA. Shell whitish, semipellucid, cylindrical, short, inflated near the apex; whorls five, obliquely finely ridged, last obliquely deeply notched, tumid and partly keeled below the notch; aperture rather ear-shaped, contracted

PUPA.—PLATE XIX.

without, tooth-plaited within, sutural plait large, expanded, margin reflected and expanded.

GOULD. —? (quoted by Hanley.)
Hab. Cape Patmos.

Species 178. (Mus. Hanley.)

PUPA FUNICULA. *Pup. testā alta, cylindricā, solidā, subroseā, obliquē liratā; apice obtuso; anfractibus sex, rectinervis, medianis subequalibus, ultimo obtusissimā angulato vix rimato; apertura subquadratā, cedentib; marginē reflexo, subexpanso; s. longa, bl. latit.*

THE FUNNEL PUPA. Shell high, cylindrical, solid, rather pink, oblique-ridged, apex obtuse; whorls six, rather straight, middle nearly equal, last very obtusely angular, scarcely notched; aperture rather square, toothless; margin reflected, rather expanded; columella broad.

VALENCIENNES. Pfr. Mon. 1868, p. 287.
Hab. Isle of France.

Species 179. (Mus. Hanley.)

PUPA CYCLOSTOMA. *Pup. testā brevi, ventricosā, costis rectinervis sculptā, subroseā, apice obtusissimulo, medio inflato; anfractibus sex, brevibus, ultimo profundè rimato; apertura subrotundā, columellā et anfractu ultimo implicatis; marginē albo reflexo, rotunda.*

THE ROUND-MOUTHED PUPA. Shell short, ventricose, sculptured with rather straight ribs, rather pink, apex rather obtuse, inflated in the middle; whorls six, short, last deeply notched; aperture rather ovate, columella and last whorl single-plaited; margin white, reflected, round.

KÜSTER. Pfeiffer, Mon. 1868, p. 293.

Pupa Küsteri, Pfeiffer (var.)
Hab. Cuba.

Species 180. (Mus. Hanley.)

PUPA LACHRYMA. *Pup. testā albida, pellucidā, clavatā, cylindricā, supernē tumida, infū recta, apice obtuso; anfractibus sex, ultimo alto, infū obliquē breviter rimato; apertura trigonā, pliis suturali et pliis dentiformibus tribus conspicuis, crassis.*

THE TEAR PUPA. Shell whitish, pellucid, club-shaped, cylindrical, tumid above, straight below, apex obtuse; whorls six, last high, with a short oblique notch below; aperture trigonal, sutural plait and three dentiform plaits conspicuous, thick.

AUCT. —? (Mus. Brit.)
Hab. Liberia.

Species 181. (Mus. Hanley.)

PUPA TERES. *Pup. testā altā, cylindricā, eleganter obliquē liratā, albā, opaca, supernē tumida, infū subattenuata; anfractibus septem, inferioribus angustioribus, ultimo arcuatum rimato, suturā profundā; apertura cedentib; perpendiculariter oblonga.*

THE LONG-ROUNDED PUPA. Shell raised, cylindrical, elegantly obliquely ridged, white, opaque, tumid above, slightly attenuated below; whorls seven, lower narrower, last with a curved notch, suture deep; aperture toothless, perpendicularly oblong.

PFEIFFER. Mon. 1868, p. 297.
Helix palauana, Ferussac.
Hab. Mauritius.

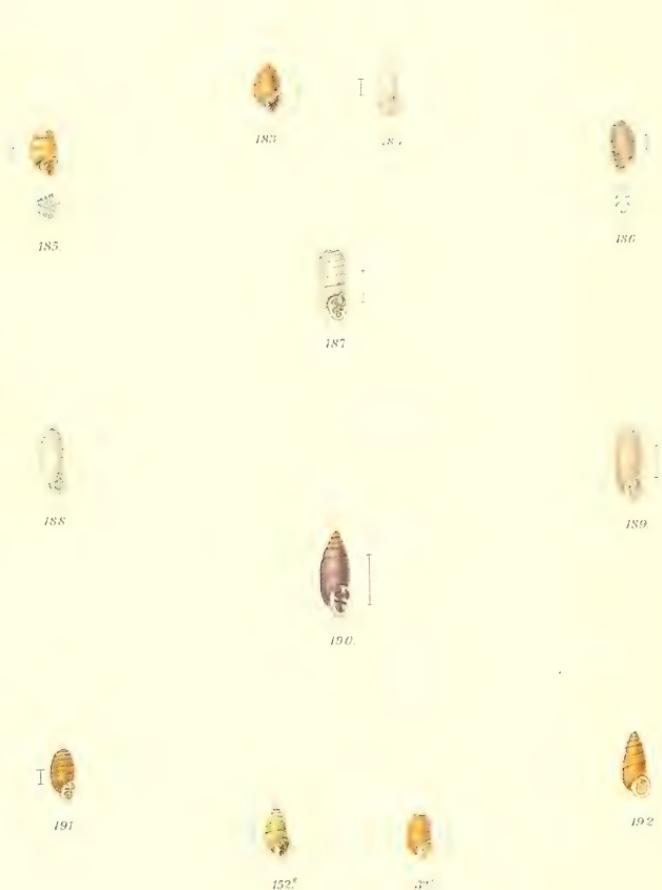

Species 182. (Mus. Hanley.)

PUPA KUREI. *Pup. testā sinistrorotā, latè pyramidalatā, levā, caraco-albida, apice acuminatā; anfractibus octo, gradatim crescentibus, ultimo profundè et longè rimato, infū rimam tumido et subcarinato; apertura elevatā, subtrigonā, intus quadriplicata callo suturali obliquē elongato, laminato, marginē tenui, vix reflexo.*

KURE'S PUPA. Shell sinistral, broadly pyramidal, smooth, bluish-white, apex acuminate; whorls eight, gradually increasing, last with a deep long notch, tumid and slightly keeled below the notch; aperture raised, subtrigonal, with four plaits within sutural callus obliquely elongated, laminar, margin thin, scarcely reflected.

KRAEUS. Pfeiffer, Mon. 1868, p. 297.

Pupa oordaria, Kurr.
Pupa footticola, Deshayes.
Hab. Cape of Good Hope.

PUPA.

PLATE XX.

Species 183. (Mus. Brit.)

PUPA ANTIVERTIGO. *Pup. testū minutā, dextrali, brevi, ventricosa, brevipatā; anfractibus quaternis; apicē obtuso; apertura trigonā, int̄ō acuminatā, dentibus octonis aut novenis, utripe latere tribus.*

THE OPPOSITE WHORL'S PUPA. Shell minute, dextral, short, ventricose, smooth; whorls four; apex obtuse; aperture trigonal, acuminate below, teeth eight or nine, three on each side.

DRAPARNAUD. 'Tabl. des Mollusques de la France,' p. 59.

Pupa Octodentata. Hartman.

Hab. Great Britain, Ireland, and France.

The aperture is triangular, with two or three teeth on each side between the angles. The small shells belonging to the group named 'VERTIGO,' by some authors being sinistral, this species, exactly resembling them in other respects, receives the above name because it is dextral.

Species 184. (Mus. Hanley.)

PUPA MODERATA. *Pup. testū ovalis; pallidē fulvo-pars, sublevigatā; anfractibus quinīs, altissimis, concrexis, suturā profundi; ultimo anfractū oblongo, rimato; apertura subovata, margine simplici, reflexo.*

THE UNPRETENDING PUPA. Shell ovate, pale fulvous, small, rather smooth; whorls five, rather elevated, convex, with deep suture; last whorl oblong, creased; aperture subovate; margin simple, reflected.

GOULD. —?

Hab. Florida.

A Bulimus-like little shell.

Species 185. (Mus. Brit.)

PUPA SUBSTRATIA. *Pup. testū minutā, fuscā, dextrali, breviter cylindrica, latā, oblique striata, anfractibus quaternis, brevibus; apertura subauriformis, marge reflexo, albo, sex-dentato.*

THE SUBSTRATED PUPA. Shell minute, brown, dextral, shortly cylindrical, broad, obliquely striated, whorls four, short; aperture somewhat auriform, margin reflected, white, six-toothed.

GRAT. (*Vertigo*) Brit. Mus. MS.

Hab. Great Britain and Germany.

Species 186. (Mus. Brit.)

PUPA TUSILLA. *Pup. testū minutā sinistrali, fuscō-fumosa, brevi; anfractibus obliquis, apicali obtuso, ultimo subobtici; apertura sinuatim trigonā, margine externo bidentato, interno supernō bidentato, columellā nuplicatā.*

THE DWARF PUPA. Shell minute, sinistral, smoky brown, smooth; whorls oblique, apical obtuse, last a little sloped; aperture sinuously triangular, outer margin with two teeth, inner with two teeth above, columella with one fold.

MÜLLER. Pfeiffer Mon. Hel. VI. p. 336.

Pupa vertigo. Draparnaud.

Hab. Germany, Spain, England.

Species 187. (Mus. Brit.)

PUPA WALBERGII. *Pup. testū subturbinata, cylindrica, albā, loci, semipellucida, anfractibus septenīs, apicalibus duobus depresso, alteris suboppositis, ultimo angustata, breviter rotata; apertura brevi, subtubiformis; plie naturali magis, dente columellarī prominenti, labio externo tridentato.*

WALBERG'S PUPA. Shell rather turbinated, cylindrical, white, smooth, semipellucid; whorls seven; apical two depressed, others nearly equal, last narrow, shortly creased; aperture short, rather auriform; natural plait large, columellar tooth prominent, outer lip tridentate.

PFEIFFER. Mon. Hel. Vol. VII.

Hab. S. Africa.

Species 188. (Mus. Hanley.)

PUPA DESHAYESI. *Pup. testū pared, albā, cylindrica-subturbinata; anfractibus octonis, brevibus costatis; ultimo profundè rimato; apertura sursim acicula, brevi; plie naturali conspicua.*

DESHAYES'S PUPA. Shell small, white, cylindrical, slightly turbinated; whorls eight, short, ribbed; last deeply creased; aperture turned upwards, short; natural plait conspicuous.

ADAMS. —?

Hab. —?

PUPA.—PLATE XX.

Species 189. (Mus. Hanley.)

PUPA DORMEYERI. *Pup. testā cylindrica, turbinata, cornēa, levī; anfractibus novēis, apicalibus puris, sequentibus superioribus latēs, inferioribus gradiatim angustatis, ultimo profundē rimato, apertura subquadrata, marginē albo, profundō, plica suturali prominenti.*

DORMEYER'S PUPA. Shell cylindrical, turbinated, horny, smooth; whorls nine, apical small, following upper wide, lower gradually narrowed, last deeply creased; aperture subquadrate, margin white, deep, sutural plait prominent.

PARRY'S —?
Hub. Greece.

Species 190. (Mus. Hanley.)

PUPA TRICOLOR. *Pup. testā pruinosa, subpyramidalē, levī, apice fuscō, acuminato; anfractibus octōbus, concurvissimis, tribus inferioribus altis; ultimo profundē rimato, umbilicato, infra umbilicum curvato; apertura subovatā, marginē falcō, interrupta, plica suturali conspicuā; plicē internis utrinque dentatis.*

THE THREE-COLOURED PUPA. Shell plum-coloured, subpyramidal, smooth, apex brown, acuminate; whorls eight, rather convex, three lower high; last deeply creased, umbilicated, keeled

below the umbilicus, aperture subovate, margin fulvous, interrupted, sutural plait conspicuous, inner plaits two on each side.

VILLA. —? ?

Hub. Lombardy.

Species 191. (Mus. Hanley.)

PUPA FUSCA. *Pup. testā minutā, breviter cylindrica, fusca, teniter liratā, anfractibus senis convexis, lamīnis inferius tenuibus, numerosis, plicē suturali proximā, albā, elongatā.*

THE BROWN PUPA. Shell minute, shortly cylindrical, brown, with thin ridges; whorls six, convex; inner lamina thin, numerous, sutural plait approximate, white, elongated.

LOWE. De Paiva Mon. Moll. p. 130.
Hub. Madeira.

Species 192. (Mus. Hanley.)

PUPA FALLAX. *Pup. testā oblongo-ovatā, fuscā, levī, subacuminatā; anfractibus senis; apertura ovatā, edentata.*

THE DECEPTIVE PUPA. Shell oblong-ovate, brown, smooth, a little acuminate; whorls six; aperture ovate, toothless.

SAY. Plffr. Mon. Hel. II. p. 309.
Bulimus exiguius. Reeve.
Hub. N. America.

Species 32. (Fig. 32,* Plate XX. Mus. Brit.)

PUPA ANGLICA. *Pup. testā minutā, cornēa, subpyramidalē, levī; anfractibus senis; apertura subtriangularē, intōs plicē, marginē albo, labio extero supra medianā sinuatim incrassato; plicē suturali parvo.*

THE ANGLICAN PUPA. Shell minute, horny, somewhat pyramidal, smooth; whorls six; aperture subtriangular, plaited within, margin white, outer lip sinusously thickened above the middle; sutural plait small.

FERRUSSAC —?

Hub. Britain and other parts of Europe.

Errata.—For *SEPTENTRIONALIS* (Species 118), read RINGENS, Sowerby.

For *VARIABILIS* (Species 32), read *MULTIDENTATA*, Olivier.

Species 152. (Fig. 152,* Plate XX., Mus. Brit.)

PUPA PYGMAEA. *Pup. testā minutā, brevissimū cylindrica, conica, levī; anfractibus quaternis ant quinīs; apertura subovatā, marginē albo sex-dentata.*

THE PYGMY PUPA. Shell minute, very shortly cylindrical, ventricose, smooth; whorls four or five; aperture subovate, margin white, six-toothed.

DRAPEAU. "Tab. des Mollusques de France."

Pupa quinque-dentata. Hartmann.

Vertigo alpestris. Ferrussac.

Hub. Britain and Central Europe.

MONOGRAPH
OF THE GENUS
VANIKORO.

"Nature, enchanting Nature, in whose form
And lineaments divine I trace a hand
That errs not."—*Couper*.

VANIKORO.

PLATE I.

Genus VANIKORO, Quoy et Gaimard.

Testa subglobosa, plerumque alba, cancellata vel decussata, epidermide tenui induta, perforata, umbilicata, umbilico in canalem desinunt; marginé apertura simplici. Operculum cornicum unguiculatum, non-spirale.

Shell subglobose, generally white, cancellated or decussated, covered with a thin epidermis, perforated, umbilicus ending in a canal; margin of the aperture simple. Operculum horny, unguiculate, non-spiral.

Synonyma. MURIA, Gray. WAMICA, Recluz.

The greater part of the species now known were described by Recluz in the Proceedings of the Zoological Society for 1843, many of them being from specimens in the late Mr. Cuming's collection. A few species have been subsequently discovered. The home of the genus seems to be the Pacific, particularly southwards.

Species 1. (Fig. a, b, Mus. Brit.)

VANIKORO CANCELLATA. *Van. testa latâ, patulâ, crassissimulâ, costis concentricis obliquis, sublaminatis, extantibus et liris tenibus spiralibus cancellatâ; aperturâ latâ, columelli arcuata, canali angustato, elongato; spira brevissimâ, depresso, epidermide crocea.*

THE CANCELLED VANIKORO. Shell broad patent, rather thick, cancellated with oblique, rather laminar outstanding concentric ribs and thin spiral ridges; aperture broad, columnella arched, canal narrow, elongated; spire very short, depressed; epidermis saffron.

QUOY ET GAIMARD, Voyage de l'Astrolabe.

Narco Quoysi, Recluz.

Hab. Vanikoro, S. Pacific.

In this species the oblique ribs are rather laminated in form, and rise to angular ridges in the most prominent parts. The colour of the epidermis is bright saffron on the younger specimens.

Species 2. (Mus. Brit.)

VANIKORO GUERINIANA. *Van. testa brevi, crassâ, latâ; costis distantibus, crassis, perobliquis, et striis spirabilibus cancellatâ; aperturâ latâ, decolorata; canali obliquè rectiæsculo, canali latâ, semilunari.*

GUERIN'S VANIKORO. Shell short, thick, broad, cancellated with distant, thick, very oblique ribs and spiral striae; aperture broad, sloped downwards; canal obliquely nearly straight, canal broad, semi-lunar.

RECLUZ, Proc. Zool. Soc., 1843.

Hab. Isl. of Capul, Philippines.

The ribs are broad, thick, and distant.

Species 3. (Mus. Brit.)

VANIKORO PLICATA. *Van. testa globosâ, tenuissimulâ, costis numerosis tenibus et striis spirabilibus sculptâ; apice subacuminato; canali semilunari; columella rectiæscula.*

THE PLATED VANIKORO. Shell globose, rather thin, sculptured with numerous thin ribs and spiral striae; apex rather acuminate; canal semilunar; columella rather straight.

RECLUZ, Proc. Zool. Soc., 1843.

Hab. Isl. Ticao.

Species 4. (Mus. Brit.)

VANIKORO CIDARI. *Van. testa rotundâ, crassi, costis latâ, subdistantibus et striis spirabilibus sculptâ; spira depresso, acuminato; aperturâ moyo, canali moderatè angustato, columellâ rectiæscula.*

THE CIDARI VANIKORO. Shell rounded, thick, sculptured with broad, rather distant ribs and spiral striae; spire depressed, acuminate; aperture large, canal moderately narrow, columella rather straight.

RECLUZ, Proc. Zool. Soc., 1843.

Hab. Isl. Masbate, Philippines.

VANIKORO.—PLATE I.

Species 5. (Mus. Brit.)

VANIKORO PETITIANA. *Van. testā globosā tenuiūsculātā, costis numerosis, concentricis versū marginem sub-crenatis et liris tenubus, acutis, spiraliibus sculptis; spirā acuminatā, anfractibus rotundis, distinctis, ultimo maximo; canali angusto; aperturā lata.*

PETIT'S VANIKORO. Shell globose, rather thin, sculptured with numerous concentric ribs becoming obsolete towards the margin and thin, sharp spiral ridges; spire acuminated, whorls rounded, distinct, last very large; canal narrow; aperture broad.

RECLUZ. Proc. Zool. Soc., 1843.

Hab. Philippines.

Species 6. (Mus. Brit.)

VANIKORO LIGATA. *Van. testā crassiūsculātā, globosā, costis elevatis, obliquis, crassis, concentricis, liris tenubus ligatis sculptā; spirā depresso, canali angustissimo, columellā arcuata.*

THE CONNECTED VANIKORO. Shell rather thick, globose, sculptured with raised, oblique, thick, concentric ribs united by thin spiral ridges; spire depressed, canal very narrow; columella arched.

RECLUZ. Proc. Zool. Soc., 1843.

Hab. Seychelles Islands.

Species 7. (Fig. a, b, Mus. Brit.)

VANIKORO CUMINGIANA. *Van. testā depresso, crassā, angulatā, carinā magnis spiraliibus et striis foveolatis*

concentricis sculptā; spirā brevi, anfractibus minutis, angulatis; aperturā subrotundā; canali lato.

CUMING'S VANIKORO. Shell depressed, thick, narrow, sculptured with large spiral keels, and pitted concentric striae; spire short, whorls minute, angular; aperture rather rounded; canal broad.

RECLUZ. Proc. Zool. Soc., 1843.

Narica tricarinata, Recluz.

Hab. —?

The *Narica tricarinata* appears to be only a depressed variety.

Species 8. (Fig. a, b, Mus. Brit.)

VANIKORO BUGATA. *Van. testā elevatā, crassā, spirā acuminatā anfractibus, superioribus crassi-costatis, intersticiis profundi foveolatis, ultimo anfractu leviter sculpto; aperturā semilunari; canali lato, columella reticulata.*

THE WRINKLED VANIKORO. Shell elevated, thick, spire acuminated, upper whorls thick-ribbed, with deeply pitted interstices; last whorl lightly sculptured, aperture semilunar; canal broad, columella rather straight.

A. ADAMS. Ms. Cun. Coll.

Hab. —?

The cancellations of the upper whorls are very deeply pitted, but they become almost obsolete towards the back and margin of the last whorl.

VANIKORO.

PLATE II.

Species 9. (Mus. Brit.)

VANIKORO GAIMARDI. *Van. testā parvā, costis paucis, distans spiralibus et liris concentricis profundi et latè cancellatā; spirā elevatā, acuminatā; apertū subrotundā; canali angusto, profundo.*
GAIMARD'S VANIKORO. Shell small, deeply and broadly cancellated with few distant spiral ribs and concentric ridges; spire elevated, acuminated; aperture rather rounded; canal narrow, deep.

ADAMS, MS. Cum. Coll.

Pinioko Quogi, Adams, non Recluz.

Hab. — ?

Species 10. (Fig. a, b, Mus. Brit.)

VANIKORO CUVIERIANA. *Van. testā subpatulā, depresso, tenui, tenuerū spiraliter et concentricē liratā; spirā depresso, acuminatā, anfractū ultimo suprū subdepresso; aperturā obliquū ovatā, canali latissimo, columnellā tenui, obliquū subarcuato.*

CUVIER'S VANIKORO. Shell rather patulate, depressed, thin, finely spirally and concentrically ridged; spire depressed, acuminated, last whorl rather depressed above; aperture obliquely ovate, canal very broad, columnella thin, a little obliquely arched.

RECLUZ. Proc. Zool. Soc., 1843.

Hab. — ?

A more finely sculptured shell than most of the other species.

Species 11. (Mus. Brit.)

VANIKORO SOULEYETIANA. *Van. testā globosū, tenuerū spiraliter et concentricē sculptū; spirā parvā, acuminatā, ultimo anfractū rotundā; apertū subrotundā; columnellā rectā, canali brevi, angusto.*

SOULETET'S VANIKORO. Shell globose, finely spirally and concentrically sculptured; spire small,

acuminated, last whorl rounded; aperture rather rounded; columnella straight, canal short, narrow.

RECLUZ. Proc. Zool. Soc., 1843.

Hab. — ?

Originally described from a specimen in Mr. Cuming's collection—locality unknown.

Species 12. (Fig. a, b, Mus. Brit.)

VANIKORO DESHAYESIANA. *Van. testā globosā, tenui, spirā acuminatā; anfractibus superioribus cancellatis, ultimo anfractū tenuerū spiraliter striatā, tectorū concentricē costatā; costis striatisque versus marginem ferè evanidis; aperturā subrotundā, columnellā leciter arcuata; canali latissculo.*

DESHAYES' VANIKORO. Shell globose, thin, spire acuminated; upper whorls cancellated, last whorl finely spirally striated, lightly concentrically ribbed; ribs and striae almost obsolete towards the margin; aperture rather rounded, columnella slightly arched; canal rather broad.

RECLUZ. Proc. Zool. Soc., 1843.

Hab. Isl. Zebu, Philippines.

In some specimens the sculpture almost disappears towards the back of the last whorl.

Species 13. (Fig. a, b, Mus. Brit.)

VANIKORO DISTANS. *Van. testā parvā, clatrā, distans-simē concentricē costatā, spiraliter tenuerū striatā; spirā elevatā, acuminatā; aperturā semilunari, obliquā; canali lato, semilunari.*

THE DISTANT VANIKORO. Shell small, elevated, very distantly concentrically ribbed, spirally finely striated; spire elevated, acuminated; aperture semilunar, oblique; canal broad, semilunar.

RECLUZ. Proc. Zool. Soc., 1843.

Hab. Isl. Bohol, Philippines.

VANIKORO.—PLATE II.

Species 14. (Mus. Brit.)

VANIKORO CLATHRATA. *Van. testā rotundo-subdepressā; crassi, suberquālitr cancellatā; aperturā obliquā; columellā rectiūsculā, canali latissimo; spira acuminatā, profundē foveolatā.*

THE LATTICED VANIKORO. Shell roundly sub-depressed, thick, rather equally cancellated; aperture oblique; columella rather straight, canal very broad; spire acuminated, deeply pitted.

RECLUZ. Proc. Zool. Soc., 1843.

Natica striata, D'Orbigny.

Natica marporitacea, Potiez.

Natica sigaretiformis, Potiez.

Hab. ——?

Species 15. (Mus. Brit.)

VANIKORO BOSEA. *Van. testā parvā, patulā, roseā, striis spiralibus et costis concentricis obliquis cancellatā; aperturā semilunari, columellā rectiūsculā; canali latissimo.*

THE PINK VANIKORO. Shell small, patulous, pink, cancellated with spiral striae and concentric oblique ribs; aperture semilunar, columella rather straight; canal very broad.

RECLUZ. Proc. Zool. Soc., 1843.

Hab. Moluccas.

The only species showing any genuine colour in the shell itself.

Species 16. (Mus. Brit.)

VANIKORO GRANULOSA. *Van. testā globosā, costis spiraliibus moniliformibus sculptā; spira elevatā: aperturā semilunari; columellā tenuī; canali latissimo, complanato.*

THE GRANULATED VANIKORO. Shell globose, sculptured with beaded spiral ribs; spire elevated; aperture semilunar; columella thin; canal very broad, flat.

RECLUZ. Proc. Zool. Soc., 1843.

Hab. New Holland.

The spiral sculpture decidedly predominates in this species in the form of beaded ribs.

VANIKORO AND NERITOPSIS.

PLATE III.

Species 17. (Mus. Brit.)

VANIKORO IMBRICATA. *Van. testā parvā, tenui, obliquā, tenuiter spiraliiter et concentricē striatā; spira elevata, acuminatā; aperturā angustē oratā, obliquē productā, canali maximo, semirotundata.*

THE IMBRICATED VANIKORO. Shell small, thin, oblique, finely spirally and concentrically striated; spire raised, acuminate; aperture narrowly ovate, obliquely produced, canal very large, half-rounded.
PEASE, MS.

Hab. Islands in the Pacific.

Species 18. (Fig. a, b, Mus. Brit.)

VANIKORO RECLIZIANA. *Var. testi clati, acuminatā, spiri cancellatā, ultimo anfractu ferè levigato; aperturā semicirculari, columellā rectiūsculā; canali elongato, latiūsculo.*

RECLIZ'S VANIKORO. Shell elevated, acuminate, spire cancellated, last whorl almost smooth; aperture semicircular, columella nearly straight; canal elongated, rather broad.

ADAMS AND ANGUS. Proc. Zool. Soc., 1867, p. 212.
Hab. New South Wales.

The early whorls are strongly cancellated, but the body whorl becomes nearly smooth.

Species 19. (Mus. Brit.)

VANIKORO HELICOIDEA. *Van. testā subrotundā, eleganter costatā, intersticiis spiraliiter depresso-striatā; spira depresso; aperturā magna, ovata; columellā tenui, rectiūsculā; canali brevi, seniliswari.*

THE SNAIL-SHAPED VANIKORO. Shell rather rounded, elegantly ribbed, interstices spirally depressed-striated; spire depressed; aperture large, ovate;

columella thin, rather straight; canal short, semi-lunar.

LE GUILLON. Recluz, Proc. Zool. Soc., 1843.
Hab. — ?

Species 20. (Fig. a, b, Mus. Brit.)

VANIKORO SOLIDA. *Van. testā solidā, globosā, spiri prominenti, anfractibus superioribus cancellatis, rotundis, ultimo anfractu tenuiter spiraliiter et concentricē striatā; aperturā magna, columellā tortuā; canali angusto.*

THE SOLID VANIKORO. Shell solid, globose, spire prominent, upper whorls cancelled, rounded, last whorl finely spirally and concentrically striated; aperture large, columella tortuous, canal narrow.

SOWERBY.

Hab. — ?

Species 21. (Fig. a, b, Mus. Brit.)

VANIKORO ACUTA. *Van. testā altiūsculā, tenui, semi-pellucida, tenuiter decussata; spira acuminata, anfractibus prominulis; aperturā subovata, columellā rectiā, canali lato, plumato.*

THE ACUTE VANIKORO. Shell rather elevated, thin, semipellucid, finely decussated; spire acuminate, whorls rather prominent; aperture subovate, columella straight, canal broad, flattened.

RECLUZ. Proc. Zool. Soc., 1843.

Hab. — ?

More finely decussated than most of the species, with sharp spire and thin substance.

Species 22. (Mus. Brit.)

VANIKORO SEMPLICATA. *Van. testā globosā, tenuiūsculā, tenuiter decussata; ultimo anfractu suprā suturam aperturā elevatā; anfractibus apicalibus minutis;*

operturā semirrotundā; columellā tenuī, rectilīuscūlā;
canalī elongato, angusto.

THE HALF-PLAITED VANIKORO. Shell globose, rather thin, finely decussated; last whorl raised above the suture of the aperture; apical whorls minute; aperture half-round; columella thin, rather straight; canal long, narrow.

PLEASE —? MS. in Cuming's Collection.

Hab. South Seas

Species 23. (Mus. Brit.)

VANIKORO ELATA. *Van. testā altā, tenuī, tenuissimā decussatā; spirālē elevatā, acuminatā, unfractibus proninuentibus; aperturā brevīscūlā, subpyriformi; columellā brevi, leviter arcuati, canali brevi, angustissimo.*

THE ELEVATED VANIKORO. Shell elevated, thin, very finely decussated; spire elevated, acuminate, whorls prominent; aperture rather short, rather pyriform; columella short, slightly arched, canal short, very narrow.

SOWERBY.

Hab. China Seas.

Much more elevated than *Vanikoro acuta*, and with a narrow canal.

Species 24. (Fig. a, b, Mus. Brit.)

VANIKORO SEMISOLUTA. *Van. testā altā, angustā, spirāliter costis moniliformibus, et concentricā striis tenuibus sculptā; spirā elevatā, acuminatā; ultimā anfractū suprā suturam perelevatō; aperturā declivī, angustā auriformi, ad suturam vix convexā, canali elongato, latiūsculo.*

THE HALF-UNCOILED VANIKORO. Shell elevated, narrow, sculptured spirally with beaded ribs, and concentrically with thin striae; spire elevated, acuminate; last whorl raised high above the suture; aperture sloped downwards, narrowly auriform, scarcely connected at the suture, canal elongated, rather broad.

SOWERBY.

Hab. East Indies.

Owing to the fall of the aperture and the comparative distinctness of the canal, the outer and inner lips seem scarcely to touch the body-whorl.

NERITOPSIS.

Genus NERITOPSIS, Gratehoupe.

Testa subglobosa, spirāliter granulatā-costata; spirā brevi, aperturā magna; labio interno crasso, planulato, metiō quadratin emarginato; labio externo intus incrassato. Operculum crassum, testaceum, non-spirale.

Shell subglobose, spirally granulately ribbed; spire short, aperture large; inner lip thick, flattened, with a square notch in the middle; outer lip thickened within. Operculum thick, shelly, not spiral.

Syn. RADULA, Gray, not Klein.

As yet the *Neritopsis radula* from the Pacific is the only recent species known, although there are many fossil ones. The operculum formerly unknown, and supposed to be thin and horny, has been recently

figured in the Zoological Proceedings and described by Mr. Henry Adams. It is thick and shelly, with a square projection to fit the notch in the columella of the shell.

Species. (Mus. Sowerby.)

NERITOPSIS RADULA. *Ner. testā obliquā ocatā, crassā; costis crassis moniliformibus spiralibus sculptā; intersticiis angustis, foecolatis; aperturā obliquā, marginē externo laqueato.*

THE ROOT NERITOPSIS. Shell obliquely ovate, thick; sculptured with thick beaded, spiral ribs; interstices narrow, pitted; aperture oblique, outer margin fluted.

LINNAEUS (*Verita*). Syst. Nat.

Hab. Ceylon.

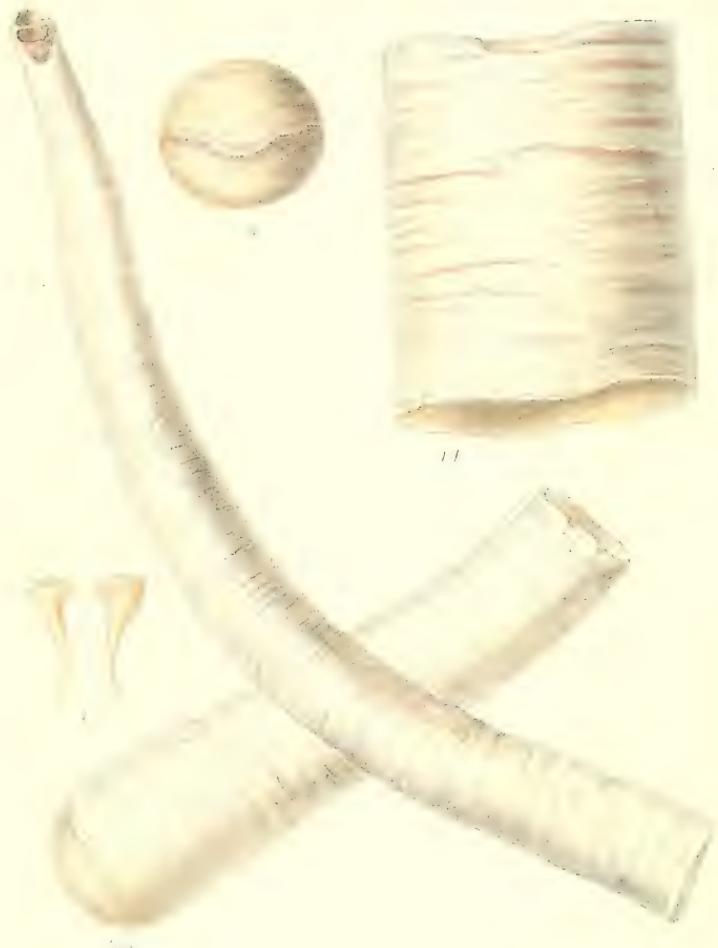

MONOGRAPH

OF THE GENUS

K U P H U S.

"All worlds, all nature, mood and measure keep
For praise and ceaseless gratulation poured
Into the ear of God—their Lord."—*Wordsworth*.

—
—
—
—
—

KUPHIUS.

Genus KUPHIUS, Guttéard (Cyphus).

Molluscum arcuicolum. *Tuba magna alba, rugosa, subannulata, posticè attenuata, intus in tubas duas divisa, lancinis septiformibus transversis concavata*. *Valva ignota*. *Palmulis compressoris testacei, deltoides*.

Molluse, sand-burrowing. Tube large, white, rough, slightly ringed, posteriorly attenuated, divided interiorly into two tubes, chambered transversely with septiform laminae. Valves unknown; compressor palmlets shelly, deltoid.

Syn. *Furella*, Oken. *Septaria*, Lamarck.

The gigantic tube of this Molluse in its anterior duplicate opening, its inner transverse septa, and its white, roughened, and irregularly annulated surface, is so exactly like a magnified representation of the tube of a Teredo as to leave little doubt as to the nature of the animal and its affinity with the genus *Teredo*. At the same time it can hardly be included in that genus, the valves having never been seen, and it being certain that the animal does not bore like the Teredines.

Species 1. (Mus. Brit.)

Kuphus gigantea. *Kup. testa maxima, tuba elongata, rugosa posticè attenuata, divisa, antice latè aperta; valvulis et palmulis compressoris ignotis*.

THE GIGANTIC KUPHUS. Shell very large; tube elongated, rugose, posteriorly attenuated, divided, anteriorly broadly open; valves and compressor palmlets unknown.

LINNAEUS (*Serpula*). *Systema Naturæ*.

Septaria arenaria, Lamarck.

Although not yet discovered, there can be little doubt but that valves of some kind exist. It is only barely possible that they may become absorbed. The tube, of which fig. *b* represents the end portion, is about three and a half feet long.

Species 2. (Fig. *a*, *b*, *c*, Mus. Brit.)

Kuphus clausa. *Kup. testa magna; tuba tenuissimata antice divisa, attenuata, concavata; posticè margin rotundata inflexa superlaminato clausa; valvulis ignotis; palmulis compressoris testaceis, aquatibus, antice styliformibus, posticè deltoides*.

THE CLOSED KUPHUS. Shell large; tube rather thin, anteriorly divided, attenuated, chambered, posteriorly closed by the roundly-inflected, super-laminated margin; valves unknown; compressor palmlets shelly, equal, anteriorly styliform, posteriorly deltoid.

SOWERBY.

Hab. —?

The end of the tube, which in the British Museum specimen is about fifteen inches long, is closed by the margin being folded inwards so as to meet and overlap across a rounded oval disc. If there were valves they would be enclosed within this termination. I do not know whether they have been sought in the specimen. The specimen in the British Museum is labelled as identical with the well-known *C. arenaria*.

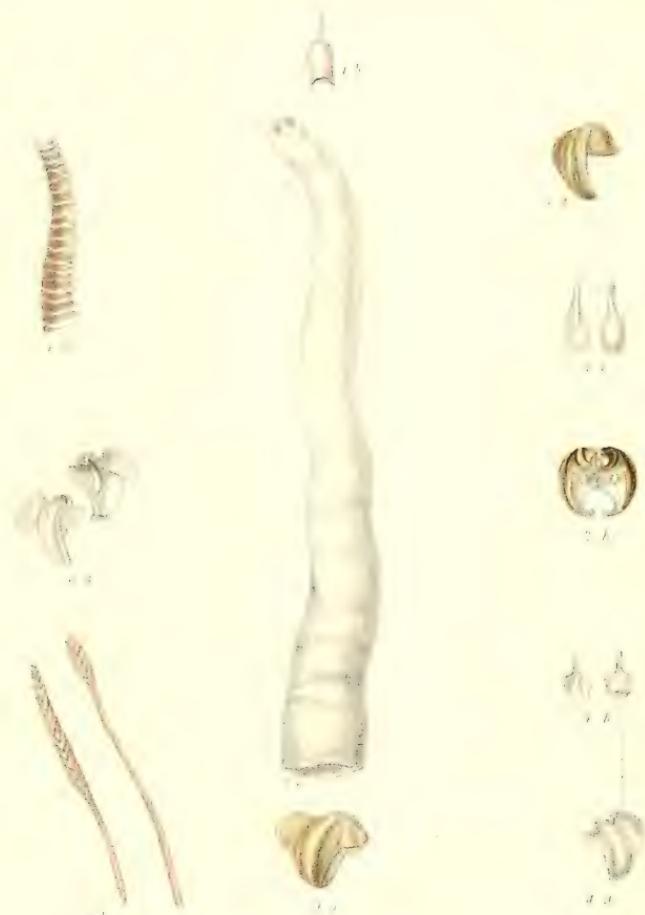

May, 1875.

MONOGRAPH

"In nature's infinite book of secrecy,
A little I can read."—*Shakspeare.*

TEREDO.

Pl. vi. 1.

Genus TEREDO. *Linnæus.*

Molluscum vermiciforme, perforans, tuba testacea plerumque formans, siphonibus stylosum cornuum vel palmarium testaceum pari munitum. Testa globosa, aquicula, anticis angulatior, posticis arcuata linea; cardine callosa, utriusque valde processu subumbonaliter munith. Tubus ad terminum siphonalem latitudi septiformatus frequenter dieci.

Mollusc worm-shaped, perforating, generally forming a shelly tube; siphons provided with a pair of horny styles or shelly pallets. Tube divided at the siphonal end by septiform laminae. Shell globose, equivalve, gaping angularly in front and in a curve behind; hinge callous, provided with a subumbonal process in each valve.

The habits of the Teredos are only too well known wherever they are found. The mischief they do in boring ship's timbers, and destroying breakwaters and piles, causes them to be reckoned among the enemies of industrial mankind. They generally bore in the direction of the grain of the wood, sometimes a little crookedly, but seldom intruding into each other's bores. The shelly tube forms the lining to the hole, and the valves are enclosed at the wider extremity. The pallets or styles are attached near the ends of the siphons, and seem to be used for the purpose of compressing and relaxing them, so as to assist the circulation of the water through the lengthened tubes. The pallets in some species are shelly and spade-shaped; in others horny and styliform. These divisions are separated generically by some authors as TEREDO and XYLOPHAGA.

Species 1. (Fig. *a, b*, only Mus. Brit.)

TEREDO NAVALIS. *Ter. testa obliqua, solidissimula; arcis anticis tenuissimis striatis; suds mediano lirato, areis posticis levigatis; auricula magni, rotundata; tuba tenuissimula, minime cameralis; palmaris testaceis, oblongis, termino concavo-arcuato; stipulis brevi.*

THE SHIP TEREDO. Shell oblique, rather solid, anterior areas very finely striated; middle sulcus ridge, posterior area smooth, auricle large, round; tube rather thin, not chambered; pallets shelly, oblong, end arched, stem short.

LINNEUS. Systema Natura.

Teredo nativus. *Sellius.*

Teredo palatalis. *Quatrefages.*

Hab. British coasts. Piles of Yarmouth Pier. Ramsgate.

Species 2. (Fig. *a, b, c*; for tube, see Fig. 1, *c, d*, Mus. Brit.)

TEREDO NORVEGICA. *Ter. testa altissimula, solidissima; valle arcuata; suds mediani profundata; arcicula angusta, semicirculata; palmaris testaceis, oblongis, termino convexa, lateribus declivior, stipulis brevissimis; tuba rotundata, concurvata.*

THE NORWEGIAN TEREDO. Shell rather high, solid, much arched; medial groove deep; auricle narrow, half-round; pallets shelly, oblong, with convex end, sloped sides, and rather short stem; tube robust, chambered.

SPENGLER. Forbes and Hanley, B. Mol. p. 66.

Teredo nigra. *Blainville.*

Teredo Brugnieri. *Delle Chiave.*

Teredo fidalis et T. Doshiai. *Quatrefages.*

Teredo marinensis. *Sellius.*

Hab. British and Northern coasts.

The breadth of the valves, as compared with the height, is less in this species than in the preceding, and the posterior auricle is much narrower.

Species 3. (Fig. *a, b*, Mus. Brit.)

TEREDO BIPENNATA. *Ter. testa alta, testae striata, umbonibus callosis; auricula posticis elevata, ad juncturam angustata, versus auriculam lateralem expedita, paulo supra umbonem elevata; stylis cornutis, inaequalibus, articulatis; uno brevi, stipulis elongatis, altero elongatis, stipulis brevissimis.*

THE BIPENNATE TEREDO. Shell high, finely striated, umboes callous; posterior auricle raised, narrow

TEREDO.—PLATE I.

at the juncture, expanded towards the lateral margin, raised a little above the umbo; styles horny, unequal, jointed; one short, with long stem; the other long, with rather short stem.

TURTON. British Bivalves.

Hab. Ireland, Scarborough, &c.

Species 4. (Fig. a, b, Mus. Hanley.)

TEREDO MEGOTARA. *Ter. testā latā, rotundatā, areō
anticā brevīsculā, marginē dorsali reflexa, recurva,
concaava; auriculā posticā latā, elevatim expansi,
supra umbones recurvā; palmulis testaceis, bre-*

*vibus, subquadratis, stipulā brevi, crassiusculā;
tubū articulatū.*

THE EXPANDED TEREDO. Shell broad, rounded, anterior arca rather short, dorsal margin reflected, recurved, concave; posterior auricle broad, raised, expanded, recurved above the umboes; pallets shelly, short, rather square, stem short, rather thick; tube jointed.

HANLEY. Forbes and Hanley, Brit. Moll.

Teredo dilatata. Stimpson.

Teredo nava? Turton.

Teredo oceanii? Sellius.

Hab. Herne Bay, Devonshire, Swansea.

T E R E D O.

PLATE II.

Fig. 1. *d.* Small end of the tube of *Teredo natalis*, showing that it is not chambered. To replace the figure in Plate I.

Fig. 2. *d.* Chambered end of *TEREDO NORVIGICA*.

Species 5. (Fig. *a, b, c*, Mus. Brit.)

TEREDO STITCHBURYI. *Ter. testi brevi, rotundata; areolae antice parvæ, obtuse, auriculæ posticæ pinnæ, contractæ; processus subumbonata expansus, validè curvus; stylæ cornue, minime articulatæ, latitudine tenuiore spinosæ; stipulae curvæ, tenue.*

STITCHBURY'S TEREDO. Shell short, rounded; anterior area small, obtuse; posterior auricle small, rounded; subumbonal process expanded, strongly curved; stylets horny, minutely articulated, finely spined at the sides; stem curved, thin.

LEACH. MS. Mus. Brit.

Hab. Sumatra.

Species 6. (Fig. *a, b, c*, Mus. Brit.)

TEREDO CABINATA. *Ter. testi oblongo-ovali, rotunda; auriculæ antice expansa, elevata, intus valdissimè carinata; stylæ cornue, elongatis, tenuibus, stipulae elongatissimæ.*

THE EELLED TEREDO. Shell rather high, much arched; anterior auricle expanded, raised, very strongly keeled, stylets horny, long, narrow, stem very long.

GRAY. MS. in Brit. Mus.

Hab. Drift-wood in British Channel.

The stylets of *Teredo bipinnata* are unequal, one being short, whet-car-like, with very long stem, and the other a much longer body with shorter stem. The stylets of *Teredo carinata* seem to differ from both. The valves in the latter are perhaps broader, but the difference is not very certain or obvious.

Species 7. (Fig. *a, b, c*, Mus. Brit.)

TEREDO MALLEOLUS. *Ter. testi parvi, alti, obliqui, angustata, valdissimè arcuata, areolæ posticæ brevi, angustæ, versus umbonem recurvæ, elevatae; processus umbonali oblique curvæ, ad terminum clavatae; palvulis brevissimis, testaceis, latis, stipulae brevi, incurvæ.*

THE LITTLE HAMMER TEREDO. Shell small, high, oblique, narrow, very strongly arched; posterior

area short, narrow, recurved towards the umbo, raised; umbonal process obliquely curved, club-shaped at the end; pallets very short, shelly, broad, with short stem, bent forwards.

TUFTON. Forbes and Hanley. Brit. Moll.
Hab. Torquay.

Species 8. (Fig. *a, b*, Mus. Brit.)

TEREDO MEGATHORAX. *Ter. testi magno, solidæ, rotundata, antice latissimè hiatata, callo arrecta, umbonibus rotundis, auriculæ posticæ brevi, rotundæ, marginæ dorsali pauci elevatae; areolæ antice brevi, areis medianis elongatis, callo terminali rugoso; processus subumbonata lato.*

THE BIG-CHESTED TEREDO. Shell large, solid, rounded, anteriorly very widely gaping, strongly arched, umbones rounded, posterior auricle short, rounded, dorsal margin a little raised; anterior area short, median areas elongated, with large terminal callus; subumbonal process broad.

GOULD —? MS. Mus. Brit.

Hab. N. America.

Species 9. (Fig. *a, b, c*, Mus. Brit.)

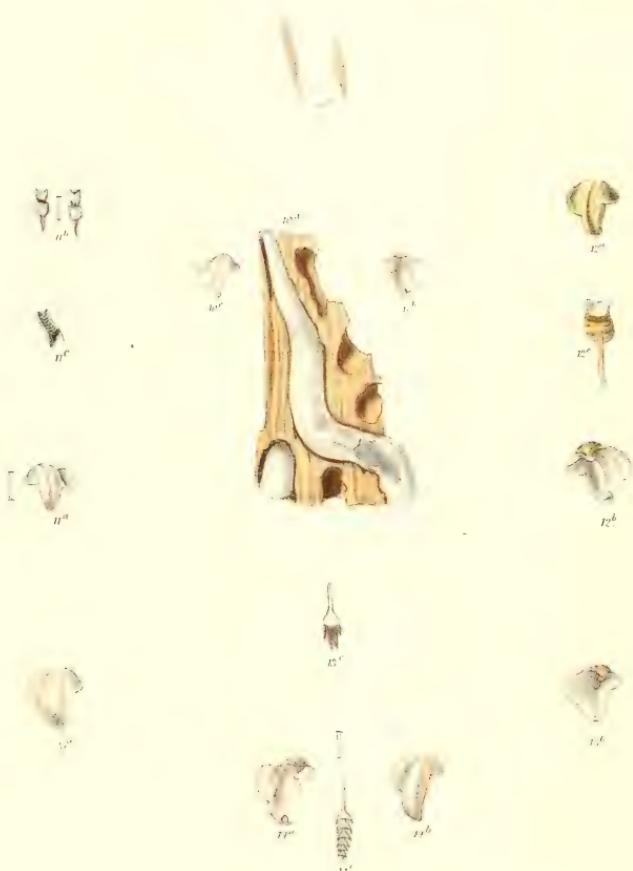

TEREDO CAMPANULATA. *Ter. testi albi, latissimæ, areolæ postico-centrali latæ, soleæ medianæ lato, levato; auriculæ posticæ ad junctionem angustata, versus marginem lateralem latè expansæ, superne concavæ-arcuatae elevatae, saepeque laterali declivæ; stylæ cornue, elongatis, dimidiatis articulis campanuliformibus uterque recurvo-spinosis ornatis.*

THE CAMPANULATED TEREDO. Shell white, rather broad, posterior-central area broad, middle sulcus broad, ridged; posterior auricle narrowed at the juncture, broadly expanded towards the lateral margin, raised in a concave curve above, lateral margin sloped downwards; stylets horny, elongated, ornamented half-way with bell-shaped joints, having recurved spines on each side.

DESHAYES. MS. Mus. Brit.

Hab. —?

The valves resemble those of *Teredo bipinnata*, but are much shorter and broader in the continuation of the central areas below the auricle. The greater difference is in the ornamentation of the pallets.

TEREDO.

PLATE III.

Species 10. (Fig. a, b, c, d, Mus. Brit.)

TEREDO SAULI. *Ter. testi subrotundata, parva, areo anticea curvata; auricula postice quadrangularis, elongata, marginem dorsalem declivis; ad juncturam inferiorem moderatè angulata, arcis centralibus infra auriculam brevissimis, processu subumbonali ad terminum expanso; tuba solidissimata, manuus quia clausa; stylis cornutis, angularium pinnatis, stipula brevis.*

SAY's TEREDO. Shell rather round, small, anterior area cuneated; posterior auricle half-round, elongated, dorsal margin sloped, moderately angular at the lower juncture; central areas rather short below the auricle; subumbonal process expanded at the end; tube rather solid, sometimes closed; stylets horny, angularly pinnated; stem short.

WRIGHT, MS., Mus. Brit.

Hab. Callao Bay.

Species 11. (Fig. a, b, c, Mus. Jeffreys.)

TEREDO PEDICILLATA. *Ter. testi parva, altissimata; areo anticea brevissimata, auricula postice prominentia, rotundata; palumis testaceis, medio quasi-articulatis, terminum concavato-convexum; stipula cornuta, longa; tuba tenui, septa terminalibus paucis.*

THE PEDICEL TEREDO. Shell small, rather high; anterior area rather short, posterior auricle prominent, rounded; pallets shelly, quasi-articulated in the middle, concavely arched; stem horny, long; tube thin, with few terminal septa.

QUATREFAGES. Ann. Nat. Scî. Ser. 3, t. II, p. 26.
Hab. Coasts of Great Britain.

The valves resemble those of *Teredo palmata*, but the kind of horny joint by which the pallets seem to be divided into two portions shows the distinctness of the species.

Species 12. (Fig. a, b, c, Mus. Brit.)

TEREDO BATAVIA. *Ter. testi brevi, rotundata, crassa; auricula postice angusta, marginem dorsalem declivis; areo anticea brevi, obtusa; umbonulus callous, incrassatus; processu subumbonali curvo, expanso; tuberculo terminali margini; palumis testaceis, spatulatis, lati, ad latera curvatis, ad terminum concavatis; stipula elongata.*

THE BATAVIAN TEREDO. Shell short, rounded, thick; posterior auricle narrow, dorsal margin sloped; anterior area short, obtuse; umbos callous, curved inwards; subumbonal process curved, expanded; terminal tubercle large; pallets shelly, spatulate, broad, convex at the sides, concave at the end; stipula elongated.

SPENGLER — ? Fid. Mus. Brit.
Hab. Batavia.

This species has been assigned to *Teredo muralis* by some authors, but the valves, as well as the pallets, are very different in form.

Species 13. (Fig. a, b, c, Mus. Deshayes.)

TEREDO AFRICANA. *Ter. testi parva, globosa, lirato-striata; areo anticea angusta; areo postice-mediae lata; auricula postice lata, elongata, arcuata pliata; haita postice parva; processu subumbonali levissima, brevis; palumis minimis, angustis, compressis; superae cornutae, quadruplicatis; stipula elongata.*

THE ALLIED TEREDO. Shell small, globose, ridge-striated; anterior area short, narrow; postero-medial area broad; posterior auricle broad, long, plaited in curves; posterior haitas small; subumbonal process very thin and rather short; pallets very small, narrow, compressed; horny and quadripartite above; stem elongated.

DESHAYES. Conch. Isl. Bourbon. Pl. XXVIII. Fig. 8-12.

Hab. Ile de la Réunion (Bourbon).

TEREDO.—PLATE III.

Species 14. (Fig. *a*, *b*, *c*, Mus. Deshayes.)

TEREDO BREVIS. *Ter. testa parva, alta, tenuisculpta, utroque latere valde aperto, arcis distinctis, antice granosis-striatis; auriculis posticis lati, eleganter tenui et plicatis; processa subumbonali brevissimae; palmaris elongatis, articulatis, articulis septem vel octo, infrauliciformibus, gradatim decrescentibus, spinis coriaceis utroque latere armatis.*

THE SHORT TEREDO. Shell small, high, rather thin,

widely gaping on both sides; areas distinct, anterior granularly striated; posterior auricle broad, elegantly thin and plaited; subumbonal process very short. Pallets elongated, jointed, joints seven or eight, funnel-shaped, gradually decreasing, armed on each side with a coriaceous spine.

DESHAYES. Conch. Isl. Bourbon, Pl. 28, Fig. 4-7.

Hab. Ile de la Réunion (Bourbon).

T E R E D O.

PLATE IV.

Species 15. (Fig. a, b, c, Mus. Brit.)

TEREDO PALMULATA. *Ter. testū parvū, rotundū; auriculā posticā et arcī aucticē productis, rotundis, arcis centralibus latis, locis oblongis; processus subumbonali curvo, expansus. Stylis cornutis, brevibus, spiciformibus, stipula longitudine aequali.*

THE PALMULATED TEREDO. Shell small, rounded, posterior auricle and anterior area produced, rounded; central areas broad, rather short; subumbonal process curved, expanded. Styles horny, short wheat-car-shaped, stem of equal length.

LAMMICK. Anim. sans. Vert.

Teredo minima. Blainville.

Teredo bipalmata. Delle Chiave.

Teredo Philippii. Fisher.

Hab. Ireland, England, &c. In floating wood.

Species 16. (Fig. a, b, c, Mus. Brit.)

TEREDO SENGALENSIS. *Ter. testū parvū; tuba rugosā, versus teretium siphonalem attenuatā; palmulis brevibus spatulatis, extis Licorinatis; stipula brevissimā.*

THE SENEGAL TEREDO. Shell small; tube rough, attenuated towards the siphonal end; pallets shortly spatulate, bicarinate outside, with very short stem.

BLAINVILLE.

Hab. Senegal coasts.

Tubes in wood, and pallets which seem quite distinct in their characters from any other species, are in the British Museum, without any specimens of the valves. The species is referred to *Teredo Norvegica* by Jeffreys.

Species 17. (Fig. a, b, c, Mus. Brit. and Sowb.)

TEREDO NUCIVORA. *Ter. testū altū, angustissimā, tenui, utriusque latissimā apertū; tuba contortū, crassā, bulbiformi.*

THE NUT-EATING TEREDO. Shell high, very narrow, thin, very widely gaping on both sides; tube contorted, thick, bulb-shaped.

SPENSER. Desh. Traité élém. Pl. 2, Fig. 9, 10.

Genus *Upervalis*. Guettard.

Guettiera uncicava. Gray.

Fistularia gregaria. Lamarek.

Teredo gregaria. Sowerby.

Hab. Isl. of France.

This species pierces its way through the shells of floating cocoa-nuts, and forms its contorted bottle-shaped tubes in the interior. Several tubes are often found twisted together, and a specimen in the British Museum shows a mass of them coiled round each other in the very heart of a nut. The writer has not met with specimens of the pallets, but the valves are narrow and much curved.

Species 18. (Fig. a, b, c, Mus. Brit.)

TEREDO DENTICULATA. *Ter. testū brevi, rotundū, solidū; auriculā posticā elongatā, expansā, supra angustatā, versus umbonem incurvā; arcis mediānis latis, infrā auriculam brevibus; umbonibus callosis, denticulis spiniformi munitis; palmulis subovatis, ad latera non dentatilatis, supra dentes decidibus, stipula brevissimā.*

THE DENTICULATED TEREDO. Shell short, round, solid; anterior area very short; posterior auricle elongated, expanded, narrow above, curved inwards towards the umbo; middle areas broad, short below the auricles; umbones callous, provided with a spine-shaped denticle; pallets subovate, with a tooth at the sides, sloped above the teeth, stem very short.

Gray. MS. Brit. Mus.

Hab. Britain?

Species 19. (Fig. a, b, c, Mus. Brit.)

TEREDO DUNLOPI. *Ter. testū brevi, crassā, globosā, extis moniliformibus sculptis; ambonibus curvis,*

TEREDO.—PLATE IV.

callosis, intus lamellā accessoriā instructā; processu subumbonalē valde arcuato, lato; areā antīcā subquadratā, areā antico-centrali latissimō; sulco mediatu angusto, profundu, areā postico-centrali angustissimā; auriculā posticā extus vix distinctā, intus biminiā rotatā; palauis semicornacis, oblongi, uno latere convexis, altero planis, ad terminum bifurcalis, stipulā brevissimā.

DUNLOP'S TEREDO. Shell short, thick, globose, sculptured with beaded striae; umbos curved, callous, fitted inside with an accessory plate; subumbonal process much arched, broad; anterior area subquadrate, anterior-central area very broad; medial sulcus narrow, deep; posterior-central area very narrow; posterior auricle scarcely distinguished on the outside, marked

within by a lamina; pallets half horny, oblong, convex on one side, flat on the other, two-forked at the end, stem rather short.

WRIGHT. Trans. Linn. Soc. 1864.
Nancitora Dunlopi. Wright.
Hab. River Como, Bengal.

The river Como flows from and returns to the river Ganges. Just on the bend Mr. Dunlop resided for some time, and the Teredos of this new species were found to have perforated some wood which had been cut down on the spot and left to float. The water of the river itself and of that part of the Ganges whence it flows is perfectly fresh, and the water, being remarkably soft, is used for drinking and all culinary purposes. We have here, therefore, a fresh-water Teredo.

P E D I C U L A R I A.

Genus PEDICULARIA, Swainson.

Testa ovata, irregularis, patula, paucispiralis, radiatum costata; spira subciliata, minuta; apertura maxima; columella planulata, rectiuncula, labio externo frequenter lobato.

Shell ovate, irregular, patulate, few-whorled, radiately ribbed; spire nearly hidden, minute; aperture very large, columnella flattened, rather straight, outer lip frequently lobed.

The Messrs. Adams state in their work on Genera that the only known species is the one found parasitically attached to Mediterranean corals. But M. Deshayes in describing *Pedicularia elegantissima*, in his shells of Bourbon, speaks as if there were many other species, but does not refer to or describe them. The only species, besides the two above named, with which I am acquainted, is the *Pedicularia Pacifica*, described by Pease.

It is somewhat uncertain to what family the curious little shells composing this genus belong. On one hand they have been thought to have some affinity with the *Cypræidae*, as there are indications of a mantle reflected over the lips, although not reaching the central region of the back. On the other hand, the shell would be most easily likened to a miniature *Concholetas* with irregularly extended margins.

Species 1. (Figs. a, b, c, d, e, Mus. Sowerby.)

PEDICULARIA SICULA. *Ped. testa crassa, vallis irregulari: albâ, fulvâ, vel roseo suffusa; radiatim et divergente costata, costis minute moniliformibus, lobis plerumque profunde lobatis, columellâ rectiuncula.*

THE SICILIAN PEDICULARIA. Shell thick, very irregular; white, fulvous, or suffused with pink; radiately and divergently ribbed, ribs very minutely

beaded, lips generally deeply lobed; columnella rather straight.

SWAINSON. Conchological Illustrations.

Hab. Found on small corals in the Mediterranean.

Species 2. (Fig. a, b, c, Mus. Sowerby.)

PEDICULARIA PACIFICA. *Ped. testa tenuiuncula, oblongâ, irregulâris, in medio contractâ, radiatim striâ elevatâ minutissimâ ornata, striâ concentricâ decussatâ, apice conspicuo, involuto; rubidâ, interdum omnino violaceâ vel cornicâ.*

THE PACIFIC PEDICULARIA. Shell rather thin, oblong, irregular, contracted in the middle, ornamented with very fine raised elevated radiating striae; decussated with concentric striae, apex conspicuous, involute; reddish, sometimes violet all over, or horny.

PEASE. Proc. Zool. Soc., 1865, p. 516.

Hab. Pacific Islands.

Species 3. (Fig. a, b, Mus. Maillard.)

PEDICULARIA ELEGANTISSIMA. *Ped. testâ ovato-oblongâ, validè concreta, purpureâ, radiatim costatâ, costis majoribus moniliformibus, minoribus interstitialibus laevibus; apertura angustâ, utraqâ extremitate paulò depresso, spirâ partim calatâ.*

THE ELEGANT PEDICULARIA. Shell ovate-oblong, purple, radiately ribbed; larger ribs beaded, smaller interstitial ones smooth; aperture narrow, a little depressed at each end; spire partly hidden.

DESHAYES. Isle de la Réunion, p. 20, Pl. XXXIII.

Hab. Isl. Bourbon.

MONOGRAPH
OF THE GENUS
MYTELLIMERIA.

"But life did never to one man allow
Time to discover worlds and conquer too;
Nor can so short a line sufficient be,
To fathom the vast depths of nature's sea." *Couthy.*

MYTILIMERIA.

PLATE I.

Genus MYTILIMERIA, Conrad.

Testa bivalvis, bimusculosa, tenuis, subaequivalvis, valde inaequalitateralis, epidermide inducta. Umbones spirales, subdistanter. Cardo edentulo; cartilagine partim in foecam instructa, lamina testacea libera obecto.

Shell bivalve, with two muscles, thin, subequivalve, very inequilateral, covered with an epidermis. Umboes spiral, rather distant. Hinge without teeth, with a cartilage placed partly in a hollow, partly covered by a free testaceous plate.

The type of this genus is the rounded oval shell named *M. Nuttalli* by Conrad. The specimens in the British Museum are odd valves, the shelly plates of which are missing. The subsequently discovered large shell from Vancouver's Island, which has been described as *Lyonsia saxicola* by Dr. Baird, is fairly well adjudged to belong to this genus, and has the osseous well developed.

Species 1. (Mus. Brit.)

MYTILIMERIA NUTTALLI. Myt. testa rotundè ovata, tenui, allâ; umbonibus terminalibus, distantibus, validi spirabilibus; latere postico expanso, terminalibus truncatis.

NUTTALL'S MYTILIMERIA. Shell roundly ovate, thin, white; umboes terminal, distant, very spiral; posterior side expanded, ends truncated.

CONRAD. Amer. Journ. Sci.

Hab. California.

The cartilage is placed in a narrow spiral groove running from the umbo, and where it comes to the hinge line it is enlarged.

Species 2. (Mus. Brit.)

MYTILIMERIA DIAPHANA. Myt. testa semipellucida, oblongâ, arcuatâ, linguiformi, subcomplanata, super aream posticam tanâ fuscâ plurimus radiatâ;

umbonibus elevatis, forâ terminalibus; latere postico ad terminum latè truncato; margine dorsali arcuatum depresso.

THE DIAPHANOUS MYTILIMERIA. Shell semitransparent, oblong, curved, tongue-shaped, rather flattened, rayed on the posterior area with several brown bands; umboes raised, nearly terminal; posterior side broadly truncated; dorsal margin depressed with a curve.

CARPENTER (*Lyonsia*). Proc. Zool. Soc., 1855.

Hab. California.

Species 3. (Mus. Brit.)

MYTILIMERIA PLICATA. Myt. testâ parvâ, lævigatâ, cinctâ; antice sinuatin plicatâ; posticâ expansâ; umbonibus acutis, forâ terminalibus; latere antico brevissimo, acuminato, margine ventrali profundè sinuato; latere postico alato, infrâ marginem dorsalem depresso, margine ventrali inflato.

THE PLAITED MYTILIMERIA. Shell small, smooth, wedge-shaped, anteriorly sinuously plaited, posteriorly expanded; umboes acute, nearly terminal; anterior side very short, acuminate; ventral margin deeply sinuated; posterior side alated, depressed below the dorsal margin, ventral margin inflated.

GRAY. MS. Brit. Mus.

Hab. — ?

Species 4. (Mus. Brit.)

MYTILIMERIA SAXICOLA. Myt. testâ magnâ, ventricosâ, oblongâ, epidermide valido, corneo-indutâ, ad margines ventralcm et terminalium hiante; latere antico brevi, angusto; latere postico elongato, ventricoso, ad terminum truncato; valva dextrâ planiusculâ valva sinistrâ profundè ventricosâ; margine dorsali depresso, arcuato; lamina cardinali magnâ, crassâ, extus convexâ.

MYTILIMERIA.—PLATE I.

THE ROCK-DWELLING MYTILIMERIA. Shell large, ventricose, oblong, covered with a strong, horny epidermis, gaping at the ventral and terminal margins; anterior side short, narrow; posterior side elongated, ventricose, truncated at the end; right valve rather flat; left valve deeply ventricose; dorsal margin depressed, curved; hinge plate large, thick, convex outside.

BAIRD (*Lyonsia*). Boundary Commission Report.
Hab. Vancouver's Island.

It has been found difficult to fix the generic status of this fine shell, which differs greatly in form and habit from the typical *Lyonsia*.

Species 5. (Mus. Brit.)

MYTILIMERIA NAVICULA. *Myt. testā oblongā, tenui, pallida, inflatā; umbonibus tumidis, fere terminalibus; latere antico brevissimo, perpendiculariter truncato; margine ventrali antico sinuato, hianti, posticē inflato; latere postico oblongo, obliquū angulato, ad terminalium truncato; margine dorsali depresso, rectiūsculo; valvā dextrā profunda.*

THE BOAT MYTILIMERIA. Shell oblong, thin, pale, inflated; umboes tumid, almost terminal; anterior side very short, perpendicularly truncated; ventral margin anteriorly sinuated, gaping, posteriorly inflated; posterior side oblong, obliquely angular, truncated at the end; dorsal margin depressed, rather straight; left valve deep.

ADAMS AND REEVE (*Lyonsia*). Proc. Zool. Soc., 1836, p. 70.

Hab. Iquique, Peru.

Species 6. (Mus. Brit.)

MYTILIMERIA FICTA. *Myt. testā subrhomboideā, solidā, lineis fusciā divaricatis pictā, ad marginem ventram latissimā hianti; umbonibus terminalibus; latere antico brevissimo subtruncato; latere postico expanso lato; valvā sinistrā ventricosimā; lamina cardinali complanata.*

THE PAINTED MYTILIMERIA. Shell somewhat rhomboidal, solid, painted with divergent brown lines, very broadly gaping at the ventral margin; umboes terminal; anterior side very short, rather truncated; posterior side expanded, broad; left valve very ventricose; hinge plate flat.

SOWERBY (*Lyonsia*). Proc. Zool. Soc., 1834, p. 88.
Hab. Vancouver's Island.

Species 7. (Mus. Brit.)

MYTILIMERIA CUNATA. *Myt. testā tenui, pallidā, anticē inflatā, posticē attenuata, complanata, latere postico brevi, truncato; umbonibus elevatis acuminatis; margine dorsali rectiūsculo, ventrali medio anticeque inflato.*

THE WEDGE MYTILIMERIA. Shell thin, pale, inflated anteriorly, posteriorly attenuated, flattened; posterior side short, truncated; umboes elevated, acuminate; dorsal margin rather straight, ventral in the middle and anterior side inflated.

GRAY. MS. Brit. Mus.

Hab. —?

MONOGRAPH
OF THE GENUS
SAXICAVA.

"For wonderful are all His Works,
Pleasant to know, and worthiest to be all
Had in remembrance always with delight."—*Milton.*

SAXICAVA.

PLATE I.

Genus SAXICAVA, *Floridan de Bellevue.*

Testa oblonga, aquiculavis, rugosa, ad marginem ventraliem hians. Cardo etate juvare minute bidentatus, etate majora edentulus. Impressiones muscularis distantes; impressione pallii postice late sinuata.
Shell equivalve, rugose, gaping at the ventral margin. Hinge in a young state bidentate, when full-grown without teeth. Muscular impressions distant; impression of the mantle broadly sinuated posteriorly.

SYN. *Byssomya*, Cuvier. *Hiatella*, Daudin.

The *Saxicava* are rock-burrowing mollusca. They are found fixed in small hollows, often in the deserted holes of the *Pholas*. To the inner wall of the hole they attach themselves by a byssus, and often in the after growth of their valves become conformed to its shape. The young shells differ in two respects from the older form. They have small cardinal teeth which disappear when the animal is adult, and they have spines on the posterior angles, which also disappear. In this younger state they represent the genus *Hiatella* of Daudin. The arctic seas, the Mediterranean, and the Cape produce most of the few species known.

Species 1. (Mus. Brit.)

SAXICAVA ARCTICA. *Sax. testa oblonga, rugosâ, crassâ, etate juniori posticè spiniferâ, cardine bidentato, etate seniori cardine edentulo; latere antico angusto, brevi, margine ventrali sinuoso, umbonibus depressis, anticis; latere postico tatori, quadrato, biangulato, latè truncato.*

THE ARCTIC SAXICAVA. Shell oblong, rugose, thick; posteriorly spiniferous when young, with two teeth on the hinge; without teeth on the hinge when adult; anterior side narrow, short; ventral margin sinuous; umboes depressed, anterior; posterior side broader, square, biangular, broadly truncated.

LINNÆUS. *Systema Naturæ.*

Hiatella arctica, Lamarck.

Solen minutus, Linneus.

Hiatella minutia, Turton.

Donac rhomboides, Deshayes.

Hab. Arctic regions, British and North American coasts.

Species 2. Mus. —? (copied.)

SAXICAVA PETITII. *Sax. testa subcuneiformi, subregulariter rugatâ; latere antico brevi, angusto, margine ventrali profundè sinuato, latè hianti; latere postico expanso, rotundatim obliquè angulato, post angulum latè, obliquè truncato; margine dorsali recto.*

PETIT'S SAXICAVA. Shell rather cuneiform, rather regularly wrinkled; anterior side short, narrow; ventral margin deeply sinuous, broadly gaping; posterior side expanded, roundly, obliquely angular, broadly obliquely truncated behind the angle; dorsal margin straight.

DESHAYES, MS. Mus. Cum. in Brit.

Hab. —?

The wrinkles in this species are regular and sharp.

Species 3. (Mus. Brit.)

SAXICAVA RUGOSA. *Sax. testa tenuisculâ, rhomboideâ, tævigatâ, posticè viz. angulata, leviter rugatâ, margine dorsali subarcuato; latere antico brevisimo.*

THE RUGOSE SAXICAVA. Shell rather thin, rhomboidal, smooth, posteriorly scarcely angular, slightly wrinkled; dorsal margin a little arched; anterior side very short.

LINNÆUS (*Mitilus*). *Systema Naturæ.*

Saxicava Gallicana, Lamarck.

Mya Byssifera, Fabricius.

SAXICAVA.—PLATE I.

Hab. British Islands.—France.

More smoothly rounded and less sharply angular than *Saxicava arctica*, with more convex ventral and dorsal margins.

Species 4. (Mus. Brit.)

SAXICAVA SULCATA. *Sax. testā crassā, subcuneatū, concentricē undis magnis profundiusculis rugatā; latere antico angusto, producto, subacuminato; umboibus elevatis, margine ventrali profunde excavato; latere postico lato, rotundatum angulato, margine ventrali convexo, margine dorsali depresso, margine terminali truncato.*

THE GROOVED SAXICAVA. Shell thick, rather cuneate, concentrically wrinkled in large waves; anterior side narrow, produced, rather acuminate; umbo elevated, ventral margin deeply excavated; posterior side broad, roundly angular; ventral margin convex; dorsal margin depressed; terminal margin truncated.

DESIGNATES —? MS. Mus. Brit.

Hab. Clyde.

The writer is uncertain respecting the authority for this species, which certainly seems distinct from any known forms of *S. arctica*, or *S. rugosa*. It is represented in the British Museum by an odd valve from the Clyde.

Species 5. (Mus. Brit.)

SAXICAVA PHOLADIS. *Sax. testā elongatā, submytiliformi, concentricē validē rugatā; latere antico brevissimo, angustiusculo; latere postico magis expanso, elongato, obliquū angulato, margine dorsali recto; margine terminali latē truncato; margine ventrali cuneato.*

THE PHOLAS-LIKE SAXICAVA. Shell elongated, rather mytilus-shaped, concentrically strongly wrinkled, anterior side very short, rather narrow; posterior

side more expanded, elongated, obliquely angular; dorsal margin straight; terminal margin broadly truncated; ventral margin convex.

LAMARCK. Anim. s. Vertébres.

Hab. Greenland.

It is quite an open question whether this may not be one of the numerous forms of *Saxicava rugosa*.

Species 6. (Mus. Brit.)

SAXICAVA SOLIDA. *Sax. testā crassā, rhomboideā, inaequivalvi; valeat dextrā profundā, ad umboem multo valcam sinistram altitudine superant; latere antico brevissimo, declivī, umboibus fere terminalibus; latere postico biangulato, angulis obliquis, moniliiformibus, margine terminali perpendiculariter truncato.*

THE SOLID SAXICAVA. Shell thick, rhomboidal, inequivalve; right valve deep, much higher than left at the umbo; anterior side very short, sloped, umboes nearly terminal; posterior side biangular, angles oblique, moniliiform; terminal margin perpendicularily truncated.

SOWERBY. Proc. Zool. Soc., 1834.

Hab. —?

A very solid shell with two posterior keeled and partly beaded angles.

Species 7. (Mus. Brit.)

SAXICAVA PLACIDA. *Sax. testā parvā, subovatā, tenuiūscula, terminalis rotundis, umboibus magnis, ferī terminalibus; margine ventrali medio subexcavato.*

THE FLACCID SAXICAVA. Shell small, rather oval, rather thin; ends rounded, umboes large, nearly terminal; ventral margin a little excavated in the middle.

GOULD. United States Exploring Expedition ?

Hab. North America.

SAXICAVA.

PLATE II.

Species 8. (Figs. a, b, c, d, Mus. Brit.)

SAXICAVA AUSTEALIS. *Sax. testā oblongā, valdī rugosā, plusminusvē distortā; umbonibus magis, percrevatis, fere terminalibus; latere postico obliquū producto, angulato, ad angulum obsolete spinoso, margine ventrali ad terminum sursū acclivis, marginē terminis obliquā truncato, margine dorsali recti, areā complanata.*

THE AUSTRALIAN SAXICAVA. Shell oblong, very rugose, more or less distorted; umboes large, much elevated, nearly terminal; posterior side obliquely produced, angular, obsoletely spinose at the angle, ventral margin sloped upwards at the end, terminal margin obliquely truncated, dorsal margin straight with a flattened area.

LAMARCK. *Anim. sans Vert.*, v. p. 153.

Saxicava distorta, Say.

Mactra crassa, Peron.

Hab. Australia—(var.) United States.

More tumid, especially towards the umboes, than *Saxicava arctica*. The younger specimens have spines on the angle, as in that species, but these are worn off as the shell becomes larger, leaving tubercles in their places. The right valve is frequently deeper and higher at the umboes than the left. The American type (fig. d) corresponds with the Australian and not with the British form.

Species 9. (Mus. Brit.)

SAXICAVA TENUIS. *Sax. testā rhomboideoē, elongatā, tenui, subinflatā; latere antico brevissimo, declivi; umbonibus elevatis, acutis, fere terminalibus; latere postico subattenuato, obliquē acutē angulato; angulo subserrato.*

THE THIN SAXICAVA. Shell rhomboidal, elongated, thin, rather inflated; anterior side very short, sloped; umboes raised, sharp, nearly terminal; posterior side rather attenuated, obliquely sharply angular; angle a little serrated.

SOWERBY. Proc. Zool. Soc., 1834, p. 88.

Hab. —?

May, 1875.

Species 10. (Mus. Brit.)

SAXICAVA GUERINIL. *Sax. testā oblongā, angustā, rectiūsculā; latere antico brevi, obliquē declivi, infrā subangulatā; latere postico elongato, ad terminum obtuse truncato; margine ventrali rectiūsculo, medio excavato.*

GUERIN'S SAXICAVA. Shell oblong, narrow, rather straight; anterior side short, obliquely sloped, a little angular below; posterior side elongated, obtusely truncated at the end; ventral margin rather straight, excavated in the middle.

PATRADEAU. Mollusca. Plate I.

Hab. Mediterranean Sea.

Species 11. (Mus. Brit.)

SAXICAVA ANGASHI. *Sax. testā irregulariter rhomboideoē, magni, solidā, alta, sublaevigata; valdī inaequilaterali, flavidō-rubescenti, fuso nebulata; valdā dextrā attiūsculā, profundiorā; latere antico brevissimo, declivi; latere postico obliquē angulato, oblongo, ad terminum quadrato.*

ANGAS'S SAXICAVA. Shell irregularly rhomboidal, large, solid, elevated, rather inequivalve, very inequilateral, reddish yellow clouded with brown; right valve rather the higher and deeper; anterior side very short, sloped; posterior side obliquely angular, oblong, square at the end.

A. ADAMS. Proc. Zool. Soc., 1865, 643.

Hab. St. Vincent's Gulf, S. Australia.

The only species exhibiting anything like distinct colouring, excepting *Saxicava purpurascens*.

Species 12. (Mus. Brit.)

SAXICAVA SPINIFERA. *Sax. testā parvā, levigatā, superne quadratā, infrā bilobatā; latere antico brevissimo, umbonibus terminalibus, margine ventrali profundē excavato; latere postico lato, truncato, margine dorsali et angulo obliquō decurrentibus spinis acutis prominentibus ornatis.*

SAXICAVA.—PLATE II.

THE SPINIFEROUS SAXICAVA. Shell small, smooth, square above, two-lobed below; anterior side very short, umboes terminal, ventral margin deeply excavated; posterior side broad, truncated, dorsal margin and obliquely decurrent angle ornamented with sharp prominent spines.

SOWERBY.

Hab. Savannah Bay.

The young of *Saxicava arctica*, *rugosa*, and *Australis* are spinose on the dorsal margin and posterior angle, but no specimen of either has been found with spines so prominent, or similar to this in other characters.

Species 13. (Mus. Deshayes? copied.)

SAXICAVA SIMILIS. *Sax. testā cuneiformi, oblongā, radiatō striatā, posticō biangulari, ad angulos carinis subspiniferis duabus unitā; valē dextrā majori, ventricosū, valē sinistrā planiusculū; latero antico angusto, brevissimo; umbonibus terminalibus; latero postico expanso, ad terminum latē truncato.*

THE SIMILAR SAXICAVA. Shell cuneiform, oblong, radiately striated, posteriorly biangular, strengthened at the angles by two subspiniferous keels; right valve the larger, ventricose, left

valve rather flatter; anterior side narrow, very short; umboes terminal; posterior side expanded, broadly truncated at the end.

DESHAYES. Mollusques de l'Isle de la Réunion.

Hab. Isl. Bourbon.

M. Deshayes likens this little species to *Saxicava arctica*, from which it differs in being radiately striated and in the keel-like ridges on the angles.

Species 14. (Mus. Brit.)

SAXICAVA PURPURASCENS. *Sax. testā elongatā, angustā, rectā, concentricē rugatā; latere antico brevissimo, umbonibus prominentibus terminalibus; latere postico purpureo suffuso, elongato, obliquē angulato; ad angulum et infrā marginem dorsalem rugoso, carinato.*

THE PURPLE SAXICAVA. Shell elongated, narrow, straight, concentrically wrinkled; anterior side very short, umboes prominent, terminal; posterior side suffused with purple, elongated, obliquely angular; with a wrinkled keel on the angle, and below the dorsal margin.

SOWERBY. Proc. Zool. Soc., 1834, p. 88.

Hab. —?

MONOGRAPH

OF THE GENUS

PUPINIDÆ.

"All things that are, though they have several ways,
Yet in their being join with one advice
To honour Thee."—*Trench.*

.....

Pipina

PUPINIDAE

PLATE I.

FAM. PUPINIDÆ. (A. ADAMS.)

Animal terrestre. Testa pupiformis, operculum cornutum, multispirale.

Genus PUPINA. Vignard. *Testa brevis, nonnunquam nitens; apertura bicanaliculata.* Sp. 1—34, 29 omisssæ.

Genus HARGREAVESIA. Adams. *Testa brevis; apertura ad suturam nai-canaliculata.* Sp. 29.

Genus CALLIA. Gray. *Testa brevis, nitens, umbilico clausa, apertura marginis integrum.* Sp. 35—38.

Genus REGISTOMA. Hasselt. *Testa nitens; apertura marginis infra columellam rimata.* Sp. 39—47.

Genus CATAULUS. Pfeiffer. *Testa pyramidalis, perforata, ultimo angusta infre carinata, apertura marginis exterioris ad carinam producta.* Sp. 48—65.

Genus ARINIA. Adams. Sp. 66.

Genus POLLICARIA. Adams. *Umbilico ferè clauso, apertura marginis interiore indigra.* Sp. 67—92.

Genus MEGALOMASTOMA. Guild. *Apertura superè tuberculata.*

Animal terrestre, shell pupa-shaped, operculum horny; multispiral. Sp. 1—34.

PUPINA. Shell short, sometimes shining; aperture with two channels. Sp. 1—34. Omit 39.

HARGREAVESIA. Shell short; aperture with a channel at the suture. Sp. 39.

CALLIA. Shell short, shining; umbilicus closed; aperture with the margin entire.

REGISTOMA. Shell shining; aperture with the margin notched under the columella. Sp. 39—47.

CATAULUS. Shell pyramidal, perforated, last whorl keeled below, aperture with outer edge produced at the keel. Sp. 48—65.

ARINIA. Sp. 66.

POLLICARIA and **MEGALOMASTOMA.** Umbilicus nearly closed, inner margin of the aperture entire. Sp. 67—92.

RAPHAULUS. Upper part of aperture provided with a tube.

The *Pupinidae* do not affect northern climates, but abound in India, Australia, also in the Pacific and other islands.

Species 1. (Mus. Sowerby. *Pupina.*)

PUPINA BILINGUIS. *Pup. testa altâ, fulvâ, pupiformis, apice obtuso; anfractibus quinque, superioribus brevibus, ultimo inflato, subgloboso; apertura parvâ, circulari, canalis dubius, obliquâ elongatis, conspicue callo-marginatis, arcuatis.*

brevibus, penultimo alto, ultimo inflato, subgloboso; apertura parvâ, circulari, canalis dubius, ad suturam uno, infra columellam altero, obliquâ oblongis, arcuatis, in tamores linguis formis producuntur.

THE DOUBLE-TONGUED PUPINA. Shell raised, fulvous, pupa-shaped, with obtuse apex; whorls five, upper short, penultimate high, last inflated, rather globose; aperture small, circular, with two canals, one at the suture, the other below the columella, obliquely oblong, curved, produced in two callous lingiform ridges.

PEIFFER. Proc. Zool. Soc. Thes. Conch. *Pupinidae, Pupina.* Fig. 8, 9, 10.

Hab. East Australia.

The channels on the upper and lower part of the aperture are prolonged in two curved tongue-shaped callousities.

Species 2. (Mus. Sowerby.)

PUPINA VENTROSA. *Pup. testa ventricosa, semi-pellucida, breviter subpyramidalis; ultimo anfractu subgloboso; apertura obliquâ ovata, antice producta, latitudo interna arcuata; canalis dubius calloso-marginatis, breviter arcuatus productus.*

THE INFLATED PUPINA. Shell ventricose, semi-pellucid, shortly rather pyramidal; last whorl rather globose; aperture obliquely ovate, anteriorly produced, inner lip arched; two callous-edged canals shortly arched, produced.

DOHEN. Adams. Sowb. Thes. *Pupinidae. Pupina.* Fig. 12, 13.

Hab. Cape York.

Species 3. (Mus. Sowerby.)

PUPINA ARTICATA. *Pup. testa ovata, alba vel fulva, breviter pupiformis, apice obtuso; anfractibus quinque, superioribus brevibus, ultimo inflato, subgloboso; apertura parvâ, circulari, canalis dubius, obliquâ elongatis, conspicue callo-marginatis, arcuatis.*

THE JOINTED PUPINA. Shell ovate, white or fulvous, shortly pupa-shaped; apex obtuse; whorls five, upper short, last inflated, subglobose; aperture small, circular, canals two, obliquely elongated, conspicuously callus-edged, curved.

BENSON. Adams. Sowb. Thes. Conch. *Pupinidae, Pupina.* Fig. 1, 2.

Hab. Moulmein, India.

PUPINIDÆ.—PLATE I.

Species 4. (Mus. —? Copied.)

PUPINA GRANDIS. *Pup. testá magná, ventricosá, pupa-formi, fusá, solidá, apice obtuso; anfractibus septem, superioribus brevibus, penultimo inflato, ultimo alto, inflato; aperturá parvá, circulari, margine aurantió, crassissímo, latíssímo, profundi bicanalulato.*

THE LARGE PUPINA. Shell large, ventricose, pupa-shaped, brown, solid, with obtuse apex; whorls seven, upper short, last but one inflated, last high, inflated; aperture small, circular; margin orange, very thick, very broad, with two deep canals.

FONDES. Adams. Sowb. Thes. *Pupinidae*, Pupina, Fig. 20.

Hab. Louisiade Archipelago.

Species 5. (Mus. Hanley.)

PUPINA AUREA. *Pup. testi albí vel fulvá, ovatá, nitente, apice effuso, anfractibus septem, superioribus brevissimis, ultimo maximo; aperturá antice obliquè producta, labio extero rotundo, canali postico latè, antice producto, recurvo, columellá brevi, latè, truncatâ.*

THE LITTLE PLOUGH PUPINA. Shell white or fulvous, ovate, shining, with obtuse apex, whorls seven, upper very short, last very large; aperture obliquely produced in front, outer lip rounded, posterior canal broad, anterior produced, recurved; columella short, broad, truncated.

BENSON. Ann. Nat. Hist. Ser. 2, vol. 17, p. 230.
Hab. Birmah.

Species 6. (Mus. Hanley.)

PUPINA BLANFORMIA. *Pup. testá albidd, nitente, spirá brevi, obtusá, ultimo subgloboso; aperturá antice obliquè producta; labio extero superne in sinum rotundum producto; columellá brevissimá, truncatâ, in canalem curvam terminante.*

BLANFOORD'S PUPINA. Shell rather white, shining; spire short, obtuse, the last rather globose; aperture obliquely produced in front; outer lip produced into a rounded sinus, columella very short, truncated, ending in a curved canal.

THIERSALD. Journ. As. Soc. Bengal, 1864.
Hab. Pegu.

Species 7. (Mus. Hanley.)

PUPINA IMBRICIFERA. *Pup. testá fasciá, brevi, ovata, subpyramidalis, nitente; anfractibus sex, superioribus brevibus, convexis, ultimo subgloboso; aperturá antice obliquè producta, labio extero latè, complanato, margine interno in liram semicircu-*

larem elevato, canalis dubius in tumores linguiformes productis.

THE IMBRICATED PUPINA. Shell brown, short, ovately subpyramidal, shining; whorls six, upper short, convex, last rather globose; aperture obliquely produced in front, outer lip broad, flattened, inner margin raised in semicircular ridge, canals two, produced in linguiform swellings.

BENSON. Ann. Nat. Hist. Ser. 2, vol. 17, p. 230.
Hab. Sylhet, Teria Ghat.

Species 8. (Mus. Sowerby.)

PUPINA MERCIONIALIS. *Pup. testá altâ, pupaformi, acuminata, fulvâ, nitente; anfractibus sex, convexis, aperturâ circulari, margine rotundo; canalis longiusculus, callosus.*

THE SOUTHERN PUPINA. Shell elevated, pupa-shaped, acuminated, fulvous, shining; whorls six, rather convex; aperture circular; margin rounded; canals rather long, callous.

PFEIFFER. Proc. Zool. Soc. Sowb. Thes. *Pupinidae*, Pupina, Fig. 33.

Hab. South Australia.

Species 9. (Mus. Sowerby.)

PUPA PLANILABERIS. *Pup. testá altâ, pupaformi, falcata, nitente, apice acuminata, anfractibus concrevissimis; aperturâ circulari; margine planulato; canale adiutorium suturem elevato, callosus, columellâ tenui, ad terminum obliquè truncato, cuneato, canali brevissimo.*

THE FLAT-LIPPED PUPA. Shell high, pupa-shaped, fulvous, shining, apex acuminated; whorls rather convex; aperture circular; margin flattened; anterior canal raised at the suture, callous, columella thin, obliquely truncated at the end, cuneate, canal very short.

PFEIFFER. Proc. Zool. Soc. Adams. Sowb. Thes. Pupina, Fig. 34.

Hab. South Australia.

Species 10. (Mus. Brit.)

PUPINA AUREA. *Pup. testá breviter pupaformi, aureofulva, nitente; anfractibus superioribus parvís, penultimo alto, inflato, ultimo subgloboso; aperturá obliquè producta, bicostatiformis; canalis praeductus, callosus.*

THE GOLDEN PUPINA. Shell shortly pupaform, golden fulvous, shining; upper whorls small, penultimate high, inflated, last rather globose; aperture obliquely produced, with two canals; canals produced, callous.

HINDS. Voy. Sulphur.
Hab. New Guinea.

PUPINIDA.

(PUPINA.)

PLATE II.

Species 11. (Mus. Brit.)

PUPINA BICANALICULATA. *Pup. testā fulvā, suturā, transversaliter, ventricosā, obliquā, politā; anfractibus ultimis et penultimis lati, inflati, altis; apertura obliquā, columellā brevi, truncata, callus suturali elongata, labio extero superiori sinuatus depresso, alios rotundos, natūrā obliquā producta.*

THE DOUBLE-CHANNELLED PUPINA. Shell fulvous, slightly golden, transverse, ventricose, oblique, polished; last two whorls broad, inflated, elevated; aperture oblique, columella short, truncated; sutural callus elongated, outer lip sinuously depressed above, narrow, white, rounded, obliquely produced in front.

SOWERBY. Thesaurus, first Monograph.

Hab. Sibonga, Island of Zebu, Philippines.

Species 12. (Mus. Brit.)

PUPINA KERAUDELI. *Pup. testā angustā, fulvā, politā, apice obtusa; anfractibus ultimo et penultimo altis; apertura parvā, columellā brevissimā, acutā; callo suturali inconspicua, labio extero angusto, obliquā producta.*

KERAUDELI'S PUPINA. Shell narrow, fulvous, polished; apex obtuse, last two whorls high; aperture small, columella very short, sharp; sutural callus inconspicuous, outer lip narrow, obliquely produced.

VIGNAL. Proc. Zool. Soc. 1864, p. 162. Ad. Thes. Conch.

Hab. New Ireland.

Species 13. (Mus. Brit.)

PUPINA MOUHOTI. *Pup. testā subaurea, ventricosa, spirali acuminatā; anfractibus quinque, tribus superioribus brevibus, rotundis, penultima majori, inflatis, ultimo rectilænculo magno; apertura subrotundatā, marginē crasso, albo, rimā superiori angusto, inferiori magno, columellā breci, ad terminum angulato, late, labio extero rotundato, superō obliquā depresso.*

MOUHOT'S PUPINA. Shell rather golden, ventricose, spire acuminated; whorls five, rapidly increased, the last subglobose; aperture oblique, sutural callus conspicuous, inner margin of the columella reflected, truncated at the end, outer lip obliquely produced, rather thick, depressed above.

PEIFFER. Proc. Zool. Soc. 1861, 196.

Hab. Cambodge.

Species 14. (Mus. Brit.)

PUPINA ANGASII. *Pup. testā ventricosa, solidā, rubescens, obliquā; anfractibus quinque, suturā crenulatā separatis, penultima maxima, inflata, ultime antice obliquā subangustata; apertura rotundata, biangulatā, marginē late, crasso, integrō, retrocurva repleta.*

ANGAS'S PUPINA. Shell ventricose, solid, reddish, oblique; whorls five, separated by a crenulated suture, penultimate whorl very large, inflated, the last a little narrowed obliquely in front; aperture rounded, with two canals, margin broad, thick, entire, reflected backwards.

ADAMS. Proc. Zool. Soc. 1875. Pl. 45.

Hab. South Australia.

Species 15. (Mus. — Copied.)

PUPINA MOULINSIA. *Pup. testā ventricosa, striatā, glauca; anfractibus quinque, tribus superioribus brevibus, rotundis, penultima majori, inflatis, ultimo rectilænculo magno; apertura subrotundatā, marginē crasso, albo, rimā superiori angusto, inferiori magno, columellā breci, ad terminum angulato, late, labio extero rotundato, superō obliquā depresso.*

MOULINS' PUPINA. Shell ventricose, striated, yellowish; whorls five, three upper short, rounded,

PUPINIDÆ.—PLATE II.

penultimate larger, inflated, last rather straight, large; aperture rather rounded, margin thick, white, upper notch narrow, lower large, columella short, angular at the end, broad, outer lip rounded, obliquely depressed above.

FISCHER et BERNARDI. Adams, Sowb. Thes. Conch. No. 25.

Hab. N. Caledonia.

Species 16. (Mus. Brit.)

PUPINA HUMILIS. *Pup. testâ subpyramidalâ, aureo-fuscâ; anfractibus quinque, tribus superioribus brevissimis, rotundis, penultima declivis, majoris, ultimo magno, inflato, ultimo magno, rotundo; aperturâ antice circulari, canali antico caudâ, rimâ posticâ magnâ, labio externo rotundo, posticâ obliquâ depresso, ante columellam contracto.*

THE HUMBLE PUPINA. Shell rather pyramidal, golden-brown; whorls five, three upper ones very short, rounded, the penultimate larger, inflated, last large, rounded; aperture rounded, anterior canal caudal, posterior notch large, outer lip rounded, posteriorly obliquely depressed, anteriorly contracted in front of the canal.

JACQUENOT. Adams, Sowb. Thes. Conch. No. 25.

Hab. New Guinea.

Species 17. (Mus. Brit.)

PUPINA SUPERBA. *Pup. testâ fuscâ, obliquâ; anfractibus quinque, tribus superioribus brevissimis, rotundis, penultima declivis, majoris, ultimo magno; aperturâ antice productâ, marginâ aureo, rotundo, rimâ posticâ magnâ, obliquâ, antice obliquâ retrocurva (occlivis).*

THE SUPERB PUPINA. Shell brown, oblique; whorls five, three upper very short, rounded, penultimate sloped, larger, last large; aperture anteriorly produced, margin golden, rounded, posterior notch large, oblique, anterior obliquely turned back (sloped upwards).

PFEIFFER. Mon. Heliocerum.

Hab. Sumatra.

Species 18. (Mus. Brit.)

PUPINA VESCOLA. *Pup. testâ globoso-pyramidalâ, bruciopolitâ, subaureâ; anfractu ultimo inflato, rotundo; aperturâ obliquâ ovata, antice productâ; rimâ*

posticâ rotundâ, collo parvo, acuminato, columellâ brevissimâ, labio externo posticâ obliquâ depresso, ante columellam contracto.

VESCOE'S PUPINA. Shell globose-pyramidal, short, polished, rather golden; last whorl inflated, rounded; aperture obliquely ovate, anteriorly produced; posterior notch rounded, callus small, acuminate, columella very short, outer lip posteriorly obliquely depressed, contracted in front of the columella.

MORELET. Adams, Sowb. Thes. Conch. No. 25.

Hab. Paulo Condor.

Species 19. (Mus. Sowerby.)

PUPINA BORNEENSIS. *Pup. testâ aureo-fuscâ, politâ, pyramidalâ; anfractibus quinque, convexâ, gradatim crescentibus; aperturâ subrotundâ, antice obliquâ productâ, marginâ crassiobscuro, alto, rotundo; rimâ posticâ inconspicua, columellâ obliquâ truncatâ.*

THE BORNEAN PUPINA. Shell golden-brown, polished, pyramidal; whorls five, convex, gradually increased; aperture rather round, anteriorly obliquely produced, margin rather thick, white, rounded; posterior notch inconspicuous, columella obliquely truncated.

PFEIFFER. Proc. Zool. Soc. Adams, Sowb. Thes. No. 25.

Hab. Borneo.

Species 20. (Mus. Brit.)

PUPINA PUPINIFORMIS. *Pup. testâ pyramidalâ, rubro-fuscâ, politâ; anfractibus octo, gradatim crescentibus, rotundatis, apice acuminato; aperturâ rotundâ, obliquâ paulò productâ, canali postico parvo, rimâ antica angusta, columellâ brevissimâ, latâ, labio externo planulato, ad rimam sinus proferens.*

THE PUPINA-SHAPED PUPINA. Shell pyramidal, reddish-brown, polished; whorls eight, gradually increased, rounded, apex acuminate; aperture rounded, a little produced obliquely, posterior canal small, anterior slit narrow, columella very short, broad, outer lip flattened, with a recurved sinus at the back.

SOWERBY. Thes. Conch. No. 25, *Pupinidae*, Pl. III. f. 38-9.

Hab. Philippines.

Species 21. (Mus. Brit.)

PETINA PFEIFFERI. *Pup. testâ altâ, angustâ, levâ, fideâ, semi-pellucidâ, obliquâ; anfractibus quinque, supra roribus quatuor brevibus, rotundis, ultimo alto, rectilobodâ; aperturâ parvâ, obliquâ subrotundâ, productâ, canali postico et callo suturali conspicuâ, columellâ brevissimâ, labio externo levâ, alto, rotundâ, superâ depresso.*

PFEIFFER'S PETINA. Shell elevated, narrow, thin, fulvous, semi-pellucid, oblique; whorls five, the four upper short, rounded, the last high, rather straight; aperture small, obliquely sub-ovate, produced, posterior canal and sutural callus conspicuous, columella very short, outer lip thin, white, rounded, depressed above.

DOWN. Adams, Sowb. Thes. No. 24-5.

Species 22. (Mus. Brit.)

PETINA THOMPSONI. *Pup. testâ solidâ, obliquâ, fideâ, politâ, media sub-angusta, apice acuminata; anfractibus quinque, ultimo magno; aperturâ antice obliquâ productâ, marginâ albâ, callo suturali lingüiformâ, labio interno callous, continuo, columelli latâ, obliquâ, truncatâ.*

THOMPSON'S PETINA. Shell solid, oblique, fulvous, polished, inflated in the middle, apex acuminate; whorls five, the last large; aperture anteriorly obliquely produced, margin white, sutural callus tongue-shaped, inner lip callous, continuous, columella broad, oblique, truncated.

FORBES. A. Adams, Mon. Sowb. Thes. *Pupinidae*, Pl. III, f. 18.

Hab. Australia.

Species 23. (Mus. Sowerby.)

PETINA MITIS. *Pup. testâ brevi, breciâ, fulciâ, subangulatâ, apice obtuso; anfractibus quatuor, penultimo inflato, brevi, ultimo magno; aperturâ obliquâ productâ, labio externo albo, angusto, callo suturali parvo, columellâ brevissimâ, acuminatâ.*

THE MELLOW PETINA. Shell short, smooth, fulvous, rather inflated, apex obtuse; whorls four, penultimate inflated, short, last large; aperture obliquely produced, outer lip white, narrow, sutural callus small, columella very short, acuminate.

A. ADAMS —? Sowerby's Thes. Conch. *Pupinidae*, Pl. III, f. 19
Hab. New Ireland.

Species 24. (Mus. Brit.)

PETINA STRANGEL. *Pup. testâ subcylindricâ, fideâ, politâ, medio inflato, apice breviter acuminato; anfractibus quinque, tribus apicalibus brevissimis, parvâ, penultima magno, inflato, ultimo meliori; aperturâ parvâ, obliquâ, callo suturali linguiformâ, labio interno marginato, columellâ brevissimâ.*

STRANGE'S PETINA. Shell subcylindrical, fulvous, polished, inflated in the middle, apex shortly acuminate; whorls five, three apical, very short, small, penultimate large, inflated, last middle-sized; aperture small, oblique, sutural callus tongue-shaped, inner lip bordered, columella very short.

PFEIFFER. Mon. Hel. Sowb. Thes. *Pupina*, Fig. 24.
Hab. Moreton Bay.

The inflation of the penultimate whorl, and the comparatively cylindrical form, distinguish this species from several of the preceding.

Species 25. (Mus. —? Copied.)

PETINA OTTONIS. *Pup. testâ ventricosâ, fulvo-cubensis, rectilobulâ, breciâ, politâ; epîna breviter pyramidalis; anfractibus quinque, gradatim crescentibus, ultimo magno, globoso; aperturâ subrotundâ, marginâ albâ, columellâ latâ, truncatâ, callo suturali subdistanti.*

PUPINIDÆ.—PLATE III.

OTTO'S PUPINA. Shell ventricose, reddish-brown, rather straight, short, polished; spire shortly pyramidal; whorls five, gradually increased, the last large, globose; aperture rather round, margin white, columella broad, truncated, sutural callus rather distant.

DOHRN. —? Adams, Sowb. Thes. *Pupinidae*, Part 25, Pl. III. f. 25.

Hab. Isl. Luzon, Philippines.

Species 26. (Mus. Brit.)

PUPINA NICOBARICA. *Pup. testâ obliquâ, ventricosâ, fulvo-rubescâ, politâ; anfractibus quatuor, tribus superioribus brevibus, rapido crescentibus, ultimo alto, inflato; aperturâ circulari, labio externo alto, anticâ obliquâ productâ, callo suturali mediocri, columellâ brevi truncata.*

THE NICOBAR PUPINA. Shell oblique, ventricose, fulvous-reddish, polished; whorls four, three upper short, rapidly increased, last high, inflated; aperture circular, outer lip white, anteriorly obliquely produced; sutural callus middle-sized, columella short, obliquely truncated.

PFEIFFER. Adams, Sowb. Thes. No. 24-5, *Pupinidae*, *Pupa*, f. 27.

Hab. Nicobar.

Species 27. (Mus. Brit.)

PUPINA RUFÄ. *Pup. testâ rectâ, subpyramidalâ, elevatâ, rufo-fuscâ, ad suturem alto-fasciatâ, apice obtuse; anfractibus quinque, aequaliter crescentibus; apertura circulari, marginâ albâ, labio extero rotundo, labio interno valido, callo suturali conspicuo, columellâ crassâ, ad terminum cuneatâ.*

THE REDDISH PUPINA. Shell straight, rather pyramidal, elevated, reddish-brown, with a whitish band at the suture, apex obtuse; whorls five, equally increased; aperture circular, margin whitish, outer lip round, inner lip strong, sutural callus conspicuous, columella thick, cuneate at the end.

PFEIFFER. Adams, Sowb. Thes. Conch. No. 25, *Pupina*, f. 29.

Hab. Japan.

Species 28. (Fig. a, b. Mus. Brit.)

PUPINA MINDORENSIS. *Pup. testâ breviâsculâ, pyramidalâ, albâ vel fuscâ, politâ, spirâ subacuminatâ; anfractibus quinque, aequaliter crescentibus, superioribus rotundis, ultimo convexisculo; aperturâ circulari, labio externo lato, canali postico et rimâ antice magno, columellâ breviâscula, latâ, truncatâ.*

THE MINDORO PUMINA. Shell rather short, pyramidal, white or brown, polished, spire a little acuminate; whorls five, equally increased, upper ones rounded, the last rather convex; aperture circular, outer lip broad, posterior canal and anterior notch large, columella rather short, rather broad, truncated.

ADAMS & REEVE. Voy. Sam.

Hab. Japan.

HARGRAVESIA. (Adams.)

Canali postico magno, rimâ antice nullâ.
Posterior canal large, no anterior notch.

Species 29. (Mus. Sowerby.)

HARGRAVESIA POLITA. *Har. testâ inflatâ, subpyramidalâ, fulvâ, politâ, breviâsculâ; anfractibus quinque, tribus superioribus brevibus, rapido crescentibus, penultimate inflato, ultimo magno; apertura circulari, obliquâ productâ, canali postico elongato, callo suturali linguiiformi, labio externo sic incrassato, cum interno antice continuo.*

THE POLISHED HARGRAVESIA. Shell inflated, rather pyramidal, fulvous, polished; rather short; whorls five, the three upper ones short, quickly increased, penultimate inflated, last large; aperture circular, obliquely produced, posterior canal elongated, sutural callus linguiform, outer lip scarcely thickened, anteriorly continuous with the inner lip.

A. ADAMS. Proc. Zool. Soc. 1870.

Hab. Solomon Islands.

Pipina

Callia

37

PUPINIDÆ.

PLATE IV.

Species 30. (Mus. —? Copied.)

PUPINA SWINHOEI. *Pup. testâ rectâ, pyramidalitâ, subventricosâ, politiâ; spirâ acuminatâ, anfractibus sex, convexis, præ aquilater crescentibus; aperturâ viz circulari, canaliculis posticâ et antice rotundis, latâ; columellâ latâ, subfocataâ, latâ truncatâ, labio externo latâ, duploato.*

SWINHON'S PUPINA. Shell straight, pyramidal, rather ventricose, polished; spiro acuminate; whorls six, convex, almost equally increased; aperture scarcely circular; posterior and anterior canals rounded, broad; columella broad, rather hollowed, broadly truncated; outer lip broad, doubled.

ADAMS' (*Pupinopsis*). Proc. Zool. Soc. 1866, p. 318.
Hab. Isl. Formosa.

Species 31. (Mus. Sowerby.)

PUPINA PINETICOLA. *Pup. testâ parvâ, levigatâ, brevi, fulviâ; anfractibus quatuor, duobus superioribus parvâ, penultimo inflato, ultimo magno, infra obliquâ subattenuato; aperturâ antice productâ, circulari.*

THE FINE-INHABITING PUPINA. Shell small, smooth, short, fulvous; whorls four, two upper small, last but one inflated, last large, obliquely rather attenuated; aperture anteriorly produced, circular.

Cox. Proc. Zool. Soc. 1866, p. 375.
Hab. Australia.

Species 32. (Mus. Sowerby.)

PUPINA DIFFICILIS. *Pup. testâ parci, subcylindrica, politiâ, pallidâ aurantio-fulviâ; anfractibus quatuor, tribus superioribus brevibus, aquilater crescentibus, ultimo majuscule; aperturâ obliquâ, canali-*

postico lato, columellâ brevi, acutâ, labio externo obliquâ productâ, aurantio, crassissimulo.

THE DIFFICULT PUPINA. Shell small, rather cylindrical, polished, pale orange, fulvous; whorls four, three upper short, equally increased, last rather large; aperture oblique, posterior canal broad, columella short, acute, outer lip obliquely produced, orange, rather thick.

SEMPER. Proc. Zool. Soc. 1864, p. 252.
Hab. Pelew Island.

Species 33. (Mus. Brit.)

PUPINA ADAMSI. *Pup. testâ altâ, subpyramidalitâ, aurantio-fusco, politiâ; anfractibus sex, superioriorum rotundis, gradatim crescentibus, ultimo majuscule, concavoz; aperturâ rotundâ, labio interno cylido, canali postico elongato, arcuato, callo suturali valido, columellâ latâ, crassa, truncata, labio externo superò sinuato, duploato.*

ADAMS' PUPINA. Shell elevated, somewhat pyramidal, orange-brown, polished; whorls six, upper ones rounded, gradually increasing, last rather large, convex; aperture rounded, inner lip strong, posterior canal elongated, curved, sutural callus strong, columella broad, thick, truncated, outer lip sinuous above, doubled.

SOWERBY. *Pupinella Swinhonis*, A. Adams. Proc. Zool. Soc. 1866, p. 318.
Hab. Isl. Formosa.

(*CALLIA*.)

Species 34. (Fig. a, b, Mus. Sowerby.)

CALLIA LUREICA. *Cil. testâ ventricosâ, breviter obliquâ, fulvâ cil lateo, pallidissimâ; anfractibus quatuor, tribus brevibus, ultimo magno, lateraliter gibboso; aperturâ rotundâ, margine albo rotundo.*

THE SHINING CALLIA. Shell ventricose, short, ob-

PUPINIDÆ.—PLATE IV.

lique, fulvous, or yellowish, brightly polished; whorls four, three short, last large, gibbous at one side; aperture rounded, margin white, rounded.

SOWERBY (*Pupina*). *Thesaurus Conchyliorum. Pupina* (first monograph), No. 1.
Hab. Isl. Panay, Philippines.

Species 35. (Fig. *a, b*, Mus. Sowerby.)

CALLIA SPLENDENS. *Cal. testâ pyramidalâ, subcentricosâ, fusco-polidâ; spira acuminatâ; anfractibus quatuor, rapidâ crescentibus; aperturâ rotundâ, margine angusto, rotundo.*

THE SPLENDENT CALLIA. Shell pyramidal, rather ventricose, brown, polished; spire acuminated, whorls four, rapidly increased; aperture rounded, margin narrow, rounded.

DODIN. —? Adams in Sowerby's *Thesaurus Conchyliorum*, No. 25.

Hab. Lizard Island.

More regularly pyramidal than the preceding, with gradually increasing whorls.

Species 36. (Mus. Sowerby.)

CALLIA AURITA. *Cal. testâ angustosculâ, albida, politissimâ, obliquâ; anfractibus quatuor, tribus brevissimis, ultimo majuscûlo; aperturâ obliquâ productâ, margine rotundo.*

THE EARED CALLIA. Shell rather narrow, whitish very polished, oblique; whorls four, three rather short, last rather large; aperture obliquely produced, margin rounded.

ZETIGER. —?

Hab. —?

Believing, from the narrower form of this shell,

that it differs from *Callia rubra*, I have adopted the name which I find attached in manuscript to a number of specimens.

Species 37. (Mus. Sowerby.)

CALLIA AMPICUA. *Cal. testâ centricosâ, subpyramidalâ, brevi, polidi, pallidâ fulvescenti; anfractibus quinque, ultimo majuscûlo; aperturâ rotundâ, obliquâ productâ, margine aurantio, columellâ ad dorsum perforatâ.*

THE AMBIGUOUS CALLIA. Shell ventricose, rather pyramidal, short, polished, pale fulvous; whorls five, the last rather large; aperture rounded, obliquely produced, margin orange, columella perforated at the back.

SEMPER —? (*Registoma*). Adams, in Sowerby's *Thesaurus. Pupinidae*, Pl. II. *Registoma*, f. 9.

Hab. Isl. Luzon, Philippines.

The minute perforation, visible only at the side or back of the columella, constitute this species a link between the *Registomæ*, which have a distinct notch or canal, and the *Calliæ*, which have the margin of the aperture quite entire. The shell, however, is much more nearly related to the latter than to the former subgenus.

Species 38. (Fig. *a, b*, Mus. Sowerby.)

CALLIA WALLACEI. *Cal. testâ aureo-fulcâ, politâ, obliquâ distortâ; anfractibus quatuor, apicalibus planulatis, ad dorsum retrorsis; aperturâ parvâ, rotundâ, simpliæ.*

WALLACE'S CALLIA. Shell golden-fulvous, polished, obliquely distorted; whorls four, the apical ones flattened, turned over the back; aperture small, rounded, simple.

PFEIFFER. —? Adams, in Sowerby's *Thesaurus*, Part 24-5. *Pupinidae*, Pl. III. *Callia*, f. 7, 8.

Hab. Ceram.

Registernia.

PUPINIDÆ.

(REGISTOMA.)

PLATE V.

Species 39. (Mus. Brit.)

REGISTOMA EXIGUUM. Reg. testâ pallidâ fulcâ, angustâ, subcylindricâ, solidâ; apice obtuso; anfractibus quatuor, penultimâ tumido, ultimo magno; aperturâ subrotundâ, obliquâ productâ, marginâ angusto, rimâ antice angustissimâ.

THE NARROW REGISTOMA. Shell pale fulvous, narrow, rather cylindrical, polished; apex obtuse; whorls four, penultimate tumid, last large; aperture rather round, obliquely produced, margin narrow, anterior slit very narrow.

SOWERBY. Thes. Conch. *Pupinidae*, Pl. II., Registoma, f. 8.

Hab. Isl. Luzon, Philippines.

Differing from *Registoma Cummingiana* in form being less elongated, and in the linear notch.

Species 40. (Mus. Brit.)

REGISTOMA VITREUM. Reg. testâ pyramidalâ, brevi, hyalina, fuscous-rubescens; anfractibus sex, brevibus, fere equaliter crescentibus, tumidis; aperturâ subcirculari, marginâ incrassato, reflexo, aurantio, columellâ crassiocaudâ, obliquâ truncatâ.

THE GLASSY REGISTOMA. Shell pyramidal, short, hyaline, brownish-red; whorls six, short, almost equally increasing, tumid; aperture rather circular, margin thickened, reflected, orange, columella rather thick, obliquely truncated.

SOWERBY. Adams, Thes. Conch. *Pupinidae*, Pl. II., Registoma, f. 7.

Hab. Isl. Luzon, Philippines.

Species 41. (Mus. Sowerby.)

REGISTOMA CUMMINGIANA. Reg. testâ exigua, altâ, pallidâ fulcâ vel albâ, solidâ, solitâsqualidâ, medio et supra tumido; anfractibus quinque, apicalibus pareis, alteris tumidis, altis, ultimo altissimo, ob-

lupo; aperturâ rotundâ, obliquâ productâ, marginâ angusta, rotunda, rimâ antice linearî.

THE CUMMINGIAN REGISTOMA. Shell narrow, raised, pale fulvous, or white, polished, rather solid, tumid in the middle and above, high, the last very high, oblique; aperture round, obliquely produced, margin narrow, rounded, anterior notch linear.

PFEIFFER. Adams, Sowerby's Thesaurus Conchyliorum, *Pupinidae*, Pl. II., Registoma, f. 12, 13.

Hab. New Caledonia.

Species 42. (Mus. Sowerby.)

REGISTOMA GRANDE. Reg. testâ obliquâ subglobosâ, politâ, aurantio, vel lacteo, vel purpureascens; anfractibus quinque, tritibus supercircularibus brevisimis, dorso retroflexis; penultima brevi, obliquâ, ultimo subglobosa, versus aperturam obliquâ gibbosâ, media planulata; aperturâ obliquâ productâ, labio exteriori expanso, columellâ planulata, truncata; rimâ rotundata.

THE LARGE REGISTOMA. Shell obliquely subglobose, polished, orange or milk-white, or purplish; whorls five, three upper very short, turned over the back, last but one short, oblique, last rather globose, obliquely gibbous towards the aperture, flattened in the middle; aperture obliquely produced, outer lip expanded, columella flattened, truncated; notch rounded.

GRAY. Adams, Sowerby's Thes. Conch. *Pupinidae*, Pl. II., Registoma, f. 1, 2, 3.

Hab. Philippines.

Species 43. (Mus. Sowerby.)

REGISTOMA FUSCUM. Reg. testâ altâ, pyramidalâ, fuscous-rubescens, solidâ; spirâ acuminatâ; anfractibus 7, brevissimis, lente crescentibus, con-

PUPINIDÆ.—PLATE V.

rexis, ultimo subrotundo; aperturâ subcirculari, marginâ aurantiâ, labio externo rotundo, columellâ rectâ, truncatâ, rimâ rotundi.

THE BROWN REGISTOMA. Shell high, pyramidal, reddish-brown, polished; spire acuminate; whorls seven, rather short, slowly increased, convex, the last rather round; aperture rather circular, margin orange, outer lip rounded, columella straight, truncated, notch round.

GRAY. Adams, Sowb. Thes. Conch. *Pupinidae*, Registoma, f. 4, 5.

Hab. Philippines.

Species 44. (Mus. Sowerby.)

REGISTOMA SIMILI. *Reg. testâ altâ, subcentricosidâ fulvâ, politâ, subpyramidalâ, spirâ obtusa; anfractibus septem, superioribus brevissimis, lente crescentibus, convexis, penultimum magisculo, ultimo magno; aperturâ subcirculari, margine albo, labio externo crasso, columellâ crassâ, evanescâ, rimâ anticâ magnâ, rotundi.*

THE SIMILAR REGISTOMA. Shell high, rather ventricose, fulvous, polished, rather pyramidal, spire obtuse; whorls four, upper two short, round, slowly increasing, convex, penultimate rather large; aperture rather circular, margin white, outer lip thick, columella thick, cornered, anterior notch large, rounded.

GRAY. Adams, Sowb. Thes. Conch. *Pupinidae*, Pl. II., Registoma, f. 6.

Hab. Isl. Luzon, Philippines.

If there be any tangible character besides the white lip distinguishing this species from the preceding, it will be found in the last two whorls being disproportionately ventricose, and the spire being, in consequence, more nearly pyramidal in form.

Species 45. (Mus. Sowerby.)

REGISTOMA PELLUCIDUM. *Reg. testâ angustâ subglobosâ, subpellucidoâ, fulrâ, politâ; anfractibus quinque, trilobis superioribus brevissimis, dorso retrosis, penultimo brevi, subretroso, ultimo obliquè elevato, subgloboso, versus aperturam obliquè gibbosâ, medio paulò planulâ; aperturâ parvâ, margine albo, columellâ angustâ, rimâ lineari.*

THE PELLUCID REGISTOMA. Shell narrowly subglobose, rather pellucid, fulvous, polished; whorls five, three upper very short, turned over the back, last but one short, rather turned backwards, last obliquely raised, somewhat globose, obliquely gibbosous towards the aperture, middle a little flattened; aperture small, margin white, columella narrow, notch linear.

SOWERBY. Adams in Thes. Conch. *Pupinidae*, Pl. II., Registoma, f. 10, 11.

Hab. Isl. Zebu, Philippines.

Species 46. (Mus. Sowerby.)

REGISTOMA COMPLANATUM. *Reg. testâ fulvâ, vel fuscâ, angustâ, subcylindricâ, altâ, politâ, spirâ obtusa; anfractibus quatuor, duabus superioribus brevibus, rotundis, duabus inferioribus altis, cylindraceis; aperturâ simplici, obliquè productâ, rimâ anticâ lineari.*

THE FLATTENED REGISTOMA. Shell fulvous, or brown, narrow, rather cylindrical, high, polished, spire obtuse; whorls four, upper two short, round, lower two high, cylindrical; aperture simple, obliquely produced, anterior notch linear.

PEASE. Adams, Sowb. Thes. Conch. *Pupinidae*, Pl. II., Registoma, f. 14, 15.

Hab. Kingsmill Group, Pacific.

A narrower and smaller shell than *Registoma pellucidum*.

Species 47. (Mus. Sowerby.)

REGISTOMA BRAZIERI. *Reg. testâ falcâ, politâ, angustâ, medio subventricosa; apice obtuso; anfractibus quinque tribus, superioribus brevibus, penultimo inflato, ultimo magisculo, oblique subattenuato; aperturâ obliquè productâ, parvâ, crenulari, rimâ aperta.*

BRAZIER'S REGISTOMA. Shell fulvous, polished, high, narrow, rather ventricose in the middle; apex obtuse; whorls five, three upper short, penultimate inflated, last rather large, oblique, anteriorly a little attenuated; aperture obliquely produced, small, circular, notch open.

CHASE. Journ. de Conch. No. XIII.

Hab. Eromanga in the Pacific.

PUPINIDÆ.

PLATE VI.

Species 48. (Mus. Hanley.)

CATAULUS NIETERI. *Cat. testa fusiformi, pallide fulva, vel fuscâ, fuscoviridi, striata, spira alta, pyramidalis; anfractibus septem, superioribus leviter crescatis, penultimâ et ultima angustis, pauci igitatis, ultimo ad umbilicatum latè carinato; apertura subrotundata, labio exterior duplo, marginè externo subobtuso.*

NIETER'S CATAULUS. Shell fusiform, pale fulvous, or brown, striped with brownish-green, spire raised, pyramidal; whorls seven, upper slowly increasing, penultimate and last rather large, a little inflated, last broadly keeled at the umbilicus; aperture somewhat produced, outer lip double, outer margin slightly winged.

HANLEY. Indian Shells.

Hab. ——? India.

Species 49. (Mus. ——? Copied.)

CATAULUS TORUOSUS. *Cat. testa alba, fusiformi; anfractibus septem, rotundis, igitatis, ultimo infra carinato, ad aperturam basale; apertura distanti, obliquè producta, marginè integra reflexa.*

THE TORTUOUS CATAULUS. Shell white, fusiform; whorls seven, rounded, lower inflated, last keeled below, loosened at the aperture; aperture distant, obliquely produced, margin entire, reflected.

GEAY. ——? Adams, Sowb. Thes. Conch. *Papuâde*, Pl. II., Cataulus, f. 1.

Hab. Nicobar Island.

Species 50. (Mus. ——? Copied.)

CATAULUS CALCAPIENSIS. *Cat. testa fuscâ, alba, subcylindrica, obliquè striata; anfractibus septem, convexis, sutura profunda; ultimo anfractu latè carinato; apertura disjuncta, perpendicularly subrotundata, antice rostrata, rimâ antice maximâ, labio exterior duplo.*

THE CALCAPIAN CATAULUS. Shell brown, high, subcylindrical, oblique, striated, whorls seven, convex, suture deep; last whorl with a wide keel, aperture disjoined, perpendicularly rather ovate, anteriorly beaked, anterior notch very large, outer lip double.

BEDDOE. Hanley, Indian Shells.

Hab. Caledonia, India.

Species 51. (Mus. Brit.)

CATAULUS DUPLICATUS. *Cat. testa fuscâ, rubescens, subpyramidalis, rotundata, media et infra subingulata; anfractibus octo, superioribus brevibus, attenuatis, ultima trilobata, igitatis; umbilicus angustus, carinat crassus; apertura rotundata, aurantia.*

THE DUPLICATE CATAULUS. Shell reddish-brown, rather pyramidal, robust, rather inflated in and below the middle; whorls eight, upper short, attenuated, last three high, inflated; umbilicus large, keel thick; aperture round, orange.

PEIFFER. Adams, Sowb. Thes. Conch. *Papuâde*, Pl. II., Cataulus, f. 2.

Hab. Ceylon.

Species 52. (Mus. Brit.)

CATAULUS CUMINGHI. *Cat. testa fuscâ, solidâ, subfuscata, angulatim rugata; spira acuminata, infra medium igitatis, umbilicus angustus, carina prominens; apertura subrotundata, marginè albâ, labio exterior lato, teretè duplo, rimâ antice maxima.*

CUMING'S CATAULUS. Shell brown, solid, rather fusiform, angularly wrinkled; spire acuminate, inflated below the middle, umbilicus rather large, keel prominent; aperture rather round, margin white, outer lip broad, slightly divergent, anterior notch very large.

PEIFFER. Adams, Sowb. Thes. Conch. *Papuâde*, Pl. II., Cataulus, f. 3.

Hab. Ceylon.

PUPINIDÆ.—PLATE VI.

Species 53. (Mus. Hanley.)

CATAULUS BLANFORDI. *Cat. testâ fuscâ-rubescens;* pyramidalis, altâ, supercînus attenuatâ; anfractibus novem, trilobis inferioribus subtriangularibus, convergâcibus, umbilico angustissimo, carinâ crassâ; aperturâ subovatâ, marginâ aurantio, lato, convexo, rimâ undicâ maximâ.

BLANFORD'S CATAULUS. Shell red-brown, pyramidal, high, attenuated above; whorls nine, three lower rather inflated, rather convex; umbilicus rather narrow, keel thick; aperture rather ovate, margin orange, broad, convex, anterior notch very large.

DOERN. Adams, Sowb. Thes. Conch. *Pupinide*, Pl. II., Cataulus, f. 16.

Hab. Kandy, Ceylon.

Species 54. (Mus. Sowb.)

CATAULUS THWAITESII. *Cat. testâ fusco-rubescens, fusi-*
formâ, robustâ, brevirostrâ; anfractibus septem,
septem inflatâ, ultimo infra ante carinam con-
tracto, umbilico parvo; aperturâ subovatâ, marginâ
lato, duplice, alba.

THWAITES' CATAULUS. Shell reddish-brown, fusiform, robust, rather short; whorls seven, middle inflated, last below contracted before the keel; umbilicus small; aperture rather oval, margin broad, doubled, white.

PEIFFER. Adams, Sowb. Thes. *Pupinide*, Pl. II., Cataulus, f. 6.

Hab. Ceylon.

Species 55. (Mus. Sowb.)

CATAULUS RECURVATUS. *Cat. testâ latâ pyramidalâ,*
straw-coloured, ventricosa, apice acuminata, rubra;
anfractibus septem, rotundatis, apud laterem crescen-
tibus, ultimo ante carinam contracto, umbilico
angusto, carinâ levâ; aperturâ sejunctâ, mar-
ginâ lato, duplice, infra ad rimam recurvato,
rimâ maximâ.

THE RE-CUED CATAULUS. Shell broadly pyramidal, straw-coloured, ventricose, apex acuminate, red; whorls seven, rounded, equally increased, last contracted before the keel, umbilicus nar-

row, keel thin; aperture rather large, margin broad, closed, bent backwards below the notch, notch very large.

A. ADAMS. Sowb. Thes. Conch. *Pupinidæ*, Pl. II., Cataulus, f. 16.

Hab. Ceylon.

The duplicate edge of the aperture, where interrupted by the notch, terminates at each side in a prominent point.

Species 56. (Mus. Hanley.)

CATAULUS EURIPTREMA. *Cat. testâ rubrâ, ventricosâ,*
pyramidalâ, versus apicem attenuatâ, acuminatâ,
medio et infrae ingratâ; anfractibus novem, duobus
ultimo latis, ingratâ, ultimo ad carinam contracto,
umbilico lato, carinâ acutâ; aperturâ perpendiculariter
oblongâ, marginibus externo et antico
latissimis, labio externo leviter duplice, rimâ
maximâ.

THE BROAD-EDGED CATAULUS. Shell red, ventricose, pyramidal, attenuated towards the apex, acuminate, inflated in and below the middle; whorls nine, two last broad, inflated, last contracted at the keel, umbilicus broad, keel sharp; aperture perpendicularly oblong, outer and lower margins very wide; outer lip slightly double, notch very large.

PEIFFER. Adams, Sowb. Thes. Conch. *Pupinide*, Pl. II., Cataulus, f. 17.

Hab. Ceylon.

Species 57. (Mus. Sowb.)

CATAULUS LAYARDI. *Cat. testâ brevirostrâ, flavidâ,*
pyramidalâ, spirâ acuminatâ; anfractibus con-
vexis, umbilico lato, carinâ acutâ; aperturâ albâ,
marginâ utrinque duplice, rimâ parvâ, ro-
tundit.

LAYARD'S CATAULUS. Shell rather short, yellow, pyramidal, spire acuminate; whorls convex, umbilicus broad, keel sharp; aperture white, margin doubled on each side, notch small, round.

(CATALUS)

Species 58. (Fig. a, b, Mus. Brit.)

CATAULUS MARGINATUS. *Cat. testâ augustâ, pyramidatâ, albâ vel fuscâ; anfractibus octo, levè crescentibus, undulatim rugosâ, ultimo infâ contracto, acute carinato, lotus carinam umbilicato; aperturâ subrotundâ, rimâ parvâ, labio externo duplicito, infâ ad rimam acutâ rostrato.*

THE BORDERED CATAULUS. Shell narrowly pyramidal, white or brown; whorls eight, slowly increased, with wavy wrinkles, the last contracted below, acutely keeled, widely umbilicated within the keel; aperture rather rounded, notch small, outer lip duplicated, sharply beaked below at the notch.

PFEIFFER, Mon. Helicorum.

Hab. Ceylon.

Species 59. (Mus. Sowerby.)

CATAULUS AUSTENIANUS. *Cat. testâ latâ pyramidatâ, brevissimâ, redicrossâ; fusco-rubescens; anfractibus octo, convexis; ultimo carinâ crassâ et umbilicâ anguo terminante; aperturâ magnâ, rotundâ, marginâ auriculâ, incrassato, latâ, convexâ; rimâ magnâ, rotundâ.*

AUSTEN'S CATAULUS. Shell broadly pyramidal, rather short, ventricose; reddish brown; whorls eight, convex, last ending with a thick keel and large umbilicus; aperture large, round, margin orange, thickened, convex, broad; notch large, rounded.

BRONSON. Ann. Nat. Hist. Ser. 2.
Hab. Ceylon.

Species 60. (Mus. Hanley.)

CATAULUS PYRAMIDATUS. *Cat. testâ latâ pyramidatâ, ventricosâ, fusco-rubescens, leviter striatâ; anfractibus septem, ultimo convexo, carinâ crassâ et*

umbilico lotu terminante; aperturâ rotundâ, marginâ alba, lata, planulata, rimâ obliquâ, maximâ.

THE PYRAMIDAL CATAULUS. Shell broadly pyramidal, ventricose, reddish brown, finely striated; whorls seven, the last convex, ending in a thick keel and broad umbilicus; aperture rounded, margin white, broad, flattened, notch oblique, very large.

PFEIFFER. Proc. Zool. Soc. 1852.

Hab. Ceylon.

Species 61. (Mus. Hanley.)

CATAULUS HEMASTOMUS. *Cat. testâ latâ pyramidatâ, obliquâ striatâ, fulvâ; apice acuminato; anfractibus octo, convexis, ultimo carinâ, supra carinâ contracto; aperturâ maxima, rotunda, margine latissimo, convexa, vixidâ rubra, ad suturam elevata, infâ rotundâ rostrato, rimâ angustâ, rotunda.*

THE EEL-MOUTHED CATAULUS. Shell broadly pyramidal, obliquely striated, fulvous; apex acuminate; whorls eight, convex, the last keeled, contracted above the keel; aperture very large, rounded; margin very broad, convex, bright red, raised at the suture, roundly beaked below, notch large, round.

PFEIFFER. Proc. Zool. Soc. 1852.

Hab. Ceylon.

More elegantly fusiform and acuminate than the two preceding.

Species 62. (Mus. Sowerby.)

CATAULUS TEMPLEMANI. *Cat. testâ subfuscâ, angusta, fusco-rubescens; anfractibus octo, medianâ subconstrictis, ultimo infâ contracto, umbilico angustâ scuto; aperturâ subrotundâ, margine vixidâ auriculâ, angusto, infâ in rostrum obtusissimum producto; rimâ parvâ.*

PUPINIDÆ.—PLATE VII.

TEMPLEMAN'S CATAULUS. Shell rather fusiform, narrow, reddish brown; whorls eight, middle ones rather ventricose, last contracted below, with a rather narrow umbilicus; aperture rather ovate, margin bright red, narrow, produced below in a very obtuse beak; notch small.

PFEIFFER. Adams. Sowb. Thes. Conch. *Pupinidae*, *Cataulus*, Fig. 62.

Hab. Ceylon.

Species 63. (Mus. Hanley.)

CATAULUS LEUCOCEHILUS. *Cat. testá pyramidálâ, striátâ, flavidâ; anfractibüs octo, medianis subventricosis, apicalibüs parvís, attenuatis, ultimo supra cariám validè contracto; cariá acútâ; umbilicó magno; aperturâ subovalâ, marginé expanso, albo, reflexo, recurvo, ad suturam elevato, ad rimam prodícto; rimâ maximâ.*

THE WHITE-EDGED CATAULUS. Shell pyramidal, striated, yellow; whorls eight, middle subventricose, apical small, attenuated, last strongly contracted above the keel; keel sharp; umbilicus large; aperture rather ovate, margin expanded, white, reflected, bent backwards, raised at the suture, produced at the notch; notch very large.

A. ADAMS. Sowb. Thes. Conch. *Pupinidae*, *Cataulus*, Fig. 62.

Hab. Ceylon.

Species 64. (Mus. Hanley.)

CATAULUS DECORUS. *Cat. testá subfusiformi, levigatâ, rubro-fuscâ; anfractibüs septem, sublevatis, convexis, ultimo supra cariáum validissimè contracto; cariá magna, acútâ; aperturâ parvâ, subovalâ, marginé lato, expanso, ad suturam elevato, subalato, infra rostrâ, rimâ magna.*

THE DECOROUS CATAULUS. Shell subfusciform, smooth,

reddish-brown; whorls seven, rather elevated, convex, last very strongly contracted above the keel; keel large, sharp; aperture small, subovate, margin broad, expanded, raised and somewhat winged at the suture, beaked below, notch large.

BENSON. Adams. Sowb. Thes. Conch. *Pupinidae*, *Cataulus*, Fig. 13.

Hab. Ceylon.

Species 65. (Mus. Hanley.)

CATAULUS AUREUS. *Cat. testá altâ, subfusiformi, aurantia, tenuiter striatâ; anfractibüs septem, allis, tribus vel quatuor apicalibüs roseis, attenuatis, medianis subventricosis, ultimo elevato; aperturâ mediocri, marginé duplicito, extus expanso, infra valvâ rostrato; rimâ maximâ.*

THE GOLDEN CATAULUS. Shell raised, subfusciform, orange, finely striated; whorls seven, elevated, three or four apical rosy, attenuated; middle rather ventricose, last raised; aperture middle-sized; margin double, expanded on the outside, strongly beaked below; notch very large.

HANLEY. Indian Shells, Pl. 106, Fig. 9.

Hab. India.

(ARINIA.)

Species 66. (Mus. —? Copied.)

ARINIA MINOR. *Ari. testá parvâ, pupaformâ, fuscâ; anfractibüs quatuor, brevibus, rotundis, superioribus elevato-striatis; aperturâ rotundâ, marginé albo, integro.*

THE SMALL ARINIA. Shell small, pupa-shaped, brown; whorls four, short, rounded, upper ridge striated; aperture round, margin white, entire.

SOWERBY (Cyclostoma). Adams. Sowb. Thes. Conch. *Pupinidae*, *Arinia*, Fig. 1.

Hab. Isl. of Panay, Philippines.

Polydora & *etc.*

PUPINIDE.

PLATE VIII.

(POLLICARIA OR HYOCISTIS)

Species 67. (Mus. Sowerby.)

POLLICARIA Mouchoti. *Pol. testi solidi, ventricosi, brevi, fusco-purpurei, pupiformi; anfractibus quinque, rapidè crescentibus, ultimo magno, alto, riz uno latere gibbo; umbilicus parvo, obliquo; apertura magna, subrotundata, postice subacuminata; marginis arcuato, rotundo.*

MOUCHOT'S POLLICARIA. Shell solid, ventricose, short, brown-purple, pupa-shaped; whorls five, rapidly increased, the last large, elevated, a very little gibbose on one side; umbilicus small, oblique; aperture large, rather round, slightly acuminate posteriorly; margin orange, round.

PFEIFFER. Proc. Zool. Soc. 1862, p. 276.

Hab. Camboja, Lao Mountains.

Species 68. (Mus. Brit.)

POLLICARIA GRAVIPES. *Pol. testi solidi, ventricosi, breviter pupiformi, fulvi; subtortuosa; apice obtuso, anfractibus quinque, tribus apicalibus brevioribus, rapidè crescentibus, penultimo ventricosum, uno latere gibbosum, ultimo magno, obliquo, uno latere gibbosum; infra angustata, rotata, umbilicata; apertura subrotundata, marginis duplicita, marginis extrema supra subteram elevata, subtubulosa, marginis interno ante' ultra' selenum extensa.*

THE HEAVY POLLICARIA. Shell solid, very ventricose, shortly pupaform, fulvous, a little tortuous; apex obtuse, whorls five, three apical short, rapidly increased, the penultimate ventricose, gibbons on one side; last large, oblique, gibbons on one side, narrow below, notched, umbilicated; aperture rather rounded, margin duplicated, outer margin raised above the suture, a little tubular; inner margin anteriorly extended beyond the enter.

BENSON. Adam. Sowb. Thes. Conch. *Pupinidae*, Pollicaria. Fig. 5.

Pollicaria pollex, Gould.

Hab. Moumein, India.

Species 69. (Mus. Brit.)

POLLICARIA MYERSI. *Pol. testi magni, inflata, fusa, fusiformi; apice obtuso; anfractibus quinque, apicalibus tribus parvis, penultimo magno, ultimo*

mazimo; infrè angustè umbilicata; apertura margini, superne subacuminata, marginis duplicita.

MYERS' POLLICARIA. Shell large, inflated, fulvous, fusiform; apex obtuse; whorls five, three apical small, last but one large, last very large; narrowly umbilicated below; aperture large, a little acuminate above, margin doubled.

HAINES. Adams. Sowb. Thes. Conch. *Pupinidae*, Pollicaria, Fig. 11.

Hab. Siam.

(MEGALOMASTOMA.)

Species 70. (Mus. Brit.)

MEGALOMASTOMA LOWELLI. *Meg. testi brevifuscula, pyramidalata, purpureofusca; apice acuminata; anfractibus septem, gradatim crescentibus, convexissimis; ultimo ad umbilicum carinato; apertura rotundata, marginis duplicita, expansa, intus arcuata, extre' alba, planulata.*

LOWL'S MEGALOMASTOMA. Shell rather short, pyramidal, purple-brown; apex acuminate; whorls seven, gradually increased, rather convex, last keeled at the umbilicus; aperture round, margin duplicate, expanded, orange within, white without, rather flattened.

ADAMS and SOWERBY. Thes. Conch. *Pupinidae*, Megalomastoma.

Hab. Labuan.

Species 71. (Mus. Sowerby.)

MEGALOMASTOMA TORTUM. *Meg. testi solidi, centris cavi, pupiformi; anfractibus sex, rotundatis, tribus apicalibus levioribus, rotundatis, pallide fulcis, ultimo purpureo-nigrescente, quam penultimo angustiori; aperturæ circulari, marginis reflexa, labio interno angusta, exterius super et infrè alata.*

THE TWISTED MEGALOMASTOMA. Shell solid, ventricose, pupa-shaped; whorls six, rounded, three apical short, rounded, pale fulvous, last blackish-purple, narrower than the penultimate; aperture circular, margin reflected, inner lip narrow, outer winged above and below.

WOOD. Suppl. Pl. 6, p. 23.

Cyclostoma auriculatum, D'Orb.

Cyclostoma alutaceum, Menke.

Cyclostoma apertum, Poey.

PUPINIDÆ.—PLATE VIII.

Cyclostoma digitale. Gundlach.
Cyclostoma Taylorianum. Pfeiffer.
Cyclostoma idolum. Ferrussac.
Cyclostoma bicolor. Goulding.
Cyclostoma semiundatum. Poey.
Hab. Cuba.

Species 72. (Mus. Brit.)

MEGALOMASTOMA SIMULACRUM. *Meg. testâ clatâ, pyramidalâ, rubro-fusca, tenuiter striata; anfractibus decora, convexis; aperturâ circulari, marginè duplicito, laterè interno angustè elevato, externo latè reflexo, expanso, planulato, albo; apud anfractum ultimum angustato, sinuatim plicato.*

THE IMAGE MEGALOMASTOMA. Shell elevated, pyramidal, reddish-brown, finely striated; whorls ten, convex; aperture circular, margin duplicate, on the inner side narrowly elevated, on the outer broadly reflected, expanded, flattened, white; narrowed and sinuously plaited against the last whorl.

MORELET. Adams. Sowb. Thes. Megalomastoma, Fig. 3, 4.

Hab. Guatemala.

Species 73. (Mus. Sowerby.)

MEGALOMASTOMA GUATEMALENSE. *Meg. testâ clatâ, pyramidalâ, angustâ, turrithâ, fusca; anfractibus retusulis, gradatim crescentibus, ultimo angustè umbilicato, carinato; aperturâ subrotundâ, marginè reflexo, angusto, albo.*

THE GUATEMALA MEGALOMASTOMA. Shell elevated, pyramidal, narrow, turreted, brown; whorls round, gradually increased, last narrowly umbilicated, carinated; aperture rather rounded, margin reflected, narrow, white.

PFEIFFER. Adams. Sowb. Thes. Megalomastoma, Fig. 6.

Hab. Guatemala.

Species 74. (Mus. Sowerby.)

MEGALOMASTOMA LEONINUM. *Meg. testâ brevi, levî, pupiformi, fulva, solidâ, ventricosa; anfractibus quinque, ultimo magno, infra carinato et umbilicato; aperturâ magnâ, subcirculari, marginè albo, angusto, reflexo, rotundo.*

THE LEONINE MEGALOMASTOMA. Shell short, smooth, pupa-shaped, fulvous, solid, ventricose; whorls

five, last large, keeled and umbilicated below; aperture large, subcircular, margin white, narrow, reflected, rounded.

PFEIFFER. Adams. Sowb. Thes. Conch. *Pupinidae* (Megal.) Fig. 7.
Hab. Cuba.

A shorter shell than *M. tortum*, with the margin of the aperture not winged.

Species 75. (Mus. Brit.)

MEGALOMASTOMA FUNICULATUM. *Meg. testâ angustâ, pupureo-fusca, pupiformi, alta; anfractibus sex, rectiōsculis, superioribus attenuatis; ultimo alto, rectilaterali, infra subcarinato et umbilicato; aperturi flavidâ, subauriformi, marginè angustè reflexo, rotundo, integro.*

THE CHIMNEY-SHAPED MEGALOMASTOMA. Shell narrow, purple-brown, pupa-shaped, high; whorls six, rather straight, upper attenuated; last high, straight-sided, slightly keeled and umbilicated; aperture yellowish, rather auriform, margin narrowly reflected, rounded, entire.

BENSON. Adams. Sowb. Thes. Conch. Megalomastoma, Fig. 8.

Hab. Darjiling, India.

Species 76. (Mus. Brit.)

MEGALOMASTOMA BITUBERCULATUM. *Meg. testâ solida, alta, ventricosa, pupiformi; anfractibus sex, convexis, superioribus pallidis, inferioribus pupureis; suture profundissimâ; aperturâ circulari, marginè latè reflexo; laterè externo foliatim duplicato, apud anfractum ultimum rotundè bialato, post aperturam canaliculato.*

THE BITUBERCULATED MEGALOMASTOMA. Shell solid, high, ventricose, pupa-shaped; whorls six, convex, upper pale, lower purple; suture very deep; aperture circular, margin broadly reflected; outer side doubly foliated, roundly two-winged, with a canal behind the aperture.

SOWERBY. Adams. Sowb. Thes. Megalomastoma, Fig. 10.

Cyclostoma solenatum. Poey.
Hab. Cuba.

A bolder and more cylindrical shell than *Megalomastoma tortum*, with the alae on the margin of the lip at the interrupted part rounded and conspicuous.

Megabromastrena.

PUPINIDEA

PLATE IX.

(MEGALOMASTOMA)

Species 77. (Mus. Sowerby.)

MELVYN DODD. Meg. testa oblongo-subcylindrica, levigata, omnino pallide cineraria vel fuscocarneata, anfractibus inferioribus fuscis fusca lati pecti; anfractibus sec, primis rotundis, brevibus; mediorum concrexis levibus, altis; ultimo altissimo, infra prope aperturam carinato, angusti umbilicato; apertura ante subproductis, circulari, margini integro, rotundo.

D'ORBIGNY'S MEGALOMASTOMA. Shell oblong-subcylindrical, smooth, all over pale orange or brown orange, with the lower whorls painted with a broad brown band; whorls six, the first rounded, short; middle rather convex, high; last very high, keeled below near the aperture, narrowly umbilicated; aperture anteriorly rather produced, circular, margin entire, rounded.

PFEIFFER. Adams, Sowb. Thes. Conch. *Pupinidae*, Megalomastoma, Fig. 12, 13.

Hab. Haiti, Peru.

Species 78. (Mus. Sowb.)

MEGALOMASTOMA SUSPENSUM. Meg. testa angusti pyramidalis, obliquae striatis, fumoso-fusca; anfractibus novem, gradatim crescentibus; ultimo alto, infra umbilicato et carinato; apertura descendente, subrotunda, margini angusto, albo, planulata, ad suturam levigata.

THE SUSPENDED MEGALOMASTOMA. Shell narrowly pyramidal, obliquely striated, smoky-brown; whorls nine, gradually increased; last high, umbilicated and keeled below; aperture descending, rather ovate, margin narrow, white, flattened, acuminate at the suture.

GULDING. Adams, Sowb. Thes. *Pupinidae*, Megalomastoma, Fig. 14.

Cyclostoma Antillarum. Sowerby.

Hab. Isl. St. Thomas, Antilles.

Species 79. (Mus. —? Copied.)

MEGALOMASTOMA VERRUCOSUM. Meg. testa brevi, subpyramidalis, obscuri falcis, minuti nodulosi; anfractibus sec, gradatim crescentibus, ultimo ante

aperturam angustissimi umbilicato; apertura subrotundata, margini albo, convexa.

THE WARTED MEGALOMASTOMA. Shell short, rather pyramidal, dull brown, minutely nodose, whorls six, gradually increased, last very narrowly umbilicated before the aperture; aperture rather round, margin white, convex.

SUTTLEWORTH. Adams, Sowb. Thes. *Pupinidae*, Megalomastoma, Fig. 15.

Hab. Porto Rico.

Species 80. (Mus. Brit.)

MEGALOMASTOMA COMPLICATUM. Meg. testa solidata, pupiformis, ventricosa, fuscopurpurea, ad suturam albo-lineata; anfractibus quinque, penultimate maxima, ultimo subcompressa; umbilico angustissimo; apertura angusta, circulari; margini albo, crasso, apud anfractum ultimum partim interrupto.

THE FLATTENED MEGALOMASTOMA. Shell solid, papilla-shaped, ventricose, brown-purple, with a white line at the suture; whorls five, penultimate very large; last a little compressed; umbilicus very narrow; aperture large, circular; margin white, thick, partly interrupted against the body-whorl.

PFEIFFER. Adams, Thes. Conch. *Pupinidae*, Megalomastoma, Fig. 16.

Hab. Cuba.

The last whorl is a little flattened in front.

Species 81. (Mus. Sowerby.)

MEGALOMASTOMA CROCEUM. Meg. testa ovo-acuminata, levi, aurantiaca, vel pallidi fulvi, anfractibus inferioribus fuscopurpureis; anfractibus septem, superiori angustioribus, infra angusti umbilicata; apertura ovata, posteriori angusti-ascida, margini angusto, duplicita.

THE YELLOW MEGALOMASTOMA. Shell ovate-acuminated, smooth, orange, or pale fulvous, with brown bands on the lower whorls; whorls seven, rather narrow above; below narrowly umbilicated; aperture ovate, posteriorly rather narrow, margin narrow, doubled.

SOWERBY. Thes. Conch. *Pupinidae*, Megalomastoma, Fig. 7.

PUPINIDÆ.—PLATE IX.

Cyclostoma bifasciatum, Sowerby
Cyclostoma Gouldianum, Petri.
Hab. Mauritius. (Var. *fasciatum*.) Guayaquil.

Species 82. (Mus. Sowerby.)

MEGALOMASTOMA MANI. *Meg. testâ subpyramidalâ, auro-fulvi, tenuiter striâ, apic acuminato; anfractibus septem, superioribus quinque brevibus, rotundis, penultimo magno, ultimo magno, infra umbilicato; aperturâ rotundâ, margine crasso, rotundo, suprâ infrâque prope anfractum ultimum paulò expanso.*

MAN'S MEGALOMASTOMA. Shell rather pyramidal, golden-fulvous, finely striated, apex acuminated; whorls seven, upper five short, round, penultimate large, last large, umbilicated below; aperture round, margin thick, rounded, a little expanded above and below near the last whorl.

POEY. Adams. Sowb. Thes. Conch. *Pupinidæ*, Megalomastoma, Fig. 18.

Megalomastoma procurcum (var.). Poey.
Hab. Cuba.

This species is not so cylindrical as *Megalomastoma tortum*, but tapers towards the apex.

Species 83. (Mus. Hanley.)

MEGALOMASTOMA ANASTOMA. *Meg. testâ breviter pyramidalâ, acuminata, purpureo-fusca; anfractibus sex, rapido crescentibus; aperturâ magnâ, circinari; margine albo, expanso, apud anfractum ultimum interrupta.*

THE WRY-MOUTHED MEGALOMASTOMA. Shell shortly pyramidal, acuminate, purple-brown; whorls six, rapidly increased; aperture large, circular; margin white, expanded, interrupted against the last whorl.

BENSON. Adams. Sowb. Thes. *Pupinidæ*, Megalomastoma, Fig. 20.
Hab. India.

The peritreme is white and more broadly expanded than in *M. Lowei*.

Species 84. (Mus. —? Copied.)

MEGALOMASTOMA GULDINGIANUM. *Meg. testâ minutâ, brevi, pupaformi, anfractibus superioribus albis,*

apice obtuso; anfractibus quinque, brevibus, rotundis, penultimo inflato; ultimo intenso purpureo; vix contracto, umbilicato; aperturâ subcirculari, margine angusto, albo, rotundo.

GULDING'S MEGALOMASTOMA. Shell minute, short, pupa-shaped, upper whorls white, apex obtuse; whorls five, short, round, last but one inflated; last deep purple, a very little contracted, umbilicated; aperture nearly circular, margin narrow, white, rounded.

PFEIFFER. Adams. Sowb. Thes. Conch. *Pupinidæ*, Megalomastoma, Fig. 21.

Hab. West Indies.

This minute shell is like a miniature representation of *M. tortum*.

Species 85. (Mus. —? Copied.)

MEGALOMASTOMA PAUPERCULUM. *Meg. testâ minutâ, pupaformi, altiuscula, anfractibus superioribus albis, convexis; spirâ acuminata, medio convexâ; anfractibus sex, concavisculis, penultimo inflato, ultimo subcontracto, umbilicato, intenso purpureo; aperturâ circulari, margine albo, duplo.*

THE POOR LITTLE MEGALOMASTOMA. Shell minute, pupa-shaped, rather high, with the upper whorls white, convex; spire acuminate, middle convex; whorls six, rather convex, last but one inflated, last rather contracted, umbilicated, deep purple; aperture circular, margin white, double.

PFEIFFER. Adams. Sowb. Thes. Conch. *Pupinidæ*, Megalomastoma, Fig. 22.
Hab. West Indies.

Resembling *M. Guldningianum* in size and general appearance, but more acuminate, and with the rim doubled.

Species 86. (Mus. Sowerby.)

MEGALOMASTOMA ALBUM. *Meg. testâ angustâ pyramidalâ, purpureo-fusca, levigata; anfractibus septem convexis, ultimo alto, umbilicato; aperturâ subcirculari, margine duplolicata, alba.*

THE HIGH MEGALOMASTOMA. Shell narrowly pyramidal, purple-brown, smooth; whorls seven, convex, last high, umbilicated; aperture rather circular, margin doubled, white.

SOWERBY. Adams. Thes. Conch. *Pupinidæ*.
Hab. Isl. Negros.

PUPINIDE.

PLATE X.

Species 87. (Mus. Brit.)

MEGALOMASTOMA UNGULA. *Meg. testū albū, solidū, pupariformi, unifacilius sex, convexis, suturā profundā separatis, ultimo angustissimō umbilicato; aperturā ante obliqui producti, bimarginata, marginē interiori ultra exteriorem obliquè extenso.*

THE TALON MEGALOMASTOMA. Shell white, solid, papashaped, whorls six, convex, separated by a deep suture; last very narrowly umbilicated; aperture anteriorly obliquely produced, with a double margin, interior margin extended obliquely beyond the outer.

POET. Adams, Sowb. Thes. Conch. *Pupinide*, *Megalomastoma*, Fig. 29.

Hab. Cuba.

The month is bordered by a kind of double rim, the inner rim being, as it were, pushed out obliquely in front, so as to overlap what would otherwise be the outer.

Species 88. (Mus. Brit.)

MEGALOMASTOMA SECTILABRUM. *Meg. testū pyramidatū, altū, acuminatū, pallidissimū fulcī; unifacilius octo, larvulus, concrecīscens, decollatus; ultimo infrā unifasciatū, tum angustissimō umbilicato; aperturā subelevatā, marginē duplicita, parte exteriori adanfractum ultimum interrupta, interiori integrā.*

THE SLIT-LIPPED MEGALOMASTOMA. Shell pyramidal, raised, acuminate, very palefulvous; whorls eight, smooth, convex, sloped; last single-banded, very narrowly umbilicated; aperture rather ovate, margin duplicated, the outer part being interrupted at the body whorl, the inner part entire.

GULDING. Adams, Sowb. Thes. Conch. *Pupinide*, *Megalomastoma*, Fig. 24.

Hab. Tavoy, Birmah.

Species 89. (Mus. —? Copied.)

MEGALOMASTOMA VENTRICOSUM. *Meg. testū solidū, ventricosissimū, brevi, fusco-rubescens; unifacilius quinque, concrecis, latis; penultimate inflato; ultimo purpureo-fuscus, infrā subangustata, profundi umbilicata; aperturā magis, circularis; marginē crasso, aurantia, rotundo, apud anfractum ultimum partim interrupta.*

THE VENTRICOSE MEGALOMASTOMA. Shell solid, very ventricose, short, reddish-brown; whorls five, convex, broad; penultimate inflated; last rather purplish, a little narrowed below, deeply umbilicated; aperture large, round; margin thick, orange, round, partly interrupted at the last whorl.

D'ORBIGNY. Adams, Sowb. Thes. Conch. *Pupinide*, *Megalomastoma*, Fig. 25.

Hab. Cuba.

Much more short and ventricose than *Meg. toulum*.

Species 90. (Mus. Brit.)

MEGALOMASTOMA GUNDLACHI. *Meg. testū brevi, pupariformi, auriculo-fusci; apice obtuso; unifacilius quinque, terbris superiorebus rotundis, penultimo magno, rectiōsculo, ultimo attissimo, recto, infra carinato, umbilicato; aperturā maximē circulari, marginē crasso, rotundo, apud anfractum ultimum semi-interrupta.*

GULDING'S MEGALOMASTOMA. Shell short, papashaped, orange-brown; apex obtuse; whorls five, three upper rounded, penultimate large, rather straight, last very high, straight, keeled below, umbilicated; aperture very large, circular, margin thick, rounded, half interrupted against the last whorl.

PEIFFER. Adams, Sowb. Thes. Conch. *Pupinide*, *Megalomastoma*, Fig. 26.

Hab. Cuba.

Species 91. (Mus. Brit.)

MEGALOMASTOMA CYLINDRACEUM. *Meg. testū altissimā, cylindricā, aurantiā (nonnunquam ultimo anfractu unifasciāto), cerasus apicē attenuatā; unifacilius octo, allis, rectis; aperturā ovali, marginē alba, angusto.*

THE CYLINDRICAL MEGALOMASTOMA. Shell very high, cylindrical, orange, sometimes with the last whorl single-banded, attenuated towards the apex; whorls eight, high, straight; aperture ovate, margin white, narrow.

CHEMNITZ. Adams, Thes. Conch. *Pupinide*, *Megalomastoma*, Fig. 27.

Turbo flavidulus. Wood.

Helix cocca. Gmelin.

Cyclotoma flavidula.

Hab. Porto Rico.

More elevated and cylindrical than *M. D'Orbigny*.

Species 92. (Mus. Sowb.)

MEGALOMASTOMA SEROTINA. *Meg. testū ovali-subpyramidalis, ventricosus, levigatus, subelevatus, fidei; unifacilius sex, concrecīscens, ultimo magno, infa carinato, angusti umbilicata, aperturā subrotundata, anticē obliqui producti, marginē crasso, duplicita, parte interiorē anticē ultra exteriōrem extenso.*

THE EVENING MEGALOMASTOMA. Shell ovate-subpyramidal, ventricose, smooth, rather acuminate, fulvous; whorls six, rather convex, last large, keeled below, narrowly umbilicated; aperture rather rounded, anteriorly obliquely produced, margin thick, double, inner part extended in front beyond the outer.

ADAMS. Sowb. Thes. Conch. *Pupinidae*, Megalomastoma, Fig. 28.

Hab. Cuba.

(*RAPHAELUS*)

Species 93. (Mus. —? Copied.)

RAPHAELUS BOMBASINUS. *Rap. testi breviter papariformi*, *fusco-saburâd*, *apice acuminato*; *aufretilbus septem*, *quaque superioribus parvis*, *brevibus*, *pyramidalis*; *penultima brevissima*, *rotundat*; *prominuti*, *ultimo magno*, *rectilineo*; *apertura magna*, *rotundâ*, *margine lato*, *circulariter canaliculata*; *tubâ rotundâ brevissima*.

THE BOMBASIN *RAPHAELUS*. Shell shortly pupaform, golden-brown; apex acuminate, whorls seven, five upper small, short, pyramidal; penultimate rather short, roundly prominent, last large, rather straight; aperture large, round, margin broad, circularly channelled; tube round, very short.

PEIFFER. Adams, Sowb. Thes. Conch. *Pupinidae*, *Raphaelus*, Fig. 3, 7.

Hab. India.

Species 94. (Mus. —? Copied.)

RAPHAELUS SIMILIS. *Rap. testi brevissimâ pupiformi*, *fusco-saburâd*; *apice obtuso*; *aufretilbus quinque*, *trilobus* *superioribus brevissimis*, *penultima brevi*, *inflata*; *ultimo ventricosus*, *alto*, *obliqua*; *apertura magna*, *rotundâ*, *margine lato*, *circulariter canaliculata*; *tubâ rotundâ*, *brevissima*.

THE SIMILAR *RAPHAELUS*. Shell very shortly pupa-shaped, golden brown; apex obtuse; whorls five, three upper very short, penultimate short, inflated, last ventricose, high, oblique; aperture large, rounded, margin broad, with a circular canal; tube rounded, very short.

SOWERBY.

Hab. —?

In the monograph of Pupinidae by Mr. Arthur Adams, this species is given as a second example of the preceding. It is, however, much shorter and more obtuse in the spire.

Species 95. (Mus. Hanley.)

RAPHAELUS CHRYSALIS. *Rap. testi breviter pupiformi*, *solidâ*, *purpureo-fuscâ*; *apice obtuso*, *an-*

fractibus quinque, *tribus superioribus brevibus*, *penultimo alto*, *rotundâ prominenti*; *ultimo alto*, *obliquo*; *apertura magna*, *circulari*, *margine lato*, *circulariter canaliculata*; *tubâ elongata*, *perpendicularly super auctuam ultimum decumbentia*.

THE CHRYSALIS *RAPHAELUS*. Shell shortly pupa-shaped, solid, purple-brown; apex obtuse, whorls five, three upper short, last but one elevated, roundly prominent; last elevated, oblique; aperture large, circular, margin broad, with a circular channel, tube elongated, perpendicularly decumbent upon the last whorl.

PEIFFER. Proc. Zool. Soc. 1852, p. 158.

Hab. Ava, Monmacin.

The tube runs up the side of the last whorl, nearly reaching the suture.

Species 96. (Mus. Brit.)

RAPHAELUS LOREAINI. *Rap. testi breviter pupiformi*, *solidâ*, *purpureo-fuscâ*, *ultimo angustius albo suprî*, *ad suturam unicolorio*; *apice obtuso*; *aufretilbus quinque*, *brevibus*, *penultima rotundâ prominenti*, *ultimo rectilineo*; *apertura magna*, *circulari*, *margine albo*, *egregio*, *rotundo*; *tubâ brevissimâ*, *extra marginem aperta*.

LORAINE'S *RAPHAELUS*. Shell shortly pupa-shaped, solid, purple-brown, last whorl with a single white band above the suture; whorls five, short, last but one roundly prominent; last rather straight; aperture large, circular, margin white, reflected, rounded; tube very short, open beyond the margin.

PEIFFER. Proc. Zool. Soc. 1852.

Hab. Pulo Penang.

Resembling *R. bombycinus* and *R. similis*, but with no groove round the margin of the aperture.

Species 97. (Fig. a, b, Mus. Hanley.)

RAPHAELUS BLanfordi. *Rap. testi brevissimâ*, *ventricosa*, *fusca*; *apice sub-pyramidalis*; *aufretilbus quinque*, *dubius apicalibus parvis*, *brevibus*, *penultima igitur*, *ultimo brevi*, *subfusfo*; *apertura circulari*, *margine crasso*, *albo*; *tubâ retrorsum plicati*, *longi* *super suturam ad dorsum producti*.

BLANFORD'S *RAPHAELUS*. Shell very short, ventricose, brown; apex rather pyramidal; whorls five; two apical small, short, last but one inflated, last short, rather inflated; aperture circular, margin thick, white; tube bent backwards, produced to some length over the suture at the back.

BENSON. Ab. Nat. Hist. 1857, p. 201.

Hab. Near Darjiling, in Sikkim, Himalaya.

MONOGRAPH
OF THE GENUS
GASTROCHENA.

"Contrivance intricate, expressed with ease
Where unassisted sight no beauty sees."—*Conquer.*

2a

2b

GASTROCHENA.

PLATE I.

Genus GASTROCHENA. Lamarck.

MOLLUSCA ACHELLOPODUM, PERFORANS, TUBICOLUM.
Testa bivalvis, inaequilateralis, aequivalvis, antice ad marginum ventralium latè hiatus, umbonibus anticis forè terminalibus; cardine dentibus plerunque subincisoribus; ligamentum exterum; tuba siphonopunctata forè libera.

MOLLUSCA ACHELLOPODUM, perforating, tube-inhabiting. Shell bivalve, inequilateral, equivale, widely gaping in front at the ventral margin, umbo almost terminal in front; hinge for the most part with inconspicuous teeth; ligament external; tube sometimes nearly free.

The Gastrochena for the most part live, like the Pholades, in hollows which they bore in limestone rocks, and which they line with a shelly tube ending in a narrow neck, like a bottle. But some of them, like the *Gastrochena dubia*, make an almost independent tube, only attached by the neck or by one side to the shell or rock through which they have bored, or to which they are otherwise fixed. There is a specimen in the British Museum of *G. dubia* in which the substance bored through and slenderly lined is crystallized carbonate of lime. The British species is common to France and many other European coasts. The Indias, East and West, the Galapagos Islands, the Mauritius, South America, the Pacific Islands, produce many species, and a small number were described by the late M. Deshayes, when in London some years since, which had been collected by the late Mr. Cuming in the Philippines.

Species 1. (Fig. a, b, c. Mus. Brit.)

GASTROCHENA DUBIA. *Gas. testa tenui, elongati, obliqua, leviter striata; hiatus centrali mediorum, prope medianam terminantur; cardine tenui, ferè edentato.*

THE DOUBTFUL GASTROCHENA. Shell thin, elongated, oblique, finely striated; ventral hiatus moderate,

terminating near the middle; hinge thin, almost without teeth.

PENNANT. British Zoology.

Gastrochena modiolina. Lamarck.

ROCELLARIA DUBIA. Adams.

Hab. British Mediterranean coasts.

The bottle-shaped tube which covers the valves and siphons of this species is composed, when free, of agglutinated sand and small pebbles; when enclosed, it forms a calcareous lining to the crypt.

Species 2. (Mus. Brit.)

GASTROCHENA PLICATILIS. *Gas. testa subcompresso, epidermide fuscæ indutâ, tortuosa, areæ posticæ elevatæ, contuberculata, sulcato-angulata, ad terminalium truncata, areæ dorsali depresso, rectiserrata, areæ medianæ posticæ in sulcata obliquum terminantur; hiatus elongatus.*

THE PLAITED GASTROCHENA. Shell sub-compressed, covered with a brown epidermis, tortuous, with the posterior area elevated, contuberculated, wrinkled with sulci, truncated at the end, dorsal area depressed, rather straight, middle area posteriorly terminating in an oblique groove: hiatus elongated.

DESHAYES. Proc. Zool. Soc. 1854, p. 320.
Hab. Isl. Zebu, Philippines.

The shell very much resembles *G. rostrata*, but the plaits on the posterior area are finer, and less deeply cut, and the dorsal area much less projecting.

Species 3. (Mus. Brit.)

GASTROCHENA BREVIS. *Gas. testa inflata, brevi, latitudinecula, levigata, antice gibbosâ, hiatus rufi arcuato, brevi.*

THE SHORT GASTROCHENA. Shell inflated, short, rather solid, rather smooth, gibbous anteriorly: hiatus strongly arched, short.

SOWERBY. Proc. Zool. Soc. 1834, 21.
Hab. — .

GASTROCHLENA.—PLATE I.

Species 4. (Mus. Brit.)

GASTROCHLENA APERTISSIMA. *Gas. testá elongatá, sub-compressá; levíller striatá; latere antice cuneato; latere postico rectiōscendo, ad terminum rotundatā subacuminatā; hiatus lato et elongato, ferè ad terminum posterium extenso.*

THE WIDE OPEN GASTROCHLENA. Shell elongated, rather compressed, finely striated; anterior side cuneated; posterior side rather straight, roundly subacuminated; hiatus broad and elongated, almost extending to the posterior end.

DESHAYES. Proc. Zool. Soc. 1854, p. 326.

Hab.—?

Species 5. (Mus. Brit.)

GASTROCHLENA DIFFICILIS. *Gas. testá obliquá, levíller striatá, compressá, cuneiformis, antice gibbosus, angustus, postice latus, ad terminum acuminatus; hiatus latus, paulo post medium extenso.*

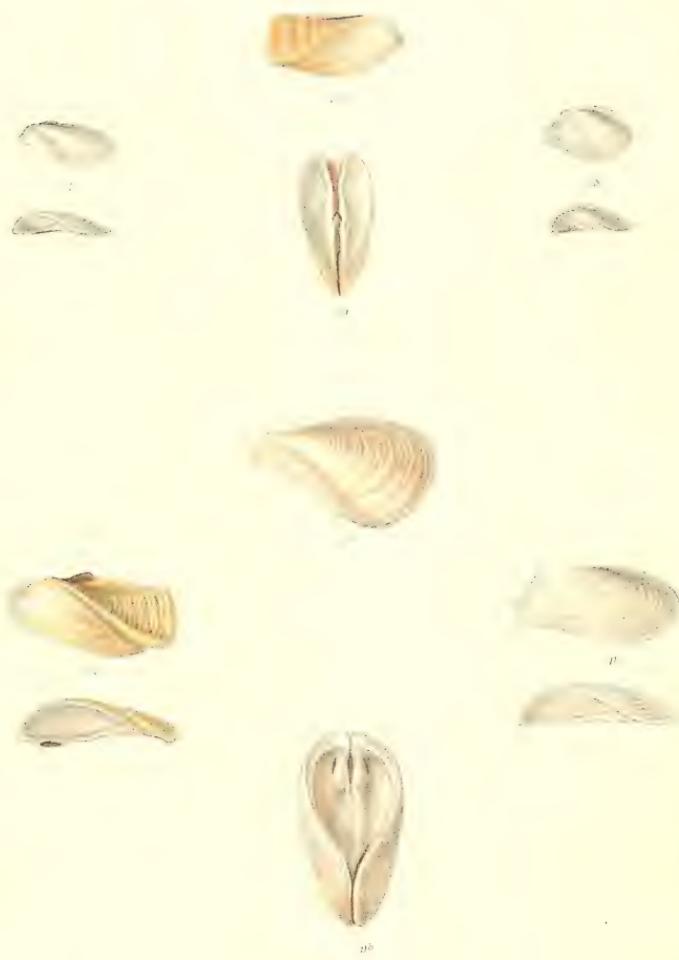

THE DIFFICULT GASTROCHLENA. Shell oblique, finely striated, compressed, cuneiform, anteriorly gibbosus, narrow; posteriorly broad, acuminate at the end; hiatus broad, extended nearly to the end.

DESHAYES. MS. in Cuming's Collection.

Hab. Isl. St. Thomas.

A rather cuneiform species, but more depressed than the one so named.

GASTROCHLENA.

PLATE II.

Species 6. (Mus. —?)

GASTROCHLENA RETZII. *Gas. testū oblongi, subcuneiformis, antice attenuata, inglata, tenui; epidermide fluorescens indutæ; latero postico latè truncato; areæ posticæ trigonæ, elevatae; areæ dorsali depresso, angustæ; hiatus maximo latissimo, ferè ad terminum posticum extenso.*

RETTZI'S *GASTROCHLENA*. Shell oblong, rather cuneiform, anteriorly attenuated, inflated, thin; covered with a yellowish epidermis; posterior side broadly truncated; posterior area trigonal, raised; dorsal area depressed, narrow; hiatus very large, very broad, extended almost to the posterior termination.

DESHAYES. Conch. Ile Réunion, p. 7.
Hab. Isl. Bourbon.

Species 7. (Mus. Sowerby.)

GASTROCHLENA PHILIPPINENSIS. *Gas. testū angustâ, rectangulâ, tenui, tenuiter et distinctor elevata-strigâ; latero antico acuminato, latè hiante; latero postico subacuminato.*

THE PHILIPPINE *GASTROCHLENA*. Shell narrow, rather straight, thin, with fine, raised, distant striae, anterior side acuminate, broadly gaping; posterior side rather acuminate.

DESHAYES. Proc. Zool. Soc. 1854, p. 328.
Hab. Isl. Zebu, Philippines.

Species 8. (Mus. Brit.)

GASTROCHLENA DENTICULATA. *Gas. testū brevi, altâ, inglata; medio subdepresso; latero antico ante umbonem paulò producta, obliquè stellæ elevatis minutissimè denticulatis sculpta; hiatus mediocri.*

THE DENTICULATED *GASTROCHLENA*. Shell short, high, inflated; slightly depressed in the middle; anterior side a little produced in front of the

umbones, sculptured obliquely with raised, very minutely denticulated striae; hiatus moderate.

DESHAYES. Proc. Zool. Soc. 1856, p. 328.
Hab. W. Columbia.

The sculpture in the front part of this shell is sufficient to distinguish the species.

Species 9. (Mus. Sowerby.)

GASTROCHLENA CUCULLATA. *Gas. testū cuneiformis, creaser; latero antico brevissimo, angustissimo; latero postico latè expanso, versus terminum cancellato; hiatus oralis, mediocri; carina dentatim magno.*

THE HOODED *GASTROCHLENA*. Shell cuneiform, thick; anterior side very short, very narrow; posterior side broadly expanded, hooded towards the end; hiatus ovate, moderate; hinge with large teeth.

DESHAYES. Proc. Zool. Soc. 1856, p. 329.
Hab. W. Indies.

A large and remarkable species, with a peculiar hollow convexity in the valves towards the posterior end.

Species 10. (Mus. Brit.)

GASTROCHLENA ROSTRATA. *Gas. testū subcompressâ, tortuosa, oblonga, epidermide fuscæ indutæ; latero antico ante umbonem producta, prope terminum rugata; hiatus maximo, ferè ad terminum posticum extenso; latero postico trigono, angulato, ante angulum depresso; areæ posticæ elevatae, costulatæ, profundè rugatae; ad terminum latè truncatae; areæ dorsali latâ, expansâ; ligamento magno, brevi.*

THE ROSTRATED *GASTROCHLENA*. Shell rather compressed, tortuous, oblong, covered with a brown epidermis; anterior side produced in front of the umbones, wrinkled near the end; hiatus very

GASTROCHÆNA.—PLATE II.

large, almost extending to the end; posterior side trigonal, angular, depressed in front of the angle; posterior area elevated, contabulated, deeply wrinkled, broadly truncated at the end; dorsal area broad, expanded; ligament large, short.

SPENGLER. Guerin, Mag. Hist. Nat.
Hab. Isl. St. Thomas.

—
Species 11. (Mus. Brit.)

GASTROCHÆNA RUPELLII. *Gas. testâ crassâ, subovatâ, inflatâ, latere antico ante umbones subproducto,*

quam posticum angustiâscule, tenuiter striato, umbonibus tumidissimis; medio levigato, striato; latere postico validè concentricè striato; hiatus centrali moderatè arcuato.

RUPELL'S GASTROCHÆNA. Shell thick, subovate, inflated, anterior side rather produced in front of the umbones, narrower than the posterior, finely striated; umbones very tumid; middle smooth, striated; posterior side strongly concentrically striated; ventral hiatus moderately arched.

DESHAYES. Proc. Zool. Soc. 1854, p. 328.
Hab. Red Sea.

GASTROCHLENA.

PLATE III.

Species 12. (Mus. Brit.)

GASTROCHLENA MYTHOIDES. *Gas. testis compressa, epidermis flavescens inoluta, oblonga, tortuosa; latera antice ante umbones producta, acuminata; latera postice ante aream depresso, areo postice contabulata, distante sordentia; areo dorsali angusti.*

THE MITTLE-SHAPED GASTROCHLENA. Shell compressed, covered with a yellowish epidermis, oblong, tortuous; anterior side produced in front of the umbones, acuminate; posterior side depressed in front of the area, posterior area contabulated, distantly grooved; dorsal area narrow.

LAMARCK. *Anim. s. Vert.*

Hab. — ?

Resembling *Gastrochena rostrata*, but with dorsal area very narrow, and posterior flattened area grooved at distant intervals.

Species 13. (Mus. Brit.)

GASTROCHLENA REGULOSA. *Gas. testis depresso, obliqui cuneiformis, elongata, antice angusta, subacuminata, postice concentrica; distante lirata; hiatus meliorum.*

THE WRINKLED GASTROCHLENA. Shell depressed, obliquely cuneiform, lengthened, narrow in front, rather acuminate, posteriorly concentrically distantly ridged; gape moderate.

SOWERBY. Proc. Zool. Soc. 1854, p. 22.

Hab. Gallapagos Islands.

Species 14. (Mus. Brit.)

GASTROCHLENA LAMELLOSA. *Gas. testis compressa, angusta, elongata, antice attenuata, acuminata, posteriori concentrica; bimini cœchis lirata; hiatus ventrali angusto, elongato.*

THE LAMELLATED GASTROCHLENA. Shell compressed, narrow, elongated, anteriorly attenuated, acuminate, posteriorly concentrically ridged with frequent laminae, ventral hiatus narrow, long.

DESHAYES. Proc. Zool. Soc. 1854, p. 328.

Hab. Isl. Zebu, Philippines.

Species 15. (Mus. Brit.)

GASTROCHLENA GIGANTEA. *Gas. testis elongato-ovata, utrinque acuminata, unilater. densè striata, media leviter depresso; hiatus latissimum, ferè ad terminum posticum valvorum extenso.*

THE GIGANTIC GASTROCHLENA. Shell elongated-ovate, acuminate at each end, finely densely striated, slightly depressed in the middle; hiatus very broad, extending nearly to the end of the valves.

DESHAYES. MS. in Cuming's Collection.

Hab. — ?

This large species is named from specimens now in the British Museum. The valves are more regularly ovate, although acuminate at the end and lengthened, than those of *G. concavaria*.

Species 16. (Mus. Brit.)

GASTROCHLENA OVATA. *Gas. testis ventricosissima, brevi, ovata, solidi, antice et usque ad medianum concentricè striata, post medianam levigata, proprie marginata dorsale obliqui tumidæ et valvæ concentricè striata; hiatus centrali subcunctudo.*

THE OVATE GASTROCHLENA. Shell very ventricose, short, ovate, solid, anteriorly and as far as the middle concentrically striated, past the middle smooth, near the dorsal margin obliquely tumid, and strongly concentrically striated; ventral hiatus rather round.

SOWERBY. Proc. Zool. Soc. 1834, p. 21.

Hab. Panama.

Species 17. (Mus. Brit.)

GASTROCHLENA PUPINA. *Gas. testis cœnalis ignotis; tubæ brevi, angusti bulbiformi, in sectiones quinque quasi-articulati, per latos ad testam adhærentes.*

THE PUPINA GASTROCHLENA. Shell with valves unknown; tube smooth, narrowly bulb-shaped, quasi-articulated in five sections, attached by the side to shells.

GASTROCHÆNA.—PLATE III.

DESHAYES. Proc. Zool. Soc. 1854, p. 326.
Hab. —?

This may be only a smooth variety of the *Gastrochæna lagenula*; but I have not seen the valves.

Species 18. (Fig. a, b. Mus. Sowerby.)

GASTROCHENA LAGENULA. *Gas. testâ parvâ, arcuatâ, tenui, angusti; areâ posticâ in tabulis divisiâ, inter tabulas sulcatâ. Tubi irregulariter bulbiformi, agglutinanti, quasi articulati divisâ.*

THE PLATE GASTROCHENA. Shell small, arched, thin, narrow; posterior area divided in tablets, with grooves between the tablets. Tube irregularly bulbiform, agglutinating, divided into quasi-articulations.

LAMARCK. Anim. s. Vert.
Hab. Ceylon, Arracan.

In Adams's Genera, this and the preceding species are included in the genus Guettiera. The valves of *G. lageaula*, however, are those of a true *Gastrochæna*, while those of *Guettiera* have the characteristics of true *Terevidies*.

Species 19. (Mus. Brit.)

GASTROCHENA TRUNCATA. *Gas. testâ rugosâ, solidissimâ, epidermide fuscâ indutâ; latere antico subangulato, unbonibus gibbosis; latere postico angulato, late truncato; areâ dorsali depresso; hiatu lato, elongato; dente cardinali magno.*

THE TRUNCATED GASTROCHENA. Shell rugose, rather solid, covered with a brown epidermis; anterior side rather attenuated, umbones gibbos; posterior side angular, broadly truncated; dorsal area depressed; hiatus broad, elongated; cardinal tooth large.

SOWERBY. Proc. Zool. Soc. 1834, p. 21.
Hab. Bay of Panama.

Species 20. (Fig. a. Mus. Brit. Fig. b, Plate IV., Mus. Sowerby.)

GASTROCHENA CUXEIFORMIS. *Gas. testâ cuneiformi, tenuiâscâ, anticâ attenuatâ, ante unbones subproductâ, acuminatâ; latere posticolo, versus terminum obliquâ subacuminato; hiatu moderatè elongato.*

THE WEDGE-SHAPED GASTROCHENA. Shell wedge-shaped, rather thin, anteriorly attenuated, a little produced in front of the umbones, acuminate; posterior side broad, obliquely rather acuminate, towards the end. Hiatus moderately long.

SPENCER. Guerin, Mag. Nat. Hist.
Hab. Isl. Zebu, Philippines.

GASTROCHLENA.

PLATE IV.

Species 20. (F. b. See Plate III.)

Species 21. (Mus. Brit.)

GASTROCHLENA HYALINA. *Gas. testi tenuissimam, semipellucidam, obliquè attenuatam, antice hiscissimam, angustissimam, posticè latibaculari, acuminatam; hiatus brevissimulus.*

THE HYALINE GASTROCHLENA. Shell very thin, semi-pellucid, obliquely attenuated, anteriorly very short, posteriorly rather broader, acuminate; hiatus rather short.

SOWERBY. Proc. Zool. Soc. 1834, p. 22.

Hab. ——?

Species 22. (Mus. Brit.)

GASTROCHLENA SPATHULATA. *Gas. testi tenuissimam, compressam, cuneiformem, posticè rugosam, truncatam; umbonulus terminalis; hiatus angustissimulus, elongatus.*

THE SPATULATE GASTROCHLENA. Shell very thin, compressed, wedge-shaped, posteriorly wrinkled, truncated; umbones terminal; hiatus rather narrow, elongated.

DESHAYES. Proc. Zool. Soc. 1854, p. 220.

Hab. Isl. Bohol, Philippines.

Species 23. (Mus. Brit.)

GASTROCHLENA IMPRESA. *Gas. testi subovata, levigata, leviter striata, utinque acuminata, posticè obliquè sulco depresso; hiatus late elongatus, ferè ad terminalia calcar extenso.*

THE IMPRESSED GASTROCHLENA. Shell rather oval, thin, finely striated, acuminate at each end; posteriorly obliquely depressed with a groove; hiatus broad, elongated, nearly extended to the end of the valve.

DESHAYES. Proc. Zool. Soc. 1854, p. 322.

Hab. ——?

Species 24. (Mus. Brit.)

GASTROCHLENA LEVIGATA. *Gas. testi ventricosam, brevi, obliquè cuneiformem, levigatam, carafealibus; latero postico subconcauato; hiatus brevis, angustissimus.*

THE SMOOTH GASTROCHLENA. Shell ventricose, short, obliquely cuneiform, smooth, bluish white, posterior side rather acuminate; hiatus short, rather narrow.

DESHAYES. Proc. Zool. Soc. 1854, p. 326.

Hab. ——?

Species 25. (Mus. Brit.)

GASTROCHLENA HUMILIS. *Gas. testi ventricosam, brevi, obliquè cuneiformem, leviter concentrica striatis; latero postico subconcauato; hiatus brevis, angustissimus.*

THE HUMBLE GASTROCHLENA. Shell ventricose, short, obliquely cuneiform, finely concentrically striated; posterior side rather acuminate; hiatus short, rather narrow.

DESHAYES. Proc. Zool. Soc. 1854, p. 327.

Hab. St. Vincent.

Species 26. (Mus. Brit.)

GASTROCHLENA INTERSECTA. *Gas. testi brevi, lati, subcompressa, laminae concentricae numerosas subdistans, inter aliea intermediae minoribus tenuiter sculpta; latero antico angustissimum, brevi; latero postico late, margine dorsali elevato, margine terminali subconcauato.*

THE INTERSECTED GASTROCHLENA. Shell short, broad, rather compressed, sculptured with numerous rather distant and other intermediate smaller concentric laminae; anterior side very narrow, short; posterior side broad, dorsal margin raised, terminal margin rather rounded.

DESHAYES. Proc. Zool. Soc. 1854, p. 327.

Hab. ——?

GASTROCHLÆNA.—PLATE IV.

The larger concentric ridges are a little distant, and the intervals are filled up with smaller raised striae.

Species 27. (Mus. Brit.)

GASTROCHLENA TENERA. *Gas. testâ tenuissimâ, elongatâ, angustâ, compressâ, tenuissimè striatâ, modioliformis post medium obliquâ vix conspicuâ sulcata; hiatus angustissimulo, elongato.*

THE THIN GASTROCHLENA. Shell very thin, elongated, narrow, compressed, very finely striated, shaped like a modiola, with scarcely conspicuous oblique sulcus; hiatus very narrow, elongated.

DESHAYES. Proc. Zool. Soc. 1854, p. 327.
Hab. Philippine Islands.

Species 28. (Mus. Brit.)

GASTROCHLENA INTERRUPTA. *Gas. testâ angustâ, rectissimâ, elongatâ, sublepressâ, tenuissimâ, levigatâ; arcu posticâ elevatâ, sulcis concentricis tribus vel quatuor divisâ; hiatus elongato-ovalis, posticâ abruptâ terminanti.*

THE INTERRUPTED GASTROCHLENA. Shell narrow, rather straight, elongated, rather depressed, very thin, smooth; posterior area raised; divided by

three or four grooves; hiatus elongate-oval, posteriorly abruptly terminating.

DESHAYES. Proc. Zool. Soc. 1854, p. 326.
Hab. Philippine Islands.

The valves of this species resemble those of *Gastrochena lagrenula*, but are very much more arched. The grooves, by which the posterior area is divided into a series of tablets, have probably, in the latter species, some connection with the exterior partitions of the tube. We have not the tube of the present species, but believe it will prove to belong to the same group.

Species 29. (Mus. Brit.)

GASTROCHLENA MACROCHISMA. *Gas. testâ brevissimâ, inflatâ, rotundato-cuneiformi, tenuiter striatâ; latore antico ante umbones producto, subacuminato; latore postico latissimo, ad terrium subrotundâ, marginâ dorsali declivi; hiatus latissimo, levigatâ.*

THE WIDE-GAPING GASTROCHLENA. Shell very short, inflated, roundly cuneiform, finely striated; anterior side produced in front of the umboes, rather acuminated; posterior side very broad, rather rounded at the end, dorsal margin sloped; hiatus very wide, rather short.

DESHAYES. Proc. Zool. Soc. 1854, p. 326.

X Y L O P H A G A.

Genus NYLOPHAGA. *Turton.*

MOLLUSCUM TUBERANS, *vermiforme, siphonilobus ad terminalium divisum. Testa bivalvis globosa, antice latissime angulariter aperta, postice ferme clausa, medio sulco lato divisa, cardine edentulo, calloso. Tubus nullus.*

BORING WORM-SHAPED MOLLUSC, with siphons divided at the end. Shell bivalve, globose, anteriorly very widely angularly open, posteriorly nearly closed, divided in the middle with a wide groove; hinge with no teeth, callous. No tube.

Xylophaga are found in floating wood, generally boring across the grain and not with it, as in the case of Teredo. Only two species are known; one British and Boreal, the other collected by Mr. Caming at Valparaiso.

Species 1. (Mus. Sowerby.)

XYLOPHAGA DORSALIS. *Xyl. testa globosa, epidermidem tenui aurantio-crecili iuncta; medio sulco plano costis duabus marginato divisa; latere antico brevi, valde latisimè angulariter; latere postico longe extenso, maxime dorsali elevato; laminae accessoriibus trigonis, latitudine longitudinem superante.*

THE DORSAL XYLOPHAGA. Shell globose, covered with an orange-green epidermis, divided in the middle by a flat groove bordered by two ribs; anterior side short, very strongly angular; posterior side rather short, with dorsal margin raised, accessory plates trigonal, broader than long.

TURTON. British Bivalves, II. Fig. 45.

Species 2. (Fig. a, b. Mus. Brit.)

XYLOPHAGA GLOBOSEA. *Xyl. testa latissimè, latere antico moderate angulariter; latere postico proecto, margine dorsali declivis; laminae accessoriibus angularis, longitudine latitudinem superantibus.*

THE GLOBOSE XYLOPHAGA. Shell rather broad, anterior side moderately angular; posterior side produced, dorsal margin sloped; accessory plates claw-shaped, longer than broad.

SOWERBY. Proc. Zool. Soc. 1834; Thes. Conch. No. 10, p. 503.

Hab. Valparaiso.

The shell is wider and the posterior dorsal margin more sloped than in *X. dorsalis*. The proportions of the accessory plates are reversed.

N A V E A.

Genus NAVEA. *Gray.*

Testa ovata, antice lato arcuatum hiatus, postice clausa, marginis superiori hiatus antice lamina reflexa marginato.
Shell ovate, anteriorly broadly gaping in an arch, posteriorly closed, upper margin of the anterior hiatus bordered by a reflected lamina.

I have not seen any species of this genus but the following one, which seems to perforate the sponges in which it is found embedded.

Species. (Fig. 3. Mus. Brit.)

NAVEA SUBGLOBOSEA. *Nave. testa medio sulco divisa; latere postico brevi, rotundato; latere antico, hiatus maximo, superiori ad marginem utrinque evanescit et reflexo.*

THE SUBGLOBOSE NAVEA. Shell divided by a groove in the middle; posterior side short, rounded; anterior side with a very large hiatus, reflected and concave at the margin above.

GRAY. MS. in Brit. Mus.

MONOGRAPH
OF THE GENUS
FISTULANIA.

"Man is permitted much
To scan and learn
In Nature's frame."—*J. H. Newman.*

Fistularia

FISTULANA.

Genus FISTULANA. Lamarck.

MOLLUSCA VERMIFORME, ALEXICOLUM, TUBICERUM.
*Valvulae liberae, elongatae, latè et angulariter
hiatus; cardine linearis, edentulo. Tuba recta,
circularis, apicem attenuata, versus terminum
posticum crescentem, termino per discum concavum
perforatum clausa.*

Syn. *Gastrochorda*, Spengler (Adams).

MOLLUSCA VERMIFORME, inhabiting sand, tube-forming.
Valves free, elongated, broadly and angularly
gaping; hinge linear, toothless. Tube straight,
circular, anteriorly attenuated, increasing to
wards the posterior end; end closed by a convex
perforated disc.

Adopting the nomenclature by which this genus is generally known, we should say that the *Fistularia* resemble the *Gastrochorda* in the most essential characters. Both have free gaping valves enclosed in a tube closed at the anterior end. The main difference is that the former bury their tubes in the sand, only the small siphonal end being visible, but are unattached, while the latter are boring mollusca, and attach their tubes to the various substances in which they make their crypts.

The two or three species hitherto known are found at low water in Singapore, Philippines, and other islands of the Eastern seas.

Species 1. (Fig. a, b, Mus. Brit.)

FISTULANA CLAVA. *Fis. testa oblonga, rectisculpta, latè
angularia hiatus, ad terminum posticum latè
truncata, margine dorsali recto; umbonibus ferè
terminalibus; inter apicem brevi, subquadrate,
angulis, margine denticulato. Tubæ clau-
gata, levigata, concentricè tonuïs striata.*

THE CLUB FISTULANA. Shell oblong, rather straight, broadly angularly gaping, broadly truncated at the posterior end, dorsal margin straight; umbones nearly terminal; anterior side short, rather square, sharply angular, margin denticulated. Tube elongated, smooth, concentrically finely striated.

LAMARCK. Anim. sans Vert.

Gastrochorda monilia, Spengler.

Hab. Singapore.

Species 2. (Fig. a, b, c, Mus. Brit.)

FISTULANA AGGLUTINANS. *Fis. testa angustissimæ,
ludim; hiatus angulatissimæ. Tubæ lapillis
arcuatisque grana agglutinante.*

THE AGGLUTINATING FISTULANA. Shell very narrow, tortuous; hiatus very angular. Tube agglutinating small stones and grains of sand.

DESHAYES. Proc. Zool. Soc.

Hab. Philippines, &c.

Species 3. (Fig. a, b, c, Mus. Brit.)

FISTULANA GRANDIS. *Fis. testa calculis magnis, latis,
postice rotundè inflatis; hiatus eix angulatu, latere
antico brevissimo, arcuato. Tubæ concentricè
rujis annulata.*

THE LARGE FISTULANA. Shell with large broad valves, roundly inflated posteriorly; hiatus scarcely angular, anterior side very short, arched. Tube concentrically annulated with wrinkles.

DESHAYES. Proc. Zool. Soc.

Hab. Philippines, &c.

MONOGRAPH

OF THE GENUS

R I S S O A.

Lord! Open our hearts that we may feel,
Unbind our eyes that we may see,
The wondrous love Thy works reveal.—*Charles Mackay.*

RISSOA.

PLATE I.

Genus RISSOA. Freminville.

Testa marina, spiralis, plurimque turrata, levris vel costata; spirae acuminatae, apertura semirotundata vel pyriformis, subcanaliculata vel integrata; labio externo plurimque incrassato. Operculum cornutum, subspirale.

Shell marine, spiral, generally turreted, smooth or ribbed; spire acuminated; aperture half-round or pyriform, slightly channelled or entire; outer lip for the most part thickened. Operculum horny, subspiral.

The above description and the following monographs are intended to include the genera *Rissoa*, *Alevania*, *Rissoida*, *Hydrobia*, and other genera, which have been separated but not very well defined, and which at least require more careful revision than has yet been accorded to them, and which it is not within the scope of this work to give. The *Rissoa* or 'Rissoida' are found in all parts of the world, generally in shallow water among seaweeds.

Species 1. (Mus. Sowerby.)

RISSEA (-oina) SCALAROIDES. *Ris. testa alba, altissima, anfractibus sexis, productis, medio angulatis, ad angulum plieatis; apertura ferè rotunda, margine crasso, rotundo, labio interno distincto, angusto.*

THE SCALARIA-SHAPED RISSOA. Shell white, very high; whorls six, produced, angular in the middle, plated at the angle, aperture almost round; margin thick, round; inner lip distinct, narrow.

C. B. ADAMS. Shells of Jamaica.

Hab. Philippines.

Species 2. (Mus. Marratt.)

RISSEA EUROPEA. *Ris. testa subpyramidalata, costis numerosis longitudinalibus et striae spiralis sculpta, fulva, latè fuscofuscata; spiræ pyramidatae, anfractibus concavisculatis, apertura breviunculata, margine externo albo, crenulata.*

THE EUROPEAN RISSOA. Shell rather pyramidal, sculptured with numerous longitudinal ribs and

spiral striae, fulvous, with broad brown bands; spire pyramidal, whorls rather convex, aperture rather short, outer lip white, crenulated.

RISSEA. Eur. Mer. Pl. IX. f. 156.

Turbo claviger. Linnæus.

Rissoa Freminvilliet. Risso.

Rissoa granulata. Philippi.

Rissoa mammillata. Risso.

Hab. Britain. Mediterranean.

Species 3. (Mus. Marratt.)

RISSEA MONTAGU. *Ris. testa fusca, breviunculata, costis paucis rufis crenulatis sculpta; spiræ productæ, pyramidatae; anfractibus sexis, concavisculensis; apertura subrotundata, margine crenulata.*

MONTAGU'S RISSOA. Shell brown, rather short, sculptured with few, coarsely crenulated ribs; spire produced, pyramidal; whorls six, rather convex; aperture rather rounded, margin crenulated.

PATERFUSCA. Cat. Moll. Corse. Pl. V. f. 13 14.

Hab. Mediterranean.

The sculpture resembles that of *Rissoa Europea*, but the ribs are fewer, and more distantly crenulated.

Species 4. (Mus. Brit.)

RISSEA CUMINGHI. *Ris. testa tueritata, albâ, pyramidata, aenè cancellata; anfractibus septenis, altis, rotundatis; ultimo inflato; apertura subtrigonata, infra subcanaliculata, margine crasso, crenata.*

CUMING'S RISSOA. Shell turreted, white, pyramidal, sharply cancellated; whorls seven, high, rounded, last swelled; aperture rather trigonal, with a slight canal below, margin thick, crenated.

REEVE. Proc. Zool. Soc.

Hab. Philippines.

Species 5. (Mus. Brit.)

RISSEA BRUGUERI. *Ris. (-oina) testa pyramidalata, alta, albâ, solidâ, costis subcurvis et sulcis distans, sculptis, spiræ productâ, pyramidata, au-*

RISSOA.—PLATE I.

fractibus senis, concavisculis; aperturā pyriformi, infrā coadiuentato, labio externo reflexo, late, marginae interno producto, tenue.

BRUGUIÈRE'S RISSOA. Shell pyramidal, high, white, solid, sculptured with slightly curved ribs and distant grooves; spire produced, pyramidal, whorls six, rather convex; aperture pyriform, channelled below; outer lip reflected, broad, inner margin produced, thin.

PAYRAUDEAU. Cat. Moll. Corse. Pl. V. f. 17-18.

Hab. Mediterranean.

Species 6. (Mus. Sowerby.)

RISSEA SCALARIANA. *Riss. (-oina) testō pyriformi, albida, patrō, longitudinaliter costatā, spiraliter tenuissimē striatā, spira altā, acuminatā; aufractibus concavis, ultimo ventricos; aperturā semirundatā.*

THE SCALARIA RISSOA. Shell pyriform, whitish, small, longitudinally ribbed; spirally very finely striated; spire raised, acuminate; whorls convex, last ventricose; aperture half-round.

ADAMS.—?

Hab. St. Vincent.

Species 7. (Mus. Sowerby.)

RISSEA D'ORRIGNYANA. *Riss. (-oina) testō turritā, tenui, fuscō-albidi; spirā elongatā, aufractibus novenis, irregulariter varicosis, iuxqualiter concavisculis; aperturā subtriangulā, supē infrāque canaliculatā; labio externo anticī angulatim producto.*

D'ORRIGNY'S RISSOA. Shell turreted, thin, whitish fawn; spire elongated, whorls nine, irregularly varieose, unequally rather convex; aperture rather trigonal, channelled above and below; outer lip angularly produced in front.

A. ADAMS. Proc. Zool. Soc. 1865. p. 64.

Hab. Australia.

Species 8. (Mus. Marratt.)

RISSEA BRYEREA. *Riss. (-oina) testō albā, obliquē costatā; spira turritā, elevatā; aufractibus septenis, concavisculis; aperturā brevi, pyriformi, suprā infrāque canaliculatā.*

BREER'S RISSOA. Shell white, obliquely ribbed; spire turreted, raised; whorls seven, rather convex; aperture short, pyriform, channelled above and below.

MONTAGU. Test. Brit. Pl. XV. f. 8.

Hab. West Indies.

Species 9. (Mus. Sowerby.)

RISSEA CINNICA. *Riss. (-oina) testō albida, turritā, altiōculi; aufractibus senis, concavisculis, transversiter costatis, tenuissimē spiraliter striatis; aperturā marginatissima, iuxta profundē canaliculatā.*

THE NEAT RISSOA. Shell whitish, turreted, rather high; whorls six, rather convex; finely ribbed, very finely spirally striated; aperture rather large, deeply channelled below.

A. ADAMS.

Hab. Japan.

Species 10. (Mus. Marratt.)

RISSEA CALATHISCA. *Riss. (Alvania) testō brevi, subpyramidalē, fuscā, longitudinaliter costatā; spirā lateriter sulcatā; costis rotundis, crenulatis; aufractibus ad suturam angulatis, aperturā subrotundatā, margine crasso, crenulato, albo.*

THE LITTLE BASKET RISSOA. Shell short, rather pyramidal, brown, longitudinally ribbed; spirally grooved; ribs round, crenulated; whorls angular at the suture; aperture rather oval, margin thick, crenulated, white.

MONTAGU. Test. Brit.

Hab. Britain.

Another variety is figured on Plate X.

R I S S O A.

PLATE II.

Species 11. (Mus. Sowerby.)

Rissoa auriscalpium. *Ris. (Acme) testi alba, ad aperturam apicemque purpurascenti, semipellucida, attissimè, medio pecto inflato; apice acuminato; anfractibus septem ad novem, superioribus frequenter longitudinaliter costatis, ultima elongata; apertura magna, orata, labio expanso.*
THE EAR-PICK RISSOA. Shell white, purplish at the aperture and apex, semipellucid, very elevated, a little inflated in the middle, apex acuminate; whorls seven, often longitudinally ribbed, last elongated; aperture large, oval, lip expanded.

Linnaeus, Systema Nature.

Rissoa acicula, Risso.

Rissoa marginatus, Montagu.

R. acuta, Desmarest.

Hab. Mediterranean.

These long-spined *Rissos* do not seem to differ generically from the more typical forms.

Species 12. (Mus. Sowerby.)

Rissoa lariosa. *Ris. testi ovo-acuminatâ, tenui, semipellucida, albo-purpurascenti, leviter costata; apice acuminato; anfractu ultimo subinghifo, costis infra medium discontinuis; apertura magna, elongata, auriformi, labio expanso.*

THE MEMBRANOUS RISSOA. Shell ovate, acuminate, thin, semipellucid, purplish white, slightly ribbed; apex acuminate; last whorl rather inflated, ribs discontinued below the middle; aperture large, long, ear-shaped, outer lip expanded.

MONTAGU. Test. Brit. Vol. II. p. 490.

Hab. Great Britain, Mediterranean.

Species 13. (Mus. Sowerby.)

Rissoa venusta. *Ris. testi subpyramidalâ, subviridi, tenui, apice acuminato, anfractibus tenuiter costatis, ultimo subventricoso, infra medium hori-*

gatis; apertura auriformi, labio expanso, intus margine acento, extus varicosa.

THE BROAD-LIPPED RISSOA. Shell rather pyramidal, greenish, thin; apex acuminated; whorls finely ribbed, last rather ventricose, smooth below the middle; aperture ear-shaped, lip expanded, inside having a sharp edge, outside varicose.

PHILLIP. Ennum. Moll. Sic. Vol. I. p. 124, Pl. XXIII. f. 4.

Hab. Mediterranean.

This does not appear to belong to any of the numerous varieties of *Rissoa labiata*. A certain closeness of the outer lip and the distinct cessation of the regular ribs at the middle of the last whorl serve to distinguish it.

Species 14. (Mus. Sowerby.)

Rissoina celata. *Ris. (Rissoina) testi pyramidatâ, solidâ, alba, costis nodosis spiraliiter cinctâ, longitudinaliter inter costas striatâ; anfractibus octo, ad latera declivibus, superioribus longitudinaliter costatis, costis angularis et nodosis; apertura subtriangularis, labio externo crasso, crenulato.*

THE IMBOSSED RISSOINA. Shell pyramidal, solid, white, spirally girt with nodose ribs, longitudinally striated between the ribs; whorls eight, sloped at the sides, upper longitudinally ribbed, ribs angular and nodose; aperture subtriangular, outer lip thick, crenulated.

A. ADAMS. Proc. Zool. Soc. 1851, 267.

Rissoina striata, Quoy.

Hab. Siquijor.

Species 15. (Mus. Marrat.)

Rissoa cingillus. *Ris. testi pyramidatâ, levigatâ, vel leviter spiraliiter striatâ, fulva, castaneo-leu- fuscata; anfractibus quinque, subrotundatis; apertura parvâ, columella calida, labio externo obtusi marginato.*

RISSEA.—PLATE II.

THE GIRDLE RISSEA. Shell pyramidal, smooth, or slightly spirally striated, fulvous, three-banded with chestnut; whorls five, a little rounded; aperture small, columella strong, outer lip blunt-edged.

MONTAGU. Testacea Britannica, Vol. II. p. 35-7.

Rissoa vittata, Donovan.

Rissoa rupestris, Forbes.

Hab. British coasts.

Species 16. (Mus. Sowerby.)

RISSEA STRIATULA. *Ris. testā albā, brevi, spiraliter, prominenter, distanterque costatā, inter costas longitudinaliter striatā; anfractibus quinque, ad medianū tenūiter costatis, superiō proprie exteriorū angulatim planudato; aperturā brevi, labio crenulato.*

THE LITTLE STRIATED RISSEA. Shell white, short, spirally, prominently, and distantly ribbed, longitudinally striated between the ribs; whorls four, last large, finely ribbed at the middle, angularly flattened above near the suture; aperture short, lip crenulated.

MONTAGU. Testacea Britannica, Vol. II. p. 306, Pl. X. f. 5.

Turbo carinatus, Da Costa.

Turbo monilis, Fleming.

Hab. British coasts.

Beautifullly sculptured with thread-like striae crossing prominent keel-like spiral ribs.

Species 17. (Mus. Sowerby.)

RISSEA SPIRATA. *Ris. (Rissoina) testā albā, turrīta, spiraliter tenūiter striatā; anfractibus moxem, sex superioribz lucidibz abrupte versus apicem acuminatum, aceribz, longitudinaliter costatis, tribus inferioribz elevatis, luciūsculis subcylindraceis; suturā profunde incisā; aperturā subpyriformi, labio externo expanso crassissculo.*

THE SPIRED RISSEA. Shell white, turreted, spirally finely striated; whorls nine, six upper short.

abruptly sloped towards an acuminated apex, longitudinally ribbed, three lower raised, rather smooth, subcylindrical; suture deeply incised; aperture rather pyriform, outer lip expanded, rather thick.

SOWERBY. Genera of Recent and Fossil Shells.
Hub. Philippines.

Species 18. (Mus. Sowerby.)

RISSEA PROXIMA. *Ris. testā albā, minutā, tenui, ovato-oblongā, spiraliter deinceps striatā; anfractibus quinque, inglati, gradatim crescentibus; aperturā ovatā, margine acuto, simplici.*

THE APPROXIMATE RISSEA. Shell white, minute, thin, ovate-oblong, spirally closely striated; whorls five, inflated, gradually increased; aperture ovate, margin simple.

ALDER MS. Thomson. Ann. Nat. Hist. Vol. XX. p. 174.

Rissoa virginea, Brown.

Hab. Ireland, very rare.

Differing from *Rissoa vitrea* in being striated spirally and in the proportionate equality of increase in the whorls.

Species 19. (Mus. —? Copied.)

RISSEA VITREA. *Ris. testā parvā, albā, tenui, semi-pellucidā, ovato-oblongā, laevigatā; anfractibus quinque, inglati, penultimo magno elevato; aperturā ovatā, margine acuto, simplici.*

THE GLASSY RISSEA. Shell small, white, thin, semi-pellucid, ovate-oblong, smooth; whorls five, inflated, the last large, elevated; aperture ovate, margin sharp, simple.

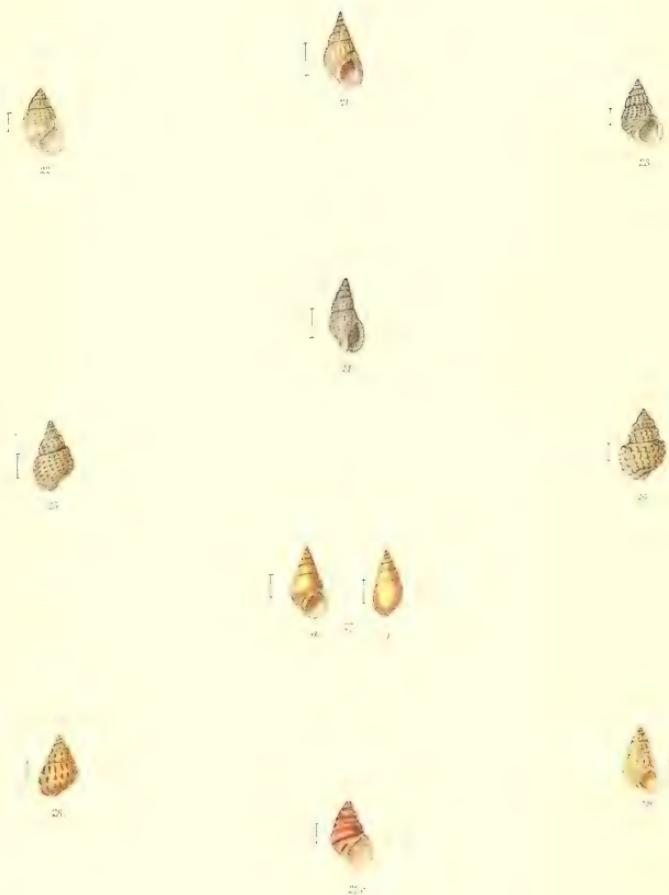

MONTAGU. Testacea Britannica, Vol. II. p. 351.

Rissoa glabra, Megherle.

Rissoa crystallina, Brown.

Hab. Exmouth, Oban, &c.

The penultimate whorl is very large in proportion to the others.

R I S S O A.

PLATE III.

Species 20. (Mus. Sowerby.)

Rissoa costata. *Ris.* testū subpyramidalē, subven-
tricōsa, falcata; aufrictibus sex, prope suturam
angulatis, obliquis costatis, spiraller striatis; ultimā
lāgiā subdecurvatis; aperturā subquadratā, columellā
rectifusculā.

THE RIBBED RISSOA. Shell rather pyramidal, rather
ventricose, fulvous; whorls six, angular near the
suture, obliquely ribbed; spirally striated, last
slightly keeled beneath; aperture rather square,
columella rather straight.

ADAMS, Trans. Lin. Soc. Vol. VIII. Pl. XIII. f. 13, 14.

Rissoa ventricosa. *Ris.* (*Hydrobia*) testū subpyra-
midatā, levigatā, pallidē falcata; aufrictibus
quadratis, rotundis; ultimā rectilēvo, leviter
umbilicata; aperturā magno, columellā rectilēsedatā,
labio externo tenui.

THE VENTRICOSE RISSOA. Shell subpyramidal, smooth,
pale fulvous; whorls five, rounded; last ventri-
cose, slightly umbilicated; aperture large,
columella rather straight, outer lip thin.

DE MOULINS, Bulletin de la Société Philosophique de
Paris, p. 8. Pl. I. f. 2.
Hab. Mediterranean.

Species 22. (Mus. Sowerby.)

Rissoa lactea. *Ris.* (*Alecania*) testū albū, oratū,
costellis numerosis, rotundis, crenulatis, spiralibus,
superē costis longitudinalibus sculptis; spira parva;
ultimā aufricta et aperturā magno, subovata.

THE MILK-WHITE RISSOA. Shell white, oval, sculp-
tured with numerous rounded, crenulated, spiral
riblets, and above with longitudinal ribs; spire
small; last whorl and aperture large, ovate.

MICHAUD, Espèces de Risso, p. 9, f. 11, 12.
Rissoa cancellata, Recluz.

Species 23. (Mus. —? Copied.)

Rissoa abyssicola. *Ris.* (*Alecania*) testū suborbitalē, albi,
superē costata, inter costas profundiē striata, ad
partem inferiorē ultimā aufricta spiraliter
costatā, spira subpyramidalē, ultimā angusta
magno; aperturā latā, labio crasso, rotundo.

THE DEEP-SEA RISSOA. Shell rather ovate, white,
ribbed above, deeply striated between the ribs,
spirally ribbed at the lower part of the last
whorl, spire somewhat pyramidal, last whorl
large; aperture broad, lip thick, round.

FORBES, Brit. Moll. p. 86, Pl. LXXVIII. f. 1.
Hab. North Scotland.

Species 24. (Mus. Sowerby.)

Rissoa cornea. *Ris.* (*Rissoina*) testū albū, solida,
pyramidalē, costis nodosis spiralibus et longitudinalibus
cancellata, inter costas incavata; spira
elongatā, subfornicata, apice obtuso, aufrictibus
quadratis, penultimā tumido; aperturā ovata, infra
cavitudinata, labio crasso, crenulata.

THE CORNEAN RISSOA. Shell white, solid, pyramidal,
cancellated with nodose spiral and longitudinal
ribs, pitted between the ribs; spire elongated,
rather tortuous, apex blunt; whorls five, last
but one tumid; aperture ovate, with a channel
below, lip thick, crenulated.

Species 25. (Mus. Sowerby.)

Rissoa cimicoides. *Ris.* (*Alecania*) testū albū, subfusi-
formis; spiraliter prominenter costata (*oderitatis*
profundis), supra medianā longitudinaliter cali-
dissimā crenulatum costatā; spira acuminatā;
aufrictibus supra suturam canaliculatis, ultimā

RISSOA.—PLATE III.

tumido: aperturâ subrotundâ, supernè prope suturam angulatâ.

THE BUG-SHAPED RISSOA. Shell white, subfusiform, spirally prominently ribbed, interstices deep; above the middle, longitudinally very strongly crenulated; spire acuminated; whorls channelled above the suture, last tumid in the middle, aperture rather rounded, angular near the suture above.

FORBES. Brit. Moll.

Hab. Britain.

Species 26.

RISSEA ZETLANDICA. *Ris. (Alvania) testâ orato-sub-elongatâ, pallidè fulvâ, spirâ turrâtâ, unfractibus subquadratis, valde nodoso-costatis, cancellatis: ultimo infrâ carinato; aperturâ brevi, subrotundâ, columellâ supernâ tumidi, labio exterius crassu, crenulato.*

THE ZETLAND RISSOA. Shell ovate, rather elongated, pale fulvous, spire turreted, whorls rather square, cancellated with strong nodose ribs, the last keeled below; aperture short, rather rounded; columella tumid above, outer lip thick, crenulated.

MONTAGU. Testacea Britannica. Mont. Trans. Linn. Soc. Vol. XI. p. 194, Pl. XIII. f. 5.

Rissoa cyclostomata, Recluz.

Hab. Great Britain.

Species 27. (Fig. a, b, c, Mus. Sowerby.)

RISSEA ULVÆ. *Ris. (Hydrobia) testâ fulvâ, trochiformi, solidâ, levâ, spirâ acuminatâ, elevatâ, unfractibus planulatis, suturâ incisi separatis, ultimo leviter angulatâ; aperturâ ovalâ, labio interno integro.*

THE SEA-WEED RISSOA. Shell fulvous, trochus-shaped, solid, smooth; spire acuminated, raised; whorls

flattened, separated by an incised suture, last slightly angular; aperture ovate.

PENNANT. Brit. Zool. Ed. 4, Vol. IV. p. 132.

Rissoa subumbilicata, Berkeley.

Rissoa Barlevi, Jeffreys.

Hab. British coasts.

Species 28. (Mus. Sowerby.)

RISSEA SEMISTRIGATA. *Ris. (Cingula) purpâ, fulvâ, marginis in sericeis, tribus costulis, subquadratibus cinctâ; spiraliter striatâ; unfractibus quinque, planiscaulis; ultimo magno, superioribus levibus; aperturâ subtriangulâ.*

THE HALF-STRIGATED RISSOA. Shell small, fulvous, banded with rather square chestnut spots in three rows; spirally striated; whorls five, rather flat, last large; upper smooth; aperture nearly trigonal.

MONTAGU. Testacea Britannica, Supp. p. 136.

Rissoa pulchra, Johnson.

Rissoa tristriata, Thompson.

Rissoa subsulcata, Philippi.

Hab. Britain.

Species 29. (Mus. Marrat.)

RISSEA COSTULATA. *Ris. testâ fulvâ, subconicâ, costis magnis, distantibus, angulatis, armatâ, spiraliter striatâ; spirâ acuminatâ, unfractibus sex, elevatis, angulatis; aperturâ subrotundâ, margine crasso.*

THE KIBBED RISSOA. Shell fulvous, rather conical, armed with large, distant, angular ribs; spirally striated, spire acuminated; whorls six, elevated, angular; aperture rather rounded, margin thick.

ALDER. As of Risso, Ann. Nat. Hist.

Rissoa sinuosa, Scacchi Cat. p. 14, 2.

Rissoa Guerinii, Rev. Zool. Cuv. 1843, p. 7.

Hab. Britain, France.

RISSOA.

PLATE IV.

Species 30. (Mus. Sowerby.)

RISSEA FORTIS. — *Ris. (Rissoina) testa albida, crassa, angusta, elevata, medio tumidiuncula, costis rectis, crebris, laxisibus, sculpta; anfractibus septem, altis, planulatis; apice acuto; apertura parva, obliqua, angusta, infra canaliculata; labio interno crassus, expansus.*

THE STRONG RISSOA. Shell whitish, thick, narrow, raised, rather tumid in the middle, sculptured, with straight, close, smooth ribs; whorls seven, high, flattened; apex sharp; aperture small, oblique, narrow, channelled below; outer lip thick, spread.

C. B. ADAMS.

Hab. Jamaica.

Species 31. (Mus. ——?)

RISSEA MACULATA. — *Ris. testa minuta, subtrochiformis, levigata, fulva; anfractibus sex, rotundis, ultimo maculata subvariolosa versus sularum, subquadrate infra, et fasciis spirali castaneis picta; apertura majuscula, labio interno reflexa.*

THE SPOTTED RISSOA. Shell minute, subtrochiform, smooth, brown; whorls six, rounded, the last painted near the suture with spots slightly enervated, below rather square, and a spiral band of chestnut; aperture rather large, inner lip reflected.

SOWERBY. Index of British Shells, as of an unnamed authority.

Rissoa inconspicua, var. *auctorum*.

Hab. Britain.

The pattern of colouring is so distinct that it may justify specific designation.

Species 32. (Mus. Marrat.)

RISSEA CRENULATA. — *Ris. testa alba, brevi, turrata, quadratum cancellata; anfractibus superne prope suturam angulatis, penultima ventricosa, ultimo magno; apertura ovali, margini extero crenulata.*

THE CRENULATED RISSOA. Shell white, short, tur-

reted, cancellated in squares; whorls angular above near the suture, penultimate ventricose, last large; aperture ovate, outer margin crenulated.

MICHAUD. Nouvelles Espèces de Rissoa, p. 15, f. 1, 2.
Turbo cancellatus, Da Costa.

Turbo cinctus, Donovan, &c., non Linnaeus.

Hab. Britain and Channel Islands.

Cancellations broad, but not so much so as those of *Zetlandica*.

Species 33. (Mus. Marrat.)

RISSEA EPIPHARIS. — *Ris. (Alcania) testa trochiformi, fulva, ad suturam rugosissima; anfractibus angulis, supra angulum distanter, leviter costatis; apice acuminata; apertura subtriangularis, margini rubra vel violacea.*

THE RED-LIPPED RISSOA. Shell trochiform, fulvous, with a red line at the suture; whorls angular, distantly, slightly ribbed above the angle; apex acuminate; aperture rather trigonal, margin red or violet.

LEACH. (Alvania) Alder. Ann. Nat. Hist. Vol. XIII. p. 325.
Rissoa hyalina, Desmoulins.

Rissoa iliacina, Recluz.

Hab. Europe.

Species 34. (Mus. Hanley.)

RISSEA INCONSPICUA. — *Ris. (Cingula) testa conica, elevata, attesta, longitudinaliter costata, inter costas tenuisimè striata; anfractibus sex, lateraliter subcompressis; apice obtuso; ultimo anfracta infelix hecigata; apertura magna; columella rectiungula.*

THE INCONSPICUOUS RISSOA. Shell conical, raised, whitish, longitudinally ribbed, very finely striated between the ribs; whorls six, rather compressed at the sides; apex obtuse; last whorl smooth below; aperture large; columnella rather straight. ALDER. Ann. and Mag. of Nat. Hist. Vol. XIII. p. 325; Pl. VIII. t. 6, 7.
Hab. Britain.

RISSOA.—PLATE IV.

Species 35. (Mus. Marrat.)

RISSOA PUNCTURA. *Ris. (Cingula) testâ ventricosâ, fulcâ, subconicâ, spirâliter puncturato-striatâ; anfractibus quinque, rotundis, suprâ infârque maculis linearibus castaneis pictis; aperturâ subrotundâ.*
THE PUNCTURED RISSOA. Shell ventricose, fulvous, rather conical, spirally striated in punctures; whorls five, rounded, painted above and beneath with linear chestnut spots; aperture rather rounded.

MONTAGU. Testacea Britannica, Vol. II. p. 320, Pl. XII. t. 5.

Rissoa puncturata, Macgillivray.

Rissoa approximata, Brown.

Hab. British coasts.

Species 36. (Fig. a, b, Mus. Marrat.)

RISSOA PARVA. *Ris. testâ conicâ, levâ, fulvâ, acuminatâ, altâ; anfractibus rotundis, brevibus, lineis mucilagine castaneis, frequenter curvis plenisque pictis; aperturâ subquadratâ, columellâ rectâscula.*
THE SMALL RISSOA. Shell conical, smooth, fulvous, acuminated, raised; whorls rounded, short, generally painted with chestnut lines and spots, frequently curved; aperture subquadrate, columella rather straight.

MATON and RACINET. Act. Linn. Soc. VIII. p. 171.

Rissoa subulata, Adams.

Rissoa interrupta, Johnson.

Rissoa laevis, Donovan.

Hab. British coasts and Channel.

Species 37. (Mus. Hanley.)

RISSOA BEANIL. *Ris. (Alvania) testâ subconicâ, fuscâ, superè leviter costatâ, omnino spiraliter striatâ, striis ad costas crenulatis; spirâ acuminatâ; anfractibus sex, convexiusculis, ultimo breviâsculo, aperturâ subovatâ, margine distincto, albo; labio externo albo.*

BEAN'S RISSOA. Shell rather conical, brown, slightly ribbed above, spirally striated all over, striae crenulated at the ribs; spire acuminated; whorls six, rather convex, last rather short; aperture rather oval, margin distinct, white; outer lip white.

HANLEY. Forbes and Hanley, British Mollusca, III. Pl. LXXVIII. f. 1.

Hab. Great Britain and Ireland.

Species 38. (Mus. —? Copied.)

RISSOA SUPRACOSTATA. *Ris. testâ breci, pallidâ, ventricosâ; anfractibus quinque, rotundis, superioribus acutè costatis, inter costas striatis; ultimo magno, levigato; spirâ acutâ, subroseâ; aperturâ magnâ, subovata.*

THE UPPER-RIBBED RISSOA. Shell short, pale, ventricose; whorls five, rounded, upper sharply ribbed, striated between the ribs, last large, smooth; spire sharp, rather rose-coloured; aperture large, subovate.

—?—
Hab. Britain.

This shell is evidently a somewhat abnormal form, but not of *R. parva*. Some author, however, having named it, it is here admitted, as it cannot be identified with any known species.

RISSOA.

PLATE V.

Fig. 10 b.

RISSEA CALATHISCUS, var. (See Pl. I.)

Species 39. (Mus. Sowb.)

RISSEA CALATHICUS. *Ris. (Alcuvia) testa subconica, pallida, semipellucida, costis longitudinalibus, subdistantibus, subdepressis, et liris spiralibus magis approximatis, interstitiis profundè forasolutis, cancellatis; anfractibus quinque convexisculis; apertura subovata; labio exterioro crasso, indus crenato.*

THE BASKET RISSEA. Shell rather conical, pale, semi-pellucid, cancellated with rather distant, rather depressed longitudinal ribs and rather nearer spiral ridges, with deeply-pitted interstices; whorls five, rather convex; aperture rather ovate, outer lip thick, crenated within.

FORBES and HANLEY. British Mollusca, Vol. III. p. 80.

Hab. British coasts and Europe generally.

Species 40. (Mus. Sowerby.)

RISSEA STRIATA. *Ris. (Anoba) testa albida, elongata, tenuiter spiraliter striata; anfractibus sex, convexis, elevatis, superne ad suturam crenulatis, ultimo brevi; apertura parva, labio exterioro extus varicoso, marginé incrassato, subcrenulato.*

THE STRIATED RISSEA. Shell whitish, elongated, finely striated spirally; whorls six, convex, raised, crenulated above at the suture, last short; aperture small, outer lip varicose without, margin thickened and slightly crenulated.

MONTAGU. (Turbo) Test. Brit. Vol. II. p. 326, Pl. XIII. f. 25, 26.

Rissoa satutissima, Michaud.

Rissoa communis, Forbes.

Rissoa gracilis, Maegillivray.

Hab. Britain.

Species 41. (Mus. Marrat.)

RISSEA VENTROSA. *Ris. testa subtriangularis, fulvescens, pyramidalata, spira elevata; anfractibus quinque, laterali compressis, ultimo rotundata, ferè umbiliata, apertura subovata, marginé acuta.*

THE INFLATED RISSEA. Shell rather greenish-buff, pyramidal, spire elevated; whorls five, laterally compressed, last round, nearly umbilicated; aperture rather oval, margin acute.

MONTAGU. (Turbo) Test. Brit. II. p. 317, Pl. XII. f. 13.

Rissoa acuta, Draparnaud.

Turbo ventricosus, Dillwyn.

Hab. Great Britain, France.

Species 42. (Mus. late Deshayes.)

RISSEA ROSEA. *Ris. testa solidata, rosea, spira elevata, anfractibus septem, moderatae convexis, longitudinale costatis, costis regularibus, solidis, levibus, rectangulis, interstitiis aequalibus; apertura auriformi, columella leviter uniplicata, labio exterioro crasso, rotunda.*

THE PINK RISSEA. Shell solid, pink, spire elevated; whorls seven, moderately convex, longitudinally ribbed, ribs regular, solid, smooth, rather straight, equalling the interstices; aperture auriform, columella slightly single-plaited, outer lip thick, rounded.

RISSOA.—PLATE V.

DESHAYES. Conch. Ile de la Réunion, p. 61, Pl. VII.
f. 29.

Hab. Isle of Bourbon.

Species 43. (Mus. late Deshayes.)

RISSEA INSOLITA. *Ris. (Alvania?) testa minimâ, candidâ, elongato-turrâ, apice obtusâsculâ; anfractibus septenâ, costis dnasbus inaequalibus proeminentibus cinctis, maiore prope suturem positâ, elegante granoso-crenulâ; ultimo anfractu breviseculo, transversim quadricostato; aperturâ minima, ovatâ, angustâ.*

THE EXTRAORDINARY RISSEA. Shell very small, white, elongate-turreted, apex rather obtuse; whorls seven, first with two unequal prominent ribs, the larger placed near the suture, elegantly granularly crenulated, last whorl rather short, transversely four-ribbed; aperture very small, oval, narrow.

DESHAYES. Conch. Ile de la Réunion, p. 63, Pl. XIII.
f. 15, 16.

Hab. Isl. Bourbon.

Species 44. (f, a, b, Mus. Crosse ?)

RISSEA GENTILISSIMA. *Ris. (Hydrobia) testa parvâ, pallidâ fulcâ, levâ, ovatâ, apice obtuso; anfractibus quatuor, concezienslis, ultimo elongato, inflato, subulato; aperturâ disjunctâ, obliquâ ovatâ, operculo fuscâ.*

THE FAMILY-RELATION RISSEA. Shell small, pale fulvous, smooth, with obtuse apex; whorls four, rather convex, last elongated, inflated, a little uncoiled; aperture disjoined, obliquely ovate.

CROSSE. Journ. de Conch. Vol. XXII. p. 112, 1874.
Hab. New Caledonia.

Mr. Crosse remarks that this is the second of the same genus found in the locality.

Species 45. (Mus. Souverbie ?)

RISSEA FIMBERIATA. *Ris. (Rissoina) testa albidâ, turrâ, almissimâ, leuci, apice obtuso; anfractibus octo,*

lateraliter compressis, distanter longitudinaliter costatis, propè suturam subangulatis; aperturâ obliquâ ovatâ, columellâ duplicitâ, labio externo duplicitato, fimbriato.

THE FRINGED RISSEA. Shell whitish, turreted, very high, smooth, with blunt apex; whorls eight, laterally compressed, distantly longitudinally ribbed, with a slight angle near the suture; aperture obliquely ovate, columella doubled, outer lip doubled, fringed.

SOUVERBIE. Journ. de Conch. p. 52, 1872.

Hab. New Caledonia.

Species 46. (Mus. Souverbie ?)

RISSEA INCERTA. *Ris. (Rissoina) testa fuscâ, solidâ, altâ, turrâ, spira elevata, apice obtuso; anfractibus octo, ad suturem angulatis, costatis, costis ad spiram continuâ, distantibus, rotundis, ad medium ultimo anfractu discontinuâ; aperturâ obliquâ ovatâ, columellâ arenatâ.*

THE UNCERTAIN RISSEA. Shell brown, solid, elevated, turreted, spire raised, with obtuse apex; whorls eight, angular at the suture, ribbed, ribs continued at the spire, distant, rounded, discontinued at the middle of the last whorl; aperture obliquely ovate.

SOUVERBIE. Journ. de Conch. 1872, p. 33, Pl. I. f. 4.
Hab. Ins. Arl. New Caledonia.

Species 47. (Mus. Marrat.)

RISSEA PULCHERRIMA. *Ris. (setia) testa minutâ, brevi, globosâ, leeci, subumbilicato, in scribus tribus maculis rubro-fuscis quadratis ornata; anfractibus quatuor, rotundis, ultimo rugoso, ventricoso; aperturâ rotundâ, marginâ simplici.*

THE VERY PRETTY RISSEA. Shell minute, short, globose, smooth, slightly umbilicated, ornamented with red-brown square spots in three rows; whorls four, rounded, last large, ventricose; aperture round, margin simple.

JEFFREYS. Ann. Nat. Hist. Vol. II. p. 351.
Hab. Channel Islands.

R I S S O A.

PLATE VI.

Fig. 1 b, *Rissoa denticulata*. See Plate I.

Species 48. (Mus. Sowerby.)

RISSEA SOLUTA. *Ris. (Setia) testū minutā, ovalā, albā, spirāliter strīatā; anfractibus tribus, brevibus, rotundis, ultimo ventricosa, subobsoleta, umbilicata; aperturā rotunda, labio externo rectilīnēculo.*
THE LOOSE-COILED RISSEA. Shell very small, oval, white, spirally striated; whorls three, short, round, last ventricose, a little uncoiled, umbilicated; aperture round, outer lip rather straight.
 PHILIPPI. Moll. Sic. Vol. II. p. 130, Pl. XXIII, f. 18.
Hab. Britain.

Species 49. (Mus. Jeffreys.)

RISSEA ALDERI. *Ris. (Setia) testū minutā, pallidā, fulvā, levā, subovatā; anfractibus quinque, rotundis, elevatis, ultima ventricosa, subumbilicata; aperturā subovatā, labio externo tenui, columellā rectilīnēculo.*

ALDER'S RISSEA. Shell minute, pale, fulvous, smooth, rather oval; whorls five, rounded, elevated, last ventricose, slightly umbilicated; aperture rather oval, outer lip thin, columella rather straight.

JEFFREYS. Ann. and Mag. of Nat. Hist. August, 1858.
Hab. North Britain.

Species 50. (Mus. Sowerby.)

RISSEA FULVIPA. *Ris. (Setia) testū minutā, fulvā, levā, nitidā, castaneo spirāliter bifasciatā, spiri brevi, obtusa; anfractibus tribus, rotundis; aperturā rotunda, marginē tenui.*

THE BRIGHT RISSEA. Shell minute, fulvous, smooth, shining, with two chestnut spiral bands, spire short, obtuse; whorls three, rounded; aperture rounded, margin thin.

ADAMS. Trans. Linn. Soc. Vol. III. p. 254.
Hab. Britain and Ireland.

Species 51. (Mus. Brit.)

RISSEA ANATINA. *Ris. (Hydrobia) testū minutā, subviridi, tenui, ovato-subgloboso, spirā brevi, apice acuto; anfractibus quinque, rapidē crescentibus, distinctis, prope suturam angulatis, ultimo subgloboso, suturā caudiculatā; aperturā subrotunda, marginē tenui.*

THE DECK'S RISSEA. Shell small, rather green, thin, ovato-subglobose, spire short, apex acute; whorls five, rapidly increased, distinct, angular near the suture, last subglobose, suture channelled; aperture rather round, margin thin.

DRAPEAU. Moll. Terr. et Fluv. de France, p. 37.
 Pl. I. f. 24, 25.

Hab. France, England.

Species 52. (Mus. Jeffreys.)

RISSEA EXIMA. *Ris. testū albida, minutissimā, subovatā, longitudinaliter costatā, costis distansib; incisis, in medio anfractuum costis spirālibus tribus decussatis, interstitiis excavatis; anfractibus quatuor, infra biangulatis, suturā profundā; aperturā subrotunda, marginē acuto.*

THE NOTABLE RISSEA. Shell whitish, very small, somewhat ovate, longitudinally ribbed, ribs distant, incised, decussated by three spiral ribs in the middle of each whorl; interstices excavated; whorls four, biangular below, suture deep; aperture rather round, margin sharp.

JEFFREYS. Sowerby's Illustrated Index of Brit. Sp. Chemnitzia Badeni, Clark.
Hab. Britain.

Species 53. (Mus. Sowerby.)

RISSEA NITIDA. *Ris. (Rissoina) testū albō, solidā, elatā, spirā elongatā, media subinflato, apice acuminato; anfractibus octo, convexis, spirāliter et longitudinaliter costatis, costis ad angulos nodosis; aperturā*

RISSOA.—PLATE VI.

parvâ, anticâ canaliculatâ, columellâ brevi, crassâ, labio externo crasso, anticâ producto.

THE NEAT RISSOA. Shell white, solid, raised, spire elongated; rather swelled in the middle, apex acuminated; whorls eight, convex, spirally and longitudinally ribbed, ribs nodose at the angles; aperture small, anteriorly channelled, columella short, thick, outer lip thick, anteriorly produced.

ADAMS. Proc. Zool. Soc. 1851, p. 266.

Hab. Philippines.

Species 54. (Mus. Sowerby.)

RISSEA EUBEA. *Ris. (Barleia) testâ conicâ, fuscâ, solidâ, politâ; anfractibus quatuor, concaviâsculis, ultimo infra medium subangulato; aperturâ subtriangulari, magnâ, columellâ rectiâsculis.*

THE RED RISSOA. Shell conical, brown, solid, polished; whorls four, rather convex, last rather angular below the middle; aperture subtriangular, large, columella rather straight.

ADAMS. Trans. Linn. Soc. Vol. III. Pl. XIII. f. 15.

Rissoa unifasciata, Montagu.

Hab. Britain, Mediterranean.

Species 55. (Mus. Marrat.)

RISSEA FUVA. *Ris. (Barleia ?) testâ conicâ, elevatâ, solidâ, fuscâ, latè fasciati, politâ; anfractibus*

quinque, lateraleriter compressis, ultimo angulatâ; aperturâ subtriangulari.

THE FULVOUS RISSOA. Shell conical, raised, solid, brown, broadly banded, polished; whorls five, laterally compressed, last angular; aperture subtriangular.

MICHAUD. Nouv. Esp. de Rissoa, p. 15, f. 17, 18.
Hab. Adriatic.

Species 56. (Mus. Marrat.)

RISSEA CREBRISULCATA. *Ris. (Rissoina) testâ elongato-ovalâ, scabriâ, costis longitudinalibus subobliquis, validis, nodosis, et lîris tenuibus spiralibus cancellatâ; anfractibus octo, concaviâsculis; aperturâ infra canaliculatâ; aperturâ parvâ, ovatâ columellâ crassâ, brevi, labio externo crasso, extus crenato.*

THE CLOSE-GROOVED RISSOA. Shell elongated-ovate, seaceous, cancellated with rather oblique, strong, nodulous, longitudinal ribs; whorls eight, rather convex; aperture channelled below, aperture small, ovate; columella thick, short, outer lip thick, crenulated outside.

SOWERBY.

Hab. —?

This beautifully sculptured little shell when received was labelled '*R. canaliculata Ad.*' but being afterwards found not to agree with the specimen in the British Museum, we have had to give another name to it.

RISSOA A.

PLATE VII.

Species 57. (Mus. Paris.)

RISSOA MOHRENSTERNI. *Ris. (Rissoina) testū minimā, albā, ovo-pyramidalē, apicē acutō; anfractibus septem, concrevīculis, longitudinaliter costellatis, striis spiralibus decussatis; ultimo anfractu magno, ventricoso, subovato; apertura semilunari, labio exterō crasso, antīcō prodito.*

MÖHRENSTERN'S RISSOA. Shell very small, white, ovately pyramidal, with acute apex; whorls seven, rather convex, longitudinally ribbed, decussated with spiral striae; last whorl large, ventricose, subovate; aperture semilunar, outer lip thick, anteriorly produced.

DESHAYES. Conchyliologie de l'Île de la Réunion, p. 62.

Hab. Ile Bourbon.

Species 58. (Mus. Brit.)

RISSOA SEMIGLADRATA. *Ris. (Rissoina) testū pyriformi, solidā, acuminatā, anfractibus septem, concrevīculis, superioribus crenulatīs, penultimā et ante-penultimā costellis indistincte spiralibus et striis minutissimis longitudinalibus decussatis, ultimo subgloboso, polito, apertura pyriformi, labio exterō crasso, dentibus transversis tribus vel quatuor munito.*

THE HALF-POLISHED RISSOA. Shell pyriform, solid, acuminate, whorls seven, rather convex, the upper with curved ribs, two before the last decussated with indistinct spiral ribs and very minute longitudinal striae, last rather globose, polished, aperture pyriform, outer lip thick, provided with three or four teeth.

A. ADAMS. Proc. Zool. Soc. 1851, p. 279.

Hab. Isl. Zebu, Philippines.

Species 59. (Mus. Brit.)

RISSOA CRASSILABRUM. *Ris. (Rissoina) testū brevi, conicā, lacteā, politā, solidā, anfractibus sex, planulatīs, apice acuminato; apertura pyriformi,*

angustā, labio exterō crasso, planulato, antīcō tridentato, columellā latā.

THE THICK-LIFTED RISSOA. Shell short, conical, milk-white, polished, solid, whorls six, flattened, apex acuminate; aperture pyriform, narrow, outer lip thick, flattened, anteriorly tridentate, columella broad.

PENSE. Proc. Zool. Soc.
Hub., California.

A curious little shell with three strong teeth across its broad, thick, outer lip.

Species 60. (Mus. Brit.)

RISSOA CANALICULATA. *Ris. (Rissoina) testū solidā, pyriformi, pallidissimē fulvi, anfractibus septem, concrevīculis, costatis; costis distantibus, levitas, media flexuosa, ad costam spiralem basalem terminatibus; ultimo anfractu infra bicuscolato; apertura pyriformi, labio exterō crasso.*

THE CHANNELLED RISSOA. Shell solid, pyramidal, very pale fulvous; whorls seven, rather convex, ribbed; ribs distant, smooth, flexuous in the middle, ending at the base, last whorl double ribbed beneath; aperture pyriform, outer lip thick.

SCHWARTZ. Monograph of Rissoina.

Hab. Philippines.

Species 61. (Mus. Brit.)

RISSOA INSIGNIS. *Ris. (Rissoina) testū brevi, solidā, superē albā, infō subnigra; anfractibus quinque superioribus latīs, quadratis, propo suturam rectangulatīs, costatis, subdecussatis, ultimo rotundo, subgloboso; apertura subovata, labio exterō crasso, rotundo, denticulato, columella crassī.*

THE WONDERFUL RISSOA. Shell short, solid, white above, rather golden below; whorls five, upper broad, square, rectangular near the suture, ribbed, slightly decussated, last round, subglobose; aperture subovate; outer lip thick, round, denticulated, columella thick.

ADAMS AND REEVE. Voy. Samarang.
Hab. —?

RISSOA.—PLATE VII.

Species 62. (Mus. Brit.)

RISSOA DESHAYESIANA. *Ris. (Rissoina) testā albā, pyramidatā, costis longitudinalibus nodosis et striis spiralibus tenuiter reticulatā; anfractibus septem, convexisculis; aperturā semiovatā, columellā brevi, crassā, labio externo crasso, crenulato.*
DESHAYES' RISSOA. Shell white, pyramidal, finely reticulated with longitudinal nodose ribs and spiral striae; whorls seven, rather convex; aperture semiovate, columella short, thick, outer lip thick, crenulated.

RECLUS. Revue Zoologique.

Hab. —?

Species 63. (Mus. Brit.)

RISSOA DEFORMIS. *Ris. (Rissoina) testā albā, elongatā, solidiusculdā, altissimā; anfractibus novem, irregulatè convolutis, inaequilater converxis, superioribus sculpitis, inferioribus levigatis, aperturā subtrigonā, productā; labio externo crasso.*
THE DEFORMED RISSOA. Shell white, long, rather solid, much elevated; whorls nine, irregularly wound, unequally curved, upper sculptured, lower smooth, aperture subtriangular, produced; outer lip thick.

SOWERBY. Genera of Shells.

Hab. Philippines.

Species 64. (Fig. a, b, c, d, Mus. Brit.)

RISSOA VARIEGATA. *Ris. (Rissoina) testā subcylindricā, albā, vel maculis vel fasciis variè pictā; anfractibus rectiūsculis, superne ad suturam crenulatis, ultimo majusculo, apice acuminato, aperturā semiocvatā, columellā brevi, acuminatā.*

THE VARIEGATED RISSOA. Shell rather cylindrical, white, or variously painted with spots or bands; whorls rather straight, crenulated above at the suture, last rather large; apex acuminate, aperture semiovate, columella short, acuminate.

ANGUS. Proc. Zool. Soc. 1867, p. 113.

Hab. Port Jackson.

Species 65. (Mus. Brit.)

RISSOA STRIOLATA. *Ris. (Rissoina) testā elevatā, tenui, tenuiter striatā, albā, apice acuminato; anfractibus novem, rectiūsculis, medianis latis, superioribus attenuatis; ultimo subangustato; aperturā auriformi, columellā infrā acuminatā; labio externo subincassato.*

THE FINE-STRIATED RISSOA. Shell raised, thin, finely striated, white, apex acuminate; whorls nine, rather straight, middle broad, upper attenuated, last rather narrow; aperture ear-shaped, columella acuminate below; outer lip rather thickened.

A. ADAMS. Proc. Zool. Soc. 1851, p. 206.

Hab. Baclayon, Isl. Bohol, Philippines.

In some degree resembling *Rissoina spirata*, but the whorls not angular.

PLATE VIII.

Species 66. (Mus. Brit.)

RISSEA PYRAMIDALIS. *Ris. (Rissoina) testa subpuparia formi, pallidè fulvæ, subcentricosæ, obtusisæculâ; anfractibus sex, brevissimis, costis eleganter flexuosis, longitudinaliter levibus liratâ; apertura subauriformis, labio externo crasso, columellâ subplicatâ.*

THE PYRAMIDAL RISSOA. Shell somewhat pupa-shaped, pale fulvous, rather ventricose, rather obtuse; whorls six, rather short, ridged with elegantly flexuous longitudinal ribs; aperture somewhat ear-shaped, outer lip thick, columella with a very slight plait.

A. ADAMS. Proc. Zool. Soc. 1851, p. 265.

Hab. Baclayon, Isl. Bohol, Philippines.

Species 67. (Mus. Brit.)

RISSEA MEMBRANACEA. *Ris. testa tenui, corniculata, altissimâ; anfractibus septem, lateraliter subcompressis, apicalibus attenuatis, ultimo brevi; apertura auriformis, anticè expansâ, subretrosp., columellâ subflexuosa, brevi, labio externo expanso.*

THE MEMBRANOUS RISSOA. Shell thin, horny, very elevated; whorls seven, laterally subcompressed, apical attenuated, last short; aperture ear-shaped, anteriorly expanded, rather inclined backwards, columella rather flexuous, short, outer lip expanded.

LÖVEN — ?

Rissoa labiosa var. *Auct.*

Hab. Black Sea and Mediterranean.

The more elevated varieties of *Rissoa labiosa* do not seem to approach the slender form and light texture of this species.

Species 68. (Mus. Brit.)

RISSEA SMITHII. *Ris. (Rissoina) testa albâ, parcâ, solidâ, pyramidatâ; anfractibus septem, convexis,*

costatis, costis longitudinalibus, leviter arcuatâ, interstitiis spiraliiter striatis, ultimo anfractu infra spiraliiter costatâ; apertura subtriangularis, labio externo crasso, columellâ crassâ, obtusâ uniplicatâ.

SMITH'S RISSOA. Shell white, small, solid, pyramidal; whorls seven, convex, ribbed, longitudinal ribs, slightly curved, interstices spirally striated, last whorl spirally ribbed below; aperture somewhat trigonal, outer lip thick, columella thick, with a blunt plait.

ANGUS. Proc. Zool. Soc. 1867, p. 114.

Hab. Port Jackson, Australia.

Species 69. (Mus. Brit.)

RISSEA TURRICULA. *Ris. (Rissoina) testa rubrofuscâ, parvâ, solidâ, pyramidatâ, acuminatâ; anfractibus octo, prominentibus, supra medium subangulatis, costatis, costis paucis medio subangulis, interstitiis tenuissimâ striatis; apertura semilunari, labio externo crasso, columellâ crassâ, brevi.*

THE LITTLE TURRET RISSOA. Shell red-brown, small, solid, pyramidal, acuminated; whorls eight, prominent, rather angular above the middle, with interstices very finely striated; aperture semi-lunar, outer lip thick, columella very thick, short.

ANGUS. Proc. Zool. Soc.

Hab. New South Wales.

The whorls are more prominent than those of *Rissoa Smithii*, and with the ribs, more angular.

Species 70. (Mus. Brit.)

RISSEA CRASSA. *Ris. (Rissoina) testa solidâ, rubrofulvâ, brevi, oblongâ; anfractibus septem, brevibus, lateraliter subcompressis, longitudinaliter costatis, costis leviter arcuatâ, ultimo anfractu infra levigato; apertura reclivisculâ, columellâ crassâ, brevi.*

THE THICK RISSOA. Shell solid, red fulvous, short, obtuse; whorls seven, short, laterally rather

RISSOA.—PLATE VIII.

compressed, longitudinally ribbed, ribs slightly arched, last whorl smooth below; aperture rather straight, columella thick, short.

ANGUS. MS. Brit. Mus.
Hab. Port Jackson.

Species 71. (Mus. Brit.)

RISSOA CINCTA. *Ris. (Rissoida) testū parvū, albū, altā, leviter interruptā custaneo fasciatā; anfractibus septem, concevixulis, costatis, costis eleganter flexuosis, intersticis striatis, ultimo anfractu brevi, rotundo, subreticulato.*

THE BELTED RISSOA. Shell small, white, high, finely interruptedly banded with chestnut; whorls seven, rather convex, ribbed, ribs elegantly flexuous, interstices striated, last whorl short, rounded, rather reticulated.

ANGUS. Proc. Zool. Soc. 1867, p. 114.
Hab. Port Jackson.

Species 72. (Mus. Brit.)

RISSOA NODICINTA. *Ris. (Rissoida) testū albū, solidā, pyramidatā, acuminatā; anfractibus octo, costellis spiralibus et longitudinalibus regulariter ad angulo nodosis ornatis; aperturā semi-ovatā, labio externo crasso, intus crenulato.*

THE BEAD-BELTED RISSOA. Shell white, solid, pyramidal, acuminate; whorls eight, ornamented with spiral and longitudinal ribs, regularly nodose at the angles; aperture semi-ovate, outer lip thick, crenulated within.

A. ADAMS. Proc. Zool. Soc. 1851, p. 266.
Hab. Isl. Capul, Philippines.

Species 73. (Mus. Brit.)

RISSOA MONOPONTIA. *Ris. (Rissoida) testū brevi, crassatā, lilacina et albū, subpyriformi; anfractibus*

quinqūe, brevibus, ultimo subovato; apertura oratā, labio externo crasso, subplanulato, columellā brevi, unidentata.

THE SINGLE-TOOTHED RISSOA. Shell short, thick, lilac and white, rather pyriform; whorls five, short, last rather oval; aperture ovate, outer lip thick, rather flattened, columella short, with a single tooth.

BIVON. MS. Mus. Brit.
Hab. —?

Species 74. (Mus. Sowerby.)

RISSOA VIOLEACEA. *Ris. testū parvū, crassatā, breviter pyramidatā, infrā aureo-fulgū, medio violacea; anfractibus quinque, superne albī, infrā castaneo latè fasciatā; aperturā subtrigonā; marginē crasso.*

THE VIOLET RISSOA. Shell small, thick, shortly pyramidal, golden brown below, violet in the middle; whorls five, white above, broadly banded with chestnut below; aperture subtriangular, margin thick.

DESMARET. —?
Hab. Nice.

Species 75. (Mus. Sowerby.)

RISSOA RETICULATA. *Ris. (Rissoida) testū albū, pyramidato, tenui, acuminatā; anfractibus novem, costis tenuissimis, eleganter flexuosis, longitudinalibus et striis spiralibus reticulatis; aperturā subpyriformi, labio externo crasso, antice producto, columellā brevi, infrā acuminatā.*

THE RETICULATED RISSOA. Shell white, pyramidal, thin, acuminate; whorls nine, reticulated with elegantly flexuous longitudinal ribs and spiral striae; aperture subpyriform, outer lip thick, anteriorly produced, columella short, acuminate below.

SOWERBY. Genera of Shells.
Hab. Isl. St. Thomas, West Indies.

RISSOA.

PLATE IX.

Species 76. (Mus. Sowerby.)

RISSEA CLATHERATA. *Ris. (Rissina) testa albida, clathrata, solida, costis spiralibus supra suturam quinque et longitudinalibus paucis magis numerosis ad angulos nodosis clatheratis; interstitiis profundi forosatis; anfractibus altis, concrevatis, ultimo unisulcato et varicoso; aperturam pyriformem, labio externo antice producta; columella brevis, crassus.*

THE LATTICED RISSOA. Shell whitish, elevated, solid, latticed with five spiral ribs above the suture, and rather more numerous longitudinal ones, nodose at the angles; interstices deeply pitted; whorls elevated, rather convex, the last with a groove and spiral varices behind the columella; aperture pyriform, outer lip anteriorly produced, columella short, thick.

A. ATAMS. Proc. Zool. Soc. 1851, p. 265.

Hab. Isl. Bohol, Philippines.

A beautiful broadly-sculptured species.

Species 77. (Fig. a, b, c, d, Mus. Brit.)

RISSEA VARIABILIS. *Ris. testa subfusiformi, acuminata, tenuiter spiralee fuscata, punctato-lineata, et striata; anfractibus octo, elevatis, tribus apicalibus levibus, alteris media angustatis, costatis, costis media prominentibus; apertura decolorata, subrotata, marginem expanso, lilacina, cerasina intusque laevassata.*

THE VARIABLE RISSOA. Shell rather fusiform, acuminate, finely spirally brown spot-lined and striated; whorls eight, elevated, three apical smooth, the others angular in the middle; aperture sloped, rather oval, margin expanded, lilac, thickened within and without.

MUHLFELDT —?

Hab. —?

Species 78. (Mus. Sowerby.)

RISSEA DECUSSATA. *Ris. (Rissina) testa albata, solida, alta, tenuissimè costellata obliquis longitudinalibus et spiralibus minutis decussata, apice obtuso; anfractibus sex, infra medium concreviscalis; aper-*

tura subpyriformis; columella brevi, attenuata, labio externo prominulati, crasso.

THE DECUSSATED RISSOA. Shell white, solid, high, very finely decussated with oblique longitudinal riblets and spiral striae, apex obtuse; whorls six, rather convex below the middle; aperture rather pyriform, columella short, attenuated, outer lip prominent, thick.

MONTAGU. Test. Brit. Vol. II, p. 399.

Hab. West Indies.

A West Indian shell described as British by Montagu. It has a smooth, and even a polished appearance until examined with the lens, when the oblique longitudinal ribs and fine spiral striae are seen.

Species 79. (Mus. Sowerby.)

RISSEA SPLENDIDA. *Ris. testa breviter subfusciformis, fulva, spiraller lineis rubris punctatis picta; spirale acuminata; anfractibus sex, brevibus, angustatim costatis, inter et infra costas fuscatae fasciatis; apertura brevi, labio externo intus et extusque crasso violaceo marginata.*

THE SPLENDID RISSOA. Shell shortly subfusciform, fulvous, spirally painted with red punctured lines, spire acuminated; whorls six, short, angularly ribbed, banded with brown between and under the ribs; aperture short, outer lip thickened within and without, edged with violet.

EICHENOW —?

Hab. Black Sea.

Shorter and more finely ribbed than *Rissoa cariabilis*.

Species 80. (Mus. Sowerby.)

RISSEA SAGRATANA. *Ris. (Rissina) testa alba, solida, alta, pyramidata; anfractibus septem, costis crenatis, obliquis, transversè tiratis, sculptis; apertura pyriformis, labio externo crassissimo, antice producta.*

THE SAGRATA RISSOA. Shell white, solid, high, pyramidal; whorls seven, sculptured with oblique crenated ribs ridged across; aperture pyriform, outer lip very thick, anteriorly produced.

D'ORBIGNY. Mollusques de Cuba.

Hab. Cuba.

Species 81. (Mus. Marrat.)

RISSEA LIGNEA. *Ris. (Alcania) testā breci, ventricosā, solidū, fuscā, acuminatā, cubro-liaeatā; anfractibus beriliis costatis, costis rotundis, crassis, crenatis; liris spiralē tenuibus; aperturi breci, subrotundā, columellā crassā, albā; labio externo intus incrassato; extē variciso.*

THE WOODY RISSEA. Shell short, ventricose, solid, brown, acuminate, red-lined; whorls short, ribbed, ribs rounded, thick, crenated; spiral ridges thin; aperture short, rather round, columnella thick, white; outer lip thickened with in, varicose without.

THORFF. Brit. Mar. Conch.

Hab. Nica.

Species 82. (Hab. Marrat.)

RISSEA CANARIENSIS. *Ris. (Alcania) testā minitā, pallidē fulvā, breci, crassā, longitudinaliter crebricostata, spiraliiter dēsē lineatā; costis crassis, crenulatis; anfractibus paucis, beriliis, maculatis vel spiraliiter lineatis, medio subangulatis, ultimo ventricoso; aperturā parvā, rotundā, labio externo incrassato.*

THE CANARY ISLAND RISSEA. Shell minute, pale, fulvous, short, thick, numerously longitudinally ribbed, spirally closely ridged, ribs thick, crenulated; whorls few, short, spotted or spirally lineated, rather angular in the middle, last ventricose; aperture small, rounded, outer lip thickened. D'ORBIGNY. Watson, Proc. Zool. Soc. 1873, p. 376.

Hab. Canary Islands, Madeira.

Finer in sculpture than the other species, with crenulated ribs.

Species 83. (Mus. Marrat.)

RISSEA DEPICTA. *Ris. testā parvā, ventricosā, fulvā, tenue spiraliiter striatā, semipellucida, obscurē sorbitim maculata; anfractibus quinque, superioribus brevissimis, ultimo rotundo, subgloboso, aperturā rotundi, labio externo crasso.*

THE FADED RISSEA. Shell small, ventricose, fulvous, finely spirally striated, semipellucid, obscurely spotted in rows; whorls five, upper ones very short, last rounded, rather globose; aperture rounded, outer lip thick.

MANZONI. (Watson) Proc. Zool. Soc. 1873, p. 383.
Hab. Madeira.

It seems more globose and less conical than *Rissoa semistriata* of Montagu.

Species 84. (Mus. Montrouzier.)

RISSEA ARTENSIS. *Ris. (Rissoina) testā elongatā, subcylindrica, subaurantia, tenui; anfractibus novem, apicalibus septem leviter plicatis, attenuatis, prope apicem subabrupte angustatis, penultimo subcylindrica, planata, alto; ultimo cylindrica elongata; aperturā subtriangulari, subaequalitātē; labio interno tenui, columellā breci, labio externo producto, incrassato.*

THE ISL. OF ART RISSEA. Shell elongated, subcylindrical, rather orange, thin; whorls nine, seven apical, slightly plaited, attenuated near the apex, rather abruptly narrowed, last but one rather cylindrical, flattened, high, last cylindrical, elongated; aperture subtriangular, with a slight canal, inner lip thin, columnella short, outer lip produced, thickened.

MONTROUZIER. Journ. Conchyl. Vol. XX. p. 364, 1872.

Hab. Ile Art, New Caledonia.

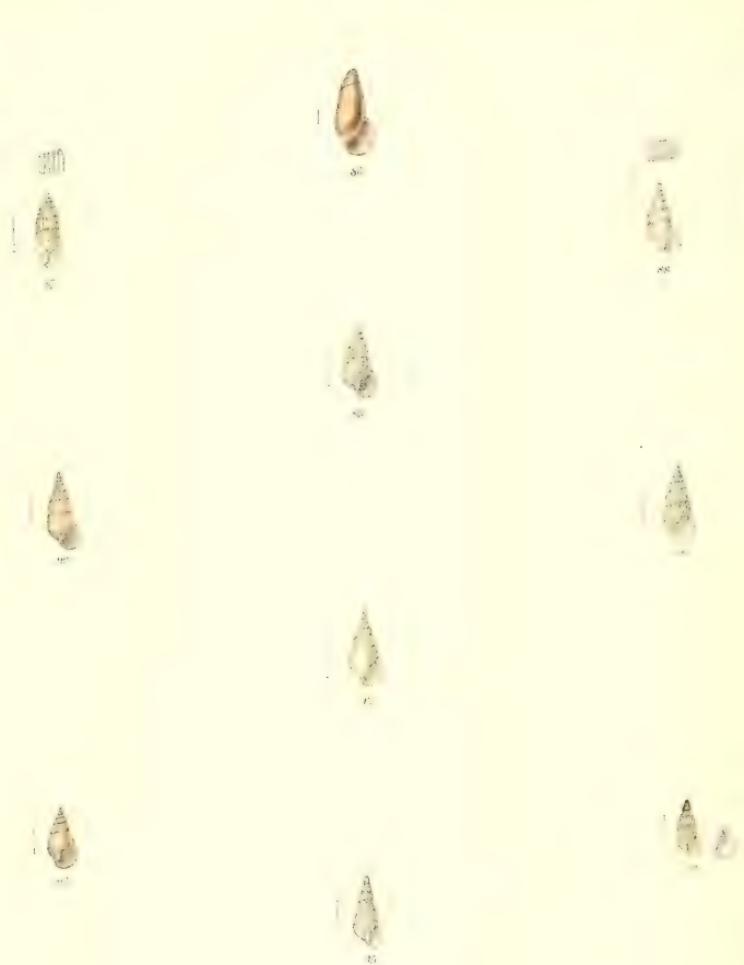

Species 85. (Mus. Souverbie.)

RISSEA SUCONCINNA. *Ris. (Rissoina) testā albā, ovatā, subpyramidalibet, altā, longitudinaliter costata, costis tenuibus leviter arenatis, distantibus, interstītībus hecib; anfractibus octo, lete crescentiibus, inferioribus subventricosis; aperturā subtriangulari, labio interno tenui, expanso, columellā uniplacata, brevi, labio externo producto, expanso, infra columellam emarginato.*

THE RATHER NEAT RISSEA. Shell white, ovately subpyramidal, high, longitudinally ribbed, ribs thin, slightly arched, distant, interstices smooth; whorls eight, slowly increased, lower rather ventricose; aperture subtriangular, inner lip thin, expanded, columnella single plaited, short, outer lip produced, expanded, emarginated under the columnella.

SOUVERBIE. Journ. Conchyl. Vol. XX. p. 364, 1872.
Hab. Ile Art, New Caledonia.

This shell is named as above from its resemblance to *Rissoina concinna* of A. Adams, from which it differs materially in having no cross striae.

RISSOA.

PLATE X.

Species 86. (Mus. Crosse.)

RISSOA (HEMISTOMIA) CALEDONICA. *Ris. testū albā, levigatā, oblongo-ovalē, tenui, apicē obtuso; anfractibus quinque, ultimo oblongo, aperturā oblique semilunari, labio externo expanso; columellā obliquā, infimā acuminatā.*

THE CALEDONIAN RISSOA. Shell whitish, smooth, oblong-ovate, thin, with obtuse apex; whorls five, the last oblong, aperture obliquely semi-lunar, outer lip expanded; columella oblique, acuminate below.

CROSSE. Journ. Conch. Vol. XII. p. 72, 1872.

Hab. Noumea, New Caledonia.

This shell bears so strongly the aspect of a true typical *Rissoa* that, in the absence of an operculum, it seems difficult to understand why a new genus should be created for it.

Species 87. (Mus. Brit.)

RISSOA (OINA) STRICTA. *Ris. testū solidū, pupiformis, pallidū fulvis, albī, rectū; anfractibus orto; apicalibus attenuatis, acuminatis; medianis subirregularibus, rectilateribus superiorē perpendicularly ribatis, ultimo infra levigato; aperturā parvā, semilunari, columellā brevi, obliquā, infimā truncatā, labio externo expanso, acuto.*

THE STRAIGHTENED RISSOA. Shell solid, pupa-shaped, pale fulvous, raised, straight; whorls eight; apical attenuated, acuminate, middle somewhat inflated, straight-sided, perpendicularly ribbed on the upper side, the last smooth below; aperture small, semilunar, columella short, oblique, truncated below, outer lip expanded, sharp.

MENKE. Zeitschrift für Malak. 1850.

Hab. Cape St. Lucas.

Rissoa fortis is a more broadly-ribbed, darkly-coloured shell.

Species 88. (Mus. Brit.)

RISSOA (OINA) STRIATICOSTATA. *Ris. testū, pyramidatā, albī, tenui, arcuatā, tenuiter costatā, spiriliter striatā, anfractibus ultimo et penultimo subinflatā,*

superioribus parris, attenuatis, apice acuminato, aperturae subtrigonā, labio externo producito, crassissimā; columelliā superne incrassatā, infimā subtenaculatā.

THE RID-STRIATED RISSOA. Shell pyramidal, white, thin, arched, finely ribbed, spirally striated, last and previous whorls a little inflated, upper small, attenuated, apex acuminate; aperture subtriangular, outer lip produced, rather thick; columella thickened above, slightly truncate below.

D'ORRIGY. Voy. Amér. Méridionale, p. 395.

Hab. St. Vincent's, West Indies.

Species 89. (Mus. Brit.)

RISSOA (OINA) CHESNELLII. *Ris. testū albā, subpyramidatā, solidū, costis solidis obliquā flexuosis et striis spiralib⁹ elevatis, cancellatā; spira acuminata, anfractibus apicalibus attenuatis, ultimo anfractu inflato; aperturā parvā, suprē infimā subangustatā, labio externo crasso, crenulato.*

CHESNELL'S RISSOA. Shell white, rather pyramidal, solid, cancellated with obliquely flexuous solid ribs and spiral striae; spire acuminate, apical whorls attenuated, last whorl inflated; aperture small, slightly channelled above and below; outer lip thick, crenulated.

MICHAUD. Cat. Ris. p. 17, f. 23-24.

Hab. India.

Species 90. (Mus. Brit.)

RISSOA (OINA) BUREANA. *Ris. testū pallidā, solidā, obtusè pyramidatā, levigatā, tenuissimā curvicolatā; aperturā parvā, subtrigonā, columellā crassā, brevi, subtortuā, subtruncatā, labio externo crasso.*

THE BUREAN RISSOA. Shell pale, solid, obtusely pyramidal, smooth, very slightly bent-ribbed; aperture small, subtriangular, columella thick, short, rather tortuous, almost truncated, outer lip thick.

SOWERBY.

R. concinna. Adams.

Hab. Isl. Burea, Philippines.

RISSEA.—PLATE X.

Species 91. (Mus. Brit.)

RISSEA (OINA) NIVEA. *Ris. testá subpyramidalát, costis obliquú flexuosis ornatá; spirá elevatá, apice acuminatá; ultimo anfractú infrá spiráliter costato, aperturá infra subquadratá; columella parvá, breviúsculá; labio extero incrassato.*

THE SNOWY RISSEA. Shell subpyramidal, ornamented with obliquely flexuous ribs; spire elevated, apex acuminate, last whorl spirally ribbed below; aperture rather square below; columella small, rather short; outer lip thickened.

ARTHUR ADAMS. Proc. Zool. Soc. 1851, p. 265.

Hab. Australia.

Species 92. (Mus. Brit.)

RISSEA (OINA) ALBIDA. *Ris. testá pyramidalát, acuminatá, albá, vel fuscá, semipellucídá, tenuí; ultimo anfractú subinghato, levigato, alteris costatis, versus apicem attenuatá; aperturá subtriangularis, columella brevi, truncatá, labio extero crasso.*

THE WHITISH RISSEA. Shell pyramidal, acuminate, white or buff, half-transparent, thin; last whorl a little inflated, smooth, the others ribbed, attenuated towards the apex; aperture rather trigonal, columella short, truncated, outer lip thick.

C. B. ADAMS. Shells of Jamaica.

Hab. West Indies.

Species 93. (Mus. Brit.)

RISSEA (OINA) LEVÍSSIMA. *Ris. testá solidi, breviter pyramidalát, pallidú fuléa, politá; spirá acuminatá, anfractibus rectifilarubris; aperturá subtriangularis, parvá, columellá crassi, brevi, truncatá.*

THE VERY SMOOTH RISSEA. Shell solid, shortly pyramidal, pale fulvous, polished; spire acuminate, whorls straightened; aperture rather trigonal, small, columella thick, short, truncated.

C. B. ADAMS. Shells of Jamaica.

Hab. West Indies.

Species 94. (Mus. Brit.)

RISSEA (OINA) CATESBYANA. *Ris. testá parvá, pyramidalát, fuscá, breviúsculá, costis obliquú flexuosis, validis ornatá; spirá brevi, anfractibus convexis; aperturá semilunari, labio interno superne incrassato; columella brevi, arcuatá, labio extero producto, incrassato.*

CATESBY'S RISSEA. Shell small, pyramidal, brown, rather short, ornamented with obliquely flexuous strong ribs; spire short, whorls convex; aperture semilunar, inner lip thickened above; columella short, arched; outer lip produced, thickened.

D'ORRIGNY. Shells of Cuba.

Rissoa scalarilla. C. B. Adams.

Hab. Jamaica, Cuba.

Species 95. (Mus. Brit.)

RISSEA (OINA) PRINCIPES. *Ris. pyramidalát, attenuatá, albá, acuminatá; anfractibus levissimè costatis et striatis; ultimo elongato, infrá levigato; aperturá subtriangularis, labio extero tenuí.*

THE PRINCE RISSEA. Shell pyramidal, attenuated, elevated, white, acuminate; whorls finely ribbed and striated, last elongated, smooth below; aperture subtriangular, outer lip thin.

C. B. ADAMS. Shells of Jamaica.

Hab. Jamaica, West Indies.

R I S S O A.

PLATE XI.

Species 96. (Mus. Brit.)

RISSEA (OINA) SCHUCHERA. *Ris. testē crassā, pallidā, pyramidalitā; anfractibus senis, spiculite costatis, costis crassis, angulatis, supra suturam tribus, interstitiis serrato-forolatis; ultimo anfractu subcentrico; aperturā pyriformi, labio externo crasso, columellā crassi, subplanaatā.*

THE GROOVED RISSEA. Shell thick, pale, pyramidal; whorls six, spirally ribbed, ribs thick, angular, three above the suture, interstices serrated in pits; last whorl subcentricous; aperture pyriform, outer lip thick, columella thick, somewhat flattened.

TROSCHEL. —? MS. Brit. Mus.

Hab. Coast of Belgium.

Of a pale colour, more broadly pyramidal than *Rissoina Trochlearis*.

Species 97. (Mus. Brit.)

RISSEA (OINA) FLEXUOSA. *Ris. testē pyramidatā, acuminatā, medio spira subconcaudā; costis longitudinalibus, supra medium angulatis spiritaliter subundosis minutis; aperturā brevi, subovata; labio interno superā suballoso, columellā acutā; labio externo intus tumida.*

THE FLEXUOUS RISSEA. Shell pyramidal, acuminate, rather concave in the middle of the spire; provided with few longitudinal ribs, angular above the middle, slightly notched; aperture short, subovate, inner lip callous above; columella acute; outer lip tumid within.

GOLD. —? MS. Brit. Mus.

Hab. North America.

Species 98. (Mus. Brit.)

RISSEA (OINA) VILLOSA. *Ris. testē pyramidatā, acuminatā, albida; anfractibus nōcōm, prope suturam angulatis, costis numerosis angulatis longitudinalibus minutis; ultimo infra medium spiritaliter costato, costis longitudinalibus desincentibus; aperturā parvā, subpyriformi; columellā infrā rectā.*

THE STEWARDESS RISSEA. Shell pyramidal, acuminate, whitish; whorls nine, angular near the suture, provided with numerous angular longi-

tudinal ribs, the last spirally ribbed in the middle, the longitudinal ribs ending; aperture small, somewhat pyriform; columella straight below. Gorrie, Smithsonian Catalogue.

Hab. Loochoo.

In the middle of the last whorl the longitudinal ribs cease, and the lower part is only ribbed spirally.

Species 99. (Mus. Brit.)

RISSEA (OINA) EULIMOIDES. *Ris. testē brevissimā, albā, politā, lateradilevā arcuata, acuminatā; anfractibus senis, ultimo rotunda; aperturā obliquā producta, labio externo intus incrassato; columellā latā, crassā, brevi.*

THE EULIMA-SHAPED RISSEA. Shell rather short, white, polished, laterally arched, acuminate; whorls six, last rounded; aperture obliquely produced, outer lip thickened within; columella broad, thick, short.

A. ADAMS. Proc. Zool. Soc. 1851, p. 279.

Hab. Isl. Capul, Philippines.

Species 100. (Mus. Brit.)

RISSEA (OINA) SEMIFLICATA. *Ris. testē parvā, politā, rectē pyramidatā, tenui, semipellucida, tenuissimē longitudinaliter plieata; aperturā parvā, subpyriformi, labio externo crasso, rotundo; columellā parvā, acuminatā.*

THE HALF-PLAITED RISSEA. Shell small, polished, smoothly pyramidal, thin, semipellucid, very finely longitudinally plaited; aperture small, rather pyriform, outer lip thick, rounded; columella small, acuminate.

PEASE. Proc. Zool. Soc. 1862.

Hab. Pacific.

Thinner, narrower, and more transparent than *S. brevissima*.

Species 101. (Mus. Brit.)

RISSEA (OINA) BROWNIANA. *Ris. testē parvā, pyramidatā, acuminatā, falcata, levā; anfractibus senis, altissimis, ultimo subrotando; aperturā pyriformi, labio externo obliquā producto.*

RISSOA.—PLATE XI.

BROWN'S RISSOA. Shell small, pyramidal, acuminate, fulvous, smooth; whorls six, rather elevated, the last somewhat round; aperture pyriform, outer lip obliquely produced.

D'ORBIGNY. Voyage dans l'Amérique Méridionale.
Hab. St. Vincent's.

Species 102. (Mus. Brit.)

RISSEA (OINA) TRITCEA. *Ris. testá brevi, crassá, albá, pupiformis; anfractibus brevibus, costatis; costis arcuatis, levibus, rotundis, infra medium anfractus ultimi descurrentibus; ultimo anfractu brevi; aperturá parvá, subauriformi, antice rotundatá; labio crasso, rotundo; columellá brevi, continuo.*

THE WHEAT RISSOA. Shell short, thick, white, papae-shaped; whorls short, ribbed, ribs curved, smooth, round, ending below the middle of the last whorl, last whorl short; aperture small, rather auriform, anteriorly rounded, lip thick, rounded, columnella short, continuous.

PEASE. Proc. Zool. Soc. 1860, p. 438.

Hab. Pacific Ocean.

Species 103. (Mus. Brit.)

RISSEA (OINA) PHILIPPINAE. *Ris. testá turriti, pallidi fulvi, longitudinaliter crenato-costata, interstictis cancellatis; anfractibus senis, rectis ad suturam angulatis; ultimo anfractu infra spirali ter costatá, aperturá parvá, subovata, columellá latá, subarvata.*

PHILIPPI RISSOA. Shell turreted, pale fulvous, longitudinally closely ribbed, interstices cancellated; whorls six, straight, with an angle at the suture, last whorl spirally grooved on the under side; aperture small, subovate; columella broad, a little curved.

PFEIFFER. —? MS. Brit. Mus.

Rissoa cancellata. Philippi.
Hab. Cuba, Jamaica.

Species 104. (Mus. Brit.)

RISSEA (OINA) WOODWARDI. *Ris. testá minutá, breviter pyramidalis, pallidissimè fulvæ; anfractibus senis, brevibus, longitudinaliter costatis; costis oblique arcuatis, levibus, rotundis; ultimo anfractu infra uicinostato; aperturá parvá, pyriformi; labio extero crasso, anfractu apicata rotundo.*

WOODWARD'S RISSOA. Shell minute, shortly pyramidal, very pale fulvous; whorls six, short, longitudinally ribbed, ribs obliquely arched, smooth, rounded, last whorl single-ribbed below; aperture small, pyriform; outer lip thick, apical whorl rounded.

CARPENTER. Shells of Mazatlan, p. 357.

Rissoa clandestina. C. B. Adams.

Rissoa firmata. C. B. Adams.

Hab. Mazatlan.

Species 105. (Mus. Brit.)

RISSEA (OINA) TROCHLEARIS. *Ris. testá breviusculi, crassá, rubro fuscá, spirali ter costis angulatis cincta; anfractibus senis, brevibus, medianis paulo inflatis; aperturá albá, subovata; columellá crassá, brevi; canali conspicuo, labio externo intus incrassato, extus crenato.*

THE COIL RISSOA. Shell rather short, thick, reddish brown, spirally belted with angular ribs; whorls six, short, middle ones a little inflated; aperture white, subovate; columnella thick, short; canal conspicuous, outer lip thickened within, crenated without.

CARPENTER. M.S. Smithsonian Inst. and B. M.

Rissoa sulcifera var. Gould.

Rissoa ligata. Gould.

Rissoa annulata. Dunbar.

Hab. —?

RISSOA.

PLATE XII.

Species 106. (Mus. Watson.)

RISSEA AURANTIACA. *Ris. testa pallidæ aurantiæ, alba, spiræ subquadratæ; anfractibus quinque, convexiæ, aliæ, spiraliter tenuiter costatis, superne costis obliquis, subdiscrepantes, longitudinalibus, sculptis, ultimo anfractu infimæ spiraliter conspicuè bicostato; aperturæ oratæ, labio late, margine interno acutè acutè produtor.*

THE ORANGE RISSOA. Shell pale orange, raised, spire a little in steps; whorls five, rather convex, spirally finely ribbed, sculptured above with oblique, rather distant longitudinal ribs, last whorl with two spiral ribs below; aperture ovate, lip broad, inner margin anteriorly sharply produced.

Watson. Proc. Zool. Soc. 1873, p. 367, Pl. XXXIV.
f. 3.

Hab. Madeira.

Species 107. (Mus. Watson.)

RISSEA CRISPA. *Ris. testa parvæ, albida, undulatæ, spiraliter costata, granulata, costis crassis longitudinalibus flexuosa ornata; apex obtuso; anfractibus quaternis, supra medium angulatis, ultimo infra spiraliter bicostato, umbilicato; aperturæ subtriangulari, labio crasso, cætis crenato, supra infrâ angulato.*

THE CRISP RISSOA. Shell small, whitish, spirally ribbed in waves, ornamented with thick longitudinal flexuous ribs; apex obtuse; whorls four, angular above the middle, last with two spiral ribs below, umbilicated; aperture subtriangular, lip thick, crenated outside, angular above and below.

Watson. Proc. Zool. Soc. 1873, p. 369, Pl. XXXIV.
f. 6.

Hab. Madeira.

Species 108. (Mus. Marrat.)

RISSEA MACANDREWII. *Ris. testa parrâ, brevi, rubro-fusca; anfractibus quinque, gradatis, angulatis, spiraliter crebrè costatis, costis perpendicularibus, crassis, supra medium angulatis munitis, ultimo*

infimæ spiraliter unicostato; aperturæ obliquæ subovatae; costæ labiali crassiæ, rotundatæ, spiraliter liratæ.

MACANDREW'S RISSOA. Shell small, short, reddish-brown; whorls five, in steps, angular, spirally closely ribbed, strengthened with perpendicular thick ribs, with an angle above the middle, last with a single spiral rib below; aperture obliquely subovate, labial rib thick, rounded, spirally ridged.

Watson. Proc. Zool. Soc. 1873, p. 372, Pl. XXXIV.
f. 8.

Hab. Gorgulho, Madeira.

Species 109. (Mus. Watson.)

RISSEA MONIZIANA. *Ris. testa brevissimæ, ferè alba, spiraliter liratæ, liris rotundis, approximatæ; apice acuto; anfractibus quaternis, brevibus, supra medium angulatis; aperturæ magnâ, rotundâ, costæ labiali subcuspidiæ, crassæ.*

MONIZA'S RISSOA. Shell rather short, almost white, spirally ridged, ridges rounded, close; apex acute; whorls four, short, angular above the middle; aperture large, rounded, labial rib rather expanded, thick.

Watson. Proc. Zool. Soc. 1873, p. 369, Pl. XXXIV.
f. 6.

Hab. Madeira.

Species 110. (Mus. Watson.)

RISSEA PICTA. *Ris. testa parvæ, trochiformi, distanter spiraliter striatæ, maculis fusci quadratis in series tres dispositis ornata; anfractibus quinque, convexis, ultimo magno; aperturæ subtriangoni, labio crasso; columellæ crassæ, arcuatae.*

THE PAINTED RISSOA. Shell small, top-shaped, distantly spirally striated, ornamented with brown square spots arranged in three rows; whorls five, convex, last large; aperture subtriangular, lip thick; columella thick, arched.

Jeffreys. Brit. Moll.

Hab. Madeira.

A narrower shell than *Rissoa picta*, the whorls being more elongated and distinct.

RISSOA.—PLATE XII.

Species 111. (Mus. Watson.)

RISSOA NOTARENSIS. *Ris. testá parvá, breviter evato-conicá, crassá, pallidissimè fulvá, costis longitudinalibus frequentibus liratis paulò arcuatis, infra medium desinenteibus, et liris spiralibus tenuibus sculptis, inter costas biseriatim fuscō-maculatis, infra maculas spiraliiter tricostatis; anfractibus quaternis, brevibus, apicali rotundo, ultimo magno; aperturā subrotundatā, labio crasso, rotundo.*

THE NOVARA RISSEA. Shell small, shortly ovate-conical, thick, very pale fulvous, sculptured with numerous ridged ribs a little curved, ending below the middle and slender spiral ridges, spotted with brown in two rows, three spiral ribs below the spots; whorls four, short, apical rounded, last large; aperture rather round, lip thick, rounded.

WATSON. Proc. Zool. Soc. 1873, p. 377, Pl. XXXV. f. 13.

Hab. Madeira.

Named after a frigate with which the shell had nothing to do.

Species 112. (Mus. Watson.)

RISSEA WATSONI. *Ris. testá parvá, tenuisculá, trochiformis, liris spiralibus proincurvatis rotundatis cinctis; anfractibus quaternis, apicali semirotundato, duobus medianis angulatis rugoso-costatis, inter costas costaneo maculatis, ultimo magno, angulato, supra angulum planulato, longitudinaliter costato, inter costas rubro-maculatis, medio et infra spiraliter rotundato costato, costá labiali hanc marginem attinente.*

WATSON'S RISSEA. Shell small, rather thin, trochus-shaped, girt with spiral prominent ridges; whorls four, apical semirotund, two middle angular, roughly ribbed, last large, angular, flattened, and longitudinally ribbed and spotted with red between the ribs above the angle, only spirally ribbed in the middle and below; labial rib not reaching the margin.

SCHWARTZ. Proc. Zool. Soc. 1873, Pl. XXXV. f. 11.
Hab. Madeira.

Species 113. (Mus. Watson.)

RISSEA PERMINIMA. *Ris. testá parvá, oblonga, alba, opaca, levigata; anfractibus quaternis, subelevatis, lateraditer rotundatis, ultimo magno, angustè umbilicato; aperturā subovatā, margine ferè integrō, tenuisculo.*

THE VERY SMALL RISSEA. Shell small, oblong, white, opaque, smooth; whorls four, rather raised, laterally rounded, last large, narrowly umbilicated; aperture rather oval, margin nearly entire, rather thin.

MANZONI. Proc. Zool. Soc. 1873, p. 385.

Rissoa abjecta. Watson.

Hab. Madeira.

Species 114. (Mus. Watson.)

RISSEA ALBUGO. *Ris. testá parvá, tenui, semipellucida, subovato-trochiformis, fasciis lineisque punctorum rubrorum picta; anfractibus quinis, brevibus, convexis; aperturā magnā, antice rotundatā, posticē acuminatā, columellā altā, subarcuatā.*

THE PEARLY FILM RISSEA. Shell small, thin, semi-pellucid, subovate-trochiform, painted with bands and lines of red spots; whorls five, short, convex; aperture large, anteriorly rounded, posteriorly acuminate, columella high, rather arched.

WATSON. Proc. Zool. Soc. 1873, p. 379.

Hab. Madeira.

The colouring consists in spiral and perpendicular rows of minute red spots.

Species 115. (Mus. Watson.)

RISSEA GIBBERULA. *Ris. testá brevi, quadrangulata, solidá, albá, vel pallidè fulvá, spiraliter angustè trifasciata, costis magis obliquè flexuosis, distantibus, ad suturam acuminatis mucilá, spira gradatá, suture concavæ; anfractibus brevissimis, ultimo infra costá spirali validè desinenti, latè umbilicato; aperturā parvæ, perpendiculariter ovati, marginé tenui, antice prominenti, costá labiali latissimá, crassá.*

THE LITTLE HUMPED RISSEA. Shell short, quadrangular, solid, white or pale fulvous, with three spiral narrow bands, strengthened with large obliquely flexuous distant ribs, pointed at the suture, spire gradated, suture concave; whorls very short, the last ending below in a solid spiral rib, broadly umbilicated; aperture small, perpendicularly oval, margin thin, prominent in front, labial rib very broad, thick.

WATSON. Proc. Zool. Soc. 1876, p. 371, Pl. XXXIV. f. 7.

Hab. Madeira.

This beautiful little shell has the general appearance of a *Cancellaria*, but is a true *Rissoa*.

RISSOA.

PLATE XIII.

Species 116. (Mus. Watson.)

RISSOA CORTICATA. *Ris. testi parvæ, albæ, tenui, Iris longitudinalibus tenibus numerosis, eleganter plexus, et strâs tenissimis spiritalibus sculpti; anfractibus quinque, apicali semirotundo, medianis convexis, ultimo anguo, subordi; aperturâ subovata, anticò rotundâ, posteriorè acuminatâ, latitudo integra, tenui.*

THE CORIACOUS RISSOA. Shell small, white, thin, sculptured with longitudinal, thin, numerous ridges, elegantly flexuous and very fine spiral striae; whorls five, apical half-round, middle convex, last large, subovate; aperture subovate, rounded anteriorly, acuminated posteriorly, lip entire, thin.

MANZONI. Proc. Zool. Soc. 1873, p. 389, Pl. XXXVI. f. 27.

Hab. Santa Cruz, Madeira.

A light inflated white shell, beautifully sculptured.

Species 117. (Mus. —?)

RISSOA (JEFFREYSIA) OPALINA. *Ris. testi subglobosæ, fusco-viridæ, diaphano, nitentæ; anfractibus quaternis, apicali semirotundo, duobus medianis brevibus, convergisimus, ultimo anguo, inflato; aperturâ subrotundâ, marginæ integro.*

THE OPAQUE RISSOA. Shell subglobose, horny-brown, diaphanous, shining; whorls four, apical half-round, two middle short, very convex, last large, inflated; aperture rather rounded, margin entire.

JEFFREYS. Brit. Moll.

Hab. Channel Islands (littoral).

Species 118. (Mus. Brit.)

RISSOA (JEFFREYSIA) DIAPHANA. *Ris. testi parvæ, nitenti, fusco-corneâ, diaphano, subconicæ; spirâ elevati, conicæ, obtuse; anfractibus quinque, gradatim crescentibus, convexis, ultimo subinflatæ; aperturâ subratunda, marginæ ferè continuo.*

THE TRANSPARENT RISSOA. Shell small, shining, horny-brown, transparent, rather conical; spire elevated, conical, obtuse; whorls five, gradually

increased, convex, last rather inflated; aperture rather round, margin nearly continuous.

ALDER. —? Forbes and Hanley, Brit. Moll.
Hab. Great Britain. Rare, littoral.

Species 119. (Mus. Brit.)

RISSOA (OINA) FASCIATA. *Ris. testi alti, acuminatæ, pallidi fulvi, castaneo-fuscâ, flexuosa crebræ costâ; anfractibus septem, declivibus; aperturâ subtriangulari, canali conspicuo, labio externo crasso, rotundo; columellæ brevi, crassæ.*

THE BANDED RISSOA. Shell raised, acuminated, pale fulvous, with two chestnut bands, with numerous flexuous ribs; whorls seven, sloped; aperture subtriangular, canal conspicuous, outer lip thick, rounded; columella short, thick.

ANGAS. Proc. Zool. Soc. 1851, p. 264.

Hab. New Zealand.

Species 120. (Mus. —?)

RISSOA CASTANEA. *Ris. testi elevatæ, levigatæ, fuscæ, apice obtuso; anfractibus quinque, convexis, subulatis; gradatim crescentibus, elevatis, ultimo unijugulo; aperturâ subpyriformi, margine crassiæculo.*

THE CHESTNUT RISSOA. Shell raised, smooth, brown; apex obtuse; whorls five, rather convex, gradually increasing, raised, last rather large; aperture rather pyriform, margin rather thick.

JEFFREYS. —? Brit. Moll.

Hab. British Islands.

Species 121. (Mus. Brit.)

RISSOA (OINA) COSTULATA. *Ris. testi parvæ, pupiformi, solidi, longitudinaliter costatæ, albæ, supra medium anfractus castaneo interruptum fasciatæ; anfractibus octavis, apicalibus attenuatis, medianis subinflatæ; aperturâ parvæ, marginæ tenui.*

THE SMALL RIBBED RISSOA. Shell small, pupa-shaped, solid, longitudinally ribbed, white, interruptedly chestnut-banded above the middle of the whorls

RISSOA.—PLATE XIII.

whorls eight; apical attenuated, middle a little swelled; aperture small, margin thin.

PLEASE. —? MS. Brit. Mus.
Hab. Sandwich Islands.

Species 122. (Mus. —? Copied.)

RISSEA (JEFFREYSIA) GULSONE. *Ris. testā parvā, fulvescenti, levigati, elevatā, spirā obtusa; anfractibus quinīs, coveris, gradatim crescentibus, ultimo angustissimō, angustissimā umbilicato; aperturā subrotundō, antice producta.*

WILSON'S RISSEA. Shell small, slightly fulvous, smooth, raised, spire obtuse; whorls five, convex, gradually increasing, last rather narrow, very narrowly umbilicated; aperture rather rounded, anteriorly produced.

CLAUK. —? British Mollusca.

Hab. Sandwith, Weymouth, Guernsey.

Species 123. (Mus. Brit.)

RISSEA (CINA) AUSTRALIS. *Ris. testā minutā, albā, costis nodosis, distinutib; longitudinalib; et liris paucis spiraliib; profundā cancellatō; anfractibus quinīs, bimarginatis; aperturā subtriangulā, canali conspicuo; columella crassa, labio externo crasso, marginē interno crenulato.*

THE AUSTRALIAN RISSEA. Shell very small, white, cancellated deeply with nodulous, distant, longitudinal ribs and few spiral ridges; whorls five, bimarginal; aperture subtriangular, canal conspicuous; columella thick, outer lip thick, inner margin crenulated.

SOWERBY.

Hab. Australia.

A deeply cancellated little species, not exactly resembling any yet described.

(ASSIMINEA.)

Species 1. (Mus. Sowerby.)

ASSIMINEA GRATANA. *Ass. testā rotundā, levigatā, epidermide subviridi indutā; spirā acuminatō; anfractibus quinīs, decubitus, rectilateribus; aperturā magnā, subtriangulā, int̄is castaneā, marginē continuo.*

GRAY'S ASSIMINEA. Shell conical, smooth, covered with greenish epidermis; spire acuminated; whorls five, sloped, straight-sided; aperture large, rather trigonal, chestnut within, margin continuous.

JEFFREYS. Trans. Linn. Soc.

Hab. Marshes of Kent.

Species 2. (Mus. Sowerby.)

ASSIMINEA LITTOREA. *Ass. testā globosā, subtriangularē, levigatā, fulvā; anfractibus tribus, superioribus brevissimis, ultimo magno, inflato, angustè umbilicato; aperturā latā, margine tenui.*

THE SHORE ASSIMINEA. Shell globose, a little transparent, smooth, fulvous; whorls three, upper very short, last large, inflated, narrowly umbilicated; aperture broad, margin thin.

DELLE CHAILLÉ. —?

Hab. Shores at Weymouth, &c.

MONOGRAPH
OF THE GENUS
SILIQUEARIA.

"Holy, holy, holy! Lord God Almighty!
All Thy works shall praise Thy Name, in earth, and sky, and sea."—*Bishop Heber.*

SILIQUARIA.

PLATE I.

Genus SILIQUARIA. Bruguière.

Testa marina, tubuliformis, spiralliter inciso-fissurata, versus apicem plerumque latè spiralis, deinde irregulariter contorta; operculum cornutum, cylindricum, multihamatum.

Shell marine, tubuliform, with a spirally-incised fissure, generally loosely spiral towards the apex, afterwards irregularly twisted; operculum horny, cylindrical, consisting of numerous laminae.

Synonym. *Tenagodes*. Guettard.

It is not within the scope of this work to enter critically into questions of generic nomenclature. If it were, we should still be disinclined to change the generally adopted and almost universally recognised name given above. The animal was formerly supposed to be an annelid, but is now ascertained to be a mollusk, with a remarkably complicated operculum, not unlike that of a solarium. The examination we have made gives us nearly a dozen fairly distinct species, with one or two of more doubtful character. The siliquarie are widely spread, the typical species being found frequently in groups embedded in sponges and entangled in the closely-twined roots of fuci. The Australian one or two species are like ponderous and coarse imitations of the Mediterranean *S. anguina*, excepting in the character of the slit. There do not appear to be any northern species of this interesting genus. M. Otto Morel, in his revision of the *Tenagodes* in the *Zoological Proceedings*, arranges the species into subgenera, and even into genera, by the characters of the slit. This, however, is so subject to variation in the same species, and even in the same individuals, that it is scarcely reliable even for specific, much less for generic, distinction.

Species 1. (Fig. a, b, c, d, Mus. Brit. Sowb.)

SILIQUARIA ORTUSA. *Sil. testa elongata, angustè convoluta, tenuissimè spiralliter striata, estus infra testa concentricè incisa; fissura spirali articulata.*

aperturi rotundi; fissuri spirali simplici, versus apicem frequenter clausi.

THE OBTUSE SILIQUARIA. Shell elongated, whorls large, spirally, rather finely lined, rather smoother within, thickened on the outside, concentrically fissured; spiral fissure simple, frequently closed towards the apex.

SCHUMACHER.

Hab. Mediterranean.

Serpula anguina, as of Linnaeus, Lam. Phil. &c.

Serpula annulatoides, Dillwyn.

Serpula angustus, Montfort.

Helix incisa, Linnaeus, test. jun.

This species being generally known by the name *Siliquaria anguina*, I should much have preferred retaining that name for it. But it appears perfectly clear that Born was wrong in taking what Linnaeus erroneously introduced as a variety for the type of his species, which is the true *Serpula anguina* Linnaeus, *S. muricata* Born. The name *S. obtusa* is founded upon what is a common variation in several species, namely, that of almost commencing with several broad, closely coiled whorls, so as to form a cylinder. *S. anguina* of Linnaeus is carefully described as having the slit subarticulated, whereas that of the present species is quite simple.

Species 2. (Fig. a, b, Mus. Brit.)

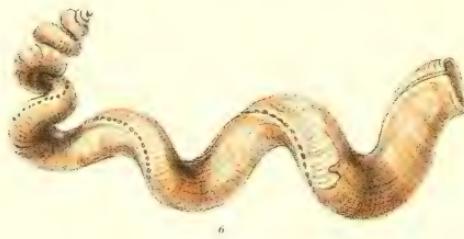

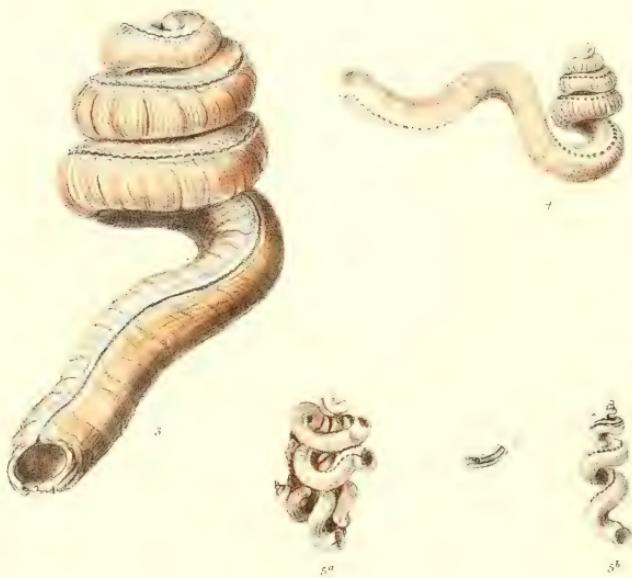

SILIQUARIA CUMINGIL. *Sil. testa elongata, aliud, angustè convoluta, tenuissimè spiralliter striata, estus infra testa concentricè incisa; fissura spirali articulata.*

CUMING's SILIQUARIA. Shell elongated, white, narrowly convolute, very finely spirally striated, finely concentrically incised on the lower part outside; spiral fissure articulated.

MÖENCH. Proc. Zool. Soc. 1860.

Hab. Isl. Ticao, Philippines; var. b. Japan.

Fig. b is a somewhat broader variety of this finely sculptured shell. The slit is articulated so as to present a chain-like appearance.

SILIQUARIA.

PLATE II.

Species 3. (Mus. Brit.)

SILIQUARIA PONDEROSA. *Sil. testa griseo-fuscescenti erassisimmo matto: anfractibus magnis, prope apicem et infra latè convolutis et approximatim, supra fissuram undulato-deundatis, intus levissimis, extus incrassatis, rudi concentricè fissuratis, ultimo laevo; fissur spirali in aequalibus superioribus clausa, tenui dentatitudi vel articulatud, deinde simplici.*

THE PONDEROUS SILIQUARIA. Shell brownish grey, very thick, large; whorls large, broadly convoluted and approximate near the apex and below; wavy dentated above the fissure, rather smooth inside, thickened outside, roughly concentrically fissured; last loose; spiral fissure closed in the upper whorls, then denticulated or articulated, afterwards simple.

MÖECKL. (Tenagodus) Proc. Zool. Soc. 1860.
Hab. Port Essington.

We admit this species on account of the apparent distinctness of form, which may nevertheless be only analogous to the turbinated variety of *Siliquaria anguina*.

Species 4. (Mus. Brit.)

SILIQUARIA TROCHLEARIS. *Sil. testa albida, rugosæ, prope apicem et versus medium densè convoluta; tuba magnitudine mediorum; anfractibus subrugatis, concentricè rudi fissuratis; fissur spirali rotundè et conspicue articulata.*

THE FULLY SILIQUARIA. Shell whitish, rugose, closely convoluted near the apex and towards the middle; tube moderate in size; whorls rather rough, concentrically rudely fissured; spiral fissure roundly and conspicuously articulated.

MÖECKL. (Tenagodus) Proc. Zool. Soc. 1860, p. 408.
Hab. Philippines.

The coiled portion of this species is close and compact, and the regular rounded articulations give a chain-like appearance to the fissure.

Species 5. (Fig. a, b, Mus. Brit.)

SILIQUARIA LACTEA. *Sil. testa parvæ, candidæ, cel fasciæ et violaceæ, plerumque irregulariter contortæ: tubæ parvæ, subrugosæ, raro striatæ; anfractibus apicalibus spiraliè pyramidatis; alteris subequalibus: fissur articulatæ, prope apicem per laminam partim clausæ.*

THE MILKY SILIQUARIA. Shell small, white, or brown and violet, generally irregularly contorted; tube small, rather rough, rarely striated; apical whorls spirally pyramidal; others nearly equal; fissure articulated, partly closed near the apex by a lamina.

LAMARCK. Hist. Nat. Anim. s. Vert V. p. 338.
Hab. Port Essington.

This little siliquaria is very gregarious, forming conglomerated masses. Fig. *b* represents a small portion of one of these masses.

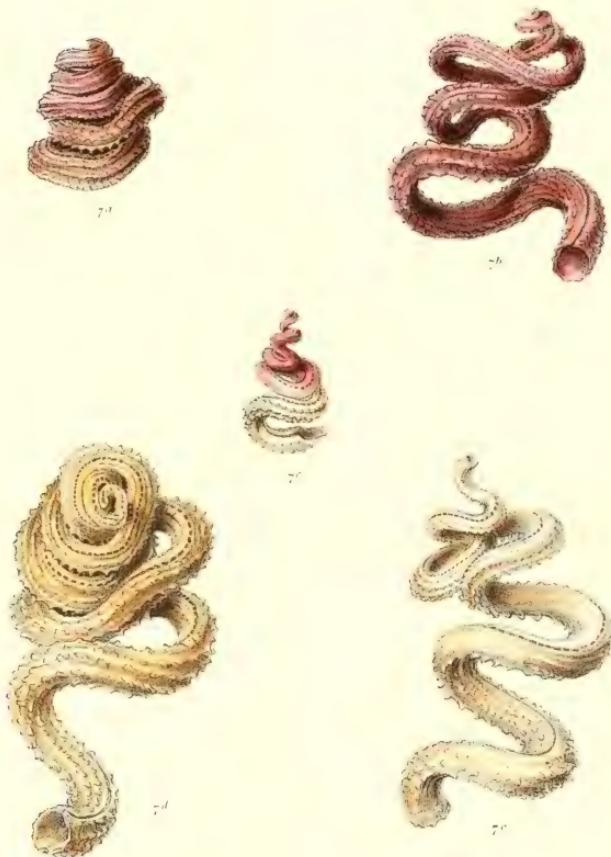

Species 6. (Mus. Brit.)

SILIQUARIA AUSTRALIS. *Sil. testa magnum, crassæ, versus apicem pyramidatæ, deinde locatæ; tubæ magnæ, regulariter crescenti, intus tenuissimè striatæ, extus crassæ, rugosæ, concentricè fissuratae; fissur spirali rotundæ articulatae, prope aperturam hianti; marginib' crassis.*

THE AUSTRALIAN SILIQUARIA. Shell large, thick, pyramidal towards the apex, then loosened; tube large, regularly increased, very finely striated on the inner side, thick, rugose on the outer, concentrically fissured; spiral fissure roundly articulated, gaping near the aperture; margin thick.

QUOY et GAIMARD. Voyage de l'Astrolabe.
Hab. Australia.

Although thicker and coarser in texture than the typical species, this species resembles it so much that it would be difficult to distinguish the two were it not for the round chain-like articulations of the spiral fissure. That of *S. obtusa* is quite simple.

SILIQUARIA.

PLATE III.

Species 7. (Fig. a, b, c, d, e, Mus. Brit. Sowb.)

SILIQUARIA ANGUINA. *Sil. testâ plerumque crassâ, lati-
et irregulariter contortâ, distanter spiraliiter liratâ,
liris acutè squamatis vel echinatis; tubâ plerumque
laeti crescenti; fissuri spirali angustissimâ in
partibus oblongo-articulata.*

THE SNAKE SILIQUARIA. Shell generally thick, broadly and irregularly twisted, distantly spirally ridged; ridges sharply squamous or spined; tube generally very slowly increasing; spiral fissure very narrow, with oblong articulations in parts.

LINNEUS. Syst. Nat. p. 1267.

Serpula muricata, Born.

Tenagoda anguina, Mörch.

Siliquaria polygyra, Blainville.

Siliquaria ruber, Schumacher.

Siliquaria papillosa (?) Rees.

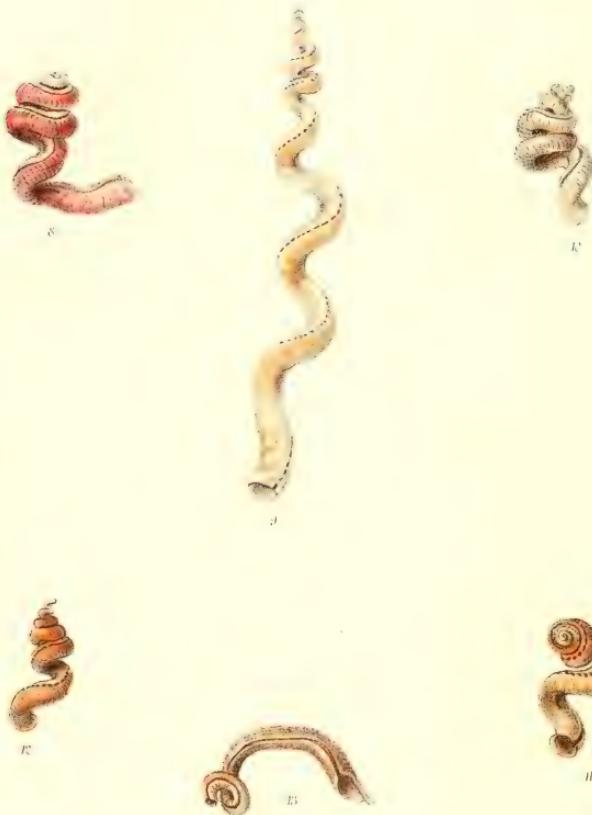

Siliquaria elegata, Lamarck.

Siliquaria sulcata, Gray.

Serpula echinata, Gmel.

Hob. Moluccas, Ceylon.

It is not without hesitation that the varieties in form and colouring represented in the plate are united under one specific name. M. Mörch applies the name *T. muricata* to the pale yellow variety (fig. d), and that of *T. ruber* to the Ceylon purple, thick-shelled, flat-whorled variety. We thought at first that the specimen fig. e might represent a distinct species, the tube and whorls being rounder and more regularly increasing, and the ridges not being so strongly developed. But having the young specimen (fig. c) before us, with the apical whorls purple and smooth, and the lower pale and spinous, while in some parts of the most rounded whorls the ridges could easily be traced, we concluded that the union could be better maintained than the separation. It is not difficult, even with comparatively few specimens, to trace the species through all its forms. The rounded and angular, smooth and spinose, thick and slender, scales without ridges and ridges without scales, the dark purple, yellow, and white colours, the articulated, closed, and simple slit are to be found within a few specimens, and sometimes in a single one.

SILIQUARIA.

PLATE IV.

Species 8. (Mus. Brit.)

SILIQUARIA SENGALENSIS. *Sil. testā parvā, rugosā, roseā vel pallidē fūdrā; tubā magnitudine mediocri, vix crescenti; anfractibus regularibus paucis, intus subverigatis, extus concentricè rugatis; fissurā spirali articulatā, tām versus aperturam simplici.*
THE SENEGA SILIQUARIA. Shell small, rugose, pink or pale fulvous; tube of middle size, scarcely increasing; regular whorls few, rather smooth on the inner side, concentrically wrinkled on the outer; spiral fissure articulated, then simple towards the aperture.

RÉCITS. Revue Zoologique.

Tenagoda incisa, Mörch, vix Chemn.

Hab. Senegal, Zanzibar?

In the rosy variety there is a strong resemblance to pink coral; the other varieties are unknown to us.

Species 9. (Mus. Brit.)

SILIQUARIA BERNHARDI. *Sil. testā albidi, fulvo-nubilatā, tenui elongatā, angustā et laxi convolutatā, versus apicem irregulatiter pyramidatā; tubā angustā, crenulatissimā striatā; fissurā spirali rotundato-articulatā.*

BERNHARD'S SILIQUARIA. Shell white, clouded with fawn, thin, elongated, narrowly and loosely twisted, irregularly pyramidal towards the apex; tube narrow, crenulately striated; spiral fissure roundly articulated.

MÖRCH.

Hab. Senegal.

A large group in the British Museum, containing hundreds of specimens, testifies to the very gregarious nature of this species.

Species 10. (Mus. Brit.)

SILIQUARIA ENCAESTICA. *Sil. testā parvā, crassā, rugosā, irregulariter pyramidatā; tubā parvā, intus levigatā, extus incrassatā, ruditæ concentricè rugatā et*

fissuratā; fissurā spirali in anfractibus superioribus clausā, tām articulatā, deinde simplici.

THE ENAMELLED SILIQUARIA. Shell small, thick, rugose, irregularly pyramidal; tube small, smooth on the inner side, thickened on the outer, roughly concentrically wrinkled and fissured; spiral fissure closed in the upper whorls, then articulated, afterwards simple.

MÖRCH. Proc. Zool. Soc. 1860, p. 408.

Hab. Ceylon.

But for the very strongly wrinkled exterior, this shell would seem to bear a rather strong resemblance to *S. trochlearis*. In the latter species, however, the slit is articulated throughout.

Species 11. (Mus. Brit.)

SILIQUARIA TOSTUS. *Sil. testā parvā, ferruginea, ad apicem intensè fissā; tubā angustā, levigatā; anfractibus ad apicem orbicularis; fissurā spirali, articulatā, utrinque linea denticulata marginata.*

THE BAKED SILIQUARIA. Shell small, ferruginous, very strong brown at the apex; tube narrow, rather smooth; whorls orbicular at the apex; spiral fissure articulated, bordered on both sides with a denticulated line.

MÖRCH. Proc. Zool. Soc. 1860, p. 405.

Hab. Ceylon.

Species 12. (Mus. Brit.)

SILIQUARIA REENTZII. *Sil. testā parvā, supernè et ad medianā spirali ter pyramidatā, fuscā; tubā parvā, extus concentricè fissurata, fissurā spirali articulata.*

REENTZ'S SILIQUARIA. Shell small, spirally pyramidal above and at the middle, brown; tube small, concentrically fissured outside; spiral fissure articulated.

MÖRCH. Proc. Zool. Soc. 1865.

Hab. — ?

SILIQUARIA.—PLATE IV.

Species 13. (Mus. Brit.)

SILIQUARIA TAHITENSIS. *Sil. testá levigatâ, pallidâ fulvâ; tubâ angustâ, laxè contortâ, liratâ, inter liras cancellatâ; fissurâ spirali angustâ, simplici.*

THE TAHITIAN SILIQUARIA. Shell smooth, pale, fulvous; tube narrow, loosely twisted, ridged, cancellated between the ridges; spiral fissure narrow, simple.

MÖRCH, Proc. Zool. Soc.
Hab. South Seas.

We have only a fragment of this species, which M. Mörch describes as differing from *Sil. lactea* in the greater size, the stronger ridges, the cancellated interstices, and the narrow slit.

Species not known.

Sil. dubius, Debrune; *Sil. gigas, Lissom;* *Sil. porosa, Boch;* *Sil. (Ten.) Aquila, Mörch;* *Sil. (Ten.) cylindrella, Mörch;* *Sil. (Pyxipoma) Mobii, Mörch.*

MONOGRAPH

OF THE GENUS

CYRENA.

"Nature is God's pure work, unsullied by sin; and therefore the study
of it is a pure delight to those who love Him."—*Dean Gobboe.*

C Y R E N A.

PLATE I.

Genus CYRENA. Lamarck.

MOLLUSCA ACEPHALOPODA, bimucensularia, fluvialia vel subfluvialia. Testa aquivalvis, inequilateralis, crassa, plus minusve orbicularis, tumida, concentrica; subtexta, et rugata; epidermis cornicis, solidis indutis; cardine crasso, dentibus cardinalibus elongatis, nonnumeratis; pollii impressione integrâ, vel ex sinuata.

MOLLUSCA ACEPHALOPODA, bimucensularia, fluvialia or subfluvialia. Shell equivalve, inequilateral, thick, more or less orbicular, tumid, concentrically grooved or wrinkled, covered with a horny solid epidermis; hinge thick, cardinal teeth two or three, lateral elongated, sometimes striated; palpal impression entire, or very slightly sinuated.

The shells composing this genus inhabit rivers and estuaries in tropical America, India, China, Australia, the Philippines and Islands of the Pacific. Although principally of freshwater habits, some are found in brackish water, and in the mud of mangrove swamps.

The distinctions between *Corbicula*, *Batissa*, and *Cyrena* seeming to me scarcely of generic importance, I have united them in this work under one generic term. It may, however, be convenient in the following list of specific numbers to designate the section to which each species belongs:—

Section 1. BATISSA. Lateral teeth straight and of moderate length. Species 1-21, 28.

Section 2. CORBICULA. Lateral teeth long, curved, and angular. Species 45-48, 51-61, 66-70, 72-77, 79-101.

Section 3. CYRENA. 22-27, 29-44, 49, 50, 62-65, 68, 71, 78, 102-114.

Species 1. (Mus. Brit.)

CYRENA GIGANTEA. *Cyr. testâ magâ, ponderosâ, subovali, valde inequilaterali, irregulariter sulcâ, epidermide crassâ, nigra indutâ; intus albâ, incrassatâ, partim purpurea tinctâ; latere antice brevi, postice producto, obscureissimâ angulato; cardine lato, dentibus cardinalibus integrâ, laterali anticâ brevi; ligamento magno, elongato.*

THE GIANTIC CYRENA. Shell large, ponderous, rather oval, very inequilateral, irregularly grooved, covered with a thick black epidermis; interior white, thick, tinted in parts with purple; anterior side short, posterior produced, very obscurely angular; hinge broad, cardinal teeth entire, anterior lateral short; ligament large, long.

PRIME. MS. Brit. Mus.

Hab. Philippines?

This species, having a short lateral tooth in front, is not very characteristic of the first or *Batissa* section.

Species 2. (Mus. Brit.)

CYRENA LENTICULARIS. *Cyr. testâ rotundâ, lenticulari, altâ, subequilaterali, irregulariter rugata, epidermide solidâ, subviridi, niteuti indutâ, intus ferrumino purpureo cinctâ suffusa; cardine subangusto, dentes cardinali centrali bifidi, laterilibus irregulariter elongatis, compressis, tenuissimè serotis.*

THE LENTICULAR CYRENA. Shell rounded, lenticular, high, subequilateral, irregularly wrinkled, covered with a solid rather green epidermis, suffused within nearly all over with vivid purple; hinge rather narrow, central cardinal tooth bifid, lateral equally elongated, compressed, very finely striated.

DESHAYES. Proc. Zool. Soc. 1854.

Hab. Philippines.

CYRENA.

PLATE II.

Species 3. (Mus. Brit.)

CYRENA TRIQUETRA. *Cyr. testâ subtrigonâ, allâ, sub-compressâ, luci, epidermide subvîridi, partim nigrescenti inolutâ; latere antico brevissimo, declivi; umbonibus elevatis; latere postico angulato, marginâ dorsali declivi.*

THE THREE-CORNED CYRENA. Shell rather trigonal, high, rather flat, smooth, covered with a rather green epidermis, blackish in parts; anterior side very short, sloped; umbones raised; posterior side angular, dorsal margin sloped.

DESHAYES. Proc. Zool. Soc. 1854, p. 13.

Hab. Philippines.

Species 4. (Mus. Brit.)

CYRENA ROTUNDATA. *Cyr. testâ rotundâ, tumidâ, in-equalitârali, irregulariter rugatâ et sulcatâ, epidermide solidâ, subvîridi, nitentî, medio radiatâ striatâ inolutâ; intus sparsim violascens; latere antico brevi, compresso; latere postico tumidissimo, sublavigato, marginâ laterali subquadrate.*

THE ROUNDED CYRENA. Shell round, tumid, inequilateral, irregularly wrinkled and grooved, covered with a solid, greenish, shining epidermis, radiately striated in the middle; sparingly purpled within; anterior side short, compressed; posterior area very tumid, rather smooth, lateral margin rather square.

LFA. Trans. Am. Ph. Soc. Pl. XVII. f. 51.

Hab. East Indies.

More tumid in the middle, and more depressed at the dorsal margin than *Cyrena lenticularis*.

Species 5. (Mus. Brit.)

CYRENA OBESA. *Cyr. testâ subovatâ, levigatâ, castaneâ, tumidâ, distanter leviter sulcatâ; latere antico brevi, tenuiter rugato, declivi; latere postico obscurè triangulato; marginâ dorsali rectilîsculo.*

THE FAT CYRENA. Shell subovate, smooth, chestnut, tumid, distantly slightly grooved; anterior side short, finely wrinkled, sloped; posterior side obscurely three-angled; dorsal margin rather straight.

HINDS. Voy. Sulphur.

Hab. Fiejoo Islands.

The posterior side is much produced, and the margin modified in shape by the three radiating obscure angles.

Species 6. (Mus. Brit.)

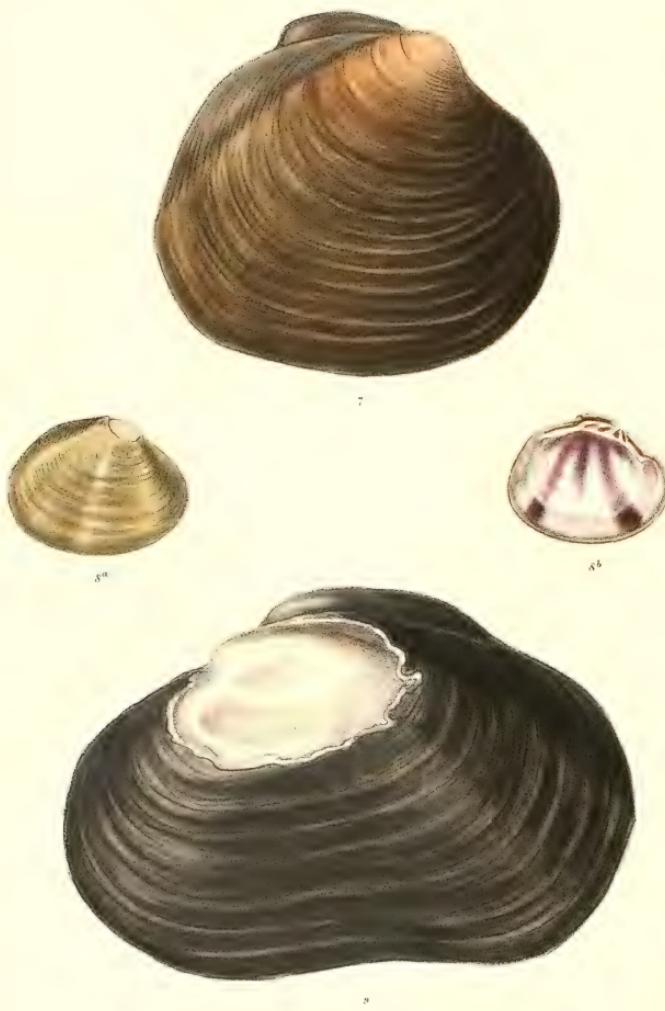

CYRENA KERAUDRENI. *Cyr. testâ magnâ, crassâ, sub-ovatâ, posticâ distanter, anticâ crebrè sulcatâ, epidermide nigra inolutâ; intus margine cardinali postico purpureo maculato, medio subradiale, latere antico brevi, declivi; latere postico productâ, subacuminato, ligamento maximo, elongato.*

KERAUDREN'S CYRENA. Shell large, thick, subovate, posteriorly distantly, anteriorly closely sulcated; covered with a black epidermis; with a purple spot on the posterior cardinal margin within, somewhat rayed in the middle; anterior side short, sloped; posterior side produced, a little acuminated, ligament very large, long.

LESSON. Voy. de la Coquille. Pl. II. f. 3.

Hab. Philippines.

Has very much the form and appearance of a large dark Cyprina.

C Y R E N A.

PLATE III.

Species 7. (Mus. Brit.)

CYRENA INSIGNIS. *Cyr. testâ elongato-subquadratâ, subcompressâ, antîcâ rugis elevatis, undulatis, non nullis bifurcatis lirata; posticâ levigata; laterâ antico brevi, rotunda; latere postico subquadrato, arcuâ dorsali impressâ obliquâ radiatu; unibonibus depresso; margine centrali rectiunculo.*

THE WONDERFUL CYRENA. Shell elongated-subquadrate, rather compressed, anteriorly ridged with raised, undulating, some of them bifurcated wrinkles, posteriorly smooth; anterior side short, round; posterior side rather square, obliquely rayed with a dorsal area; umboes depressed, ventral margin rather straight.

DESHAYES. Proc. Zool. Soc. 1854, p. 18.

Hab. Philippines.

The wrinkles on the anterior surface of this shell are very remarkable.

Species 8. (Fig. a, b, Mus. Brit.)

CYRENA MINOR. *Cyr. testâ ovato-subrotundâ, depresso; compressâ, subiridi-stramineâ, medio albo bistrati, levigato; intus viridâ purpureo radiato; laterâ antico breviter lirato, brevi, valde declivi; latere postico latiori; unibonibus obtusis; margine dorsali depresso; cardine augusto, dente lateralâ antico brevissimo.*

THE SMALLER CYRENA. Shell ovate-roundish, depressed, compressed, greenish straw, with two

white rays, smooth; rayed with bright purple within; anterior side shortly ridged, short, much sloped; posterior side wider; umboes obtuse; dorsal margin depressed; hinge narrow, lateral anterior tooth rather short.

PRIME. MS. Mus. Brit.

Hab. —

This little shell being rayed within and without, and being more depressed at the dorsal margin than most of the group to which it belongs, may show it to be a distinct species, rather than the young of some other.

Species 9. (Mus. Brit.)

CYRENA UNIONIFORMIS. *Cyr. testâ crassâ, oblongâ, reniformi, subarcuata, epidermide nigra, rugata indentata; latere antico brevi, margine dorsali declivâ unibonibus parvis incurvâ, depresso, latere postico producto, margine dorsali arcuato, margine centrali excavato; ligamento maximo.*

THE UNIO-SHAPED CYRENA. Shell thick, oblong, kidney-shaped, rather arched, covered with a black, rough epidermis; anterior side short, dorsal margin sloped; umboes small, incurved, depressed; posterior side produced, dorsal margin arched; ventral margin excavated; ligament very large.

PRIME. Proc. Zool. Soc. 1860, p. 319.

Hab. —?

R

n

r^o

C Y R E N A.

PLATE IV.

Species 10. (Mus. Brit.)

CYRENA INFILATA. *Cyr. testā inuidissimā, crassā, valde inaequilaterall, epidermide rugosā, crassā, nigra indutā, intus versus marginem densē purpureā, ad marginem nigrescenti; margine cardinali lato, fulero latissimo, dente antico brevi, magno; latere antico brevi, angusto; latere postico expanso, inflato, ad marginem biangulato; margine dorsali elevato.*

THE INFLATED CYRENA. Shell very tumid, thick, very inequilateral, covered with a rough, thick black epidermis, deep purple within towards the margin, deepening into black at the margin; cardinal margin broad, fulerum very broad; anterior tooth short, large; anterior side short, narrow; posterior side expanded, inflated, with two angles at the margin; dorsal margin raised.

PRIME. Proc. Zool. Soc. 1860, p. 20.

Hab. Nicobar Islands.

Species 11. (Mus. Brit.)

CYRENA VENERIFORMIS. *Cyr. testā ovalā, solidā, castanā, tumidā; intus purpureo partim suffusā; latere antico brevi, declici, ferè usque ad medium subregulariter lirato; latere postico inflato, tumido, ad marginem rotundato; umbonibus prominentibus.*

THE VENUS-SHAPED CYRENA. Shell ovate, solid, chestnut, tumid, suffused with purple inside; anterior side short, sloped, rather regularly ridged as far as the middle; posterior side in-

flated, tumid, rounded at the margin; umboes prominent.

SOWERBY.

Batissa fuscata. Prime.

Cyrena fuscata of Lamarck belongs to the section separated by authors as a genus under the name *Corbicula*. It is a very inconvenient practice, in naming new shells, to repeat a name already applied to a species in what has recently been considered the same genus.

Species 12. (Mus. Brit.)

CYRENA PRODUCTA. *Cyr. testā magnā, altā, subrotundā, epidermide fuso-subcirculari nitentē indutā, medio levigatā, utroque latere distanter sulcatā; intus roseā, densē purpurascenti, latere antico brevissimo, areā depresso sublunari, ad marginem sinuatā; latere postico subquadrate, margine dorsali elevato; umbonibus elevatis, prominentibus, incurvis; ligamento magno, brevi.*

THE PRODUCED CYRENA. Shell large, elevated, rather round, covered with a greenish brown shining epidermis; smooth in the middle, distantly grooved on each side; rose, shading into deep purple within; anterior side very short, sinuated at the margin by a depressed lunule-like area; posterior side rather square, dorsal margin elevated; umboes raised, prominent, turned inwards; ligament large, short.

DESHAYES (*Batissa*). Proc. Zool. Soc. 1854, p. 13.

Hab. —?

C Y R E N A.

PLATE V.

Species 13. (Mus. Brit.)

CYRENA AUSTRALIS. *Cyr. testā oratā, crassā, inflatā, castaneā, intus posticē roseo-purpurascēti radiatā; latere antico brevi, angustato, subaequāvato, subregulariter lirato, prope marginem dorsalem areā depressā subsinuato; latere postico tumidissimo, radiatim biangulato; umbonibus ovatis, depresso-*

THE AUSTRALIAN CYRENA. Shell ovate, thick, inflated, chestnut, posteriorly rayed with rose-purple within; anterior side short, narrow, rather acuminate, nearly regularly ridged; slightly sinuated near the dorsal margin by a depressed area; posterior side very tumid, radiately biangular; umbones ovate, depressed.

DESHAYES. Proc. Zool. Soc. 1854, p. 14.

Hab. South Australia.

Species 14. (Mus. Brit.)

CYRENA TENEROSA. *Cyr. testā ovo-oblongā, compressā; intus posticē densē purpureā, cætōs epidermide fuscō-castaneā intutā; latere antico brevi, angusto, obtuso, liris acutisulcūs rugato; umbonibus depresso; medio levē, complanato; latere postico producto, lato, validō biangulato; marginē dorsali rectisulco, subelevato.*

THE SHADOWY CYRENA. Shell ovate-oblong, compressed; deep purple posteriorly within, covered outside with a smoky chestnut epidermis; anterior side short, narrow, obtuse, wrinkled with rather sharp ridges; umbones depressed, middle smooth, flat; posterior side produced, broad, with two strong angles, dorsal margin somewhat straight, rather raised.

HINDB. Voy. Sulphur.

Hab. Feeje Islands.

Species 15. (Mus. Brit.)

CYRENA VIOLACEA. *Cyr. testā ovo-oblongā, subcompressā, castaneā, intus violaceo suffusā; latere*

antico liris distinctis, romantīs intercalatis, ad medium extensis sculpi, marginē dorsali declivī; latere postico productō, obscurē radiatim triangulato; marginē dorsali elevato, arcuato, marginē ventrali paulō excavato.

THE VIOLET CYRENA. Shell ovate-oblong, rather compressed, chestnut; suffused with violet within; anterior side sculptured with distinct ridges, some intercalated, extending to the middle, dorsal margin sloped; posterior side produced, with three obscure radiating angles; dorsal margin raised, arched, ventral margin a little excavated.

LAMARCK. Anim. s. Vert. Chén. Illus. Conch. Pl. VII f. 5.

Hab. Indian Ocean.

There can be little certainty as to the identification of this Lamarekian species. The specimen figured resembles in form and compression the one figured by Chén as Lamarek's shell. It is, however, uncoated.

Species 16. (Mus. Brit.)

CYRENA FORTIS. *Cyr. testā subcompressā, subovatā, crassā; intus dentibus lateralibus subequalibus, elongatis, serratis, cardinalibus bifidis armatā; cætōs epidermide viridi-fusca, crassā, subrugosā intutā; latere antico sulcis crebris sculpto; latere postico sulcis distantiibus rugato; latē angulato, post angulum liris divergentibus subnodosis rugato.*

THE STRONG CYRENA. Shell rather compressed, rather oval, thick; armed within with rather equal elongated, serrated, lateral and bifid cardinal teeth, covered outside with a greenish-brown, rather rough epidermis; anterior side sculptured with numerous ridges; posterior side wrinkled with distant sulci; broadly angular, behind the angle wrinkled with diverging, rather nodose ridges.

PRIME. Proc. Zool. Soc. 1860, p. 320.

Hab. New Caledonia.

Species 22. (Mus. Brit.)

CYRENA PAPUA. *Cyr. testā ovatā, compressā, stramineā, concentricē subdistanter fibrillationē striatā; versus umbones utrinque areā impressā marginatā; laterē antico brevi, rotundo, margine dorsali concordē, declīri; laterē postico productō, radiatō angulatō, marginē dorsali prope umbones convexa, tūm delevi, marginē terminali breviter truncata; umbonibus depresso.*

THE PAPUA CYRENA. Shell oval, compressed, straw-coloured, concentrically rather distantly fringed-striated; bordered on each side near the umboes with an impressed areæ; anterior side short, round, dorsal margin convex, sloped downwards; posterior side produced, radiately angular, dorsal margin convex near the umboes, then sloped downwards, terminal margin shortly truncated; umboes depressed.

LESSON. Guérin: Mag. Zool. Pl. XI.
Hab. —?

Species 23. (Mus. Brit.)

CYRENA BENGALENSIS. *Cyr. testā solidā, tumidā, crassitā, subtriangulari, fuscō-nigrescenti, rugoso-striatā; laterē antico alto, brevissimo, declīri, amplio; laterē postico producto, marginē dorsali longe declīri, ad terminalia truncata, ante angulum cū excavato.*

THE BENGAL CYRENA. Shell solid, tumid, thick, subtriangular, blackish-brown, roughly striated; anterior side high, very short, sloped, full; posterior side produced, dorsal margin with a long slope, truncated at the end, very slightly excavated in front of the angle.

LAMARCK. Anim. sans Vert. Cyrena, 19.
Hab. Bengal.

Species 24. (Mus. Brit.)

CYRENA CYPRINOIDES. *Cyr. testā magnā, attīssimā, rotundo-subquadratā, subcircularē fuscō, rugoso-striatā; laterē antico brevissimo, subitus umbones excavato, areā sublunulari impresso; umbonibus tenuis, ferē terminalibus; laterē postico subquadratō, radiatō impresso, marginē dorsali arcuatā, marginē terminali sinuato.*

THE CYPRINA-LIKE CYRENA. Shell large, very high, roundly subquadrate, greenish-brown, roughly striated; anterior side very short, excavated under the umboes, impressed with a lunule-like area; umboes incurred, nearly terminal; posterior side rather square, radiately impressed, dorsal margin arched, terminal margin sinuous. GUOU. Voyage de l'Astrolabe. Pl. LXXXII, f. 1-2.
Hab. —.

Species 25. (Mus. Brit.)

CYRENA TRIANGULARIS. *Cyr. testā trigonā, attīssimā, compressā, concentricē transversā, vītūtū undulatō striatā; laterē antico brevissimo, versus marginem centralē acuminatā productō, subitus umbones subexcavato, ferē perpendiculariter declīri; umbonibus attīssimis; laterē postico versus marginem radiatō impresso, marginē terminali subtruncato, marginē dorsali longō arcuatā declīri.*

THE TRIANGULAR CYRENA. Shell trigonal, very high, compressed, concentrically finely, minutely, wavyly striated; anterior side very short, acuminately produced towards the ventral margin, somewhat excavated under the umboes, almost perpendicularly sloped; umboes very high; posterior side radiately impressed not far from the margin, dorsal margin with a long, arched slope.

METCALFE. MS. Cum Coll.
Hab. —?

Species 26. (Mus. Brit.)

CYRENA SINOSA. *Cyr. testā subquadratā, attīssimā, ponderosa, epidermide fuscō-nigrescenti rugoso-striatā indutā; laterē antico brevi, infī subrotundatō; umbonibus ferē terminalibus; laterē postico producto, subquadratō, sulcis duobus sinuatō radiatō impresso, marginē terminali sinuato, marginē dorsali arcuatā declīri.*

THE SINUOUS CYRENA. Shell subquadrate, rather high, ponderous, covered with a blackish-brown roughly-striated epidermis; anterior side short, roundish below, umboes nearly terminal; posterior side produced, rather square, radiately impressed with two sinuated grooves, terminal margin sinuous, dorsal margin sloped with a curve.

DESHAYES. Proc. Zool. Soc. 1854, p. 18.
Hab. Ceylon.

CYRENA.

PLATE VIII.

Species 27. (Fig. *a, b*, Mus. Brit.)

CYRENA CARDIFORMIS. *Cyr. testā tenuisculptā, subtriangulā, profundā, inflatā; obscurā fuscā, intus mucinōsum purpureo-nebulatā, extus concentricī sublistantib⁹ striatā; laterē postico brevi, excavato, areo semilunari impresso; laterē postico producto, declīsi, ad terminum breviter truncato; umbonibus inflatis, rotundis; margine centrali concavo, proprie terminū posticum paulo concavō.*

THE HEART-SHAPED CYRENA. Shell rather thin, subtriangular, deep, inflated; dull brown, sometimes ellooded with purple inside, outside concentrically rather distantly striated; posterior side produced, sloped, shortly truncated at the end; umboes inflated, rounded; ventral margin convex, a little concave near the end.

DESHAYES. —? MS. in Cum. Coll.
Hab. Payta, Peru.

Species 28. (Mus. Brit.)

CYRENA DIVERGATA. *Cyr. testā crassi, tumidissimā, nigrescenti, concentricā, undulatā, latē striatā; intus pallidē carniō; laterē antico brevissimo, declici, subexcavato; umbonibus depresso, ferū terminalibus, laterē postico tumido, angulato, post angulum et paulo ante diverguntib⁹ rugato, marginē dorsali arcuato.*

THE DIVERGENT CYRENA. Shell thick, rather fumid, nearly black, with concentric undulating broad striae; pale, fleshy within; anterior side very short, sloped, slightly excavated; umboes depressed, almost terminal, posterior side tumid, angular, behind and a little before the angle divergently wrinkled; dorsal margin arched.

DESHAYES. Proc. Zool. Soc. 1874, p. 17.
Hab. New Guinea.

Species 29. (Mus. Brit.)

CYRENA PANAMAENSIS. *Cyr. testā inflatā, globosā, altā, fuscō-subiridi, laterē antico subtus umbones rotundib⁹ excavato, infū rotundū producto; umbonibus elevatis, rotundis; margine ventrali concavo; laterē*

postico angulato, ad angulum obscurissimō curvante, areo postangulare excavati, planata.

THE PANAMA CYRENA. Shell inflated, globose, high, greenish-brown; anterior side roundly excavated under the umboes, roundly produced below; umboes elevated, round; ventral margin convex; posterior side angular; very obscurely keeled at the angle, postangular area cornered, flat.

PRIME. —? MS. Mus. Brit.

Hab. Panama.

Species 30. (Mus. Brit.)

CYRENA MARITIMA. *Cyr. testā inflatā, subglobosā, altissimā, epidermide papyracea indutā, concentricā striatā; marginē dorsali utrinque declīsi; laterē postico angulato, ad angulum obtusū curvato; umbonibus rotundis, inflatis.*

THE MARITIME CYRENA. Shell inflated, subglobose, very high, covered with a papyraceous epidermis, concentrically striated; dorsal margin sloped on each side; posterior side angular, with an obscure keel at the angle; umboes rounded, inflated.

C. B. ADAMS. Proc. Zool. Soc. 1854, p. 355.
Hab. —?

Species 31. (Fig. *a* and Fig. *b, c*, Pl. X. Mus. Brit. and Sowerby.)

CYRENA CAROLINIENSIS. *Cyr. testā altā, brevi, tumida, valde inflatā, epidermide rugoso-striatā, olivacea vel pallidē fulvā indutā, intā subtus umbones carniē, ad laterā cardinācūque purpureo-maculatā et radiatā; laterē antico brevissimo, declīsi; umbonibus altis, tumidis, prominentibus; laterē postico latā, subtruncato, marginē dorsali declīsi.*

THE CAROLINA CYRENA. Shell raised, short, tumid, much inflated, covered with a roughly striated olive or pale fulvous epidermis, fleshy within, under the umboes spotted and rayed, with purple at the sides and hinge; anterior side very short, sloped; umboes high, tumid, prominent; posterior side broad, slightly truncated, dorsal margin sloped.

BOSC. Nich. Enc. Am. Pl. I, f. 10.
Hab. S. Carolina, N. America.

CYRENA.

PLATE IX.

Species 32. (Mus. Sowerby.)

CYRENA OLIVACEA. *Cyr. testa tenui, straminea, subtriangularis, undulatim striata, tubus pauperrimus, dentibus cardinalibus parvis, lateribus anticus brevioribus; latera antica declivi; latera postica angulata, marginis dorsali declivi, laterali obliquè truncata, infra acuminata, marginis ventrali ante angulum excavata, umbonibus subcentralibus.*

THE OLIVACEOUS CYRENA. Shell thin, straw-coloured, greenish, subtriangular, undulately striated, inside purple, cardinal teeth small, anterior lateral rather short; anterior side sloped, posterior side angular, dorsal margin sloped, lateral obliquely truncated; acuminate below; ventral margin excavated in front of the angle; umboes nearly central.

CARPENTER. —— ♀ MS.
Hab. California.

Species 33. (Mus. Brit.)

CYRENA OBSCURA. *Cyr. testa crassissima, trigona, subconcreta, epidermis nigra, crassa, densa striata inclusa; latera antica brevi, subexcavata, areæ lunulari impresso; latera postica angulata, coddè declivi, marginis ventrali ante angulum subexcavata.*

THE OBSCURE CYRENA. Shell thick, trigonal, somewhat compressed, much elevated, covered with a black, thick, closely striated epidermis; anterior side short, rather excavated, impressed with a lunular area; posterior side angular, much sloped, ventral margin a little hollow in front of the angle.

PRIME. Proc. Zool. Soc. 1860, p. 321.
Hab. New Granada.

Species 34. (Mus. Brit.)

CYRENA FONTAINEL. *Cyr. testa altissima, subtriangularis, compressa; densa castanea, striata; latera antica brevi, declivi, marginis ventrali rotunda; umbonibus elevatis subacuminatis; latera postica subangulata, coddè declivi, infra acuminata.*
FONTAINEL'S CYRENA. Shell very high, subtriangular, thick, compressed; deep chestnut, striated; anterior side short, sloped, ventral margin rounded; umboes elevated, rather acuminate; posterior

side rather acutely angular, much sloped, acuminate below.

D'ORBIGNY. —— ♀ MS.

Hab. —— ?

Species 35. (Mus. Brit.)

CYRENA VENTRICOSA. *Cyr. testa subovata, crassa, tumida, pallide straminea, levigata; latera antica brevi, rotunda; latera postica producta, marginis dorsali declivi, marginis terminali truncata, infra subexcavata.*

THE VENTRICOSE CYRENA. Shell subovate, thick, tumid, pale straw, smooth; anterior side short, rounded; posterior side produced, dorsal margin sloped, terminal margin slightly truncated.

DESHAYES. Proc. Zool. Soc. 1854, p. 16.
Hab. Australia.

Species 36. (Mus. Brit.)

CYRENA ESSINGTONENSIS. *Cyr. testa orata, castanea, distante concentrica flavidato-striata; latera antica brevi, declivi, areæ lunulari impressa; latera postica producta, marginis dorsali arcuata; marginis ventrali concava; umbonibus depresso.*

THE PORT-ESSINGTON CYRENA. Shell ovate, chestnut, distantly concentrically fringe-striated; anterior side short, sloped, impressed with a lunular area; posterior side produced, dorsal margin arched; ventral margin convex; umboes depressed.

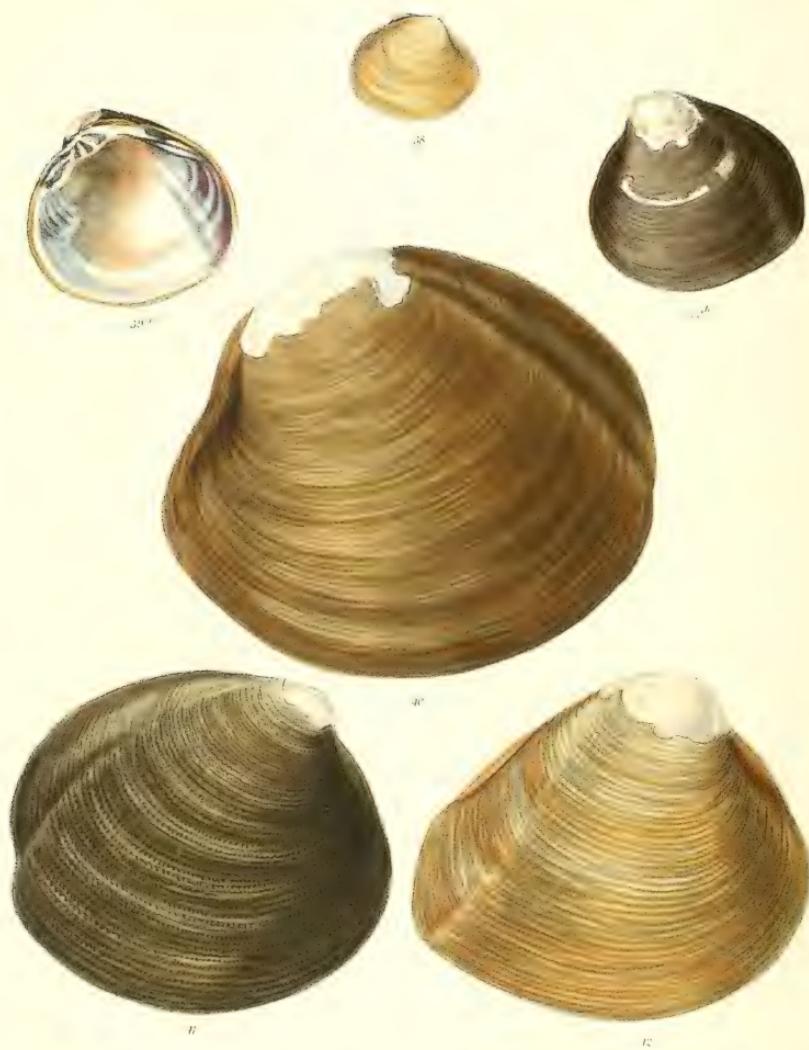

DESHAYES. Proc. Zool. Soc. 1854, p. 19.
Hab. Port-Essington, Australia.

Species 37. (Mus. Brit.)

CYRENA OBLONGA. *Cyr. testa oblongo-ovalis, crassa, subdilatata subdilatata testa, stramineo-roseo-cente; latera antica brevissima, subtus umbonibus excavata, areæ lunulari impresso; latera postica producta, obcurè angulata, ad terminalium truncata, marginis dorsali declivi.*

THE OBLONG CYRENA. Shell oblong-ovate, thick, rather distantly wavy striated, reddish straw, anterior side rather short, hollow under the umboes, impressed with a lunular area; posterior side produced, with an obscure angle, truncated at the end; dorsal margin sloped.

DESHAYES. Proc. Zool. Soc. 1854, p. 341.
Hab. —— ?

C Y R E N A.

PLATE X.

Fig. 31, b, c. CYRENA CAROLINIENSIS. (See Pl. VIII.)

Species 38. (Mus. Brit.)

CYRENA NITIDULA. *Cyr. testâ ovatâ, subcompressâ, concentricâ tenuiter striatâ, stramineâ, anticâ breviori, subacuminata, posticâ magis expansâ, obtusa; umbonibus subdepressis, margine dorsali posticâ paulò, anticâ valle declivi.*

THE SHINING LITTLE CYRENA. Shell ovate, subcompressed, concentrically finely-striated, straw-coloured, in front rather short, subacuminated, posteriorly more expanded, obtuse; umbones rather depressed, dorsal margin a little sloped behind, much in front.

DESHAYES. Proc. Zool. Soc. 1854, p. 21.

Hab. —?

Species 39. (Mus. Brit.)

CYRENA SUBLOBATA. *Cyr. testâ magnâ, crassâ, oblongâ, epidermide fuscâ, rugosâ indutâ; latere antico breccissimum, sub umbo arcâ lunulari convexâ impresso; latere postico producto, radiatum bisulcato, marginâ dorsali arcuata declivi, marginâ terminali leviter sinuosa lobato.*

THE SUBLOBED CYRENA. Shell large, thick, oblong, covered with a brown rough epidermis; anterior side very short, impressed with lunular convex area; posterior side produced, with two radiating grooves, dorsal margin sloped in an arch, terminal margin sinuously slightly lobed.

DESHAYES —? MS. Cum. Col.

Hab. The Louisiana Archipelago.

In some degree like *Cyprina Cyprinoides*, but more oblong, and having a double groove at the back, which gives a lobed character to the posterior margin.

Species 40. (Mus. Brit.)

CYRENA CALEDONICA. *Cyr. testâ subquadrate, grossâ, epidermide crassis, rugosâ, olivaceo-fusca, subdistanter striatâ, striâ squamulosa-fimbriatis; latere antico breccissimum, arcâ lunulari impresso, marginâ laterali fusi perpendiculari; umbonibus subteretis-nubibus; latice postico subquadrate, marginâ dorsali arcuata, marginâ terminali sinuata.*

THE CALEDONIAN CYRENA. Shell subquadrate, thick, covered with a thick, rough, olive-brown epidermis, distantly striated, striae with a scaly fringe; anterior side very short, impressed with a lunular area; lateral margin almost perpendicular; umbones nearly terminal; posterior side rather square, dorsal margin arched, terminal margin sinuated.

GASSIES. —? MS. Brit. Mus.

Hab. New Caledonia.

Species 41. (Mus. Brit.)

CYRENA FALAX. *Cyr. testâ obliquâ subtriangularis, tumida, melius distinxer, ad lateres densâ striatâ, sordidâ oliveacea, prope umbo subgibbosâ; latere antico brevi, declivi, arcâ lunulari, convexâ impresso; umbo elevatus, ovalis, ventris, marginâ dorsali declivi, marginâ postico-laterali breviter truncato.*

THE FALLACIOUS CYRENA. Shell obliquely subtriangular, tumid, striated distantly in the middle, closely at the sides, dull olive, rather gibbous near the umbones; anterior side short, sloped, lunule, impressed with a convex lunular area, umbones elevated, oval, posterior area sloped, dorsal margin sloped, postero-lateral margin shortly truncated.

DESHAYES. Proc. Zool. Soc. 1854, p. 15.

Hab. —?

50

CYRENA.

PLATE XI.

(Species 42 inadvertently omitted.)

Species 43. (Mus. Brit.)

CYRENA TRIGONA. *Cyr. testi ovata, subiniquilaterali, straminis, concentricè tenuer striatâ; latere posteriori majori, subarcuatum declivè; prope marginem angulata, marginè ventrali convexo; latere antico subacuminato, umbonibus versus marginem anticus inclinatis; marginè antico valde declivis.*

THE TRIGONAL CYRENA. Shell ovate, rather inequilateral, straw-coloured, concentrically finely striated; posterior side the larger, sloped in a slight curve, angular near the margin, ventral margin convex; anterior side slightly acuminate, umboes inclined towards the anterior margin, anterior margin much sloped.

DESHAYES. Proc. Zool. Soc. 1854, p. 344. Hanley, Conch. Ind. Pl. 155.

Hab. Pondicherry.

This is given on the authority of the British Museum (as type) and the Conch. Ind., but the shell is far from being of a trigonal form.

Species 44. (Mus. Brit.)

CYRENA BENSONI. *Cyr. testi subovata, subcompressa, straminis, tenuissimè radiatâ, tenuiter undulatim concentricè rugatâ, equilaterali; latere antico prope marginem angulata; latere postico angulata, ad angulum dicaricatum rugatâ; umbonibus centralibus latè extisque rubris.*

BENSON's CYRENA. Shell subovate, subcompressed, straw-coloured, very finely rayed, wrinkled with fine concentric undulations, equilateral; anterior side angulated near the margin; posterior side angular, divergently wrinkled at the angle; umboes central, red inside and out.

DESHAYES. Proc. Zool. Soc. 1876, p. 315.

Hab. River Jumna.

Said to be notable for its general smoothness. To the writer it appears most remarkable for the acutely angular diverging wrinkles on the posterior angle.

Species 45. (Mus. Hanley).

CYRENA IRAVADICA. *Cyr. testi trigono-subovata, ultra, ventricosa, concentricè profundè rugatâ, ad umbones caruculâ; infrâ olivaceâ, intâ purpureâ, umbonibus subcentralibus elevatis, margine ventrali utrinque declivis; margine ventrali validè convexo.*

THE IRAWADDY CYRENA. Shell trigono-subovate, elevated, ventricose, concentrically deeply rugose, blue at the umboes, olivaceous below, purple within; umboes nearly central, raised, dorsal margin sloped on each side; ventral margin very convex.

BLANDFORD. MS. Hanley. Conch. Ind. Pl. 155.

Hab. River Irawaddy, Pegu, Ava.

Species 46. (F. a, b, Mus. Sowerby.)

CYRENA EROSA. *Cyr. testi altissimâ, solidiusculâ, sub-angulatrigona, infâ omnino, prope marginem densissimè purpuratâ, dentibus lateralibus elongatis, serratis, cardinalibus tricus, elongatis; latere antico obvîsculo, areâ semilunatâ, planudatis, latere postico infâ subproducto, umbonibus elevatis; lîris concentricâ distansibus, tenuibus.*

THE TRIANGULAR CYRENA. Shell very high, rather solid, subequilateral, trigonal, purpled within all over, very deeply near the margin; lateral teeth elongated, serrated; cardinal three; anterior side rather short, with a semilunar, flattened area; posterior side a little produced below, umboes much raised; concentric ridges distant, thin.

DESHAYES. MS. Proc. Zool. 1854, p. 354.

Cyrena triangularis. Deshayes?

Hab. —?

Species 47. (a, b, Mus. Sowerby.)

CYRENA RADIANA. *Cyr. testi altâ, obliquè subtriangularis, tumidâ, regulariter sublisterior liratâ, intâ utrinque radiatim purpureo-fuscatâ; latere antico brevissculo, areâ depresso, lunulari; latere postico obliquè paulo producto, radiatim angulato; umbonibus elevatis, acuminatis, marginibus lateralis declivibus.*

CYRENA.—PLATE XI.

THE BAYED CYRENA. Shell elevated, obliquely sub-trigonal, tumid, regularly rather distantly ridged, radiately banded within on each side with purple; anterior side rather short, with a depressed lunular area; posterior side a little produced obliquely, radiately angular; umboes elevated, acuminate, lateral margins sloped.

HANLEY. —? MS.

Hab. —? :

Species 48. (Mus. Hanley.)

CYRENA OCCIDENTIS. *Cyr. testā ovatā, subcompressā, subdepressā, inaequilaterali, liris subdistantibus, regulariis concentricè rugatā; intus purpureis, subtus umboes triradiati; apice crenulatō; epidermide silenti, subviridi; laterē antico breviāculo, crenulatō, uniradiati; laterē postico paulo productō, subattenuato, ad terminum subtruncatō.*

THE SUN-SET CYRENA. Shell ovate, slightly compressed, slightly depressed, inaequilateral, concentrically wrinkled with rather distant, regular ridges; purple within, three-rayed under the umboes; apex blue; epidermis shining, greenish; anterior side rather short, with a single ray of blue; posterior side a little produced, rather attenuated, slightly truncated at the end.

BENSON. Deshayes, Cat. Mus. Brit.

Sikkim. Bundelkund.

The umboinal rays from which the name is derived are not always present in the specimens.

Species 49. (Mus. Hanley.)

CYRENA STRIATELLA. *Cyr. testā subovatā, subvirili, subcuneatā, subinflatā; distanter regulariter rugatā; umboibus moderatè elevatis; intus purpureis; laterē antico breviāculo, rotundatō, uniradiatō; laterē postico producto, subtruncatō; margine dorsali utriusque declivī.*

THE SMALL-STRIATED CYRENA. Shell subovate, greenish, rather blue, slightly inflated, distantly regularly wrinkled; umboes moderately raised, purple within; anterior side rather short, rounded, single-rayed; posterior side produced, slightly truncated; dorsal margin sloped on each side.

DESHAYES. Proc. Zool. Soc. 1854, p. 314.

Hab. Pondicherry.

Species 50. (Mus. Hanley.)

CYRENA BENGALENSIS. *Cyr. testā parvā, ovatā, roseofulvā, tenuiter liratā, compressā; laterē antico angusto, subacuminato, breviāculo; laterē postico paulo magis producto; umboibus moderatè declivibns.*

THE BENGAL CYRENA. Shell small, ovate, pinky-fulvous, finely ridged, compressed; anterior side narrow, rather acuminate; rather short; posterior side a little more produced; umboes moderately sloped.

DESHAYES. Proc. Zool. Soc. 1854, p. 344.

Hab. River Jumna.

CYRENA.

PLATE XII.

Species 51. (Fig. *a, b*. Mus. Brit.)

CYRENA COR. *Cyr. testā subtriangularē, crassā, tumidā, altā; aurātū-fusca, vel grisea, purpureo-fasciata; tenui-versatilē; sulcis cerasus marginata magis numerosis, ad latera evanidis; latere antico brevi, superē exscavato; latere postico producto, angulato, marginā dorsali declivi, marginē terminali truncato; intus alba, media purpurea.*

THE HEART CYRENA. Shell subtriangular, thick, tumid, high, orange-brown, or grey, banded with purple, finely grooved, grooves more numerous towards the margin, fading off at the sides; anterior side short, excavated above; posterior side produced, angular, dorsal margin sloped, terminal margin truncated, white within, purplish in the middle.

LAMARCK. *Anim sans Vert.*

Cyrena consoberia. Deshayes.

Hab. River Euphrates. (small var.)

Species 52. (Mus. Brit.)

CYRENA RHOMBOIDEA. *Cyr. testā ovato-subtriangularē, subdepressa, superē regulariter rugatā, cerasus marginata brevissimā, latere postico angulato, post angulum complanato, marginā dorsali declivi, latere antico brevi; umbonibus elevatis, subacuminatis, marginē ventrali rectifasciata.*

THE RHOMBOIDAL CYRENA. Shell ovate, subtriangular, subdepressed, regularly wrinkled above, rather smooth towards the margin, posterior side angular, flattened behind the angle, dorsal margin sloped; anterior side short; umbones raised, rather raised, slightly acuminate, ventral margin rather straight.

PRIME. Catalogue of Corbiculae, 3, 1863.

Hab. Malacca.

Species 53. (Mus. Brit.)

CYRENA CUMINGII. *Cyr. testā subovata, inflata, tenui, subaurantiā, liris distinibus, acutis, hinc illicē concurrentibus rugatā; latere antico brevi, subrotundo; latere postico producto, leviter angulato, ad terminum truncato, marginā dorsali declivi.*

CUMING'S CYRENA. Shell rather oval, inflated, thin, rather orange, wrinkled with distant, sharp, here and there concurrent ridges; anterior side short, rather round; posterior side produced, slightly angular, truncated at the end; dorsal margin sloped.

DESHAYES.

Hab. Philippines.

Species 54. (F. *a, b*. Mus. Hanley.)

CYRENA ORIENTALIS. *Cyr. testā solidā, subtriangularē, altā, liris crassis, rotundis, rugatā, epidermide nitidā, aurantiō-olivaceo, nigrescenti indutā, intus purpureā; latere antico brevissimo, marginē lateralī declivi; latere postico angulato, callo declivi, ad terminum truncato.*

THE ORIENTAL CYRENA. Shell solid, subtriangular, high, wrinkled with thick, rounded ridges; covered with a shining orange-olive blackish epidermis, purple within, anterior side rather short, lateral margin sloped, posterior side angular, much sloped, truncated at the end.

LAMARCK.

Cyrena fluminalis. Müller.

Hab. India, (var. *f, b*). Japan.

Species 55. (Mus. Brit.)

CYRENA YOKOHAMENSIS. *Cyr. testā ovata, solidā, subdepressa, saldissimenter concentricē liratā; epidermide nitidā, crassā, nigrescenti indutā, intus purpureā; latere antico brevissimo; latere postico angulato, obliquē truncato, subacuminato.*

THE YOKOHAMA CYRENA. Shell ovate, solid, rather depressed, rather distantly concentrically ridged; covered with a thick, shining, blackish epidermis, purple within; anterior side very short, posterior side angular, obliquely truncated, rather acuminate.

SOWERBY.

Hab. Yokohama, Japan.

CYRENA.—PLATE XII.

Species 56. (Mus. Brit.)

CYRENA FLUMINEA. *Cyr. testā subtrigonā, altō, ferē
equilaterali, latō, epidermide subaureantō levigatō
indulā; lirīs distantib⁹ validis rugatā; umboni-
bus elevatis, subacuminatis, margine dorsali
strinque declivi; latere postico obscure angulato,
ad terminium truncato; dentibus laterilib⁹ clou-
gatis.*

THE RIVER CYRENA. Shell trigonal, high, nearly equilateral, broad, covered with a smooth, somewhat orange epidermis, wrinkled with distant, strong ridges; umbo raised, slightly acuminate, dorsal margin sloped on each side; posterior side with an obscure angle, truncated at the end; lateral teeth elongated.

LAMARCK. *Anim. sans Vert. V. VI. p. 274.*

Hab. China, &c.

Species 57. (F. a, b, Mus. Hanley and Brit.)

CYRENA FUSILLA. *Cyr. testā parvā, oratā, albida, vel
purpurascenti, vel fuscō-flavida, subcompressā,
medio tumida, tenuissimē rugatā; latere antico*

*breviūsculo, latere postico magis producto, subtrun-
cato.*

THE DWARF CYRENA. Shell small, oval, whitish or purple, or brownish-yellow, rather compressed, tumid in the middle, very finely wrinkled; anterior side rather short; posterior side more produced, slightly truncated.

PHILIPPI. —? Mus. Brit.

Hab. Upper Nile, Syene.

Species 58. (Mus. Brit.)

CYRENA COMPRESSA. *Cyr. testā subovatā, compressā,
concentricē leviter rugatā, ad latera levigata, epi-
dermide pallidā indulā; latere antico breviūsculo,
rotundo; latere postico angulato, obliquē truncato,
margine dorsali valde declivi.*

THE FLATTENED CYRENA. Shell subovate, compressed, concentrically slightly wrinkled, smooth at the sides, covered with a pale epidermis, anterior side rather short, round, posterior side angular, obliquely truncated, dorsal margin much sloped.

MOUSSON. Deshayes, B. M. Cat. 1854.

Hab. Java.

C Y R E N A.

PLATE XIII.

Species 59. (Mus. Brit.)

CYRENA AFRICANA. *Cyr. testa subcompresso, subtriangularis, fuscata, leviter concentricè rugata; intus sordidè violacea, dentibus lateraliibus crenatis; apice elevato, margine dorsali utriusque declivi; marginis posticis laterali subrectangulis; soleis versus marginia subcrenatis.*

THE AFRICAN CYRENA. Shell rather compressed, somewhat trigonal, brown, finely concentrically wrinkled, dull violet within; lateral teeth equal; apex raised, dorsal margin sloped downwards on each side; posterior lateral margin somewhat truncated; wrinkles dying out towards the margin.

KRAUSS. Süd-Afrikanischen Mollusken, p. 8, Tab. I. f. 8.

Ogcocephala Guaritziana. Krauss, in correspondence.
Hab. River Guaritz, South Africa.

Species 60. (Mus. Brit.—Hanley.)

CYRENA CASHMIRENSIS. *Cyr. testa compressa, alta, subtriangularis, rugulosa, et dense concentricè lineata, epidermis fuscocinerea, intus pallidissima, umbonibus rotundatis, elevatis, marginis dorsali utriusque declivi, marginis posticis laterali subrectangulis; marginis centrali rotundato; soleis ad latera excurrentibus.*

THE CASHMERE CYRENA. Shell compressed, raised, subtriangular, regularly deeply, and closely concentrically ridged, covered with a blackish-brown epidermis, deeply violet or white within; umbos rounded, raised, dorsal margin sloped on each side, postero-lateral margin rather truncated, ventral margin rounded; grooves disappearing at the sides.

DESHAYES, PRIME. Pro. Ac. Nat. Sci. Phil. 1854.
Hab. Cashmere.

M. Hanley has a single valve of this shell densely purple within; while the specimens in the British Museum are pure chalky white.

Species 61. (Mus. Sowerby.)

CYRENA LARGILLIERI. *Cyr. testa subtriangularis, epidermis stramineo-olivacea, intus, antice subirregulariter rugata, postice leviorisca; intus prope marginem purpureo-fasciata; umbonibus tenuis, purpureo-triadulatis, elevatis; marginis dorsali utriusque declivi, marginis ventrali rotunda; latere postico truncata, subrugulata.*

LARGILLIERI'S CYRENA. Shell trigonal, tumid, covered with an olive-straw epidermis, anteriorly somewhat irregularly wrinkled, posteriorly rather more smooth; banded with purple inside near the margin; umbos tumid, three-rayed with purple, raised; ventral margin rounded; posterior side truncated, slightly angular.

PHILIPP. Zeitschrift für Malak., 1844.
Hab. China.

Species 62. (Mus. Sowerby.)

CYRENA SUMATRENsis. *Cyr. testa subovata, tumida, concentricè irregulatè rugata, epidermis olivaceofusca, subfusca, intus albâ, medio pallidissimâ aurantiâ, dente cardinali antice brevissimo, postico magis remoto; latere antice brevi, marginis dorsali declivi; latere postico magis producto, marginis dorsali elevato; umbonibus obtusissimis, depresso.*

THE SUMATRA CYRENA. Shell subovate, tumid, concentrically irregularly wrinkled, covered with an olive-brown slightly leafy epidermis; white within, very pale orange in the middle; anterior cardinal tooth very short, posterior more remote; anterior side short, dorsal margin sloped; posterior side more produced, dorsal margin raised; umbos very obtuse, depressed.

SOWERBY. Genera of Shells. No. 2.

Cyrena Saigonensis. ——.

Hab. Sumatra.—Saigon, China.

CYRENA—PLATE XIII.

Species 63. (Mus. Brit.)

CYRENA WOODIANA. *Cyr. testá subovatá, altá, obliqua, epidermide crasso, sicuti, olivaceo-nigricant, aurantió-fasciata; indutá, medio distinctor rugatá; latere antico brevissimo, margine dorso-lateralí valde decliví; umbonibus elevatís, margine ventralí valde convexo; latere postico produceto, angulato, subacuminato, margine ventrali sursum decliví, margine dorsali longè decliví.*

Wood's CYRENA. Shell subovate, high, oblique, covered with a thick, shining, blackish-olive epidermis, banded with orange, distantly wrinkled in the middle; anterior side very short, dorso-lateral margin much sloped; umbo raised, ventral margin very convex; posterior side produced, angular, slightly acuminate, ventral margin sloped upwards, dorsal margin with a long slope.

LEA. Trans. Amer. Phil. Soc. 1832.

Cyrena Primateana. Murch.

Hab. China.

Cyrena shallis, Gray, and *Cyrena granulis*, Deshayes, both resemble this species, which, however, is much more oval and higher than either. The first-named is a more triangular shell with a radiated angle, while the second holds a middle station between the other two.

Species 64. (Mus. Brit.)

CYRENA SIMILIS. *Cyr. testá ponderosá, subtriangulá, tumida, irregulariter rugatá, epidermide ferruginea, striatá indutá; latere antico brevi, latere dorsali decliví; latere postico producto, acuminato, subrostrato, angulato, margine laterali longe decliví.*

THE SIMILAR CYRENA. Shell ponderous, subtriangular, tumid, irregularly wrinkled, covered with a ferruginous, striated epidermis; anterior side short, dorsal margin sloped downwards; posterior side produced, acuminate, somewhat beaked, angular; dorsal margin with a long slope.

GRAY. Griffith's Cuvier. 1834.

Hab. Philippines.

See remark on the preceding species.

Fig. 47, c. (Mus. Hanley.)

CYRENA RADIATA. Young. See Plate XI. for species.

Fig. 48, b. (Mus. Brit.)

CYRENA OCCIDENTIS var. See Plate XI. for species.

C Y R E N A.

PLATE XIV.

Species 65. (Mus. Brit.)

CYRENA RIVALIS. *Cyr. testū subtrigonā, solidā, altā, rugosā; liris approssimatis ad latera evanidis concentricis rugatis; epidermide deorsū olivaceo-nigris utri iuditū; latere antico rotundato, infra umbones excavato; latere postico angulato, obliquè truncato; umbonibus prominentibus, subroseis.*

THE RIVER CYRENA. Shell subtrigonal, solid, high, regularly concentrically wrinkled with approximate ridges, obsolete at the sides; covered with a dark blackish-olive epidermis; anterior side rounded, excavated near the umboes; posterior side angular, obliquely truncated; umboes prominent, rather pink.

Ven BUSCH. Phil. Abbild. III. 110, Pl. 3. 1849.
Hab. Java.

Species 66. (Mus. Sowerby.)

CYRENA CONCINNA. *Cyr. testū griseō, fuscō, tumidissimā, subtrigonā, solidā, altā, liris crebris, prominulis, ad latera conflatis rugatā, intā pallidē violacea, ad latera pectinatae bimarginatae; latere antico laceri, tumidissimum, infra umbones excavato; latere postico producto, subacuminato, angulato, ad terminum subtruncato, subrotundato.*

THE NEAT CYRENA. Shell greyish-brown, very tumid, subtrigonal, solid, high, wrinkled with close, deep ribs continued at the sides, pale violet within, with a purple ray at each side; anterior side short, very tumid, excavated at the umboes; posterior side produced, slightly acuminated, angular, subtruncated, and beaked at the end.

SOWERBY.

Hab. —?

I have seen only one specimen of this species. Its locality is unknown.

Species 67. (Mus. Hanley.)

CYRENA GRACILIS. *Cyr. testū tumidā, depressā, ovatā, tenui, liris irregularibus, majusculis, distantibus, concentricis, ad latera obsoletis, rugatā, epidermide*

aurantio-subviridi indutā, intā ad marginem cardinalem purpureā, versus marginem glaucidā; latere postico producto, rie truncato, subacuminato, latere antico rotundo, infra umbones excavato; umbonibus roseis, obtusis.

THE SLENDER CYRENA. Shell tumid, depressed, ovate, thin, wrinkled with irregular, rather large, distant, concentric ridges, obsolete at the sides, covered with a greenish-orange epidermis, inside purple at the hinge margin, yellowish towards the margin; posterior side produced, scarcely truncated, subacuminated, anterior side rounded, excavated beneath the umboes; umboes pinkish, obtuse.

PRIME American Journal of Conchology, X. 389.
1862.

Hab. Java.

Species 68. (Mus. Brit.)

CYRENA BULLATA. *Cyr. testū altā, tumidissimā, brevissimā, epidermide rugosā, denudata striatā fumoso-fuscā indutā; latere antico breve, subrotundato; latere postico magis producto, obtuse angulato, margine dorsali declivē; umbonibus ocellis, obtusissimis; margine ventrali convexa.*

THE BULLED CYRENA. Shell high, very tumid, rather short, covered with a rough, finely striated smoky-brown epidermis; anterior side short, rather round; posterior side more produced, obtusely angular; dorsal margin sloped; umboes oval, very obtuse; ventral margin convex.

SOWERBY.

Cyrena insquis. Deshayes.

Hab. California.

Having already figured a species of *Cyrena* (*Batisse*) under the name of *insquis*, Deshayes, we cannot repeat the name in a second division of what we regard as the same genus.

Species 69. (Mus. Brit.)

CYRENA CYRENIFORMIS. *Cyr. testū crassā, altissimā, subtrigonā, tumidā, subobliquā, distanter rugatā,*

CYRENA.—PLATE XIV.

epidermide levigata fusco-subvirens, intus violaceus; latere postico obliquè producto, angulato, versus marginem levigato; latere antico brevi, declivi, infra umbones areo levigata lunulato; umboibus productis.

THE CYRENIFORM CYRENA. Shell thick, very high, subtrigonal, tumid, rather oblique, distantly wrinkled, covered with a smooth, greenish-brown epidermis, violet within; posterior side obliquely produced, angular, smooth towards the margin; anterior side short, sloped, with a smooth lunular area; umboes produced.

PRIME —? (Corbicula) MS. Brit. Mus.

Hab. —?

It would be better to avoid giving such specific names to species of very closely allied genera as cannot with propriety be used when the genera are considered as one. Such tautologies as the 'Cyrena-shaped Cyrena' would not then occur.

Species 70. (Mus. Hanley.)

CYRENA SULCATA. *Cyr. testa subtrigonum, roseo-purpurea, altius, tenuissimè sulcatum striatum, postice et ad latera levigata, epidermide straminea indutum, intus purpureo marginatum; umboibus elevatis, margine dorsali utrinque declivi, infra umbones areo pallida, planulata; anticè subexcavata; margine ventrali convexo.*

THE FINE-GROOVED CYRENA. Shell subtrigonal, purplish-pink, high, very finely groove-striated, posteriorly and at the sides rather smooth, covered with a straw-coloured epidermis, purple-bordered within; umboes elevated, dorsal margin sloped on each side with a pale, flattened area, slightly excavated anteriorly; ventral margin convex.

DESHAYES. Proc. Zool. Soc. London. 1864.
Hab. China.

Species 71. (Mus. Brit.)

CYRENA GRANDIS. *Cyr. testa magnum, ovato-subtrigonum, irregulariter rugata, subcompressum, intus et ad umboes roseo-aurantia; latere antico brevi; latere postico acuminato, angulato; margine ventrali valde convexo; margine dorsali utrinque declivis.*

THE LARGE CYRENA. Shell large, ovate-subtrigonal, irregularly wrinkled, compressed within and at the umboes pinky orange; anterior side short; posterior side acuminated, angular; ventral margin convex; dorsal margin sloped on each side.

DESHAYES —? MS. Brit. Mus.
Hab. —?

CYRENA CRASSULA. *Cyr. testū altissimā, subtrigonā, angustatū, subarcuata, levander liratā, crassi, epidermide olivacea indutā, ad apicem intusque crenulata, rotundata; latere postico armato, prope marginem lateralem angulata; latere antico subexcavata; umbonibus incurvatis forē lateraliiter terminatib; lobos round.*

THE THICK CYRENA. Shell very high, subtrigonal, narrow, rather arched, finely ridged, thick, covered with an olive epidermis; bluish at the tip and inside; posterior side arched, angular near the margin; anterior side somewhat excavated; umboes curved inwards, almost terminal at the side.

MORSSON —? MS. in Brit. Mus.
Hab. Lebanon.

Species 73. (Mus. Brit.)

CYRENA AMBIGUA. *Cyr. testū subtrigonā, subangulatā, olivacea-nigricostata, moderatē tumidā, levander liratā; latere antico declivī, sohoreando; latere postico declivī, obscurī, biungulata.*

THE AMBIGUOUS CYRENA. Shell subtrigonal, blackish-olive, moderately tumid, finely ridged; anterior side sloped downwards, rather round; posterior side sloped downwards, with two obscure angles.

DESHAYES, Proc. Zool. Soc. London. XXII, p. 345.
Hab. River Euphrates.

Species 74. (Mus. Sowerby.)

CYRENA MANILLENSIS. *Cyr. testū crassi, subrhomboidē, distante liratā, versus umbones griseā, versus marginem subarcuātā, intus albi crenulātē, epidermide nitentī indutā; latere antico brevi, marginē dorsali declivī, laterali brevi, truncata; latere postico producta, marginē dorsali declivī, terminatī truncata; umbonibus rotundis.*

THE MANILLA CYRENA. Shell thick, rather rhomboidal, distantly grooved, grey towards the umboes, somewhat orange, bluish-white within,

covered with a shining epidermis; anterior side short, dorsal margin sloped, lateral short, truncated; posterior side produced, dorsal margin sloped, terminal, truncated; umboes round.

PHILIPPI. Abild. Zeit. f. Malak. 1841.
Hab. Manilla.

Species 75. (Mus. Brit.)

CYRENA NEPEANENSIS. *Cyr. testū subrhomboidē, fusco vel aurantiā, recti, levigata, compressa; latere antico breviāscula; latere postico angis producta, latē truncata; apicē petro, subarcuātā, marginē dorsali utrinque leviter declivī; marginē rectiāscula.*

THE NEPEAN CYRENA. Shell rather rhomboidal, brown or orange, straight, smooth, compressed; anterior side rather short; posterior side more produced, broadly truncated; apex small, somewhat acuminate; dorsal margin slightly sloped on each side; ventral margin rather straight.

LESSON —? MS. Brit. Mus.
Hab. River Nepea.

Species 76. (Mus. Brit.)

CYRENA REGULARIS. *Cyr. testū pallidi, subovata, subdepressa, regulariter cyathē lirata; latere antico breviāscula, subarcuātā, infre umbones excavata; latere postico latē truncata, marginē dorsali declivī; umbonibus obtusis, depressis.*

THE REGULAR CYRENA. Shell pale, rather oval, rather depressed, regularly, closely ridged; anterior side rather short, slightly acuminate, excavated below the umboes; posterior side broadly truncated, dorsal margin sloped; umboes obtuse, depressed.

CYRENA OVALINA. *Cyr. testū ovata, tumida, epidermide nitenti, nigrescenti indutā, rugis distantibus, sape-*

CYRENA.—PLATE XV.

rrioribus validis, continuis, versus marginem ventralern evanidis, posticè obsoletis induitâ; latere antico breviâsculo, rotundo; latere postico producto, late truncato; umbonibus obtusissimis, margine dorsali utrinque levigato, margine ventrali squadrilatero convexo.

THE OVAL CYRENA. Shell ovate, tumid, covered with a shining, blackish epidermis dying out towards the ventral margin, posteriorly obsolete; anterior side rather short, rounded; posterior side produced, broadly truncated; umboes very obtuse, dorsal margin smooth on each side, ventral margin equally convex.

DESHAYES. Proc. Zool. Soc. 1854, p. 343.
Hab. Port Essington, Australia.

Species 78. (Mus. Brit.)

CYRENA MAXIMA. *Cyr. testâ subtriangulari, altissimâ, sub-compressâ, lati, rugis parvis, distantibus, posticè evanidis irregulariter cinctâ; epidermide flavido-subaurantia induitâ; latere antico brevi, areâ lunulari concavâ; latere postico producto, infra medium acuminata, margine dorsali longè declivi, convexo; umbonibus elevatis; margine ventrali prominenter convexo.*

THE VERY LARGE CYRENA. Shell rather trigonal, very high, rather compressed, smooth, irregularly belted with few, distant wrinkles disappearing posteriorly, covered with a yellowish-orange epidermis; anterior side short, lunular area convex; posterior side produced, acuminate below the middle, dorsal margin with a long slope, convex; umboes raised; ventral margin prominently convex.

DESHAYES. Proc. Zool. Soc. 1860, p. 321.
Hab. —?

Species 79. (Mus. Brit.)

CYRENA BRAZILIANA. *Cyr. testâ altâ, tenuissimè liratâ, solleatimnud, intâ alba; latere antico rotundo, brevi; latere postico obliquè producto, margine dorsali longè declivi; epidermide aurantio-strigata, custaneo angustè fasciata, umbonibus elevatis, versus laterem anticum declinatis.*

THE BRAZILIAN CYRENA. Shell high, very finely grooved, rather rounded; white within, anterior side rounded, short; posterior side obliquely produced, dorsal margin with a long slope; epidermis orange-straw, with narrow bands of chestnut; umboes raised, turned towards the anterior side.

DESHAYES. Cat. Brit. Mus. 1854.
Hab. Brazil.

Species 80. (Mus. Brit.)

CYRENA TENUISTRIGATA. *Cyr. testâ subtriangulari, altâ, pallidè fulvâ, fere levigata, compressâ, obscurè tenuissimè striatâ; latere antico brevi, usque ad marginem ventralem declivi, marginem ventrali rotundo, producto, latere postico declivi, producto, infra medium subacuminato, marginem ventrali sursum acclivi; umbonibus elevatis.*

THE FINE-STRIATED CYRENA. Shell subtriangular, high, pale fulvous, almost smooth, compressed, obscurely, very finely striated; anterior side short, sloped down to the ventral margin; ventral margin round, produced, posterior side sloped downwards, produced, slightly acuminate below the middle, ventral margin sloped upwards; umboes elevated.

PINE. Proc. Zool. Soc. 1860, p. 323.
Hab. —?

Species 81. (Mus. Brit.)

CYRENA PARACENSIS. *Cyr. testâ altissimâ, angustâ, tiris irregularibus posticè evanidis rugatâ, obscurè olivacea, intâ purpurea; latere antico brevissimo, margine lateralâ rectâsculo; latere postico, margine dorsali breviter declivi, margine lateralâ obliquè declivi; margine ventrali subconvexo.*

THE PARACA CYRENA. Shell very elevated, narrow, wrinkled with irregular ridges, posteriorly fading, obscurely olivaceous, purple within; anterior side very short, lateral margin rather straight; posterior side, dorsal margin shortly sloped, lateral margin obliquely sloped; ventral margin rather convex.

CYRENA AUSTRALIS. *Cyr. testa ovato-subtriangularis, depresso, compressa, pallidissimae fumosae-fusca, vel fuscata, vel levigata, irregulariter et leviter rugata; latera antica brevi, margine latero-dorsali declivis, levigatis; latera postica producto, infra medium armamentum, margine dorsochordaliter convergente, declivis, levigatis.*

THE AUSTRALIAN CYRENA. Shell ovate-subtriangular, depressed, compressed, very pale smoky-fusaceous, or brown, or orange, irregularly and slightly wrinkled; anterior side short, latero-dorsal margin sloped, smooth; posterior side produced, acuminate below the middle, dorso-lateral margin rather convex, sloped, smooth.

DESHAYES. Ed. Lamarek.
Hab. Isl. of Timor.

Species 83. (Mus. Brit.)

CYRENA LYDICA. *Cyr. testa tumida, subrotundata, altitudine latitudinem aquanti, a quilateralis, rugositate solaris palliter et subdistanter rugata, infra griseo-suberis, supra nigritissimi, castaneo rotundata, intus dense violacea; umbonibus rotundis, elevatis, margine dorsali utrinque declivis; latera postica infra medium subacuminata.*

THE LYDIC CYRENA. Shell tumid, rather rounded, the height equalling the breadth, equilateral, regularly rather equally and distantly wrinkled, greyish-green below, blackish above, rayed with chestnut, deep purple within; umbo rounded, raised, dorsal margin sloped on each side; posterior side rather acuminate below the middle.

PRINCE. Cal. Corp. 3. 1863.
Hab. Siam.

Species 84. (Mus. Brit.)

CYRENA SEMISULCATA. *Cyr. testa oblonga, depressa, ferè levigata, leviter partim rugata, obscurè fulva, carneo-fusca, intus dense purpurea; latera antica brevissima, infra umbones subexcavata, margine dorsali valde declivis; latera postica*

producto, oblonga, margine dorsali leviter declivis, margine laterali late truncata.

THE HALF-GROOVED CYRENA. Shell oblong, depressed, almost smooth, slightly wrinkled in parts, dull fulvous, banded with blue, deep purple within; anterior side very short, slightly hollow under the umbo, dorsal margin much sloped; posterior side produced, oblong, dorsal margin slightly sloped, lateral margin broadly truncated.

DESHAYES. Proc. Zool. Soc. 1854, p. 342.
Hab. Pondicherry.

Species 85. (Mus. Brit.)

CYRENA OBSOLETA. *Cyr. testa obliquè trigonata, alta, tenuissime striata, compressa, superè subcircularis, media rufa-fusca, intus purpurea; latera antica brevi, valde declivis; umbonibus elevatis, subacuminatis, margine centrali convexa; latera postica producto, declivis, infra medium acuminata.*

THE ODOLETO CYRENA. Shell obliquely trigonal, high, very finely striated, compressed, greenish above, reddish-brown in the middle, purple within; anterior side short, much sloped; posterior side produced; umbo raised, somewhat acuminate, ventral margin convex; posterior side produced, sloped, acuminate below the middle.

DESHAYES. Proc. Zool. Soc. 1854, p. 343.
Hab. —?

Species 86. (Mus. Brit.)

CYRENA INCRASSATA. *Cyr. testa subovata, depressa, crassa, subcompressa, densè fuscæ-subcircularis, tenuissime striata, ferè levigata, antice distanter tenuiter rugata; latera antica brevissima, infra umbones excavata; umbonibus antice inclinatis, depressis; latera postica producto, acuminate, margine arcuata declivis.*

THE THICKENED CYRENA. Shell rather oval, depressed, thick, slightly compressed, dark greenish-brown, very finely striated, almost smooth, with distant slender wrinkles; anterior side very short. hol-

CYRENA.—PLATE XVI.

low under the umbones; umbones leaning to the front, depressed; posterior side produced, acuminate, margin sloped in an arch.

DESHAYES. Proc. Zool. Soc. 1854, p. 342.

Hab. —?

Species 87. (Fig. a, b, Mus. Brit.)

CYRENA VARIEGATA. *Cyr. testá altá, subrotundá, tenui, subterrá et nigrá, cel subaurantia, nebulis radiisque variegatá, tenuissimae striatá, vix rugatá, latere postico producto, rotundo, latere antico brevissimo.*

THE VARIEGATED CYRENA. Shell high, rather rounded, thin, greenish or black, or rather orange, variegated with clouds and rays of purple, very finely striated, scarcely wrinkled, posterior side produced, rounded, anterior side very short.

DESHAYES. MS. Mus. Cuming.

Hab. La Plata.

Species 88. (Mus. Sowerby.)

CYRENA MALLACENSIS. *Cyr. testá tenui, subrhomboidá, fumoso olieaceo, nibrati, regulariter, distanter, acutirugatá, intus alba; latere antico brevi, declivi; latere postico producto, obliquè truncato.*

THE MALACCA CYRENA. Shell thin, subrhomboidal, smoky-olive, shining, regularly, distantly, sharply wrinkled, white within; anterior side short, sloped; posterior side produced, obliquely truncated.

DESHAYES. Proc. Zool. Soc. 1854, p. 343.

Hab. Malacca.

Species 89. (Mus. Hanley.)

CYRENA NITENS. *Cyr. testá subaurantia, nitenti, compressa, subdepressa, obliquè trigoná, tenueri subcatá, intus et ad umbones subrosea; latere antico brevi, rectiæsculo, valde declivi; latere postico obliquè producto, margine dorsali longè declivi, ad marginem centralem acuminato; margine centrali rectiæsculo.*

THE SHINING CYRENA. Shell rather orange, shining, compressed, rather depressed, obliquely trigonal, finely grooved, rather pink at the umbones; anterior side short, rather straight, much sloped; posterior side obliquely produced, dorsal margin with a long slope, acuminate at the ventral margin; ventral margin rather straight.

Hab. ——?

Species 98. (Mus. Brit.)

CYRENA FRAGILIS. *Cyr. testâ oblongâ, tennissimâ, densâ subviridi, lîcis distantibus subobliquis, posticâ exanidâ, nonnullis concurrentibus rugatâ, intus alba; latere antico brevi, infra umboes excavato; latere postico oblongo, margine dorsali leviter declivi, margine terminali latâ, obliquâ truncato.*

THE FRAGILE CYRENA. Shell oblong, very thin, deep greenish, wrinkled with distant, rather oblique ridges disappearing posteriorly, some running into each other, white within; anterior side short, hollowed beneath the umboes; posterior side oblong, dorsal margin slightly sloped, terminal margin broadly, obliquely truncated.

DESHAYES. ——? MS. Brit. Mus.

Hab. ——?

Species 99. (Mus. Brit.)

CYRENA SQUALIDA. *Cyr. testâ tenui, oblongâ, depressâ, compressâ, epidermide sordidâ olivaceâ, violaceo-nubilatâ inductâ, ad latera levigatâ, medio irregulatâ rugatâ; latere antico brevi, rotundo, infra umboes excavato, latere postico producto; margine dorsali declivi, margine laterali obliquâ truncato, infrâ subcuminato.*

THE SQUALID CYRENA. Shell thin, oblong, depressed, compressed, covered with a dirty olive epidermis clouded with violet, smooth at the sides, irregularly wrinkled in the middle; anterior side short, rounded, hollowed under the umboes; posterior side produced, dorsal margin sloped, lateral margin obliquely truncated, slightly acuminate below.

DESHAYES. Proc. Zool. Soc. 1854, p. 342.

Hab. ——?

Species 100. (Mus. Brit.)

CYRENA SALMACIDE. *Cyr. testâ donaciformi, tenui, levigatâ, albida, purpureo-nubilatâ; latere antico alto, brevissimo, umbonibus acutis, margine dorsali valde declivi, latere postico producto, acuminato.*

THE SALMACIDIAN (?) CYRENA. Shell donax-shaped, thin, smooth, whitish, clouded with purple; anterior side high, very short; umboes acute, dorsal margin much sloped, posterior side produced, acuminate.

MORELET. ——? MS. Brit. Mus.

PLATE XVIII.

Species 101. (Mus. Brit.)

CYRENA OVALIS. *Cyr. testi tenui, ovata, subequilaterali, regulariter, dense livata, epidermide olivaceo-nigricanti, umboni induti, intus purpurei; latere antico brevissimi, rotundu; latere postico late subtenuato; umboibus elevatis, purpureo perpendicularlyiter fasciatis.*

THE OVAL CYRENA. Shell thin, ovate, subequilateral, regularly and very closely ridged, covered with an olive-blackish, shiny epidermis, purple within; anterior side the shorter, rounded; posterior side broadly subtruncated; umbones raised, perpendicularly banded with purple.

PRIME. Journal de Conchyliologie, Pl. 2, f. 6.
Hab. —?

The ridges in this corbicula are more fine, close, and continuous than either of the two similarly shaped species.

Species 102. (Mus. Brit.)

CYRENA FLORIDANA. *Cyr. testi brevi, alti, crassis, tumidissimis, inaequilaterali subtriangulo, levigata, subtus epidermidem rosat, intus carnis, epidermide flavido-fusca, cuncta maculata; latere postico declivi angustata, ad angulum ferè carinata, inferè acuminata; umboibus tumidis, elevatis; latere antico brevi, declivi.*

THE FLORIDA CYRENA. Shell short, high, thick, very tumid, inequilaterally trigonal, smooth, pinky under the epidermis, flesh-coloured within; epidermis yellowish fawn, spotted with chestnut; posterior side sloped, almost keeled at the angle, acuminate below; umboes tumid, raised; anterior side short, sloped.

CONRAD. Freshwater Shells of United States.
Hab. Florida.

Species 103. (Mus. Brit.)

CYRENA ISOCARDIOIDES. *Cyr. testi brevi, altissimam, tenuissimam, superas subtriangulam, epidermide levigatam, tenui, cornuti induti, intus ad cardinem et subtus umboes purpurei; latere antico brevissimo, subtus umboes excavato, versus medium valde inflato; umboibus subdistantibus, latere*

postico subrostrato, angustato, truncato, marginae ventrali valde curvato.

THE ISOCARDIA-LIKE CYRENA. Shell short, very high, thin, very tumid, triangular at the upper part, covered with a smooth, thin, horny epidermis, purple inside at the hinge, and under the umboes; anterior side very short, excavated beneath the umboes; umboes a little distant, posterior side rather beaked, angular, truncated; ventral margin very convex.

DESHAYES —? MS. Cum. Coll.
Hab. —?

Species 104. (Mus. Brit.)

CYRENA SOLIDA. *Cyr. testi crassi, magni, breviter subrhomboides, tum dissimili, epidermide tenuissima indutum, antice leviter rugatum; latere antico brevissimum, umboibus ferè terminalibus; latere postico producta, obtuse angulato; margine laterodorsali elongata, arcuata; margine ventrali concava, versus angulum posticum sorsum velici.*

THE SOLID CYRENA. Shell thick, large, shortly subrhomboid, very tumid, covered with a very thin epidermis, anteriorly lightly wrinkled; anterior side very short, umboes nearly terminal, posterior side produced, obtusely angular; dorsal margin lengthened, arched; ventral margin convex, sloped up towards the posterior angle.

DESHAYES —? MS. Cum. Coll.
Hab. Australia.

Species 105. (Mus. Brit.)

CYRENA JUKESI. *Cyr. testa ovata, compressa, levigata, epidermide fusca, crenulatum striatam indutum; latere antico brevi; latere postico producta, marginae dorsali arcuatum declivi.*

JKES'S CYRENA. Shell ovate, compressed, smooth, covered with a brown epidermis with crenulated striae; anterior side short; posterior side produced, dorsal margin slightly arched, sloped downwards.

DESHAYES. Proc. Zool. Soc. 1854, p. 19.
Hab. Port Essington.

CYRENA.—PLATE XVIII.

Species 106. (Mus. Brit.)

CYRENA PLACIDA. *Cyr. testā ovato-rotundatā, cōm-*
pressatā, altō, levigatō, epidermide striatā inductā,
ferē aquilatērali, intō pallidē rosē, laterib⁹
rotundis, umbonib⁹ depresso, obtusissimis.

THE PLACID CYRENA. Shell ovately rounded, compressed, high, smooth, covered with a striated epidermis, almost equilateral, pale rose within, sides rounded; umboes depressed, very obtuse.

DESHAYES. Proc. Zool. Soc. 1854, p. 19.

Hab. —? Cum. Coll.

Species 107. (Mus. Brit.)

CYRENA NOTARILIS. *Cyr. testā subrhomboidēd, depresso,*
subcōpressatā, leviter striatā, epidermide tenuis-

simā inductā; latere antice brevē, rotundo, infra-
umbones excavato; latere postico oblongo, angu-
lato, post angulum extēs intōisque purpureo, mar-
gine dorsali paulo declivī, arcuato, margine termi-
nati latē truncato.

THE REMARKABLE CYRENA. Shell subrhomboidal, depressed, rather compressed; finely striated, covered with a very thin epidermis; anterior side short, rounded, excavated under the umboes; posterior side oblong, angular, purple within and without behind the angle, dorsal margin a little sloped, arched, terminal margin broadly truncated.

DESHAYES. Proc. Zool. Soc. 1854, p. 21.

Hab. Payta, Peru.

Having much the form of a *Cypricardia*.

C Y R E N A.

PLATE XIX.

Species 108. (Mus. Sowerby.)

CYRENA DONACIFORMIS. *Cyr. testi parvi, tenuissimè tenui, trigonæ, valde inaequilaterali; marginè dorsali utrinque valde declivi, areo purpurei, ultra que valvi semilunata; latere antico brevissculo, declivi, subacuminata, latere postico attenuatim protracta, ad terminalia acuminata.*

THE DONAX-SHAPED CYRENA. Shell small, very finely ridged, trigonal, very inequilateral; dorsal margin much sloped on each side, with a semilunar area of purple on each valve; anterior side rather short, sloped, rather acuminate, posterior side taperingly produced, acuminated at the end.

SOWERBY.

Hab. Florida.

This species belongs to the *Corbicula* group in the character of the hinge.

Species 109. (Mus. Brit.)

CYRENA ANOMALA. *Cyr. testi tenuissimè, inflatè, altè, subtriangulari, epidermide tenui, pallidè subveridis inoluta, intè ad cardinam et infra umbones purpurei; latere antico inflato, rotundatè, brevi; umboibus inglatè, rotundatè, marginè ventrali valdè convexo; latere postico producto, acutè rostratè, attenuata.*

THE ANOMALOUS CYRENA. Shell very thin, inflated, high, subtriangular, covered with a thin greenish epidermis; purple within on the hinge and under the umboes; anterior side inflated, rounded, short; umboes inflated, rounded, ventral margin very convex; posterior side produced, sharply beaked, attenuated.

DESHAYES. Proc. Zool. Soc. 1854, p. 51.

Hab. Bay of Caracas.

Very full and globular in front, compressed and narrowed to a point at the back.

Species 110. (Mus. Sowerby, odd valves.)

CYRENA MEXICANA. *Cyr. testi ovatè, inflatè, tenui, epidermide obscurè fuscè inoluta, intè pallidissimè*

carnei, ad latas posticum purpurei; latere antico brevissimo; medio inflato; latere postico producto, margine latero-dorsali declivi, margine terminali obtusa, obtusissimè angulata.

THE MEXICAN CYRENA. Shell ovate, inflated, thin, covered with a dull brown epidermis, very pale flesh-colour within, purple at the posterior side; anterior very short, middle inflated; posterior side produced, dorso-lateral margin sloped, terminal margin obtuse, very obtusely angular.

BRODERIP and SOWERBY. Zool. Journ. V. 5.

Hab. Mazatlan, Mexico.

Species 111. (Mus. Sowerby.)

CYRENA CEYLONICA. *Cyr. testi magna, solidè, subtriangulari, subcompressa, altè, subaequilaterali, epidermide tenui, flavidè, jimbriatim striatè inoluta; latere postico obtusè biangulato, ante angulum anticum subconicatu, post angulum productum conplanatum, valde declivi; latere antico brevissculo, margine latero-dorsali conq lanato, declivi.*

THE CEYLON CYRENA. Shell large, solid, subtrigonoid, subcompressed, high, subequilateral, covered with a thin, yellowish epidermis, with fringed striae; posterior side obtusely two-angled, rather concave in front of the anterior angle; flattened, much sloped behind the posterior angle; anterior side rather short, latero-dorsal margin flattened, sloped.

CHEMNITZ. (Venus) Marl. and Chemn.

Venus convoluta, Gmel.

Cyrena Ziegleriana, Lamarck.

Cyrena pallida. Deshayes.

Species 112. (Mus. Brit.)

CYRENA COMpta. *Cyr. testi ovato-oblongi, depresso, tumida, crassa, levigata, epidermide pallidè glaciidè nitenti inoluta; latere antico brevi; latere postico producto, subattenuato, angulato, ante angulum subcompresso, margine dorsali declivi, margine terminali binigulato, truncato.*

THE SPRUCE CYRENA. Shell ovate-oblong, depressed,

CYRENA.—PLATE XIX.

tumid, thick, smooth, covered with a pale yellowish shining epidermis; anterior side short; posterior side produced, rather attenuated, angular, rather flattened in front of the angle; dorsal margin sloped, terminal margin biangular, truncated.

DESHAYES. Proc. Zool. 1854, p. 21.

Hub. — ?

Species 113. (Mus. Sowerby.)

CYRENA BUSCHI. *Cyr. testā venusiformi, ovato-subtri-*
gonā, solidā, subeompressā, epidermide fusco-
flavida fimbriatā strāti indūti; latere antico
lucidi, prope marginem dorso-lateralē planulato;
latere postico magis producto, marginē dorso-
lateralē arcuato; umbonibus elevatis, versus latus
anticus inclinatis.

VON BUSCH'S CYRENA. Shell venus-shaped, ovately subtrigonal, solid, rather compressed, covered with a brownish-yellow epidermis; anterior side short, flattened near the dorso-lateral margin; posterior side more produced, dorso-lateral

margin arched; umbo raised, leaning towards the anterior margin.

PHILIPPI — ? Adams' Genera.

Lauta. Deshayes.

Hub. — ?

Species 114. (Mus. Brit.)

CYRENA EQUILATERALIS. *Cyr. testā subtrigonā, com-*
pressā, altā, subequilaterali, fulvo-subaurantiā,
laevigatā; latere antico brevissimulo, declivī, infra
umbones excavato; latere postico paulò magis
producto, infrā acuminato, prope marginem dorso-
lateralem angulato.

THE EQUILATERAL CYRENA. Shell rather trigonal, compressed, high, nearly equilateral, fulvous orange, smooth; anterior side rather short, sloped, hollowed under the umbo; posterior side a little more produced, acuminate below, with an angle near the dorso-lateral margin.

DESHAYES. Proc. Zool. Soc. 1854, p. 20.

MONOGRAPH
OF THE GENUS
SPHÆRIUM.

"While Thee, by Whom were all things made, we praise
For ever, and tell out in sweetest lays

An endless Alleluia."—*Nestor*.

SPHÆRIUM.

PLATE I.

Genus SPHÆRIUM. Scopoli.

MOLLUSC ACEPHOLOPODUM, BIMUSCULOSUM, FLUVIATILE,
SIPHONIBUS SEPARATIS. *Testa tenuis, intus tenuiter
testacea, extus cornea, opaculus, fere equilateralis,
plerumque inflata. Cardo utramque calcis dentibus
duobus cardinalibus divergentibus, lateralibus
elongatis, compressis, duplicitis et simplicibus.
Pallii impressionibus integris.*

MOLLUSC ACEPHOLOPODUM, BI-MUSCULAR, FLUVIATILE,
WITH SEPARATED SIPHONS. Shell thin, thinly
shelly within, horny without, equivalve, nearly
equilateral, generally inflated. Hinge in each
valve with two cardinal diverging teeth, lateral
teeth, two and one in each valve, elongated, com-
pressed. Paléal impression entire.

Synonym. *Cyclas*. Bruguière.

The chief difference between this genus and *Pisidium* is to be found in the siphons of the animal, which are divided in the former, and separated in the latter. The shells, however, are in general to be distinguished by those of the present genus being less oblique, and more equilateral. Wherever there are rivers and lakes, are also to be found shells of the *Sphaerium* genus, excepting, perhaps, in the torrid regions. They abound in Europe and North America. The British Museum, largely reinforced by the Cumming Collection, presents a large array of species which are given in this monograph, besides others which are accessible to me; still, however, leaving some which cannot be got together for identification.

Species 1. (Mus. Brit.)

SPHÆRIUM STEINBUCHII. *Sph. testa parvæ, politæ, sub-
obliquæ, semipellucidiæ, pallidiæ; latere postico
obliquè productæ, marginæ dorsali decliviæ; latere
antico brevissimæ; umbonibus prominentibus,
reversæ latere anticum inclinatis.*

STEINBUCH'S SPHÆRIUM. Shell small, polished, rather
oblique, semipellucid, pale; posterior side ob-
liquely produced, dorsal margin sloped; anterior

side rather short; umboes prominent, leaning
towards the anterior side.

MÖLLER. Adams. Geneva.
Hab. Greenland.

Species 2. (Mus. Brit.)

SPHÆRIUM TRANSVERSUM. *Sph. testa transversè ovatæ,
pallide cornæ, tenui, opaci, umbonibus ovatis,
subcentralibus, margine dorsali rectiæ; latere
antico brevissimæ, marginibus lateribus sub-
truncatæ, marginæ ventrali convexæ.*

THE TRANSVERSE SPHÆRIUM. Shell transversely oval,
pale horn, thin, opaque, umboes oval, subcentral,
dorsal margin rather straight; anterior side
rather shorter, posterior lateral margin, a little
obliquely truncated, ventral margin convex.

SAY. Proc. Acad. Nat. Sci. Phil. 1862.
Hab. United States.

Species 3. (Mus. Brit.)

SPHÆRIUM RIVALE. *Sph. testæ rectiæ, subtriangula-
lariæ, inflatæ, transversæ, cornæ, fuscæ-subviridiæ,
fuscæ; umbonibus ovatis, meiosis; marginæ
ventrali rectæ, lateribus subtruncatæ.*

THE RIVER SPHÆRIUM. Shell rather straight, nearly
equilateral, inflated, transverse, horny, banded
with greenish brown; umboes oval, large;
ventral margin straight, sides rather truncated.
Drap. Moll. Pl. X.
Hab. Europe.

Generally regarded as a variety of *Sphaerium corneum*,
but more transverse and rhomboidal.

Species 4. (Mus. Sowerby.)

SPHÆRIUM RIVICOLUM. *Sph. testæ magnæ, oratæ,
tenuiter sulcatæ, intensè fuscæ-viridiæ, latæ medio
carneolæ, versus marginæ cardeæ; umbonibus
subcentralibus, obtusis, margine dorsali utriusque
decliviæ.*

THE RIVER-DWELLING SPHÆRIUM. Shell large, oval,

SPHÆRIUM.—PLATE I.

finely grooved, deep greenish-brown, within fleshy in the middle, blue towards the margin; umboes rather central, obtuse, dorsal margin sloped at both sides.

LAMARCK. Anim. s. Vert.

Cyclas cornuum. Dilwyn.

Hab. Great Britain. Europe generally.

Species 5. (f, a, b, Pl. V. Mus. Brit.)

SPHERIUM LACUSTRE. *Sph. testa ovata, inflata, pallidâ, levâ, latere antico breviori, latere postico obliquâ truncato, margine dorsali subdecli-
vi.*

THE PALE SPHERIUM. Shell ovate, inflated, pale, smooth, anterior side shorter; posterior side, scarcely obliquely truncated, dorsal margin a little sloped.

DEPARNAUD. Hist. Moll. p. 130, Pl. X. f. 6, 7.

Cyclas ovata. FERRUSAC.

Cyclas pallidum. Gray.

Hab. Regent's Park, London. France.

Species 6. (Mus. Sowerby.)

SPHERIUM LENTICULARIS. *Sph. testa subcompresso,
politiâ, breviter ovali, corneo-griseoventri, alta;
umbonibus subcentralibus, margine dorsali utrinque
decli-
vi, margine postico obtusissimâ truncato.*

THE LENTICULAR SPHERIUM. Shell rather compressed, polished, shortly oval, greyish horn, high; umboes rather central, dorsal margin sloped on each side; posterior margin very obtusely truncated.

SOWERBY.

Hab. —? We have no locality for this rather peculiar shell.

Species 7. (Mus. Brit.)

SPHERIUM SULCATUM. *Sph. testa magnâ, inflata, sub-
rhomboidâ, valvâ sulcata, fuscо-subviridi, trans-
versu; umbonibus subcentralibus, prominentibus;
margine dorsali utrinque pondo declivè, notoginibus
lateralibus obliquè subtruncatis, margine ventrali
recti-
vi.*

THE GROOVED SPHERIUM. Shell large, inflated, rhomboidal, strongly sulcated, greenish brown, transverse; umboes nearly central, prominent; dorsal margin a little sloped on each side;

lateral margins a little truncated obliquely; ventral margin rather straight.

LAMARCK. Anim. s. Vert.

Hab. Massachusetts.

Species 8. (Mus. Hanley.)

SPHERIUM INDICUM. *Sph. testa subrotundâ, pallidâ,
levâ, altiuscula; umbonibus subcentralibus, pro-
minentibus, rotundis, margine ventrali convexo,
margine dorsali postico recti-
sculo.*

THE INDIAN SPHERIUM. Shell rather rounded, pale, smooth, rather high; umboes rather central, prominent, rounded, ventral margin convex, dorsal margin rather straight posteriorly.

DESHAYES. Proc. Zool. Soc. 1854, p. 342.

Hab. Loodianah, India.

Species 9. (Mus. Brit.)

SPHERIUM SCALDIAEUM. *Sph. testa oblongo-subquadrate,
pallidâ aurantiâ, tenuiâ, levigatâ, subincurvata-
terali, latere antico breviori; umbonibus promi-
nentibus; margine dorsali postico recti-
sculo, margine ventrali recti-
sculo.*

SCALDI'S SPHERIUM. Shell oblong-subquadrate, pale orange, tumid, smooth, rather inequilateral, anterior side shorter; umboes prominent, postero-dorsal margin rather straight, ventral margin rather straight.

NORMAND. Notez Cycl. Nord. p. 3, 1854.

Hab. Europe.

Species 10. (Mus. Brit.)

SPHERIUM CALYCATUM. *Sph. testa subquadratâ,
complanatâ, compressâ, inaequilaterali; latere
antico breviori, obliquè subtruncato, margine dor-
sali recto, brevi; latere postico expando; obliquè
quadrato, margine dorsali recto, paulò elevato;
umbonibus acutis, tuberculo calyceiformi desinenti.*

THE CAPPED SPHERIUM. Shell rather square, flattened, compressed, inequilateral; anterior side shorter, obliquely subtruncated, dorsal margin straight, short; posterior side expanded, obliquely square, dorsal margin straight, a little raised; umboes sharp, ending in a little cup-shaped tubercle.

DEPARNAUD. Moll. Pl. X. f. 14, 15.

Hab. Europe.

Quite distinct from *Cyclas lacustris* of the same author.

S P H E R I U M.

PLATE II.

Species 11. (Mus. Brit.)

SPHERIUM NUCLEUS. *Sph. testâ tumidâ, altâ, pallidâ, cornicis, fasciis griseis ornata, subrhomboidalis; sub-equilaterali; umboibus angulis, obtusis, marginie dorsali utrinque rectilincolâ, marginie centrali rectâ, marginibus lateraliibus subrundatis.*

THE SUT-LIKE SPHERIUM. Shell tumid, high, pale, horny, ornamented with grey bands, subrhomboidal, nearly equilateral; umboes large, obtuse; dorsal margin rather straight on each side, ventral margin rather straight, lateral margins a little truncated.

STRIDER. Jay's Catalogue.
Hab. Moravia.

Species 12. (Mus. Brit.)

SPHERIUM PISIDIODA. *Cyr. testâ viridi, subdistanter sulcata, obliquâ, tumida, latere quam altâ; latere postico obliquè producto, marginie dorsali declivi; latere antico breviori, marginie dorsali declivi; umboibus elevatis, tumidis, rotundis.*

THE PISIDIUM-SHAPE SPHERIUM. Shell green, rather distantly grooved, oblique, tumid, longer than high; posterior side obliquely produced, dorsal margin sloped downwards, anterior side shorter, dorsal margin sloped, umboes elevated, tumid, rounded.

GRAY. MS. Brit. Mus.
Hab. Europe.

Species 13. (Mus. Brit.)

SPHERIUM STRIATINUM. *Sph. testâ subrhomboidalis, sub-distanter sulcata, obliquâ; latere antico brevi, lîris validis; latere postico obliquè producto, ad marginem ventralem obliuâ angulato, lîris subelevatis; marginie dorsali declivi, marginie postico-laterali obliquè truncata.*

THE LITTLE STRIATED SPHERIUM. Shell rather rhomboidal, rather distantly sulcated, oblique; anterior side short, ridges strong; posterior side obliquely produced, obtusely angular at the ventral

margin, ridges almost disappearing; dorsal margin sloped, postero-lateral margin obliquely truncated.

LAMARCK. Anim. s. Vert. Cycas, Sp. 10.

Hab. South America.

Species 14. (Mus. Brit.)

SPHERIUM TUMIDUM. *Sph. testâ subrotundata, tumida, rotunda et distanter sulcata, fasciis griseis, altâ, subangulata; latere antico rotundo, latere postico subobliquâ producto, prope marginem centraleum subacuminatâ.*

THE TUMID SPHERIUM. Shell rather round, tumid, strongly and distantly ridged, horny-brown, high, rather orange within; anterior side round, posterior side rather obliquely produced, acuminate near the posterior margin.

BRAID. Proc. Zool. Soc. 1863. p. 69.
Hab. Vancouver's Island.

Species 15. (Fig. a, b, Pl. IV.)

SPHERIUM PARTUMEIUM. *Sph. testâ pallidâ, flavida, vel griseo-cornicis, subrotundata, tumida, altâ, levigata; latere antico brevi, rotundata; latere postico subproductio, subquadrata.*

THE PRODUCTIVE SPHERIUM. Shell pale yellowish, hornily-grey, rather rounded, tumid, high, smooth; anterior side short, round; posterior side a little produced, rather square.

SAY. Gould. Invertebrata, p. 75. f. 55.
Hab. Ohio.

Species 16. (Mus. Brit.)

SPHERIUM EUGOSUM. *Sph. testâ solidissimata, subrhomboidalis, subiridi-fasciata, medio sulcata, ad latere levigata; latere antico brevi, ad marginem dorsalem subelevata, latere truncata; latere postico producto, obliquè truncata.*

THE RUGOSE SPHERIUM. Shell rather solid, subrhomboidal, greenish-brown, sulcated in the

SPHÆRIUM.—PLATE II.

middle, smooth at the sides; anterior side short, a little cornered at the dorsal margin, truncated at the side; posterior side produced, obliquely truncated.

WHITMORE. MS. Mus. Brit.
Hab. ——?

Species 17. (Fig. a, b, c, and d, Pl. V. Mus. Brit.)

SPHÆRIUM CORNEUM. *Sph. testā breviter ocellā, tumidā, subrotundatā, fusatā vel flavidatā, griseo-fasciatā, vel albida; umbonibus obtusis, margine dorsali utrinque declivis; marginibus laterilibus obtusissimè truncatis.*
THE HORN SPHÆRIUM. Shell shortly ovate, tumid, rather round, brown or yellow, or banded with grey or whitish; umboes obtuse, dorsal margin sloped on both sides; lateral margins very obtusely truncated.

LINNAEUS (*Tellina cornuta*) Syst. Nat.
Cyclas ricardii. Draparnaud.
Hab. Great Britain, Europe generally.

Species 18. (Mus. Brit.)

SPHÆRIUM TERVERIANTM. *Sph. testā subglobosā, altit, ad apicem cornet, fere omniū estinatā; latec avido ante umboes excavato; umboibus prominentibus, latere postico inflato, margine dorsali declivis.*

TERVEN'S SPHÆRIUM. Shell rather globose, high, horny at the apex, chestnut nearly all over, anterior side excavated in front of the umboes; umboes prominent, posterior side inflated, dorsal margin sloped.

DUPUY. Extr. Gall. Test. 87, 1849.
Hab. France.

Species 19. (Mus. Brit.)

SPHÆRIUM CONSOERINUM. *Sph. testā compressā, subquadratā, lavigatā, cornēd; latere antico brevi, depresso; latere postico subexpanso; margine dorsali elevato, marginibus laterilibus ventralique rectiōsculis; umbonibus parvis, acutis.*

THE RELATED SPHÆRIUM. Shell compressed, subquadrate, smooth, horny; anterior side short, depressed; posterior side rather expanded; dorsal margin raised, lateral and ventral margins rather straight; umboes small, sharp.

CAILLAUD. Voyage de la Méroé.
Hab. Pyrmont.

A smaller species than *Sph. calyculatum*, resembling it, but without the calyx-shaped tubercle.

Species 20. (Mus. Brit.)

SPHÆRIUM OCCIDENTALE. *Sph. testā subcompressā, ovato-subquadratā, corneo-flavescenti, lavigatā; laterilibus subtruncateis, margine dorsali antico declivis, postico paucō elevato.*

THE WESTERN SPHÆRIUM. Shell rather compressed, ovato-subquadrate, yellowish, horny, smooth; sides a little truncated, anterior dorsal margin sloped downwards, posterior a little raised.

PRIME. MS. Mus. Brit.
Hab. Montreal.

SPHÆRIUM.

PLATE III.

Species 21. (Mus. Brit.)

SPHERIUM MACULATUM. *Sph. testū parvū, altā, compressā, subquadratā, tenui, cornuti, maculis nigris variegatā; latere antico brevi, ante umbones patinā excavato; latere postico magis expanso, subquadratō, margine dorsali rectiōsculo, margine laterali late truncato.*

THE SPOTTED SPHERIUM. Shell small, high, compressed, rather square, thin, horny, variegated with blackish spots; anterior side short, a little excavated in front of the umboes; posterior side more expanded, rather square, dorsal margin rather straight, lateral margin broadly truncated.

MORELET. Test. Nov. p. 25, 1851.

Hab. Yucatan, Mexico.

Species 22. (Mus. Brit.)

SPHERIUM MADAGASCARIENSE. *Sph. testū ovato-subrhomboidē, ferruginea, cornuta, subcircularis, tumidū, concentricā minutiōssimē striatū, margine dorsali rectiōsculo, marginibus lateraliibus subtruncateis; umbonibus obtusis.*

THE MADAGASCAR SPHERIUM. Shell ovate, sub-rhomboidal, ferruginous or banded with greenish horn, tumid, concentrically very minutely striated, dorsal margin rather straight, lateral margins rather truncated; umboes obtuse.

TRISTAN (?) MS. Mus. Brit.

Hab. Madagascar.

Species 23. (Mus. Brit.)

SPHERIUM STRAMINEUM. *Sph. testū subrhomboidē, solidū, epidermī fulvo-flavida indutā, medio versō apicē distinctor liratā, ad latera et versus marginē ventralē levigatā; umbonibus rotundis prominentiōs.*

THE STRAW-COLOURED SPHERIUM. Shell subrhomboidal, solid, covered with a fulvous yellowish epidermis; middle, towards the apex, distantly ridged, smooth at the sides and towards the ventral margin; umboes rounded, prominent.

CONRAD. Silliman's Journal, Vol. XXV., p. 342.
Hab. Missouri.

Species 24. (Mus. Brit.)

SPHERIUM ELEGANS. *Sph. testū tenui, altā, compressā, subquadratā, levigatā, pallidē cornutā, lineis nigrescentiis et fasciis albis ornata; umbonibus subcircularibus, margine dorsali utrinque pauci declivi.*

THE ELEGANT SPHERIUM. Shell thin, high, compressed, rather flat, smooth, pale horn, ornamented with dark lines and white bands; umboes nearly central, dorsal margin a little sloped on each side.

ADAMS. Boston Journal of Science, 4, Pl. IV, f. 2.

Hab. Vermont.

Species 25. (Mus. Brit.)

SPHERIUM EBURNEUM. *Sph. testū altā, solidā, eburaea, levigatā, rotundā-subquadratā; latere antico angustiori, breviori, rotunda; latere postico expansa, lato, subquadrata, margine dorsali recto, ad terminum emarginata.*

THE IVORY SPHERIUM. Shell high, solid, ivory-white, smooth, roundly subquadrate; anterior side narrower, shorter, rounded; posterior side expanded, broad, rather square, dorsal margin straight, cornered at the end.

ANTHONY (?) MS. Brit. Mus.

Hab. United States.

Species 26. (Mus. Brit.)

SPHERIUM FABALE. *Sph. testū compressā, leviter subcircularē, costatae, epidermī ferruginea indutā, subrotundā, depressā, vadī inequilateralē; latere antico brevi, declivī, subacuminata; latere postico productō, lato, margine dorsali elevata, subacute, marginē ventralē rectiōsculo.*

THE BEAN SPHERIUM. Shell compressed, slightly grooved, chestnut, covered with a ferruginous epidermis, rather oval, depressed, very inequilateral; anterior side short, sloped, rather acuminate; posterior side produced, broad, dorsal margin raised, slightly arched; ventral margin rather straight.

PRIME. Pro. Soc. Nat. Hist. Brit. IV. 1851, p. 159.

SPHÆRIUM.—PLATE III.

Sphaerium castaneum. Prime.

Sphaerium sulclosa. Charpentier.

Hab. United States.

Species 27. (Mus. Brit.)

SPHERIUM SIMILE. *Sph. testū subovatū vel subrhomboidā, cornicē, subaequilaterali, liris validis, versus apicem fortioribus rugosā; latere antico declivi, infrā subaeuminato, latere postico obliquū et obtusissimè truncato.*

THE SIMILAR SPHERIUM. Shell subovate or subrhomboidal, horny, nearly equilateral, wrinkled with strong ridges, stronger towards the apex; anterior side sloped, rather acuminated below; posterior side obliquely and very obtusely truncated.

SAY. Nichol's Encycl. Am. Ed. 11.

Hab. North America.

Cyclas Surragata. Lamarck.

It is not so rhomboidal as *Sphaerium sulcatum*, and the sulci are larger at and towards the apex.

Species 28. (Mus. Brit.)

SPHERIUM TRUNCATUM. *Sph. testū parvā, pallidē cornēd, grisecenti, compressā, subolidiquā; latere antico brevi, subrotundō; latere postico expanso, obliquē truncato.*

THE TRUNCATED SPHERIUM. Shell small, pale horn, greyish, compressed, rather oblique; anterior

side short, rather round; posterior side expanded, obliquely truncated.

LINSLEY. Amer. Journ. Sci. N. Ser. VI. p. 234.

Hab. United States.

Species 29. (Mus. Brit.)

SPHERIUM INCUVUM. *Sph. testū parvā, oblongā, compressā, subferruginē; latere antico brevissimo, depresso; latere postico producto, truncato; umbonibus acuminatis, incurvis.*

THE INCURVED SPHERIUM. Shell small, oblong, compressed, rather ferruginous; anterior side very short, depressed; posterior side produced, truncated; umbones acuminated, turned inwards.

GUPPY. Proc. Sci. Asso. Trinidad. 1872.

Hab. Isl. Trinidad.

Species 30. (Mus. Brit.)

SPHERIUM ELEVATUM. *Sph. testā rotundā, altā, pallidissimē aurantio-cornicē; latere antico brevi, rotundo; latere postico subexpanso, ad marginem dorsalem cuneato; umboibus rotundis, prominentibus.*

THE RAISED SPHERIUM. Shell rounded, high, very pale, orange-tinted, horny; anterior side short, round; posterior side a little expanded, cornered at the dorsal margin; umbones round, prominent.

HALDEMAN. Proc. Ac. Nat. Hist. Phil. I p. 53.

Hab. America.

SPHÆRIUM.

PLATE IV.

Species 31. (Mus. Sowerby.)

SPHERIUM CAROLINENSIS. *Sph. testā subempressā, alta, rotundato-subquadratā, fuscō-cornēa; latere antico subrotundato, angusto; latere postico obliquā obtusissimā tenuato; marginē ventrali paulo convexo; umbonibus parvis, haud prominentibus.*

THE CAROLINA SPHERIUM. Shell rather compressed, high, subquadrate, brown-horny; anterior side rather round, narrow; posterior side obliquely very obtusely truncated; ventral margin a little convex; umboes small, not prominent.

DESMAYES. Lamarck, N. ed. Anim. sans Vert.
Hab. Carolina, United States.

Species 32. (Mus. Brit.)

SPHERIUM RHOMBOIDEUM. *Sph. testā subovata, pallidū, levī, altiōsculī; latere antico breviōsculo, marginē dorsali depresso, latere postico subexpanso, subtruncato; marginē ventrali rectiōsculo; umbonibus prominentibus, acuminatis.*

THE RHOMBOIDAL SPHERIUM. Shell subovate, pale, smooth, rather high; anterior side rather short, dorsal margin depressed, posterior side a little expanded, slightly truncated; ventral margin rather straight; umboes prominent, acuminate.
SAT. Journ. Acad. Nat. Sci. 2. p. 389.
Hab. Vermont.

Species 33. (Mus. Sowb.)

SPHERIUM SECURIS. *Sph. testī, subquadratā, griseo-cornēa, tumidā, brevīspī, umbonibus productis, calyculatis; latere antico brevi, rectiōsculo; latere postico evanato, latē truncato, marginē ventrali paulo convexa.*

THE HATCHET SPHERIUM. Shell subquadrate, grey-horny, tumid, smooth; umboes produced, calyculated; anterior side short, rather straight; posterior side cornered, broadly truncated, ventral margin a little convex.

PRIME. Proc. Zool. Soc. Nat. Hist. Bost. iv. p. 160.
1851.

Hab. United States.

Species 34. (Mus. Brit.)

SPHERIUM DISTORTUM. *Sph. testā solidā, obliquā, antice scutatā, postice levigatā, corneo-subcavatā, latere antico brevi, rotundo, amplio; latere postico obliquā producta, angusto, post umbones excavato, marginē terminali obliquā truncato.*

THE DISTORTED SPHERIUM. Shell solid, oblique, anteriorly grooved, posteriorly smooth, greenish horny, anterior side short, round, full; posterior side obliquely produced, narrow, excavated behind the umboes, terminal margin obliquely truncated.

C. B. ADAMS.
Hab. America.

Species 35. (Mus. Brit.)

SPHERIUM CREEPINI. *Sph. testā subglobosā, subridatā, lineis nigrescentib⁹ et fasciis albidi concentrici cinctā; latere postico brevi, ad marginem dorsalem evanato; latere antico obliquā producta, rotundo, ante umbones excavato.*

CEEPLIN'S SPHERIUM. Shell rather globose, rather rounded, concentrically belted with dark lines and whitish bands; posterior side short, cornered at the dorsal margin; anterior side obliquely produced, round, excavated in front of the umboes.

DUNKER. Zeit. für Malak. 20, 1845.
Hab. Europe.

This little rounded shell has a peculiar bend forward in the anterior side, with a hollow under the umboes.

Species 36. (Mus. Brit.)

SPHERIUM SOLIDUM. *Sph. testā subquadratā, solidā, tumidā, cornēa, griso-fasciatā, regulariter scutatā; umbonibus productis, subcentralibus, marginē dorsali utrinque paulo declivi; laternis obtusissimā subtruncatis, marginē ventrali rectiōsculo.*

THE SOLID SPHERIUM. Shell subquadrate, solid, tumid,

SPHÆRIUM.—PLATE IV.

horny, banded with grey, regularly grooved; umbones produced, nearly central, dorsal margin slightly sloped on both sides; sides very obtusely truncated, ventral margin rather straight.

NORMAND. Nat. Cycl. Valenc. 6, f. 34.
Hab. France.

Species 37. (Mus. Brit.)

SPHÆRIUM NOVÆ-ZELANDE. *Sph. testā parvā, semi-pellucidā, compressā, cornēd, griso-fuscātā, levī, subquadratā, anticē rotundā, posticē obtusā truncatā, umboīibus subcentralib⁹.*

THE NEW ZEALAND SPHÆRIUM. Shell small, semipellucid, compressed, horny, banded with grey, smooth, rather square, anteriorly rounded, posteriorly obtusely truncated; umbones nearly central.

DESHAYES. Proc. Zool. Soc. 1854, p. 342.
Hab. New Zealand and New Holland.

Species 38. (Mus. Brit.)

SPHÆRIUM SUBTRANSVERSUM. *Sph. testā hyalinā, compressā, pallidē straminēd, versus apicem cornēd; latere antico subacuminato; latere postico lato, subexpanso; margine dorsali recto, margine laterali obliquē truncato.*

THE SUBTRANSVERSE SPHÆRIUM. Shell hyaline, compressed, pale straw, fleshy towards the apex; anterior side rather acuminated; posterior side broad, slightly expanded; dorsal margin straight, lateral margin obliquely truncated.

PRIME. Proc. Zool. Soc. 1860, 322.
Hab. Mexico.

Species 39. (Mus. Brit.)

SPHÆRIUM SOLIDULUM. *Sph. testā ovato-subtriangonā, solidā, rugatā, rugis versus apicem magis distantibus; latere antico breviāsculo, declivī; latere postico obliquē truncato, prepe mariginē ventrale producto, subacuminato, margine dorsali declivī.*

THE SOLID SMALL SPHÆRIUM. Shell ovato-subtriangular, solid, wrinkled, wrinkles more distant towards the apex; anterior side rather short, sloped, posterior side obliquely truncated, produced near the ventral margin, slightly acuminate, dorsal margin sloped.

PRIME. Proc. Soc. Nat. Hist. Bost. iv. 158, 1852.
Hab. North America.

Species 40. (Mus. Brit.)

SPHÆRIUM PUNCTIFERUM. *Sph. testā parvā, compressā, obliquē subrotundā, semipellucidā, pallidissimā, umboīibus anticē inclinatis, acutis; margine dorsali utrinque recto; margine postico-ventrali subproducto.*

THE PUNCTURED SPHÆRIUM. Shell small, compressed, a little obliquely rounded, semipellucid, very pale, umbones leaning anteriorly, sharp, dorsal margin straight on each side; postero-ventral margin slightly produced.

GUPPY —? MS. Mus. Brit.
Hab. Trinidad.

SPHERIUM

PLATE V.

Plate V. (Mus. Brit.)

Fig. 17 d. *Sphaerium cornicum*, var. *glaucescens*, Macgillivray v., Pl. II.

Fig. 5 b. *Sphaerium laeustum*. See Plate I.

Species 41. (Mus. Brit.)

SPHERIUM INCON-PICUM. *Sph. testū securiformi*, *glauco-caerulea*, *superū succinat*, *brevigat*, *obliqua*, *inequilaterali*; *lateralē antico brevi*, *oblique truncato*; *lateralē postico subexpanso*, *margine postico centrali obliqui* *producto*, *margine dorsali elevato*; *margine centrali recti*-*sculo*, *lato*; *umbonilus productis*, *sulcavittatis*.

THE INCONSPICUOUS SPHERIUM. Shell hatchet-shaped, yellowish-flesh, amber above, smooth, oblique, inequilateral; anterior side short, obliquely truncated; posterior side a little expanded; postero-ventral margin obliquely produced, dorsal margin raised; ventral margin rather straight, broad; umbones produced, a little acuminate.

PRIME. Proc. Zool. Soc. Bost.

Hab. Asia Minor.

Species 42. (Mus. Brit.)

SPHERIUM BORNEENSE. *Sph. testū oblongā*, *ferruginea*, *tenuiter striatā*, *fusco-obscurō angulatim maculatā*; *lateralē antico subrotundo*; *lateralē postico obliqua*, *subquadrate*, *margine centrali recti*-*sculo*; *margine dorsali utriusque parvū dentif*.

THE BORNEAN SPHERIUM. Shell oblong, ferruginous, finely striated, angularly spotted with dull brown; anterior side rather round; posterior side oblique, rather square, ventral margin rather straight, dorsal margin on each side a little sloped.

SOWERBY.

Hab. Borneo.

Species 43. (Mus. Sowerby.)

SPHERIUM ELONGATUM. *Sph. testū magis*, *oblongā*, *tumidā*, *subovatā*, *subciclidī*, *corpus apicem griseo-*

coronat; *umbonilus obtusis*, *depressis*, *subcentrali*-*bus*; *lateralē antico brevi*-*sculo*; *lateralē postico parvū magis obliqui* *producto*, *margine laterali obliqui* *subtruncata*; *margine centrali recti*-*sculo*, *clavigat*; *margine dorsali utriusque recta*, *beccī*.

THE ELONGATED SPHERIUM. Shell large, oblong, tumid, subovate, greenish, horny grey towards the apex; umbones obtuse, depressed, nearly central; anterior side rather short; posterior side a little more obliquely produced, lateral margin obliquely slightly truncated; ventral margin rather straight, elongated; dorsal margin on each side straight, short.

SOWERBY.

Hab. —?

We have no information respecting the locality of this rather handsome species, of which the three fine specimens in our possession are the only ones we have seen.

Species 44. (f, a, b, Mus. Brit.)

SPHERIUM MORMONICUM. *Sph. testū solidū*, *subquadri-*
cotā, *fecī* *longitudo*, *altū*, *subequilaterali*, *coronat*,
fusco-fasciatū *et lineatū*; *intūs coruled*, *fasciatū*;
lateralē obdassimilē truncatū; *umbonilus rotundis*
obtusis; *margine dorsali utriusque brevi*, *vix* *declici*.

THE MOREMON'S SPHERIUM. Shell solid, rather square, nearly smooth, high, subequilateral, horny, banded and lined with brown; bluish within, banded; sides very obtusely truncated; umbones rounded, obtuse, dorsal margin short on each side, scarcely sloped.

SOWERBY.

Hab. Great Salt Lake.

Broader and more solid than the European *Sph. rivularis*.

Species 45. (Fig. a, b, Mus. Brit.)

SPHERIUM CAPENSE. *Sph. testū subquadritatim ocati-*
tumidā, *ferruginea*, *intūs subcivitas*, *fasciatā*; *um-*
bonilus rotundis; *lateralē antico brevi*, *depresso*,

SPHÆRIUM.—PLATE V.

*rotundo; latere postico obscure angulato, obtusim
simè subquadrato.*

THE VINOUS SPHÆRIUM. Shell subquadrate ovate, tumid, ferruginous, a little wine-coloured, banded; umboes rounded; anterior side short, depressed, rounded; posterior side obtusely angular, very obtusely quadrate.

SOWERBY

Hab. S. Africa.

Sphærium Capense of Krauss is a more shortly ovate and more compressed lenticular shell than this.

Species 46. (Mus. Brit.)

SPHÆRIUM TRANSLUCIDUM. *Sph. testa parvâ, translucida, subcompressâ, oblongâ, antice subacuminatâ, posticâ expansâ, latâ subteminatâ, marginâ ventrali convexo, lato, marginâ dorsali brevissimo, recto; umboibus acutis.*

THE TRANSLUCID SPHÆRIUM. Shell small, translucent, rather compressed, oblong, anteriorly slightly acuminate, posteriorly expanded, broadly sub-

truncated, ventral margin convex, broad; dorsal margin rather short, straight; umboes sharp.

SOWERBY.

Hab. Palm-tree Creek, Australia.

Species 47. (Mus. —? Copied.)

SPHÆRIUM FERRUGINEUM. *Sph. testâ parvâ, tenui, fuscâ, obliquâ, levî, valde inaequilaterali; latere antico brevissimo, angusto, subacuminato, margine ventrali acclivo; latere postico expando, oblongo, margine dorsali convexissimo; margine postico-laterali obliquâ subtruncato.*

THE FERRUGINOUS SPHÆRIUM. Shell small, thin, brown, oblique, smooth, very inequilateral; anterior side very short, narrow, subacuminate, ventral margin sloped upwards; posterior side expanded, oblong, dorsal margin rather convex, postero-lateral margin obliquely subtruncated.

KRAUSS. Sudafrikanischen Mollusken.

Hab. River Kynsa, S. Africa.

Resembling *Sph. invenatum*.

Genus PLANORBIS. *Gmelin.*

Molluscum aquanticum.

Testa interdum sinistralis, spiralis, discoidea, spirâ depressâ, anfractibus tribus ad septem: apertura semilunari, vel ovata vel trigonâ, margine plerimque tenui.

MOLLUSC, FRESHWATER. Shell spiral, sometimes sinistral, spire depressed, whorls three to seven; aperture semilunar, or ovate or trigonal, margin generally thin.

Synonyms. *Coretus*, Adams. *Orbis*, Schrot. Inclusus. *Planorbula*, Hald. *Segnivalia*.

The late Mr. G. B. Sowerby, in his *Genera of Shells*, expresses his conviction that the Planorbis are sinistral shells, because when the shell is so placed that the aperture is on the left side, the whole of the whorls of what seems to be the spire are visible, while what is then the lower disc is hollow, and the apical whorls are more or less engulfed. This, however, is not the case throughout the genus, but chiefly among the typical forms. The Messrs. Adams describe the genus as consisting of dextral shells. My impression is that some are sinistral and others dextral. My attention had not been drawn to the subject before several plates had been drawn, and some of the figures being placed as if dextral will seem to have an upside-down appearance. The genus is widely diffused throughout all parts of the globe. Wherever there are ditches, ponds, wells, and rivers, there the Planorbis appear.

Species 1. (Fig. a, b, Mus. Sowerby.)

PLANORBIS CORNEUS. *Pla. testâ tumidâ, latâ, sinistrâ, cornuâ, levigatâ, medio anfractuum castanum; spirâ concaviâsculâ, anfractibus sensim, convexâsculis, rapide crescendibus, prope suturam rotundatis; tum declivibus, infâ ventricosus; disco inferiore concavâ, anfractibus rotundis, apicalibus obtectis, aperturâ latâ, altâ, subquadratâ.*

THE HORNY PLANORBIS. Shell tumid, broad, sinistral, horny, smooth, chestnut in the middle of the whorls; spire rather concave; whorls six, rather convex, rapidly increased, rounded near the suture, then sloped, ventricose below; lower

disc concave, whorls rounded, apical hidden; aperture broad, high, subquadrate.

LINNEUS. *Systema Naturae.*

Hab. Great Britain.

The specimen represented by figure *b* belongs to a recently discovered albino variety.

Species 2. (Mus. Brit.)

PLANORBIS TRIVOLVIS. *Pla. testâ tumidâ, altâ, pallidâ fuscâ, obliquâ rugatâ, sinistrali; spirâ excavatâ, angusta, supra suturam elevatâ, angulatâ; anfractibus quatuorvis superiorâ, tribus inferiorâ apparetibus; aperturâ subtrigonâ, altâ, intus castaneo-marginatâ.*

THE THREE-WHORLED PLANORBIS. Shell tumid, high, pale brown, obliquely wrinkled, sinistral; spire hollowed, narrow, raised above the suture, angular; whorls, four appearing above, three below; aperture subtrigonal, high, bordered inside with chestnut.

SAT. American Conchology, 1860.

Hab. New York.

Species 3. (Mus. Sowerby.)

PLANORBIS PERUVIANUS. *Pla. testâ albida, semipellucidâ, altissimâ, sinistrâ, spirâ angustâ, anfractibus quatuorvis, angustis, supra suturam elevatis, ultimo magno, subdeclinâ; versus aperturam validè expanso; suturâ profundâ; aperturâ subtrigonâ, supra infræque anfractuum ultimum productâ, disco inferiori excavato, anfractibus rotundis, apicâ obtecta.*

THE PERUVIAN PLANORBIS. Shell whitish, semipellucid, rather high, sinistral, spire narrow, whorls four, narrow, raised above the suture; last large, somewhat sloped, much expanded towards the aperture; suture deep; aperture subtrigonal, produced above and below the last whorl; lower disc hollow, whorls rounded, the apical one hidden.

BRODERIP. Proc. Zool. Soc. 1842, f. 125.

Hab. Peru.

PLANORBIS.—PLATE I.

Species 4. (And Fig. b, Pl. X., Mus. Sowerby.)

PLANORBIS CORPULENTUS. *Pla. testā tenuī, inflatā, subglobosā, subvīrīdē cornēā, concentricē obliquē rugatā, altā, superī angulatā, infrā subangulatā, sinistrā; spirā infundibulatā, anfractibus supra suturam elevatis, angulatis, lateraliter planulatis; medio altis, convexis; ultimō versus aperturam expansis; aperturā maximā, supra infrāque ultimum anfractum productis, supernē subangulatā, infernē latā, margine expanso, intus castaneo; disco superiori profundē umbilicato.*

THE CORPULENT PLANORBIS. Shell thin, inflated, sub-globose, greenish horny, concentrically obliquely wrinkled, high, angular above, a little angular below, sinistral; spire funnelled, whorls raised above the suture, angular, laterally flattened, high, convex in the middle; last expanded towards the aperture; aperture very large, produced above and below the last whorl, rather narrow above, broad below, margin expanded, chestnut within; upper disc deeply umbilicated.

SAY. Albers. Mon. Pl. III. f. 79.

Hab. Winnipeck River.

It is difficult to distinguish the less developed forms of this species from the more elevated forms of *Planorbis lentus*. The latter is a stouter shell, with the wrinkles more defined, and it is never quite so high. *Planorbis trivolis* is considerably more depressed than either.

Species 5. (Mus. Sowerby, &c.)

PLANOREIS COMPLANATUS. *Pla. testā dextrali cornēō fulvā, levigatā, compressā, supernē convexiōculā, infernē planulatā; spirā meliō subcavatā; anfractibus quinīs, moderatē crescentibus, ultimō infrā carinatis; aperturā obliquē suboculatā, supra anfractum ultimum elevatā et producta.*

THE FLATTENED PLANORBIS. Shell horny fulvous, smooth, compressed, rather convex above, flattened below; spire a little hollowed in the middle; whorls five, increasing moderately, last

keeled below; aperture obliquely subovate, raised and produced above the last whorl.

LINNEUS. Systema Naturae.

Planorbis marginatus. Draparnaud.

Planorbis umbilicatus. Müller.

Hab. France, England, Sicily.

Species 6. (Fig. a, b, Mus. Brit.)

PLANORBIS OLIVACEUS. *Pla. testā sinistrā, depressā, olivaceo-fuscā, nitentī, latā, supernē declivī, infrā latissimā, spirā concavā, angustatā, anfractibus senīs, compressā, supra suturam paulo elevatā, tūn lēvitē declivibus; aperturā subtriangularē, margine inferiori obliquē productā; disco inferiori concavo.*

THE OLIVE PLANORBIS. Shell sinistral, depressed, olive-brown, shining, broad, sloped above, very broad beneath; spire concave, narrow; whorls six, compressed, a little raised above the suture, then gently sloped; aperture subtriangular, lower margin obliquely produced; lower disc concave.

SIX. Testacea Braziliania, p. 26, Pl. XVIII. f. 1, 2.
Planorbis Caminguianus. Dunker. Proc. Zool. 1848.

Hab. Brazil.

Species 7. (Mus. Brit.)

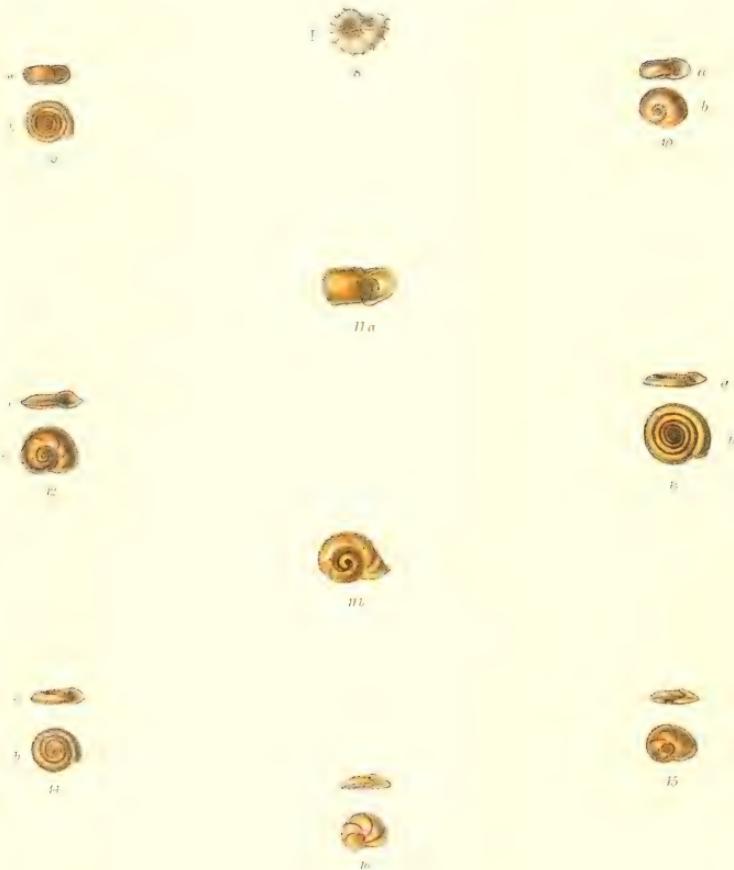

PLANORBIS BICARINATUS. *Pla. testā sinistrālī, tenuī, levigatā, altissimā, pallidē stramineā; spirā angustā, propemodō infundibulatā, anfractibus tribus, supernē infernēque carinatis; ultimō anfractu maximo, ad aperturam altissimō, supernē acuminatō, infrā latiōscō; disco inferiori profundē umbilicato, anfractu apicalē obtecto.*

THE TWO-KEELED PLANORBIS. Shell sinistral, thin, smooth, very high, pale straw; spire narrow, deeply funnelled, whorls three, keeled above and below; last whorl very large, very high at the aperture, acuminate above, rather wide below; lower disc deeply umbilicated, apical whorl hidden.

SAY. Journ. Nat. Sci. Phil.

Hab. River Ohio.

PLANORBIS.

PLATE II.

Species 8. (Mus. Sowb.)

PLANORBIS NAUTILEUS. *Pla. testā allidā, pārvā, sub-depressū; aufractibus quatuor, rapidē crescentibus, līris cornis, ad marginem spinosis annulatis, ultime disjuncta; disco superiori planulato, aufractibus rotundato-depressis; disco inferiori latè usque ad apicem umbilicato.*

THE NAUTILOID PLANORBIS. Shell whitish, small, rather depressed, whorls four, quickly enlarging, ridges horny, annulated with horny ridges spinous at the margin, last disjoined, upper disc flattened with round-depressed whorls; lower disc broadly umbilicated as far as the apex.

LINNEUS. *Systema Natura.*

Planorbis nautilus. Müller.

Planorbis nautilus. Draparnaud.

Hab. France, Great Britain.

Species 9. (Fig. a, b, Mus. Sowb.)

PLANORBIS CONTOCTUS. *Pla. testā fulvā, medio-rērē depresso, superē planulatā, infī angulatā umbilicata; aufractibus sensī, leātē crescentibus, angustis, superē rotundatis, infī ad marginem umbilicē angulatis, umbilicē angusto, profundo; aperturā semilunari.*

THE EVEN-WHEELED PLANORBIS. Shell fulvous, moderately depressed, flattened above, angularly umbilicated below; whorls six, slowly increased, narrow, rounded above, angular at the edge of the umbilicus, umbilicus narrow, deep; aperture semi-lunar.

MÜLLER. Drap. Mol. Pl. I. f. 39-41.

Planorbis crassus —?

Planorbis umbilicatus —?

Hab. England, France.

Species 10. (Fig. a, b, Mus. Sowb.)

PLANORBIS GLABER. *Pla. testā subangulatā, nitenti, altissimolē, aufractibus trilobis, rapidē crescentibus, ultimo lato, superē subplanulatā, disco superiori quatuor inferiori angustiori, disco inferiori planō, tuberculata; aperturā obliquā, labio extero convexē obliquo.*

THE SMOOTH PLANORBIS. Shell somewhat orange, shining, rather elevated; whorls three, quickly increasing; the last wide, rather flattened at the top, upper disc a little narrower than lower; lower disc flat, tuberculated; aperture oblique, outer lip convexly oblique.

JEFFREYS —? British Mollusca, &c.

Planorbis levius. Alder.

Hab. Penzance, Falmouth, Swansea, Belfast, &c.

Species 11. (Fig. a, b, Mus. Brit.)

PLANORBIS CAMPANULATUS. *Pla. testā altā, levissimē obliquā latitā; aufractibus sensī, rapidē crescentibus, exterō majorō; disco superiori profundā excavato, aufractibus interī colatā, exterō rotundatis, ultimo versus aperturā contracto, tūm expanso; disco inferiori aufractibus prope suturam angulatis; aperturā subpyriformi, expansā, sūperē elevatā, intib⁹ contracta.*

THE BELL PLANORBIS. Shell high, finely obliquely ridged; whorls six, rapidly increased, outer one large; upper disc deeply hollow, inner whorls hidden, outer rounded, last contracted towards the aperture, then expanded; lower disc with whorls angular near the suture; aperture rather pyriform, expanded, raised above, contracted within.

SAY. Journ. Am. Soc. Phil. Vol. II. p. 166.

Hab. Newport, Iowa, U.S.

Species 12. (Mus Sowerby.)

PLANORBIS CARINATUS. *Pla. testā depresso; aufractibus quatuor, extīs paulo infra medium acutē carinatō; ultimo lato; disco superiori excavato, aufractibus convexis; disco inferiori magis convexo, aufractibus subplanulatis.*

THE KEELED PLANORBIS. Shell depressed; whorls four, sharply keeled on the outer side a little below the middle; last broad; upper disc hollow, whorls convex; lower disc more convex, with rather flattened whorls.

MÜLLER. Drap. Mol. Pl. 2, f. 13, 14.

Helix planorbis. Linnaeus.

Planorbis planatus —?

PLANORBIS.—PLATE II.

Planorbis lutescens. Lamarck.

Hab. Britain and other parts of Europe.

Resembling *Planorbis marginatus*, but with outer whorls wider, and the keel planed more towards the middle of the whorls.

Species 13. (Fig. a, b, Mus. Brit.)

PLANORBIS VORTEX. *Pla. testâ depresso, utrinque complicitâ; anfractibus octavîs, angustissimis, lenti crescentibus; disco superiori subexcavato, inferiori paulo convexo, anfractibus angusti prope suturam elevatis.*

THE VORTEX PLANORBIS. Shell depressed, flattened on both sides; whorls eight, very narrow, slowly increasing; upper disc a little hollow, lower a little convex, with whorls narrowly raised near the suture.

LINNAEUS. (*Helix*) *Systema Naturae.*

Planorbis compressus. Michelet.

Hab. Europe generally.

Species 14. (Fig. a, b, Mus. Sowerby.)

PLANORBIS SPIRORUM. *Pla. testâ compressâ; anfractibus sexi, lente crescentibus, superne angustioribus; disco superiori angustiori, planudato; disco inferiori concavo; aperturâ supra anfractum ultimum elevata; infra productâ, rotunda.*

THE SPIRORUM PLANORBIS. Shell compressed; whorls six, slowly increasing, narrower above; upper disc narrower, flattened; lower disc concave; aperture raised above the last whorl, produced, rounded below.

MÜLLER. *Verm. et Fluv.* p. 161. No. 347.

Hab. Britain, France.

Species 15. (Fig. a, b, Mus. Sowerby.)

PLANORBIS NITIDUS. *Pla. testâ compressâ, succinatâ, medio obtuso angulatâ, suprâ infrâque ferè aequaliter conceudâ; ultimo anfractu maximo; disco spirali contracto, planato, anfractibus internis angustis; disco inferiore latè excavato.*

THE NEAT PLANORBIS. Shell flattened, amber, obtusely angular in the middle, almost equally convex above and below: last whorl very large; spiral disc contracted, flattened, with narrow inner whorls; lower disc broadly excavated.

MÜLLER. *Drap. Moll.* Pl. 2, f. 20–22.

Hab. Britain, France.

Species 16. (Fig. a, b, Mus. Sowerby.)

PLANORBIS LACUSTRI. *Pla. testâ compressâ, succinatâ, interne divisa, lineis rubris distantibus, obliquè concentricâ extâ notata; suprâ subconica; spiri minimâ; medio subacuto angulato, infra angulum planudato, umbilicato.*

THE LAKE PLANORBIS. Shell compressed, amber, internally divided, externally marked by distant obliquely concentric red lines; somewhat conical above; spire very small; middle rather sharply angular, flattened below the angle, umbilicated.

LIGHTFOOT. —? *Brit. Moll.*

Segmentina lineata. —?

Hab. Ponds and ditches in England.

PLANORBIS.

PLATE III.

Species 17. (Mus. Sowerby).

PLANORBIS ALBUS. *Pla. testá pallidissimá, depresso;*
spiralibus tenuibus tenuis ornato; anfractibus
pauis, ultimo maximo; aperturá obliqué pro-
ducta; disco superiori lenticulari, disco inferiori
circulari.

THE WHITE PLANORBIS. Shell very pale, depressed, spirally ornamented with thin hairy ridges; whorls few, last very large; aperture obliquely produced; upper disc lenticular; lower disc concave.

MÜLLER. Drap. Moll. Pl. I. fig. 45-48.

Planorbis hispidus. Draparnaud.

Hab. Britain, France.

Species 18. (Mus. Sowb.)

PLANORBIS ARMIGERUS. *Pla. testá subdepresso, solidissi-*
matis, pallidi cornuti; anfractibus quinque, subcom-
presso, ultimo superne subcontracto, supra anfractus
squamis elevata, versus aperturam depresso; disco
inferiori profundè umbilicata; aperturá declivi,
intus prope marginum incrassato, ovoata.

THE ARMOUR-BEARING PLANORBIS. Shell rather depressed, solid, pale horny; whorls five, rather compressed, last rather contracted above, raised above the spiral whorls, depressed towards the aperture; lower disc deeply umbilicated; aperture sloped, thickened within near the margin, ovate.

SAY. Haldeman's Monograph, Pl. IV. f. 11-15.

Hab. New York.

Species 19. (Fig. a, b, Mus. Sowerby.)

PLANORBIS SUCCINENS. *Pla. testá depresso, succinæ,*
politi; anfractibus quaternis, sublatis crescenti-
bus, apicalibus angustis, externo tumido; disco
inferiori latè concavo, subcomplanato; aperturá
depresso, obliquè ovatæ, angustiæ.

THE AMBER PLANORBIS. Shell depressed, amber, polished, whorls four, rather slowly increasing, apical ones narrow, last tumid; lower disc widely

concave, rather flattened; aperture depressed, obliquely ovate, narrow.

SOWERBY.

Hab. —— ?

Two specimens are all I have seen of this pretty little amber-coloured species.

Species 20. (Fig. a, b, c, Mus. Brit.)

PLANORBIS REDEFIELDI. *Pla. testá pallidè fulvæ, alti;*
anfractibus paucis, supræ infrâque carinatis; disco
superiori profundiexcavato, ultimo anfractu convexo;
disco inferiori profundiissimè umbilicato;
aperturâ altissimâ, superne expansa, auriformi.
supræ infrâque angulata.

THE EARED PLANORBIS. Shell pale fulvous, high; whorls few, keeled above and below; upper disc deeply excavated, last whorl convex; lower disc very deeply umbilicated; aperture very high, expanded above, auriform, angular above and below.

C. B. ADAMS. Conch. Contrib. p. 23.

Hab. Jamaica.

Species 21. (Fig. a, b, Mus. Sowerby.)

PLANORBIS COACTATUS. *Pla. testá alti, pallidè stra-*
minciæ; anfractibus quinque, compressis, supræ
frâque rotundè angulatis, medio concezis; disco
superiori profundiexcavato, disco inferiori com-
planato, anfractibus gradatim crescentibus, ultimo
anfractu versus aperturam angustato, aperturâ
angustâ, subovatâ, margine paulò expanso, intâ
coactato.

THE CONTRACTED PLANORBIS. Shell high, pale straw; whorls five, compressed, roundly angular above; convex in the middle; upper disc deeply excavated; lower disc flattened, whorls gradually increasing, last whorl narrow towards the aperture; aperture narrow, rather oval, margin a little expanded, narrow within.

SOWERBY.

Hab. —— ?

PLANORBIS.—PLATE III.

Species 22. (Fig. *a, b*, Mus. Sowerby.)

PLANORBIS ORICULATUS. *Pla. testi depressa, albâ, semipellucidâ; anfractibus quinque, superne convexo-planulatis, latiâculis, infrâ angustatis; aperturâ obliquâ elevatâ, margine inferiori sursum eccliri.*

THE ORICULAR PLANORBIS. Shell depressed, white, semipellucid; whorls five, convexly flattened above, rather broad, narrow below; aperture obliquely raised, lower margin sloped upwards.

MORELET —? Adams.

Hab. —?

Species 23. (Fig. *a, b*, Mus. Sowerby.)

PLANORBIS PHILIPPINARUM. *Pla. testi depresso, griseo, subopacâ; anfractibus scutis, subcompressis, suprâ infâque convexiâculis, medio obtusissimâ angulatis; disco inferiori planulato; disco superiori mugis concavâ; aperturâ superne paulo elevatâ.*

THE PHILIPPINE PLANORBIS. Shell depressed, grey, rather opaque; whorls six, rather compressed, rather convex above and below, very obtusely

angular in the middle; lower disc flattened, upper disc more concave; aperture a little raised above.

DUNKER. C. B. Adams. P. Z. 1848.

Hab. Philippines.

This shell is stouter and deeper than the preceding, and the discs are less flattened.

Species 24. (Mus. Sowerby.)

PLANORBIS LUGUBRIS. *Pla. testâ altiâculâ, tenui, levigatâ, nitenti, castaneâ; anfractibus quinque, superne rotundis, latiâculis, infrâ magis contractis; disco superiori profundi excavato, disco infâriori subcirculari, subcontracto.*

THE DARKSOME PLANORBIS. Shell rather deep, thin, smooth, shining, chestnut; whorls five, rather rounded above, rather broad, more contracted below; upper disc deeply excavated; lower disc greenish, rather contracted.

WAGNER. Spix, Testacea Brasiliana. P. 27. No. 2.
Hab. Brazil.

PLANORBIS.

PLATE IV.

Species 25. (Mus. Sowerby.)

PLANORBIS BIANGULATUS. *Pla. testâ altiusculâ, solidâ, jumosâ-fusca, utrinquè angulatum latâ umbilicatum dextrâlî; anfractibus paucis, suprâ infrâque subcarinatis, aperturali subtriangulari, declivi, infî acuminatâ labio externo intus incrassato.*

THE TWO-ANGLED PLANORBIS. Shell rather high, solid, smoky-brown, angularly broadly umbilicated on each side; whorls few, keeled above and below; aperture subtriangular; sloped, acuminate below; outer lip thickened within.

—? Sowerby.

Hab. Brazil.

The whorls are not flattened at the top, as in *Planorbis bicarinatus*, but the lower funnel-shaped umbilicus is very similar.

Species 26. (Fig. a, b, Mus. Brit.)

PLANORBIS COSTULATUS. *Pla. testâ parvâ, compressissimâ, obliquâ concentricâ costulatâ, cardeco-subcirculari; anfractibus paucis, rapide crescentibus, superne leviter concavâ, ultimo magno; apertura obliquâ subrotundâ, disco inferiore subplanulata.*

THE RIBBED PLANORBIS. Shell small, very compressed, obliquely concentrically ribbed, greenish blue; whorls few, rapidly increased, slightly convex above, last large; aperture obliquely rather oval; lower disc a little flattened.

KRAUSS. Sudafrikan. Mollusken. Tab. V. f. 8.
Hab. Natal.

Species 27. (Fig. a, b, Mus. —? Copied.)

PLANORBIS BENGALENSIS. *Pla. testâ compressâ, tenui, pallidâ succinæ, levâ, superne concavâ, infâ planulatâ, anfractibus tribus, apicalibus paulò depresso; umbilico basali parvo; apertura subtriangulari.*

THE BENGAL PLANORBIS. Shell compressed, thin, pale amber, smooth, convex above, flattened below, whorls three, apical a little depressed, basal umbilicus small; aperture subtriangular.

DUNKER. Index Molluscorum. Tab. II. f. 1-4.
Hab. Bengal.

This shell does not appear from Dunker's figure to have the chambered character of the *Seguenzia* group, as shown in *Planorbis calathus*, which it somewhat resembles otherwise, although not nearly so tumid.

Species 28. (Mus. Sowerby.)

PLANORBIS AFFINIS. *Pla. testâ cornuâ, tenuiâ; spirâ concavâ, anfractibus quinâ altiusculis, prope suturam subangulatum elevatâ, tum declivibus, infâ rotundatis, apicali obteco; apertura magâscula, superne depresso.*

THE RELATED PLANORBIS. Shell horny, tumid; spire concave, whorls five, rather high, subangularly elevated near the suture, then sloped, rounded beneath, the apical one hidden; aperture rather large, depressed above.

ADAMS, C. B. Conchological Contributions, p. 44.
Hab. Jamaica.

More depressed and slight than *Planorbis cornu*, with the whorls beneath more deeply sunk in the umbilicus.

Species 29. (Mus. Brit. Sowb.)

PLANORBIS DECLIVIS. *Pla. testâ altâ, angustissimâ, cornu vel subcavata, tenuissimâ liratâ; spirâ planitascula, anfractibus angustis, ultimo magno, superne angustâ elevato, tam declivi, infâ rotundo, disco inferiore profundâ concavo, anfractibus rotundatis; apertura magnâ, auriformi, infâ caldi expanso, produtto.*

THE SLOPED PLANORBIS. Shell raised, rather narrow, horny, or chestnut, very finely ridged; spire rather flat, whorls narrow, last large, narrowly raised above, then sloped, rounded below, lower disc deeply concave, whorls rounded, aperture large, ear-shaped, much expanded and produced below.

SOWERBY.
Hab. —?

Differing from *Planorbis cornu* in the narrowness and elevation of the whorls, and in the great expansion and production of the lower part of the mouth.

PLANORBIS.—PLATE IV.

Species 30. (Fig. 1, a, b, Mus. Hanley.)

PLANORBIS CALATHUS. *Pla. testā parvā, dextrali, nūlenti, succinē, interne segmentatā, extē fasciis albī obliquē radiantibus ornatā, supernē convexā, infrā planulatā, spirā caldē contractā; anfractibus tribus, ultimo magno, subconico, infrā acutē angulato, angustē umbilicato.*

THE BASKET PLANORBIS. Shell small, dextral, shining, amber, divided by segments within, ornamented without by white rayed bands, convex above, flattened below; spire much contracted, whorls three; last large, somewhat conical, acutely angular, narrowly umbilicated.

BENSON. Ann. Nat. Hist. Ser. 2, Vol. V. (1850), p. 349.

Hab. Moradabad, Kattiawar, Ceylon, Cashmere.

Belonging to the 'Segmentina' group.

Species 31. (Mus. Hanley.)

PLANORBIS EXUSTUS. *Pla. testā subcirculari, fuso, tenuiter liratā, spirā subplanulatā, anfractibus tribus, ultimo maximo, aperturā supernō subangulatim elevata, tum depresso, declīci, infrā expansa, subproductā, disco inferiori latē concavo.*

THE BURNT PLANORBIS. Shell greenish brown, finely ridged; spire rather flattened; whorls three, last large; aperture angularly raised, then depressed, sloped, expanded below, rather produced; lower disc broadly concave.

DESHAYES. Belanger's Voyage. Ind. Ori. Zool. p. 417.

Planorbis Indicus. Benson.

This appears quite distinct from *Planorbis coromandelicus* in form and surface.

Species 32. (Fig. a, b, Mus. —? Copied.)

PLANORBIS NATALIS. *Pla. compressā, fumoso-fuscā; spirā subplanulatā, anfractibus quaternis, rotundis; ultimo lato, medio prominenti; disco inferiori latē concavo; aperturā compressa, lateraliter elongata.*

THE NATAL PLANORBIS. Shell smoky brown; spire rather flat, whorls four, rounded; last broad, prominent in the middle; lower disc broadly concave, aperture compressed, laterally elongated.

KRAUSS. Sudafrikanischen Mollusken. Tab. V. f. 9. Hab. Cape Natal, S. Africa.

Species 33. (Mus. —? Copied.)

PLANORBIS PFEIFFERI. *Pla. testā olivaceā, laevi, subcompressā; spirā subcomplanata, anfractibus tumidis, rotundis, supernē convexisculis, infrā angustatis; aperturā rotundē subquadrate; disco inferiori angustē umbilicata.*

PFEIFFER'S PLANORBIS. Shell olive, smooth, rather compressed; spire rather flattened, whorls tumid, rounded, convex above, narrow below; aperture roundly subquadrate; lower disc narrowly umbilicated.

KRAUSS. Sudafrikanischen Mollusken. Tab. V. f. 33. Hab. Cape Natal, South Africa.

Species 34. (Mus. Brit.)

PLANORBIS COROMANDELICUS. *Pla. testā altā, castaneocornicā, tenui, levigatā, irregulariter undatā; spirā contractā, concavā; anfractibus quaternis, supra suturam angulatim elevatis, perpendiculariter subcomplanatis; ultimo magno, ad aperturam expanso; aperturā supra suturam elevato, tum declīci, infrā obliquē expansi, productā; disco inferiori concavo, anfractibus rotundis, apicali obtecto.*

THE COROMANDEL PLANORBIS. Shell high, chestnut-horny, smooth, irregularly undated; spire contracted, concave; whorls four, angularly raised above the suture, perpendicularly flattened, last large, expanded towards the aperture; aperture raised above the suture, then sloped, obliquely expanded, produced; lower disc concave, whorls rounded, apical one hidden.

KÜSTER, as of Fabricius.

Hab. Co. of Coromandel.

PLANORBIS.

PLATE V.

Species 35. (Fig. a, b, Mus. Brit.)

PLANORIS SIBIRICUS. *Pla. testā parvā, tumidā, dextrā, rubescēti-cornēd; spirā planulatā, anfractibus tribus ad quaternos, tumidis, subrotundis; disco inferiore valle concava, anfractū apicali profundiō obtecto; aperturā obliquā subovata.*

THE SIBERIAN PLANORBIS. Shell small, tumid, dextral, reddish horn; spire flattened, whorls three to four, tumid, rather round; lower disc very concave, apical whorl deeply hidden; aperture obliquely subovate.

DUNKER. Proc. Zool. Soc. 1848, p. 12.

Hab. Siberia.

Species 36. (Fig. a, b, Mus. Brit.)

PLANORIS STELZNERI. *Pla. testā dextrā, pallidissimè fulvā, solidā, compressā, disco-superiori complanato, inferiori ad marginem convexo, tunc angulato, planulato, medio lato umbilicato; anfractibus quinque, superāt concretiōculis, supra medium subangulatis, tunc versus columellam inclinatis; aperturā obliquā subovata.*

STELZNER'S PLANORBIS. Shell dextral, very pale fulvous, solid, compressed; upper disc flattened, lower convex at the margin, then angular, flattened, broadly umbilicated in the middle; whorls five, rather convex above, subangular above the middle, then sloped inwards towards the columella; aperture obliquely subovate.

DOHN. Proc. Zool. Soc. 1858.

Hab. Ceylon.

Species 37. (Fig. a, b, Mus. Brit.)

PLANORIS GILBERTI. *Pla. testā subcompressā, dextrali, tenui, fori albi; spirā parvā; anfractibus tribus; ultimo magno, tumido, superne subconico, infra medium obtuse angulato; disco inferiori planulato, umbilicato; aperturā angusta, infra medium angulata.*

GILBERT'S PLANORBIS. Shell subcompressed, dextral, thin, almost white; spire small; whorls three,

last large, tumid, rather conical above, obtusely angular below the middle; lower disc flattened, umbilicated; aperture narrow, angular below the middle.

DUNKER. Proc. Zool. Soc. 1848, 40.

Hab. East Australia.

Species 38. (Fig. a, b, c, Mus. Brit.)

PLANORIS ERUNEUS. *Pla. testā alta, tumidā, undulatā, levi, albā, medio asperitum castaneā fasciatā; apice parvo, anfractibus tribus, superne subplanulatis, tum declivibus, infra inflatis, ultimo magno, alto, rapidē crescenti; disco inferiori convexo, anfractū apicali obtecto; aperturā magno, superne flexuoso depressi, infra inflata, producta.*

THE IVORY PLANORBIS. Shell high, tumid, undulating, smooth, white, banded with chestnut in the middle of the whorls; apex small, whorls three, rather flattened above, then sloped, inflated below; last large, high, rapidly increased; lower disc convex, apical whorl hidden; aperture large, flexuously depressed above, inflated below, produced.

GRAY —? MS. Mus. Brit.

Hab. Ceylon.

Species 39. (Fig. a, b, Mus. Brit.)

PLANORIS OBTUSUS. *Pla. testā compressā, subrugosa, ferruginea, apice lato, planulato; anfractibus quinque, lentē crescentibus, convexiōculis, superne sub-declivibus, infra obtuse angulatis, infra angulum planulatis; aperturā obliquā subovata, infra obtuse angulata.*

THE OBTUSE PLANORBIS. Shell compressed, rather rough, ferruginous, apex broad, flattened; whorls five, slowly increased, rather convex; rather sloped above, obtusely angular below, flattened below the angle; aperture obliquely subovate, obtusely angular below.

DESHAYES. Proc. Zool. Soc.

Hab. Adelaide.

PLANORBIS.—PLATE V.

Species 40. (Fig. a, b, Mus. Brit.)

PLANORBIS BRUNNEUS. *Pla.* testa subglobosa, alta, levigata, ferruginea; spirae parvae, anfractibus tribus, superne contractis, supra saturam, elevatis, subangulatis, tum rotundis, medio inflatis; disco inferiore angustè umbilicato, apertura semilunari, infra producta, expansa.

THE BROWN PLANORBIS. Shell subglobose, high, smooth, ferruginous, spire small, whorls contracted above, raised, a little angular above the suture, then rounded, inflated in the middle; lower disc narrowly umbilicated; aperture semi-lunar, produced and expanded below.

GRAT. Adams. Genera.

Hab. Bombay.

Species 41. (Fig. a, b, Mus. Brit.)

PLANORBIS MACNABIANUS. *Pla.* testa tenuissima, pellucida, succinæ, utrinque planulata, compressissima; anfractibus septenatis, ledissimè crescentibus, apertura subrhomboidalis; infra angulata.

MACNAB'S PLANORBIS. Shell very thin, pellucid, amber, flattened on both sides, very compressed; whorls seven, very slowly increased; aperture subrhomboidal, angular below.

ADAMS, C. B. Conchological Contributions, p. 42.

Hab. Jamaica.

Species 42. (Mus. Brit.)

PLANORBIS TENIATUS. *Pla.* compressa, dextræ, pallidæ cornæ; spiræ parvæ, anfractibus quaternis vel quinque, intercisis tribus angustissimis, ultimo tumido, latissimo, utrinque rotundato; medio fasciato, apertura obliquæ oblonga.

THE BIBAND PLANORBIS. Shell compressed, dextral, pale horny; spire small, whorls four or five, inner three very narrow; last tumid, rather broad, rounded on both sides, banded in the middle, aperture obliquely oblong.

MORELET. Adams. Genera.

Hab. Isle of Pines.

Species 43. (Fig. a, b, Mus. Brit.)

PLANORBIS STAGNICOLA. *Pla.* testa dextrali, complanata, olivacea, minutissimè lirata, superè convexa; anfractibus tribus, rapidè crescentibus, ultimo lato; apertura obliquæ subovata; disco inferiore concavo, anfractibus conspicuis, planulatis.

THE STILL-WATER PLANORBIS. Shell dextral, flattened, olive, very finely ridged; rather convex above; whorls three, quickly increasing, last broad; aperture obliquely subovate; lower disc concave, whorls conspicuous, flattened.

MORELET. —? Adams. Gen. of Shells.

Hab. —?

Very like *Planorbis albus* in form, but of a dark green colour, and finely wrinkled.

45.

46.

47.

48.

49.

50.

51.

PLANORBIS.

PLATE VI.

Species 44. (Fig. *a, b*, Mus. Brit.)

PLANORBIS HINDSIANUS. *Pla. testā parvā, dextrali, compressā, pallidē succinē, supernē convexā, infrā concavā, levī; spīrā parvā, anfractibus tribus, duobus apicalibus angustis, ultimo lato, rapidē crescenti; aperturā latā, perobliquā.*

HINDS' PLANORBIS. Shell small, dextral, compressed, pale amber, convex above, concave below, smooth, spire small, whorls three, two apical narrow, last broad, rapidly enlarged; aperture broad, very oblique.

DUNKER. Proc. Zool. Soc. 1848, p. 41.

Hab. Puna Islands.

Species 45. (Fig. *a, b*, Mus. Brit.)

PLANORBIS CATILLUS. *Pla. testā utrinque compressā, parvā, alba, dextrali; spīrā compressā, anfractibus quinque, angustis, tenuē crescentibus, infrā angustatis; aperturā obliquā subovatā, angustissimā, anticē productā, marginē inferiori subangustatā.*

THE LITTLE DISH PLANORBIS. Shell compressed on both sides, small, white, dextral, spire compressed, whorls five, narrow, slowly increased, angular below; aperture obliquely subovate, rather narrow, anteriorly produced, lower margin rather angular.

ANTON. —? Adams. Genera of Mollusca.

Hab. —?

Species 46. (Fig. *a, b*, Mus. Brit.)

PLANORBIS SALLEANUS. *Pla. testā tumida, dextrali, ferruginea, leviāscula; spīrā subcompressā, angustā; anfractibus quaternis, altis, supernē angustatis, infrā medium inflatis; aperturā subobliquā ovata, anticē subcepsa; disco inferiori lato, umbilicato.*

SALLE'S PLANORBIS. Shell tumid, dextral, ferruginous, rather smooth; spire rather compressed, narrow; whorls four, raised, narrow above, inflated below the middle; aperture rather obliquely

ovate; anteriorly rather expanded; lower disc broadly umbilicated.

DUNKER. Proc. Zool. Soc. 1853, p. 54.

Hab. St. Domingo.

Species 47. (Fig. *a, b*, Mus. Brit.)

PLANORBIS INFLATUS. *Pla. testā angustā, robustā, altā, levigatā; pallidē olivacea, infra medium intusque castanea; spīrā parvā, profundiā concava; anfractibus quaternis, apicalibus tribus parvis, ultimo altissimo, supra suturam perelato, rotundo, infra medium magis inplate; disco inferiori concavo, anfractu apicali obtecto; aperturā subauriformi, alta, margine inferiori subexpanso.*

THE INFLATED PLANORBIS. Shell large, robust, high, smooth, pale olive, chestnut below the middle and within; spire small, deeply concave; whorls four, three apical small, last very high, much raised above the middle, round, more inflated below the middle; lower disc concave, apical whorl hidden; aperture rather ear-shaped, lower margin a little expanded.

DUNKER. Proc. Zool. Soc. 1848, p. 40.

Hab. —?

Species 48. (Fig. *a, b*, Mus. Brit.)

PLANORBIS CIRCUMLINEATUS. *Pla. testā succinē, subpellucida, tumiliūscula, dextrali, levī; spīrā parvā, anfractibus quaternis, rapidē crescentibus, ultimo lato, prope aperturam subexpanso, aperturā obliquā subovatā, angustissimā, infrā paulo expansa.*

THE CIRCUMLINEAR PLANORBIS. Shell amber, rather pellucid, rather tumid, dextral, smooth; spire small, whorls four, rapidly increasing, last broad, a little expanded near the aperture; aperture obliquely subovate, rather narrow; a little expanded below.

SHUTTLEWORTH. —? MS. Mus. Brit.

Hab. Porto Rico.

PLANORBIS.—PLATE VI.

Species 49. (Fig. *a, b*, Mus. Brit.)

PLANORBIS TEEVERSANUS. *Pla. testá tumidá, palli-
dissimé corná, levigatá; spíri parvá, planulatá,
anfractibus tribus, ultimo tumido, supra saturam
rotundó elevato; aperturá obliquá, angustá, su-
perná suboblitata; disco inferiori concava.*

THE THREE-TURNED PLANORBIS. Shell tumid, very pale horn, smooth; spire small, flattened; whorls three, last tumid, roundly elevated above the suture; aperture oblique, narrow, rather dilated above; lower disc concave.

D'ORBIGNY. —? MS. Coll. Cam. in Brit. Mus.
Hab. St. Thomas, West Indies.

Species 50. (Fig. *a, b*, Mus. Brit.)

PLANORBIS ANDECOLUS. *Pla. testá albá, altit. dextrali;
spíri subcomplanatá, anfractibus tribus, convexis;
ultimo maximo, altissimo versus marginem super-
iorem et paulo supra medium, angulato infrá, ad
marginem inferiorem subcarinato, post carinam
late et profunde umbilicato; aperturá paulo de-
pressá, trigoná, antice productá, acuminatá, su-
perná latá, subdepressá.*

THE PLANORBIS OF THE ANDES. Shell white, high, dextral; spire rather flattened; whorls three, convex; last very large, very high, angular near the upper margin and a little above the middle,

slightly keeled at the lower margin, broadly and deeply umbilicated behind the keel; aperture a little depressed, trigonal, anteriorly produced, acuminate, broad, rather depressed above.

D'ORBIGNY. Voyage dans l'Amérique Méridionale, Pl. XLV.

Hab. South America.

Species 51. (Mus. Brit.)

PLANORBIS TENAGOPHILUS. *Pla. testá, compressa, solidá,
griseo-fuscá; utrinque concavá; apice umbilicato;
anfractibus quinque, supra saturam angulatis;
ultimo magno, supernè declivis, infri subcetratis,
disco inferiori lato, versus marginem complanato,
medio (hand profundi) umbilicato.*

THE SHALLOW-WATER PLANORBIS. Shell broad, compressed, solid, fulvous-gray; concave on each side; apex umbilicated; whorls five, angular above the suture, last large, sloped above, somewhat ventricose below, lower disc broad, flattened towards the margin, umbilicated (not deeply) in the middle.

D'ORBIGNY. Voy. Amér. Meridionale, Pl. XLV., f. 17-20.

Hab. South America.

The funnel-shaped umbilicus on the spire is narrower and more decidedly angular than in *Planorbis commutatus*.

PLANORBIS.

PLATE VII.

Species 52. (Fig. a, b, Mus. Brit.)

PLANORBIS KERMATOIDES. *Pla. testa subcompressa, attigid, supra truncato-conica, infra planulata, carinata, ad medium umbilico infundibuliforme excavata; spira depressa, anfractibus quaternis, ultimo magno.*

THE SHELL-SHAPED PLANORBIS. Shell a little compressed, whitish, truncato-conical above, flattened below, keeled, hollowed in the middle, with a funnel-shaped umbilicus; spire depressed, whorls four, last large.

D'ORBIGNY. Voy. Amér. Mérid. Pl. XLV., f. 1-4.
Hab. S. America.

Species 53. (Mus. Brit.)

PLANORBIS LUCIDES. *Pla. testa compressa, semiplicata, levigata, obscurè castaneo-cornuta; spira depressa, anfractibus quinis subplanulatis, ultimo convexa, infra medium subangulata; disco inferiore concava, angustissimata, aperturam subquadratam, infra latitudinalem.*

THE LUCID PLANORBIS. Shell compressed, semiplicid, smooth, chestnut-horn; spire depressed, whorls five, rather flat, last convex, rather angular below the middle; lower disc concave, rather narrow, aperture rather square, rather broad below.

PHILIPPI — ? MS. Brit. Mus.
Hab. — ?

Species 54. (Fig. a, b, Mus. Brit.)

PLANORBIS SEPTEMGYRATUS. *Pla. testa valde depressa, utrinque concavata, fuso-subviridis, anfractibus septem, angustissimis, ultimo angusto, apertura parva, obliquè orata.*

THE SEVEN-WHORLED PLANORBIS. Shell much de-

pressed, concave on both sides, brownish-green, whorls seven, very narrow, last narrow; aperture small, obliquely ovate.

ZEIGLER — ? MS. Brit. Mus.

Hab. Vienna.

A remarkably thin, wafer-like shell.

Species 55. (Fig. a, b, Mus. Sowerby.)

PLANORBIS BECKIANUS. *Pla. testa tumida, sinistrata, levigata, cornuta, medio anfractuum et infra castanata, spira depressa, anfractibus quaternis, supra suturam elevata, rotundata, ultimo rotundata, ventricosa, rotunda, infra latitudine aperturam magnam: disco inferiore profundiexcavata, anfractus apiculatus.*

BECK'S PLANORBIS. Shell tumid, sinistral, smooth, horn, chestnut at the middle of the whorls and below; spire depressed, whorls four, raised above suture, rounded, last large, ventricose, rounded, rather broad below; aperture large, lower disc deeply excavated, apical whorl hidden.

DUNKER — ? Ad. Gen. of Sh.
Hab. — ?

Little differing from *Planorbis cornuta*, but with the whorls more uniformly rounded than in that somewhat variable species.

Species 56. (Fig. a, b, Mus. Brit.)

PLANORBIS PALLIDUS. *Pla. testa tumidissimata, levata, pallida, cornuta, utrinque subcomplanata; spira angustata, anfractibus quaternis, rapidè crescentibus, ultimo latitudine aperturam declivè, infra medium inflata, disco inferiore subcomplanata; apertura obliquè subovata, marginè superiori cinnamomea producta, depresso.*

PLANORBIS.—PLATE VII.

THE PALE PLANORBIS. Shell rather tumid, smooth, pale horn, flattened on each side; spire narrow, whorls four, quickly increasing, last rather broad, sloped above, inflated below the middle; lower disc a little flattened; aperture obliquely subovate, lower margin sinuously produced, depressed.

C. B. Adams. Basl. Proc. Nat. Hist. Vol. II, p. 102.
Hab. Jamaica.

Species 57. (Fig. a, b, Mus. Brit.)

PLANORBIS CHILENSIS. *Pla. testa tumidiunculata, albâ, superne complanata; infrâ concavâ; anfractibus quinque, mediocriter crescentibus, ultimo tumido; aperturâ magnâ, subquadratâ, margine inferiori rectâsceno.*

THE CHILI PLANORBIS. Shell rather tumid, white, flattened above, concave below; whorls five, moderately increased, last tumid; aperture large, rather square, lower margin rather straight.

ANTON —? MS. Brit. Mus.
Hab. Chili.

Species 58. (Fig. a, b, Mus. Brit.)

PLANORBIS LANIERANUS. *Pla. testâ depressâ, corneo-castaneâ, translucidâ, levigatâ; spirâ compressâ, parci; anfractibus quaterois, ultimo superne latitusculo, infrâ angustiori, aperturâ angulatâ.*

LANIER'S PLANORBIS. Shell depressed, horny chestnut, translucent, smooth; spire compressed, small; whorls four, last rather broad above, rather narrower below.

D'ORBIGNY. Moll. Cuba.
Hab. Isl. Cuba.

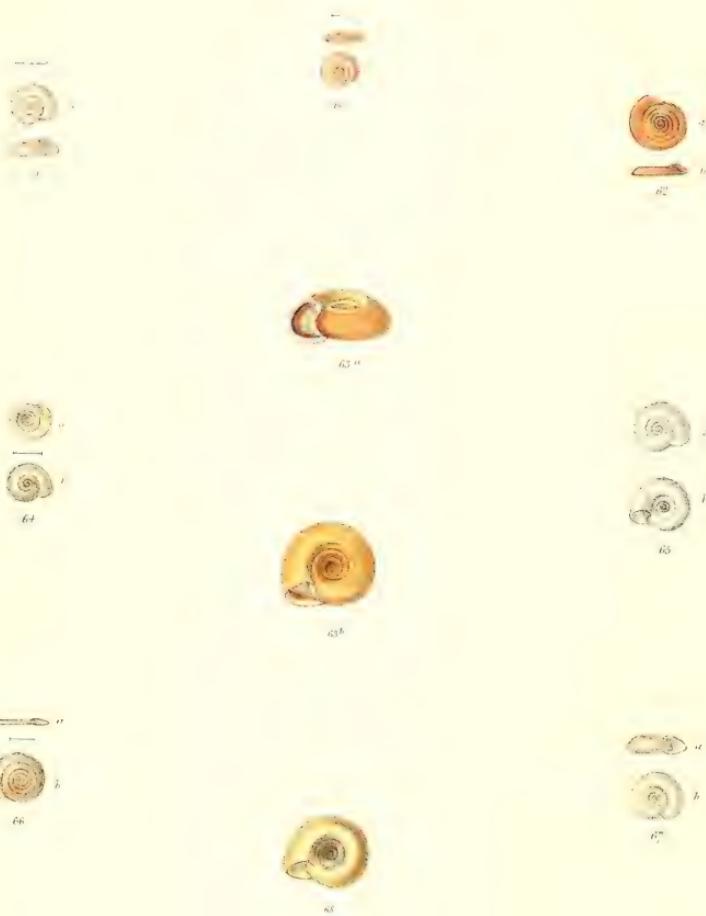

Species 59. (Fig. a, b, Mus. Brit.)

PLANORBIS ROSSMÄSLERI. *Pla. testâ parvâ, compressâ, ferruginea; spirâ subcomplanata, anfractibus quaternis, rapidè crescentibus, rotundatis; disco inferiori umbilicato; aperturâ obliquâ ovata.*

ROSSMÄSLER'S PLANORBIS. Shell small, compressed, ferruginous; spire rather flattened, whorls four, quickly increased, rounded; lower disc umbilicated; aperture obliquely ovate.

SCHMIDT —? Adams, Genera of Shells.
Hab. Anerswald, near Leipsic.

PLANORBIS.

PLATE VIII.

Species 60. (Fig. *a, b*, Mus. Brit.)

PLANORBIS SPENCERI. *Pla. testā pareā, flavidō-fuscā, subdepressā, sinistrā, levigatā; spira compasnatā, parvā, anfractibus quaternis, ultimo latissimā, superē concavōscula, ad marginem obscurissimā angustata, infra angulum angustatā; disco inferiori excavato; apertura semilunaria.*

SPENCER'S PLANORBIS. Shell small, yellowish-brown, subdepressed, sinistral, smooth; spire flattened, small, whorls four, last rather broad, rather convex above, very obscurely angular at the margin, narrowed below; lower disc excavated; aperture semilunar.

ALLES —? MS. Brit. Mus.

Hab. Portugal.

Species 61. (Fig. *a, b*, Mus. Brit.)

PLANORBIS NEIDCLUS. *Pla. testā tenui, pellucidi, pallidissimā cornē, tumidōscula; spira planissimā, medio excavata, angustā, anfractibus quaternis, utriusque tumidōscula; disco inferiori excavato; apertura superē lata, infra angustata.*

THE NEAT LITTLE PLANORBIS. Shell thin, pellucid, very pale brown, rather tumid; spire rather flat, a little excavated in the middle, narrow; whorls four, rather tumid on each side; lower disc excavated; aperture broad above, narrow below.

DUNKER. Proc. Zool. Soc. 1848, p. 40.

Hab. Malacca.

Species 62. (Fig. *a, b*, Mus. Brit.)

PLANORBIS UNGULATUS. *Pla. testā latā, depressā, arcuata, corneo-rubescens; spira cix convexa, anfractibus septenis, levē crescentibus, supernē angulatis, subcarinatis; disco inferiori concezo; apertura obliqua, supernē arcuē angulata, producta.*

THE TALONED PLANORBIS. Shell broad, depressed,

arched, reddish-horny, spire hardly convex; whorls seven, slowly increased, angular above, somewhat keeled, lower disc convex; aperture oblique, sharply angular above, produced.

CHITTY —? MS. Brit. Mus.
Hab. Jamaica.

The sharp prominent angle in the margin of the whorls, with the slightly arched under surface, gives the profile of this shell a talon-like appearance.

Species 63. (Fig. *a, b*, Mus. Brit.)

PLANORBIS COMMUTATUS. *Pla. testā sinistrā, tumida, ventricosā, pallidō fuscā, tenui; spira infundibulatā; anfractibus quīvis, angulatis, supernē angustatis, infra ventricosā, rotundis; disco inferiori profunde umbilicato, anfractu apicali obiecto; apertura rotunda-subtriangularis.*

THE CHANGED PLANORBIS. Shell sinistral, tumid, ventricose, pale brown; spire funnelled, whorls five, angular, narrow, ventricose, rounded below; lower disc deeply umbilicated, apical whorl hidden; aperture roundly subtriangular.

DUNKER —? MS. Brit. Mus.

Hab. N. America.

Species 64. (Fig. *a, b*, Mus. Brit.)

PLANORBIS ARCTICUS. *Pla. testā pareā, pallidē fulvā, subdepressā; spira pareā, paulo excavatā; anfractibus levibus, rotundis, rapidē crescentibus, tumidiōscula, disco inferiori latē umbilicato, apertura rotundā.*

THE ARCTIC PLANORBIS. Shell small, pale fulvous, rather depressed; spire small, a little excavated; whorls three, rounded, quickly increasing, rather tumid, lower disc broadly umbilicated; aperture rounded.

BECK —? MS. Mus. Brit.
Hab. Greenland.

PLANORBIS.—PLATE VIII.

Species 65. (Fig. *a, b*, Mus. Brit.)

PLANORBIS GRACILENTUS. *Pla. testâ dextrali, albida, opaca; spirâ planisculâ; anfractibus quinque, apicalibus angustis, externis latissimis, ad aper- turam subdilatatis; apertura subtriangularis; disco inferiori latè umbilicata.*

THE SLENDER PLANORBIS. Shell dextral, whitish, opaque; spire rather flat; whorls five, apical narrow, external rather broad; a little dilated at the aperture; aperture a little trigonal; lower disc broadly umbilicated.

GOULD —? MS. Brit. Mus.

Hab. Colorado Desert.

Species 66. (Fig. *a, b*, Mus. Brit.)

PLANORBIS DEPRESSISSIMUS. *Pla. testâ complanatâ, callo- depressâ, pellucidâ, pallidâ cornuatâ, spirâ complanatâ; anfractibus septem, tenuibus, leato crescenti- bus, superne ad marginem acutè angulatis; disco inferiori planulato; apertura latecalcarata elongatâ, angulo externo acentro.*

THE VERY FLAT PLANORBIS. Shell flattened, much depressed, pellucid, pale horn, spire flattened; whorls seven, thin, slowly increased, at the margin above sharply angular; lower disc flattened; aperture laterally lengthened, outer angle sharp.

MORICAND —? MS. Mus. Brit.

Hab. —?

The whorls are perhaps the flattest of any in the genus.

Species 67. (Fig. *a, b*, Mus. Brit.)

PLANORBIS SUBANGULATUS. *Pla. testâ pallidâ cornuatâ, tumidiâsculâ, sinistrali; anfractibus tribus, rapidè crescentibus, superne convexis, latissimis; disco superiori lato, concavo; inferiori subangulato, ex- cavato; apertura superne lateraliter productâ, infra versus medium inclinato.*

THE SUBANGULAR PLANORBIS. Shell pale, horny, rather tumid, sinistral whorls three, quickly increased; convex, rather broad; upper disc broad, convex, lower rather angular, excavated; aperture laterally produced above, inclined towards the middle below.

PHILIPPI. Eneycl. 2, Pl. XXI., f. 6.

Hab. Malta, Sicily.

Species 68. (Mus. Brit.)

PLANORBIS SERICEUS. *Pla. testâ sinistrali, tumidiâsculâ, pallidâ fuscâ, spirâ angustâ infundibulatâ; anfractibus quinque, superne angulatis, angustatis; disco inferiori excavato, anfractibus rotundis; apertura subtriangularis, infra expansâ, rotunda.*

THE CHICORY PLANORBIS. Shell sinistral, rather tumid, pale brown, spire narrowly funnelled; whorls five, angular above, narrow; lower disc excavated, whorls rounded; aperture subtriangular, expanded, rounded below.

DUNKER. Proc. Zool. Soc. 1848, 42.

Hab. —?

Differing from *Planorbis communatus* in the proportionate narrowness of the whorls, and the funnel-shaped excavation is more angular, distinct, and narrow.

PLANORBIS.

PLATE IX.

Species 69. (Mus. Brit.)

PLANORBIS ELEGANTULUS. *Pla. testā obliquā compressā, pellucida, cornēa, dextrali, tenuiter striatā, superā convexā, infā concavā; spīd parvā, aufractibus tribus, ultimo lato, ad aperturam obliquā expanso; aperturā peralbidā ovata.*

THE ELEGANT PLANORBIS. Shell obliquely compressed, transparent, horny, dextral, finely striated, convex above, concave below; spire small, whorls three, last wide, obliquely expanded at the aperture; aperture very obliquely ovate.

DOWEN. Proc. Zool. Soc. 1858, p. 134.

Hab. —?

Species 70. (Mus. Hanley.)

PLANORBIS TROCHOIDES. *Pla. testā tumidiōsculā, tenui, semipellucida, subiridi, distanter concentricā albofasciālē, superē convexā, infā subcognitātē, angustissimā umbilicātā, interē segmentatā; spīd angustissimā, ultimo aufracta superē labē expanso; infra medium angulata, nentē carinata.*

THE TROCHOIDAL PLANORBIS. Shell rather tumid, thin, semipellucid, rather green, distantly concentrically banded with white, convex above, rather flattened below, very narrowly umbilicated, internally divided in segments; spire very narrow, last whorl broadly expanded above; angular below the middle, acutely keeled.

BENSON. Asiatic Society Bengal, 1836, p. 742.

Hab. Barrackpore.

Remarkable for the way in which the outer whorl covers the inner, and the very small opening left in the centre of the upper and under discs.

Species 71. (Mus. Brit.)

PLANORBIS MORICANDI. *Pla. testā sinistrali, tumidā, ferruginea; spīd angustē infundibulatā, aufractibus supra suturam angulatā elevatā; ultimo labē declī; aperturā trigonā, infra medium subangulatā, infā subrotundatā; disco inferiori umbilicata.*

MORICAND'S PLANORBIS. Shell sinistral, tumid, ferruginous; spire narrow, with narrow funnel-shaped cavity, whorls raised angularly above the suture, last broadly sloped; aperture trigonal, rather angular below the middle, a little rounded underneath; lower disc umbilicated.

BECK. Adams, Genera of Shells.

Hab. —?

A narrower shell than *Planorbis tenagophilus*, with the funnel-shaped opening more narrow and angular.

Species 72. (Fig. a, b, c, Mus. Brit.)

PLANORBIS MULTIVALVIS. *Pla. testā cornēa, sinistrali, altā; spīd exsertā, subturreta; aufractibus septenī, superē angustis angulatis, ultimo compresso, alto, prop̄ aperturam contracto tumido, ad aperturam expanso; aperturā elevatā, margine expanso; disco inferiori profundi umbilicato; aufractibus rotundis, tribus apicilibus obtectis.*

THE MANY-WHORLED PLANORBIS. Shell horny, sinistral, high, spire exserted, subturreted; whorls seven, narrow and angular above, last compressed, deep, contracted near the aperture, then tumid, expanded at the aperture; aperture raised, margin expanded, lower disc deeply umbilicated; whorls rounded, three apical hidden.

CASE. Adams, Genera of Shells.

Hab. Lake Superior, Michigan.

In the contraction and swelling of the last whorl near the mouth, and expansion of the lip, this shell resembles *Planorbis campanulatus*, but the whorls of the spire are more numerous and are pushed out conically.

Species 73. (Fig. a, b, Mus. Brit.)

PLANORBIS FERRUGINEUS. *Pla. testā tumidā centris, sinistrali, castaneo-cornēa; spīd concavā, aufractibus senis, subangulatis, supra suturam elevatā, infra angulum subdecelibut, ultimo lato, infā subconcavā; aperturā obliquā subtrigonā; disco inferiori labē concavo; aufractibus subrotundis.*

PLANORBIS.—PLATE IX.

THE FERRUGINOUS PLANORBIS. Shell tumid, ventricose, sinistral, chestnut horn, spire concave; whorls six, rather angular, raised above the suture, rather sloped below the angle, last broad, rather convex below; aperture obliquely subtriangular; lower disc broadly concave, whorls somewhat rounded.

SPIX. Test. Braz. Tab. XVIII., f. 1-2.

Hab. Brazil.

The whorls are more angular above than is the case in *Planorbis olivaceus*.

Species 74. (Fig. a, b, Mus. Brit.)

PLANORBIS FUSCUS. *Pla. testā dextrali, depresso, ferruginea, supernū concurvissimū, infrah latē excavatū; spirā angustā; anfractibus tribus, ultimo lato; aperturā obliquè angustatā, marginē integro*

THE BROWN PLANORBIS. Shell dextral, depressed, iron-rust, rather convex above, broadly excavated below, spire narrow; whorls three, last broad; aperture obliquely narrow, margin entire.

DUNKER. Proc. Zool. Soc. 1848, p. 42.

Hab. Valparaiso.

Species 75. (Fig. a, b, Mus. Brit.)

PLANORBIS NANUS. *Pla. testā pallidè fuligineo, dextrali, compressū, supernū concurvissimū, infrah latē et profundiè umbilicatū; spirā angustū, complanatū;*

anfractibus tribus, obliquè striatis, rapidè crescentibus, ultimo latissimo; aperturā depressā, latissimā, labio externo supernè obliquè producta.

THE DWARF PLANORBIS. Shell pale fulvous, dextral, compressed, rather convex above, broadly and deeply umbilicated below; spire narrow, flat; whorls three, obliquely striated, rapidly increased, last very broad; aperture depressed, very broad, outer lip obliquely produced above.

BENSON. Proc. Zool. Soc. 1856, p. 186.

Hab. India.

Species 76. (Mus. Brit.)

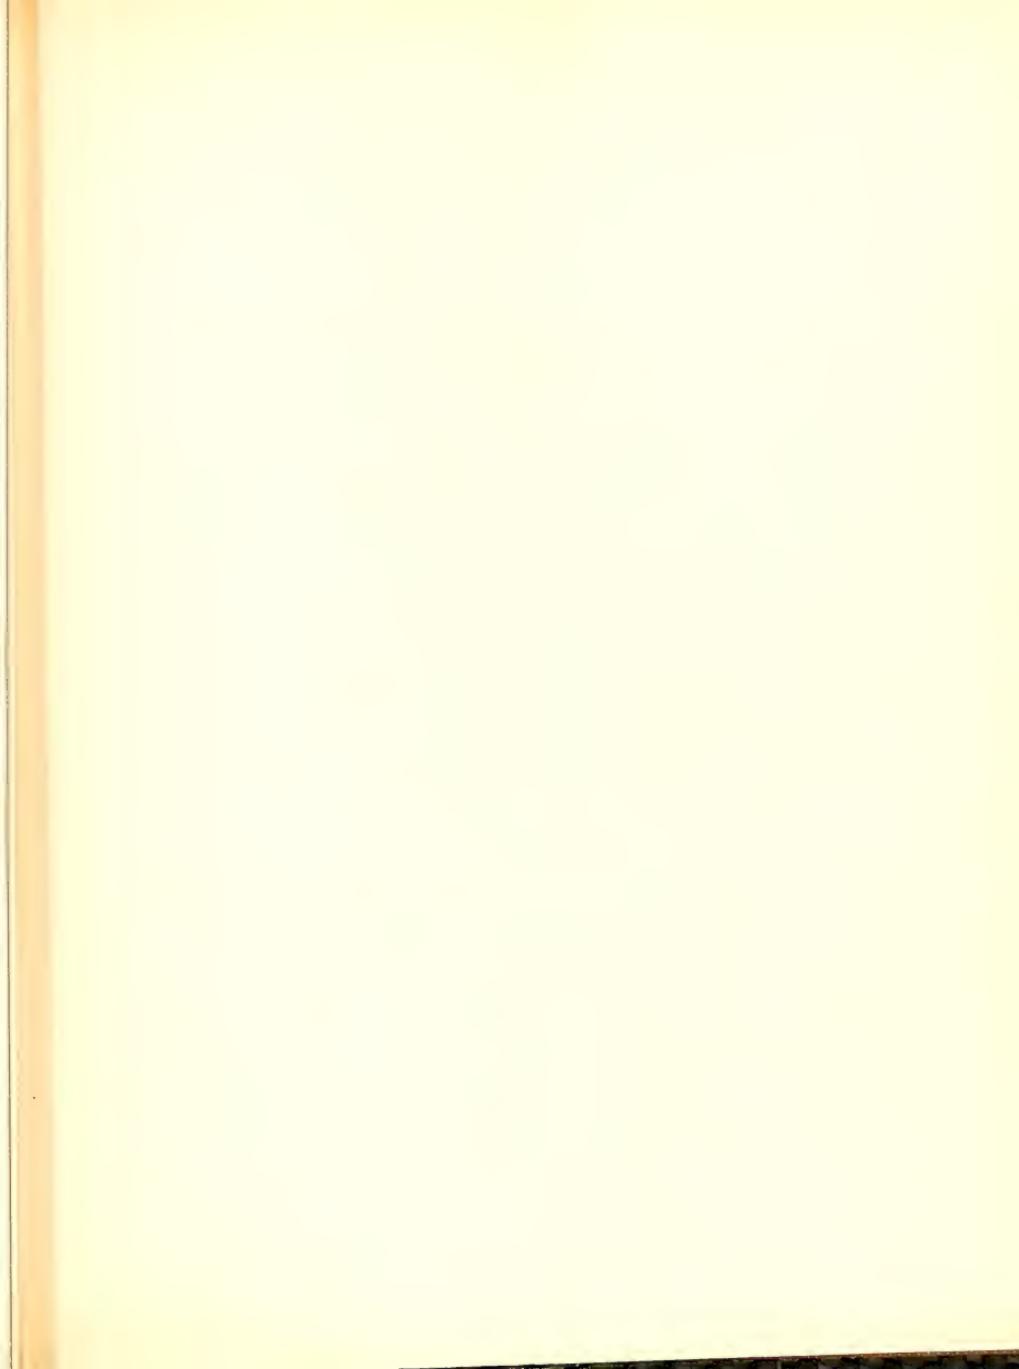

PLANORBIS MODICUS. *Pla. testā cornea, tumida, sinistrali, spirā infundibulata; anfractibus quinque, propè suturam elevatis et angulis, ultimo lato, declivi, concentricè tenuiter rugatā; aperturā subtriangularis, disco inferiori concava, anfractibus subplanutatis.*

THE MIDDLE PLANORBIS. Shell horny, tumid, sinistral, spire funnel-shaped; whorls five, raised and angular near the suture, last broad, sloped, concentrically finely wrinkled; aperture subtriangular, lower disc concave, whorls rather flat.

BENSON. Adams, Genera of Mollusca.

Hab. India.

Belonging to the same group as *Planorbis cornens*, but smaller, with narrow, angular, funnel-like spiral excavation.

PLANORBIS.

PLATE X.

Species 77. (Fig. *a, b*, Mus. Hanley.)

PLANORBIS UMBILICALIS. *Pla. testi dextrali, sequentata, fusca, tenui, intenti, levigata, superne tumida, infra planisendo, infra medianu carinata; spiræ angusta, planata; aufractibus tribus, ultimo angusto, lato, supra carinatum tumido; aperturæ obliquæ latæ, marginæ superiori sinuatim producto, disco inferiori medio anguste umbilicato.*

THE UMBILICAL PLANORBIS. Shell dextral, divided in segments, brown, thin, shining, smooth, tumid above, rather flat below, keeled below the middle; spire narrow, flat; whorls three, last large, broad, tumid above the middle; aperture obliquely broad, upper margin sinuously produced, lower disc narrowly umbilicated in the middle.

BENSON. Journ. Asi. Soc. Bengal, Vol. V, p. 741.
Hab. East Bengal.

Species 78. (Fig. *a, b*, Mus. Hanley.)

PLANORBIS CENOSUS. *Pla. testi dextrali, sequentata, pallide subcirculari, levigata, superne truncato-conica, infra subplanata, medio anguste umbilicata; spiræ angustissima, ultimo aufractu latissimo, infra medianu anguste carinata; aperturæ trigonæ, marginæ superne infræ flexuosa depresso.*

THE MEEI PLANORBIS. Shell dextral, divided in segments, greenish, smooth, truncated-conical above, rather flat below, narrowly umbilicated in the middle; spire very narrow, sharply keeled below the middle; aperture trigonal, margin flexuously depressed above and below.

BENSON. Ann. Nat. Hist. 1850, p. 349.
Hab. Near Moradabad, Ceylon.

Species 79. (Fig. *a, b*, Mus. Hanley.)

PLANORBIS CANTORI. *Pla. testi sordidæ subviridi, dextrali, sequentata, superne tumida, infra convexula, medio umbilicata; spiræ latiuscula, ultimo aufractu lato, infra medium obtuse carinata;*

aperturæ subtrigonæ, marginæ superne flexuosa productæ.

CANTOR'S PLANORBIS. Shell dull greenish, dextral, divided in segments, tumid above, convex below, umbilicated in the middle; spire rather broad, last whorl broad, obtusely keeled below the middle; aperture rather trigonal, upper margin flexuously produced.

BENSON. Ann. Nat. Hist. 1850, p. 349.

Hab. Barrackpore, India.

Species 80. (Fig. *a, b*, Mus. Brit.)

PLANORBIS PONSONBYI. *Pla. testi dextrali, allissimæ, ventricosæ, albæ, epidermide tenui pallide floridæ indutæ, superne subconicæ, infra latæ et profundæ umbilicata; spiræ subturrata; aufractibus dubios, brevibus, subangulatis, ultimo aufractu superne planulato, marginibus superiori inferiorique carinatis; aperturæ latæ, subtrigonæ, infra acuminatæ, superne expansæ.*

PONSONBY'S PLANORBIS. Shell dextral, very high, ventricose, white, covered with a yellowish thin epidermis, a little conical above, broadly and deeply umbilicated below; spire subturred; whorls two, short, rather angular, last whorl flattened above, upper and lower margin keeled; aperture broad, rather trigonal, acuminate below, expanded above.

SMITH. (*Carinifer.*) Proc. Zool. Soc. 1875, No. 2.
Hab. California.

In *Planorbis bicarinata* and *Pl. aurita*, the spire is sunk, and not, as in this species, exserted. Otherwise, the two former much resemble the latter. I cannot see any reason for separating these shells generically. At least one very different species has an exserted spire.

Species 81. (Mus. Brit.)

PLANORBIS NEWFERRYI. *Pla. testi dextrali, allissimæ, ventricosæ, cornicæ, epidermide tenui indutæ, infra*

PLANORBIS.—PLATE X.

latè et profundi insinuabilatè; spirā exsertā; anfractibus duobus, subangulatis, ultimo anfractu magno, ventricoso, superne infernè crenulatum carinato, medio obscurè carinato; aperturā trigonā, ferè ad medium ultimā anfractus depresso, superne angulatū, infra angulum productū, infra medium angustatū, acuminatū.

NEWBEREY'S PLANORBIS. Shell dextral, very high, ventricose, horny, covered with a pale thin epidermis, with a deep and wide funnel-shaped cavity below; spire exerted; whorls two, rather angular, last whorl large, ventricose, crenulated keeled above and below, obscurely keeled in the middle; aperture trigonal, depressed almost to the middle of the last whorl, angular above, produced below the angle, narrow and acuminate below the middle.

LEE. Proc. Acad. Phil. 1854, p. 51.

Genus, *Corinifex*. Binney.

Hab. California.

Species 83. (Mus. Sowerby.)

PLANORBIS LENTUS. *Pla. testā fusco-subviridi, medio anfractum subcrenatum, sinistrali, tumida, alta; spirā depressa; anfractibus planiusculis, prope suturam obscurè carinatis, ultimo concentricè lirato, tenuiter spiraliiter striatā; disco inferiori excavato, anfractu apicali obtecto; aperturā magnā, ad anfractum ultimum contractā, paulò elevatā; intus fuscō-fusci, margine incrassato, flexuoso, albo.*

THE SLACK PLANORBIS. Shell greenish-brown, bluish in the middle of the whorls, sinistral, tumid, high; spire depressed; whorls rather flat, obscurely keeled near the suture, last concentrically ridged, finely spirally striated, lower disc hollow, apical whorl hidden; aperture large, contracted at the last whorl, a little raised, smoky-brown within, margin thickened, white.

SAY. Albers, Monograph. Planorbis, Pl. III. f. 4-6.

Hab. S. Carolina.

More tumid and deep, and less sloped at the top of the whorls than *Planorbis tricolvus*.

Species 82. (Mus. Sowerby.)

PLANORBIS OBESUS. *Pla. testā tumida, altā, sinistrali, castaneo-subviridi, tenui, inflatā; spirā angustissimā, culū, angulatum concavē; anfractu ultimo magno, superne angulato, infernō rotundō; aperturā semi-circulari, disco inferiori medio concavo, anfractibus apicalibus obtectis.*

THE FAT PLANORBIS. Shell tumid, high, sinistral, greenish chestnut, thin, inflated; spire rather narrow, angularly concave; last whorl large, angular above, rounded below; aperture semi-circular, lower disc concave in the middle, apical whorls hidden.

DUNKER. Proc. Zool. Soc. 1848, p. 41.

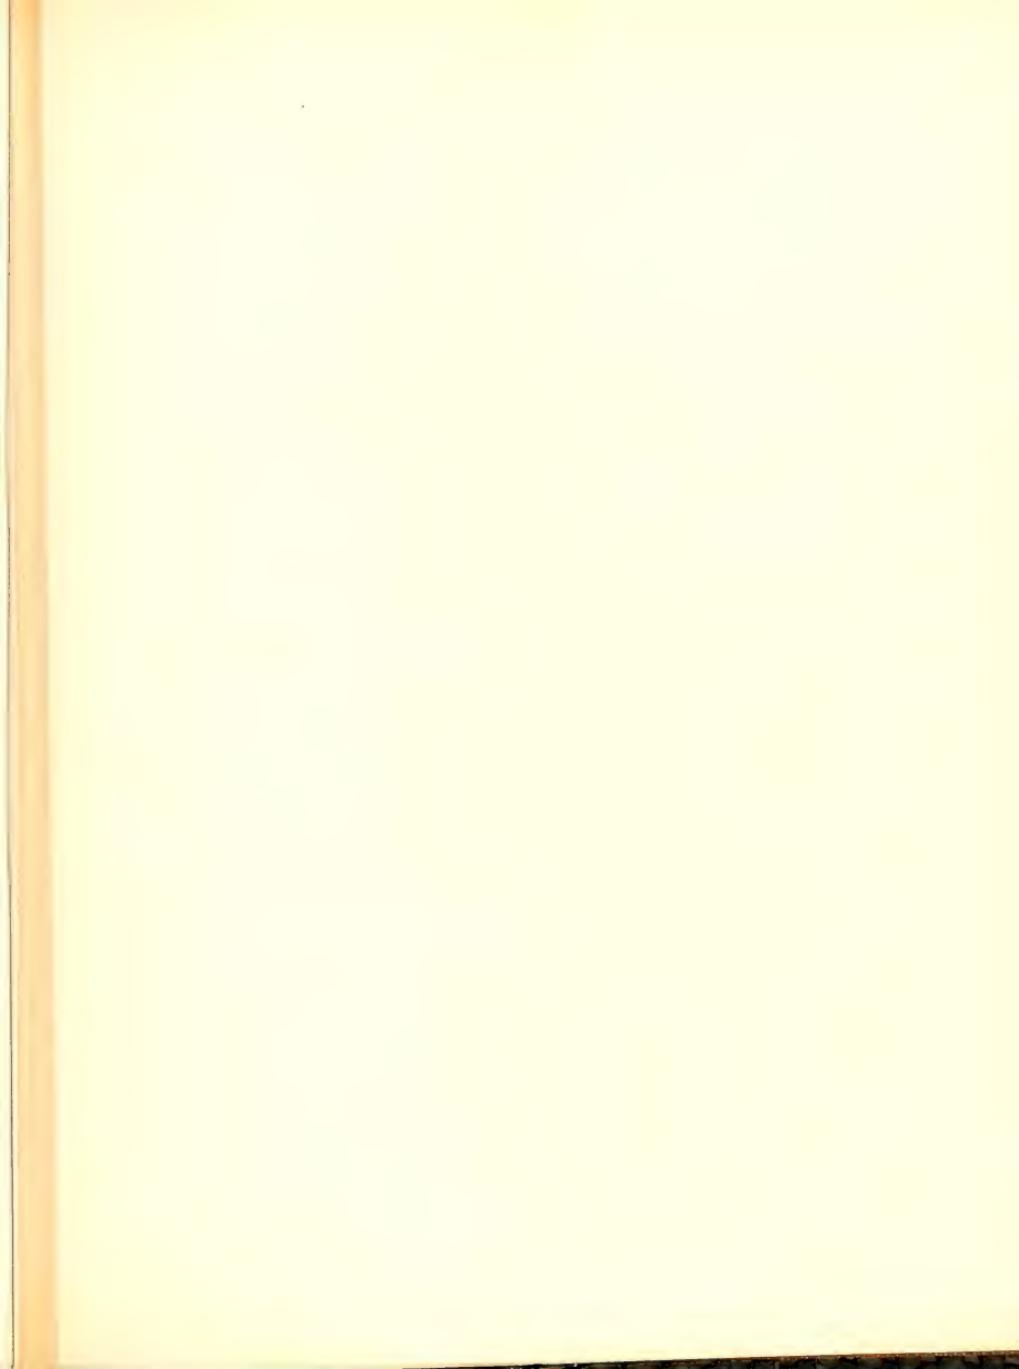

Hab. ——

Species 84. (Mus. Brit.)

PLANORBIS PEGREGRINUS. *Pla. testā subcompressā, dextrali, pallidissimè coracā; obliquè striatā; spirā angustissimā, medio subexcavata; ultimo anfractu lato, tumido, supra medium obscurissimè angulato; disco inferiori angulatum umbilicato; aperturā subquadrigulata.*

THE WANDERING PLANORBIS. Shell subcompressed, dextral, very pale horn, obliquely striated; spire rather narrow, slightly excavated in the middle; last whorl broad, tumid, very obscurely angular above the middle, lower disc angularly umbilicated; aperture slightly quadrangular.

D'ORBIGNY. Voy. Amér. Mérid. Pl. XLIV. f. 13-16.
Hab. Bahia.

PLANORBIS.

PLATE XI.

Species 85. (Mus. Sowerby.)

PLANORBIS MERGUIENSIS. *Pla. testā fusā, concentricā
tearū striatā, tumidā, angustā, albā, sinistrālē;
spīrā parē, infundibulatā; anfractibus apicotilis
angustis, ultimo superne angulatis, super suturam
elevatis; media et infrā rotundatis; apertura
semilunarē, supra anfractus ultimum elevatā, int̄
tis castanea, marginē subexpanso, int̄tus incrassato.*

THE MERGUI PLANORBIS. Shell brown, concentrically finely striated, tumid, narrow, high, sinistral; spire small, funnelled; apical whorls narrow, last angular above, raised above the suture; rounded in the middle and below; aperture semilunar, raised above the last whorl, chestnut within, margin a little expanded, thickened within.

PHILIPPI. —? Hanley, Indian Shells.
Hab. Mergui, Burmah.

Species 86. (Fig. a, b, Mus. Sowerby.)

PLANORBIS CONCAVUS. *Pla. testā parvā, albā, depressā,
dextralē, levigatā; spīrā planisessili, anfractibus
quaternis, rapidē crescentibus, superne inferneque
rotundatis; apertura obliquā rotundā, magno;
disco inferiori excavata.*

THE CONCAVE PLANORBIS. Shell small, white, depressed, dextral, smooth; spire rather flat, whorls four, quickly increased, rounded above and below; aperture obliquely rounded, large; lower disc hollow.

ANTHONY. —? MS. Mus. Brit.
Hab. River Ohio.

Species 87. (Fig. a, b, Mus. Sowerby.)

PLANORBIS PARVUS. *Pla. testā depressā, complanatā,
semipeltocellā, subciclide fusā, dextralē; spīrā
latā, subcomplanatā; anfractibus quaternis, su-
perne concavisessili, inferne rotundatis; ultimo
latissimā; apertura obliquā subciclide, depressā;
disco inferiori concavo.*

THE SMALL PLANORBIS. Shell depressed, flat, semi-peltocell, greenish brown, dextral; spire broad, flattened; whorls four, convex above, rounded below; last rather broad; aperture obliquely subovate, depressed; lower disc concave.

SAY. Alb. Monog. Pl. IV. f. 19, 20.

Planorbis fallax. Say (?)

Hab. New York.

Species 88. (Mus. Brit.)

PLANORBIS DEFLEXUS. *Pla. testā depressā, pallidi cor-
nei, levigatā, dextralē; spīrā angustā, depressā,
anfractibus tribus, supernā concavis, inferne rotun-
dis, rapido crescentibus, ultimo latō; apertura
magno, radiō deflexa.*

THE DOWN-BENT PLANORBIS. Shell depressed, pale horn, smooth, dextral; spire narrow, depressed, whorls three, convex above, rounded below, rapidly increased, last broad; aperture large, strongly deflected.

SAY. Long's Expedition, Appendix, Pl. XV. f. 8.

Planorbis viridis. Adams.

Hab. River Ohio.

Species 89. (Mus. Brit.)

PLANORBIS ORIENTALIS. *Pla. testā tenui, irregulariter
undulatā, dorsi albida, sinistra; spīrā angustā,
depressā; anfractibus supra suturam patula ele-
vatis, ultimo lato, declivē, versus aperturam ex-
panso; apertura suprā inférie compresā, magno;
obliquā deflexa; marginē sinuato; disco inferiori
concavo.*

THE ORIENTAL PLANORBIS. Shell thin, irregularly undulated, yellowish white, sinistral; spire narrow, depressed; whorls a little raised above the suture; last broad, sloped, expanded towards the aperture; aperture compressed above and below, large, obliquely deflected; margin sinuous; lower disc concave.

LAMARCK. Anim. s. Vert.

Hab. India.

PLANORBIS.—PLATE XI.

Species 90. (Mus. Brit.)

PLANORBIS STRAMINEUS. *Pla. testā tumidā, depresso^d, dextrali, stramineā; spirā complanatā, medio subdepresso^d, anfractibus quaternis, supernā planulatis, medio ventricosis, infrahū rotundis; disco inferiori excavato, anfractu apicali obteco.*

THE STRAW-COLOURED PLANORBIS. Shell tumid, depressed, dextral, straw-coloured; spire flattened, middle rather depressed, whorls four, flattened above, ventricose in the middle, rounded below; lower disc excavated, apical whorl hidden.

DUNKER. Proc. Zool. Soc. 1848, p. 42.

Hab. ——?

Species 91. (Mus. Brit.)

PLANORBIS GLAREATUS. *Pla. testā sinistrali, fulvo-corneā, tumidā, subdepresso^d, levigatā; spirō angustā, depresso^d, anfractibus angustis supra suturam elevatis; ultimo lato, supernē declivi; aperturā magnā, margine inferiori producta; disco inferiori media excavato.*

THE POLISHED PLANORBIS. Shell sinistral, fulvous-horny, tumid, somewhat depressed, smooth; spire narrow, depressed; whorls narrowly raised above the suture; last broad, sloped above; aperture large, lower margin produced, and lower disc hollowed in the middle.

SAY. Adams' Genera of Mollusca.

Hab. Florida.

Species 92. (Fig. a, b, Mus. Sowerby.)

PLANORBIS ANTIGENSIS. *Pla. testā latā, compressā, levigatā, fusco-corneā, sinistrali; spirā depresso^d, anfractibus quinque, compressis, rotundis, prope marginem supra suturam elevatis, rapidē crescentibus; ultimo latiusculo; aperturā magna, elevata, subtriangularē; disco inferiori concavo.*

THE ANTIGUA PLANORBIS. Shell broad, compressed, smooth, brown-horny, sinistral; spire depressed, whorls five, compressed, rounded, raised near

the margin above the suture, quickly increased; last broad; aperture large, raised, rather trigonal; lower disc concave.

GULDING. ——?

Hab. Antigua, West Indies.

Species 93. (Fig. a, b, Mus. Hanley.)

PLANORBIS CONVEXUSCULUS. *Pla. testā subcomplanatā, albā, tumidāsculā, levigatā, dextrali; anfractibus quaternis, rapidē crescentibus; ultimo lato, rebus aperiturā expanso; aperturā obliquē subovatā, supra ultimum anfractum elevato; disco inferiori excavato.*

THE RATHER CONVEX PLANORBIS. Shell rather flattened, white, rather tumid, smooth, dextral; whorls four, rapidly increased; last broad, expanded towards the aperture; aperture obliquely subovate, raised above the last whorl; lower disc excavated.

HUTTON. Journ. Asiatic. Soc. Beng. 1849, Vol. XVIII. p. 652.

Hab. Afghanistan.

Species 94. (Fig. a, b, Mus. Sowerby.)

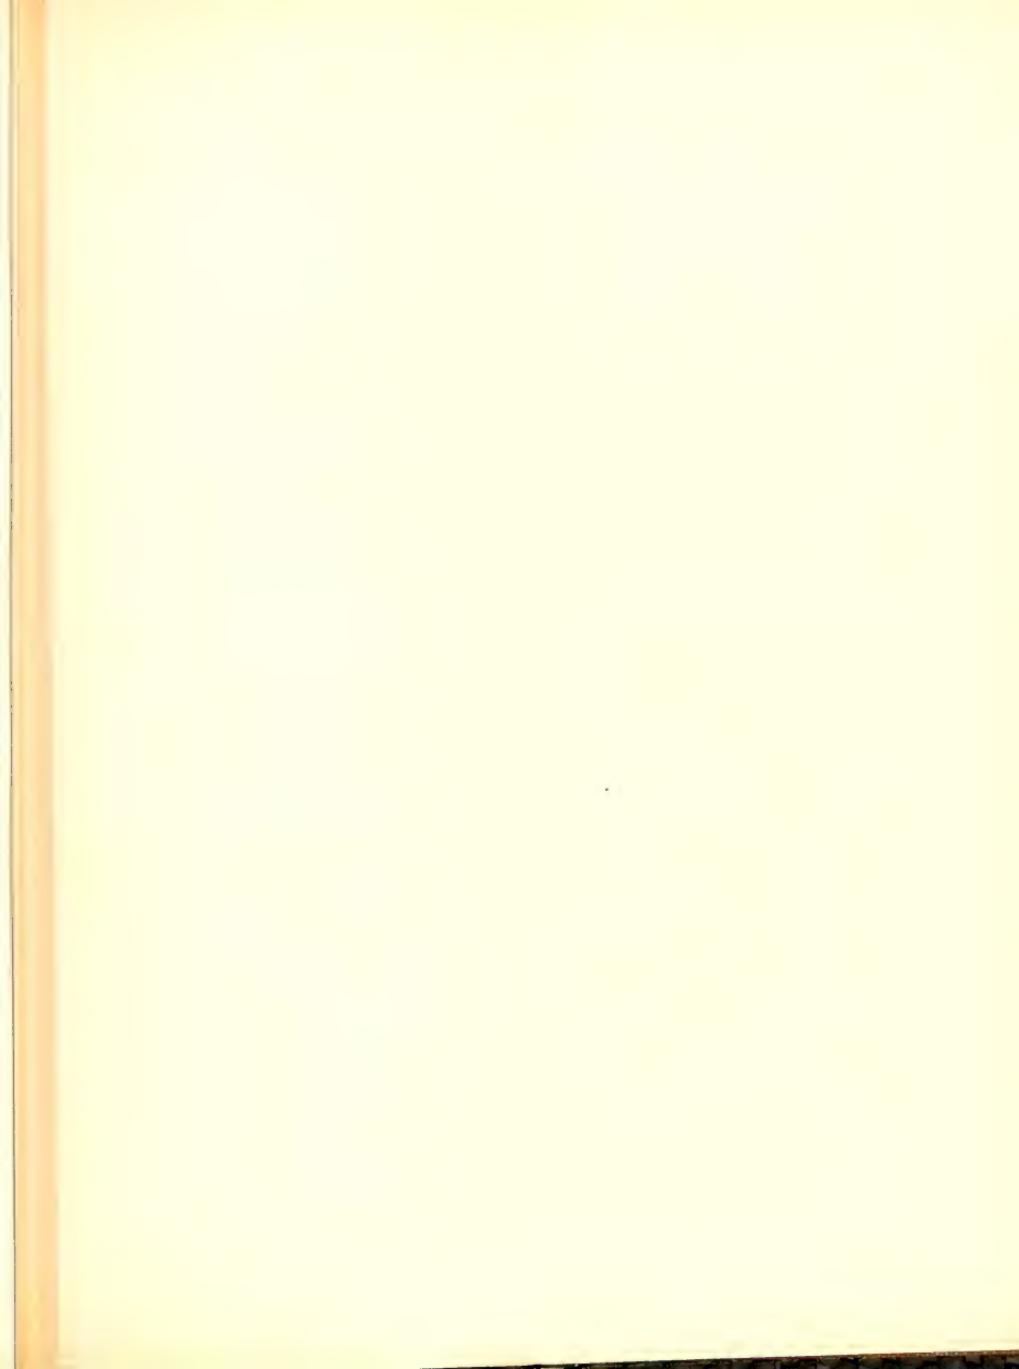

PLANORBIS EXACUTUS. *Pla. testā depresso^d, fusco-corneā, dextrali, supernē convexā, inferniē planūsculā, pauli infra medium acutē carinatā; aperturā compressā, lateraliē obliquē elongatā, margine extero acuminatā; disco inferiori subcomplanatā, medio umbilicato.*

THE SHARP PLANORBIS. Shell depressed, brown-horny, dextral, convex above, rather flat below, sharply keeled a little below the middle; aperture compressed, laterally obliquely elongated, outer margin acuminated; lower disc rather flat, umbilicated in the middle.

SAY. Journ. Amer. Journ. Soc. Phil.

Planorbis Indicus. Benson.

Hab. United States.

PLANORBIS.

PLATE XII.

Species 95. (Fig. a, b, Mus. Brit.)

PLANORBIS PANAMENSIS. *Pla. testi parvæ, albido, compressa, semipellucida, dextrali; spiræ parvæ; anfractibus tribus, depresso-concavæ, distinctæ, rapide crescentibus; ultimo lato; disco inferiori concavo, anfractibus rotundis; aperturæ subovatae.*
THE PANAMA PLANORBIS. Shell small, whitish, compressed, semipellucid, dextral; spire small; whorls three, depressed-concave, distinct, quickly increased; last broad; lower disc concave, anfractibus rotundis, aperture subovate.

D'ORBIGNY. Proc. Zool. Soc. 1848, p. 41.
Hab. Panama.

Resembling *Planorbis albus*, but with the whorls more rounded and distinct.

Species 96. (Mus. —? Copied.)

PLANORBIS BELOICUS. *Pla. testi lati, complanata, dextrali, fusco-ferrugineæ, striatæ, paulo arcuata; spiræ planata, anfractibus quinque, rotundis; aperturæ obliquè ovata, subrotundata; disco inferiori excavata.*

THE NAIL-SHAPED PLANORBIS. Shell broad, flat, dextral, rusty-brown, striated, a little arched; spire flattened, whorls five, round; aperture obliquely rounded-oval; lower disc hollow.

D'ORBIGNY. Voy. Amér. Mérid. Pl. XLV. fig. 9-12.
Hab. South America.

Species 97. (Mus. —? Copied.)

PLANORBIS PAROPSEIDES. *Pla. testi recti, parvæ, latiusculæ, subcomplanata, dextrali, fusco, ferrugineæ, obliquè striata; spiræ complanata, anfractibus quinque, superne subcomplanata, angustis, infra medium tumidissimæ, aperturæ depressæ, infra paulo inflata; disco inferiori latè umbilicata.*

THE 'DISH-LIKE' PLANORBIS. Shell straight, small, rather broad, flattish, dextral, rusty-brown, obliquely striated; spire flattened; whorls five, rather flattened above, narrow, rather tumid below the middle, aperture depressed, a little inflated below; lower disc broadly umbilicated.

D'ORBIGNY. Voy. Amér. Mérid. Pl. XLV. f. 5-8.
Hab. South America.

Species 98. (Fig. a, b, Mus. Brit.)

PLANORBIS HILLIÆ. *Pla. testi planata, subdepressa, pallide fædæ, sinistrali, levigata; spiræ infundibulata; anfractibus quinque, tumidissimæ, supra suturam angustatim elevatis, infra rotundis; ultimo superne subangustata, tunc declinat, versus aperturam expanso; aperturæ superne subacuminata, infra latæ.*

THE SUN-LOVING PLANORBIS. Shell flattened, subdepressed, pale fulvous, sinistral, smooth; spire funnelled; whorls five, rather tumid, angularly raised above the suture, rounded below; last somewhat angular above, then sloped, expanded towards the aperture; aperture subacuminated above, broad below.

D'ORBIGNY. Voy. Amér. Mérid. Pl. XLV. f. 13-16.
Hab. South America.

Species 99. (Fig. a, b, Mus. Brit.)

PLANORBIS ANATINUS. *Pla. testi montata, tumidæ, cornuta, depressæ, subglobosæ; spiræ parvæ, subexcavata; anfractibus tribus, altis, media convexæ; aperturæ angusta, semilunari; disco inferiori angustè umbilicata.*

THE DUCK'S PLANORBIS. Shell minute, tumid, horny, depressed, subglobose; spire small, slightly excavated; whorls three, high, convex in the middle; aperture narrow, semilunar, lower disc narrowly umbilicated.

D'ORBIGNY. Voy. Amér. Mérid. Pl. XLV. fig. 17-20.
Hab. South Africa.

Species 100. (Fig. a, b, Mus. Brit.)

PLANORBIS ARAKANENSIS. *Pla. pallide cornutæ, translucida, tumidæ, dextrali; spiræ angustæ; anfractu ultimo tumido, supernè subangustata, infra medium ventricosa; disco inferiori concava, anfractu apicidi oblecto.*

THE ARAKAN PLANORBIS. Shell pale horn, translucent, tumid, dextral; spire narrow; last whorl tumid, a little angular above, ventricose below the middle; lower disc concave, apical whorl hidden.

GOULD. —? MS. Brit. Mus.
Hab. Trinidad.

PLANORBIS.—PLATE XII.

Species 101. (Fig. a, b, Mus. Brit.)

PLANORBIS ISABEL. *Pla. testū parvā, tumidū, altū, dextrali, ferruginea, levigata; spīrā parvā, sub-complanata; anfractibus tribus, angustissimis, superē subangulatis, tōm declivibus; ultimo nūgno, propē aperturam expanso; disco infernōi umbilicato; aperturā angustā, semilunari, margine superiori sinnatūm producto.*

THE ISABEL PLANORBIS. Shell small, tumid, high, dextral, ferruginous, smooth; spire small, rather flat; whorls three, rather narrow, slightly angular above, then sloped; last large, expanded near the aperture; lower disc umbilicated; aperture narrow, semilunar, upper margin sinuously produced.

MORELET. —? Adams. Genera of Mollusca.

Hab. —?

Species 102. (Fig. a, b, Mus. Brit.)

PLANORBIS ACIES. *Pla. testū parvā, utrinque complanata, albā, levigata; anfractibus quinīs, subrotundis, superē angustissimis, infernō magis rotundis; aperturā obliquā ovatā, suprat suturam elevatā.*

THE SPEAR PLANORBIS. Shell small, flattened on each side, white, smooth; whorls five, rather rounded, rather narrow above, more rounded below; aperture obliquely ovate, raised above the suture.

PORRO. Meg. Villa. Cat. 1844, p. 8.

Hab. Milan.

Species 103. (Mus. Brit.)

PLANORBIS LARGILLIERI. *Pla. testū truncato-conica, castanea, altissimā, nitentia, infra medium sub-planulata, suprā declivis; spīrā angustata, anfractibus tribus, angustissimis, ultimō magno, tumido; aperturā subtriangularis, margine superiori flexuoso depressa; disco inferiori angustē umbilicato.*

LAEGILLIERI'S PLANORBIS. Shell truncated-conical, chestnut, rather raised, shining, rather flattened below the middle, sloped above; spire narrow; whorls three, very narrow, last large, tumid; aperture rather trigonal; upper margin flexuously depressed; lower disc with a narrow umbilicus.

— MS.

Hab. —?

Species 104. (Fig. a, b, Mus. Sowerby.)

PLANORBIS VERMICULARIS. *Pla. testū olivaceo-viridi, politi, parvā, dextrali; spīrā planissimā, anfractibus quinīs, rotundis, angustatis, declivibus, infra medium subventricosis, subangulatis; disco infernōi concavo; aperturā subtriangularis.*

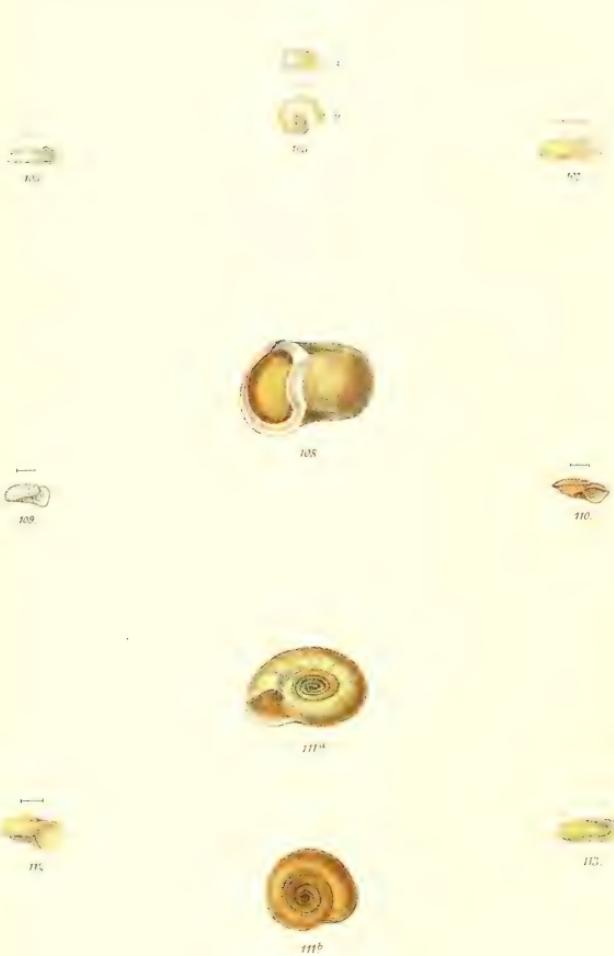

THE VERMICULAR PLANORBIS. Shell olive-green, polished, small, dextral; spire rather flattened; whorls five, rounded, narrow, sloped, rather ventricose below the middle, slightly angular; lower disc concave; aperture subtriangular.

SOWERBY.

Hab. —?

Shell with a broader disc and more whorls than *Planorbis parvus*, which, from its colour and general form, it resembles.

PLANORBIS.

PLATE XIII.

Species 105. (Fig. *a, b*, Mus. Brit.)

PLANORBIS PERFORATUS. *Pla. testā parvā, tumidā, pallidē cornicē, truncato-subconicē, spirā angustissimā, anfractū ultimō tumido, alto, superne declī, infra medium ventricosus; disco inferiore planulato, medio angustissimē et profundi umbilicato.*

THE PERFORATED PLANORBIS. Shell small, tumid, pale horn, truncated-subconical, spire very narrow, last whorl tumid, raised, sloped above, ventricose below the middle; lower disc flattened, narrowly and deeply umbilicated in the middle.

Gould —? MS. Mus. Brit.
Hab. United States.

Species 106. (Mus. Brit.)

PLANORBIS CULTURATUS. *Pla. testā pellucidā, hyalinā, albā, truncato-conicē, spirā plana, anfractibus tribus, depresso; anfractū ultimō declī, infra planulo, marginē acuminato; apertura obliquā subtriangularē, angustā; marginē externo infrah acutē angulato; disco inferiore plano, medio angusti umbilicato.*

THE SHARPENED PLANORBIS. Shell pellucid, hyaline, white, truncato-conical, spire small, whorls three, sunk; last whorl sloped, flattened below, margin acuminated; aperture obliquely subtrigonal, narrow; outer margin sharply angular below; lower disc umbilicated.

D'ORBIGNY —? MS. Mus. Brit.
Hab. St. Vincent.

Species 107. (Mus. Brit. —? Copied.)

PLANORBIS MONTANUS. *Pla. testā depressā, pallidē falcata, sinistrali; spirā infundibulatā; anfractū ultimā tumido, superē infrahāc angulato; disco inferiore concavo; apertura subquadrilaterali, angulā, superē anfractū ultimā elevata.*

THE MOUNTAIN PLANORBIS. Shell depressed, pale falcous, sinistral; spire funnelled; last whorl tumid, angular above and below; lower disc concave; aperture rather quadrilateral, large, raised above the last whorl.

D'ORBIGNY. Voy. Amer. Mérid. Pl. XLIV, f. 5, 8.
Hab. South America.

Species 108. (Mus. Brit.)

PLANORBIS AMMON. *Pla. testā sinistrali, maximā ventricosissimā, altā, pallidē subcandidatā, concentricē rugatā; spirā profunde infundibulatā; anfractibus quaternis, supra suturam rotundā elevatis; ultimo lotu, rapide crescenti, ad aperturam expanso; disco inferiore profundi excavato; apertura magna, altissimā, subovata, superne supra suturam elevata, acuminate; infra anfractū ultimā rotundā produtto, intus subcostato, marginē interno incrassato.*

THE AMMON PLANORBIS. Shell sinistral, very large, very ventricose, high, pale greenish-fawn, concentrically wrinkled; spire deeply funnelled; whorls four, roundly elevated above the suture; last wide, rapidly enlarged, expanded at the aperture; lower disc deeply hollow; aperture large, very high, subovate, raised above over the suture, acuminate; roundly produced below the last whorl, rather chestnut within, lower margin thickened.

GOLD. United States' Expedition.
Hab. America.

The deep specimen of *Pla. corporulentus*, figured in the first plate, resembles this species, but is not nearly so high nor so ventricose, and the upper part of the whorls are angular instead of being round.

Species 109. (Mus. Brit.)

PLANORBIS ELEVATUS. *Pla. testā parvā, albā, dextrali, levigatā, altiāscendit; spirā planulatā, anfractibus concavis, ultimā subquadrate, superne declī, supra infrahāc angulato; apertura infra angulum ultimā anfractū depresso, magnā, superē infrahāc angulatā, medio concava; disco inferiore angulatum concavo.*

THE ELEVATED PLANORBIS. Shell small, white, dextral, smooth, rather high; spire flat, whorls a little convex, last rather square, sloped above, angular above and below; aperture depressed below the angle of the last whorl, convex in the middle; lower disc angularly concave.

SAY. Journ. Bost. Soc. Nat. Hist. 3, Pl. III. f. 15.
Hab. Vermont.

The above name is probably given to the shell because the last whorl against the mouth is raised considerably above the aperture.

PLANORBIS.—PLATE XIII.

Species 110. (Mus. Brit.)

PLANORBIS LENTICULARIS. *Pla. testā parvā, subcon-
pressā, fusca, levī, dextralī; spira planiscula,
anfractibus trilobis, convexisculis, ultimo superne
angustato, carinato, infra angustatā; disco inferiori
profundè umbilicata; apertura subtriangularis, ad
angulum externum subovinatā.*

THE LENTICULAR PLANORBIS. Shell small, rather flat, brown, smooth, dextral; spire rather flattened, whorls three, rather convex, last angular above, keeled, narrow below; lower disc deeply umbilicated; aperture subtriangular, acuminate at the outer angle.

HARTMAN —? Adams, Genera of Mollusca.

Planorbis opercularis. Gould.

Hab. Sacramento River.

Species 111. (Fig. a, b, Mus. Brit.)

PLANORBIS GUADLOUPENSIS. *Pla. testā sinistrali, com-
pressā, lata, fulvā, pulchra; spira concava, anfracti-
bus senis, convexisculis; ultimo anfractu angusto,
supra suturam elevata, tum decliri, infra latissi-
cula; disco inferiori convexa; aperturā subtriangularis,
marginē inferiori ad anfractum ultimum pro-
ducta.*

THE GUADALOUPE PLANORBIS. Shell sinistral, compressed, broad, fulvous, polished; spire concave, whorls six, convex; last whorl large, raised above the suture, then sloped, rather broad below; lower disc convex; aperture rather triangular, lower margin produced on the body whorl.

SOWERBY. Genera of Recent and Fossil Shells.

Hab. Guadalupe.

Species 112. (Mus. Brit.)

PLANORBIS DILATATUS. *Pla. testā albā, dextralī, superne
angulatā, infra angustum angustatā, disco inferiori
profundè excavato, apertura maxima, trigonā,
superne complanatā, infra acuminatā.*

THE DILATED PLANORBIS. Shell white, dextral, angular above, narrow below the angle, lower disc deeply excavated, aperture very large, trigonal, flattened above; acuminate below.

PFEIFFER. Moll. de l'Allemagne, Vol. II. p. 165.

Hab. Massachusetts.

The last whorl suddenly expands towards the mouth, which is the largest of the whole genus in proportion to the body whorl.

Species 113. (Mus. Brit.)

PLANORBIS SWINHOEI. *Pla. testā subdepressā, semipel-
lucidā, fusca, subconico-truncatā, superne plana-
tū, medio subangulatum productā, infra plana-
tū; disco inferiori angustè umbilicato; aperturā
subtriangularis, marginē exterius producta, marginē
superiori flexuosa depresso.*

SWINHOE'S PLANORBIS. Shell subdepressed, semipellucid, brown, rather angularly truncated, flattened above, somewhat angularly produced in the middle, flattened below, lower disc narrowly umbilicated; aperture rather trigonal, outer margin produced; upper margin flexuously depressed.

H. ADAMS. Proc. Zool. Soc.

Hab. Isl. Formosa.

PLANORBIS.

PLATE XIV.

Species 114. (Fig. a, b, Mus. Brit.)

PLANORBIS DEFORMIS. *Pla. testā parvā, cinereo-ferruginea, complanata, dextralī; spirā planulatā; anfractibus quaternis, tumidis, subrotundis; ultimo versus aperturam irregulariter tumida, ad marginem expansu; aperturi arcuatis-conica, anfractum ultimum supra infrānique superante; disco inferiori ad marginem planulato, medio concavo.*

THE REFORMED PLANORBIS. Shell small, rusty-grey, flattened, dextral; spire flattened, whorls four, tumid, rather rounded, last irregularly swelled, expanded at the margin; aperture curved-conical, extending above and below the last whorl; lower disc flattened at the margin, concave in the middle.

LAMARCK. Anim. sans Vert.

Hab. —?

The last whorl becomes tumid a little way before the expansion of the aperture.

Species 115. (Fig. a, b, Mus. Brit.)

PLANORBIS ALEXANDRINUS. *Pla. testā dextrali, sub-compressa, fulva, anfractibus quaternis, ultimo latiseculo, medio tumido, infra subaestato; aperturi subtrigonā, dentibus quinque laminatis longe interris armata; margine intus incrassato; disco inferiori lati umbilicato.*

THE ALEXANDINE PLANORBIS. Shell dextral, rather compressed, fulvous, whorls four, last rather wide, middle tumid, rather narrow below; aperture subtrigonal, armed far back internally with five teeth; margin thickened within; lower disc broadly umbilicated.

EHRENBURG. Roth. Moll. Sp. Pl. II. f. 8.

Genus, *Planorbula*. Haldeman.

Hab. Egypt.

This species belongs to the section which has been separated under the generic name of *Planorbula*. Far back in the throat may be seen laminated plates jutting out so as to contract the opening.

Species 116. (Mus. Brit.)

PLANORBIS DENTATUS. *Pla. testā dextrali, compressa, fulva, spirā planulatā; anfractibus convexis, supernū lati, infra medium angustatis, disco superiore lato, disco inferiori angustato, profundi et angustè excavato; aperturi magno, infra anfractum ultimum productā, longe intus laminatum tridentatō, margine intus incrassato.*

THE TOOTHED PLANORBIS. Shell dextral, compressed, fulvous, spire rather flat; whorls convex, broad above, narrow below the middle, upper disc broad, lower disc narrow, deeply and narrowly excavated; aperture large, produced below the last whorl, with three laminar teeth far within, margin thickened within.

DUNCKER. (*Planorbula*) —? Adams' Gen. of Moll.

Hab. —?

Species 117. (Fig. a, b, Mus. Brit.)

PLANORBIS ALBICANS. *Pla. testā albida, solidiuscula, dextrali, spirā planulatā; anfractibus convexis-culis, quaternis, moderatè crescentibus, ultimo ad aperturam valde deflexo, disco inferiori angulatum excavato; aperturi usque ad marginem inferiorem ultimi anfractus depressi.*

THE WHITISH PLANORBIS. Shell whitish, rather solid, dextral, spire rather flattened; whorls four, rather convex, moderately increased, last much bent down at the aperture, lower disc angularly convex; aperture bent down to the lower margin of the last whorl.

PFEIFFER.

Hab. Lima.

Species 118. (Fig. a, b, Mus. Brit.)

PLANORBIS COMPRESSUS. *Pla. testā compressa, latiuscula, pallida, levigata, dextrali, supernū angustata, infra lati, subcarinata, spirā depresso; aperturi obliquè pyramidata, supernū angustata, margine inferiori producto.*

PLANORBIS.—PLATE XIV.

THE COMPRESSED PLANORBIS. Shell compressed, rather broad, pale, smooth, dextral, narrowed above, broad below, somewhat keeled, spire depressed; aperture obliquely pyramidal, angular above, lower margin produced.

HUTTON. Journ. Asi. Soc. Beng. Vol. III. p. 91.

Planorbis Towlanensis. Monsson.

Hab. River Ganges.

Species 119. (Mus. Brit.)

PLANORBIS DENTIFERUS. *Pla. testā angustā, tumidā, albida, spirā planissimā; anfractibus quaternis, altis, superm̄ centricosis, infernē subangustatis, disco inferiori subangustō excavato; aperturā magnā, auriformi, supra infraque ultimum anfractum productā, longō int̄is quinqūfariūtum laminaūtum destituta.*

THE TOOTH-BEARING PLANORBIS. Shell narrow, tumid, whitish, spire rather flat; whorls four, high, ventricose above, slightly narrowed below, lower disc rather narrowly excavated; aperture large, ear-shaped, produced above and below the last whorl, with five lamellar teeth far within.

ADAMS, C. B. Contributions to Conchology.

Hab. Jamaica.

Species 120. (Fig. a, b, Mus. Hanley.)

PLANORBIS HYPTIOCYCLOS. *Pla. testā tumidā, albida, dextrali, spirā depressā; anfractibus tribus, latiāculis, supra suturam tumidē elevatā; aperturā supra suturam elevatā, tūm declivis, margine inferiori obliquā, disco inferiori excavatā.*

THE REFLECTED PLANORBIS. Shell tumid, whitish, dextral, spire depressed; whorls three, rather broad, raised in a swelling above the suture; aperture raised above the suture, then sloped, lower margin oblique, lower disc excavated.

BENSON. Ann. Nat. Hist. 1863, Ser. III. Vol. II. p. 89.

Hab. Ceylon.

Species 121. (Fig. a, b, Mus. Hanley.)

PLANORBIS ROTULA. *Pla. testā parvā, pallidē fulcēt, tumidiāculi, levigatā, dextrali, spirā depressā;*

anfractibus quinīs, convexis, supra suturam paulū elevatis, disco inferiori latē concavo, anfractibus rotundis; aperturā obliquā ovatā.

THE LITTLE WHEEL PLANORBIS. Shell small, pale fulvous, rather tumid, smooth, dextral, spire depressed; whorls five, convex, a little raised above the suture, lower disc broadly concave, whorls round; aperture obliquely ovate.

BENSON. Ann. Nat. Hist. 1863, Series II. Vol. V. p. 351.

Hab. Moradabad.

Species 122. (Fig. a, b, Mus. Brit.)

PLANORBIS CORINTA. *Pla. testā parvā, albida, levigatā, dextrali; anfractibus quaternis, rotundis, distinctis; disco superiori subdepresso, disco inferiori concavo; aperturā transversē subovato.*

THE CORINTH PLANORBIS. Shell small, whitish, smooth, dextral; whorls four, rounded, distinct; upper disc rather depressed, lower disc concave; aperture transversely subovate.

GRAY. Proc. Zool. Soc. 1850.

Hab. New Zealand.

Species 123. (Fig. a, b, Mus. Brit.)

PLANORBIS INTERTEXTUS. *Pla. testā angustā, altā, sinistrali, tenuissimā striatā, castaneā, distanter concentricō albo-fasciatā et nigro-lineatā, spirā medio angusto infundibulatā; anfractū ultimo supra suturam angulatūm elevatō, disco inferiori latā, angulatā, excavatā; aperturā altā, subtriangulari, int̄is griseā.*

THE TEXTILE PLANORBIS. Shell narrow, high, sinistral, very finely striated, chestnut, distantly concentrically white-banded and black-lined, spire narrowly funnelled in the middle; last whorl raised above the suture in an angle, lower disc broad, angular, hollow; aperture high, subtriangular, grey within.

SHUTTLEWORTH. —? MS. Brit. Mus.

Hab. Florida.

Resembling *Planorbis biangulatus*, excepting in the white bands bordered by dark lines appearing on the surface of the outer whorl.

PLANAXIS.

PLATE I.

Genus PLANAXIS. Lovmark.

Teste ovato-conica, solida, pleoquo spirali vel sulcata; spira plicatim brevis, couet; apertura subtriangularis, intus dentato-lirata, nativè leviter canaliculata, emarginata; columella subarcuata, planata, ad terminum truncata; operculum ovoate-oblongum, unispiciale, nucleo ferè terminali.

Shell ovately conical, solid, generally spirally grooved; spire for the most part short, conical; aperture rather trigonal, tooth-ridged within, with a slight canal and notch in front; columella slightly arched, flattened, truncated at the end; operculum ovoate-oblong, with one-whorled spire, nucleus nearly terminal.

Few genera so restricted in numbers are so widely spread in their habitats. We have identified 39 species, of which the greater number are tenants of Australian, South Sea Island, and Philippine groups. The Red Sea and Persian Gulf, the Mauritius and West Indies contribute their portion; the Chinese and Indian Seas have several, but there are no European species. The animals are marine, but partly amphibious, and spend a large portion of their existence above water. The slight canal and notch at the front of the aperture, and the flattened columella terminating in a notch, render this genus characteristic and easily distinguishable.

Species 1. (Mus. Hanley.)

PLANAXIS ENCAUSTICUS. *Pla. testi crassâ, brevi, albida, cornuta, fuscopunctata et fasciata, levigata; anfractibus seuis ad septenos, ultimo ventricosa, infra medium rotundata, ad suturam angustè angulata, nigro-punctata, spiralisiter, tenuiter, distanter, infra angulum valde sulcata; apertura castanea, columellâ brevi, late truncata, prope suturam valde callosa; labro intus distanter et valde dentato-lirato.*

THE ENAMELLED PLANAXIS. Shell thick, short, whitish, clouded, and banded with blue and brown, smooth; whorls six to seven, the last ventricose, roundly angular below the middle, and narrowly at the suture; black-spotted, spirally, finely, distantly grooved, strongly below the angle; aperture chestnut, columella short, broadly truncated, with a strong callus near the suture,

outer lip distantly and strongly tooth-ribbed within.

SMITH. Proc. Zool. Soc. 1872, p. 38.
Hab. ——.

In the specimens from which the description was taken (no others being known) the upper whorls are much corroded, and the body whorl being smooth, with spiral grooves almost obsolete above, gives the remaining surface a sort of enamelled appearance.

Species 2. (Mus. Brit.)

PLANAXIS CASTANEUS. *Pla. testi subpyriformi, levigata, castanea, spiralisiter tenuiter striata, longitudinale oblique subridata; spicè elevata, acuminata, anfractibus seuis, convexiusculis; ultimo bulbiformi, apertura parva, labro intus 7-dentato-lirato, marginè tenuè, columellâ subarcuata, infra subexpansâ.*

THE CHESTNUT PLANAXIS. Shell somewhat pyriform, smooth, chestnut, spirally finely striated, longitudinally obliquely slightly ridged; spire raised, acuminate, whorls six, rather convex; end bulb-shaped, aperture small, outer lip seven-toothed within, margin thin, columella slightly arched, rather expanded below.

SMITH. Proc. Zool. Soc. 1872, p. 41.
Hab. ——?

Species 3. (Mus. Brit.)

PLANAXIS CRASSISPIRA. *Pla. testi oblongâ, subdiscante spiralisiter sulcatâ, grisea, nigro-punctata; spicè elevata, crassi, subcyliadriæ, obtusa; anfractu ultimo obtuse angulata, apertura parva, subtrigonâ, columellâ allud, infra latè productâ, labro intus calidè dentata.*

THE THICK-SPIRED PLANAXIS. Shell oblong, rather distantly spirally grooved, grey, spotted with black; spire elevated, thick, subcylindrical, obtuse; last whorl obtusely angular; aperture small, subtrigonous, columella white, broadly produced below; outer lip strongly toothed within.

SMITH. Proc. Zool. Soc. 1872, p. 39.
Hab. ——?

Differing from *Planaxis sulcatus* in the narrow, straight-sided form.

PLANAXIS.—PLATE I.

Species 4. (Fig. *a, b, c*, Mus. Hanley.)

PLANAXIS SULCATUS. *Pla. testâ trochiformi, crassâ, profundâ sulcatâ, fuscoc-rubescens, nigro alboque maculata, costis prominentibus; spirâ conicâ, anfractibus quinque, ultimo magno, infra medium obscurâ angulato; aperturâ subtriangulari, columellâ rectiunculâ, latâ, ad saturam valde callosâ et canaliculatâ; labro intus validâ callousâ denticulatâ, margine crenulatâ.*

THE GROOVED PLANAXIS. Shell trochus-shaped, thick, deeply-grooved, spotted with reddish-brown, black and white, ribs prominent; spire conical; whorls five, last large, obscurely angular below the middle; aperture subtriangular, columella rather straight, broad, with a strong callousness and a canal at the suture; outer lip strongly toothed within, margin crenulated.

BORN. (*Buccinum*) Mus. Vindob. p. 258, Pl. X. f. 5, 6.

Planaxis buccinoides. Deshayes.

Planaxis undulata. Lamarck.

Buccinum pyramidale. Lamarck.

Hab. Australia, Philippines, Mauritius, South Africa.

Species 5. (Mus. Brit.)

PLANAXIS OBSCURA. *Pla. testâ angustâ pyramidata, profundâ et crebro sulcatâ, griseâ, maculata; spirâ elevata, anfractibus quinque, aperturâ brevissimâ, canali postico lata, columellâ arcuatâ, ad terminalia acuta truncatâ; labro intus valide dentato, marginâ tenui, sahyglossa.*

THE OBSCURE PLANAXIS. Shell narrowly pyramidal, deeply and closely grooved, grey, spotted; spire elevated, whorls five; aperture rather short, sharply truncated; outer lip strongly toothed within, margin thin, rather flexuous.

A. ADAMS. Proc. Zool. Soc. 1851, p. 271.

Hab. —?

The whorls are more straight-sided than in *Planaxis planicostata*, and the grooves narrower.

Species 6. (Mus. Brit.)

PLANAXIS PREVICULUS. *Pla. testâ breviter trochiformi, latâ, crassâ, spiraliter (infra magis profundâ)*

sulcatâ, griseo-brunneâ, nigro maculatâ; spirâ brevi, anfractibus quinque, ultimo maximo, infra medium obscurâ angulato; aperturâ subtriangulari, fuscâ, ad marginem nigro maculatâ, columellâ brevi, supernâ validâ callosâ, infra latâ, late truncatâ, labro fuso, liris dentiformibus maguis.

THE SHORT LITTLE PLANAXIS. Shell shortly trochus-shaped, broad, thick, spirally-grooved (more deeply below), grey-brown, spotted with black; spire short, whorls five, last very large, obscurely angular; aperture subtriangular, brown, black-spotted at the margin, columella short, with a strong callus above, broad below, broadly truncated, outer lip brown, with large tooth-shaped ridges.

DESHAYES. Mag. de Zool. 1844, Pl. CVIII.
Hab. Guam and New Guinea.

Broader and more finely grooved than *Planaxis sulcata*.

Species 7. (Mus. Hanley.)

PLANAXIS NUCLEUS. *Pla. testâ ovato-acuminatâ, nigro-fusco, prope saturam, infra medium et post marginem apertura profundâ sulcatâ, medio levigata; spirâ breviunculâ, acuminatâ; anfractibus brevibus, convexiunculatis; aperturâ pyriformi, longisulcata, radiissimâ bicamaliculata, columellâ latissimâ, planulatâ, medio longitudinaliter sulcatâ, termino subrotundato; labio externo expanso, valide crenulato.*

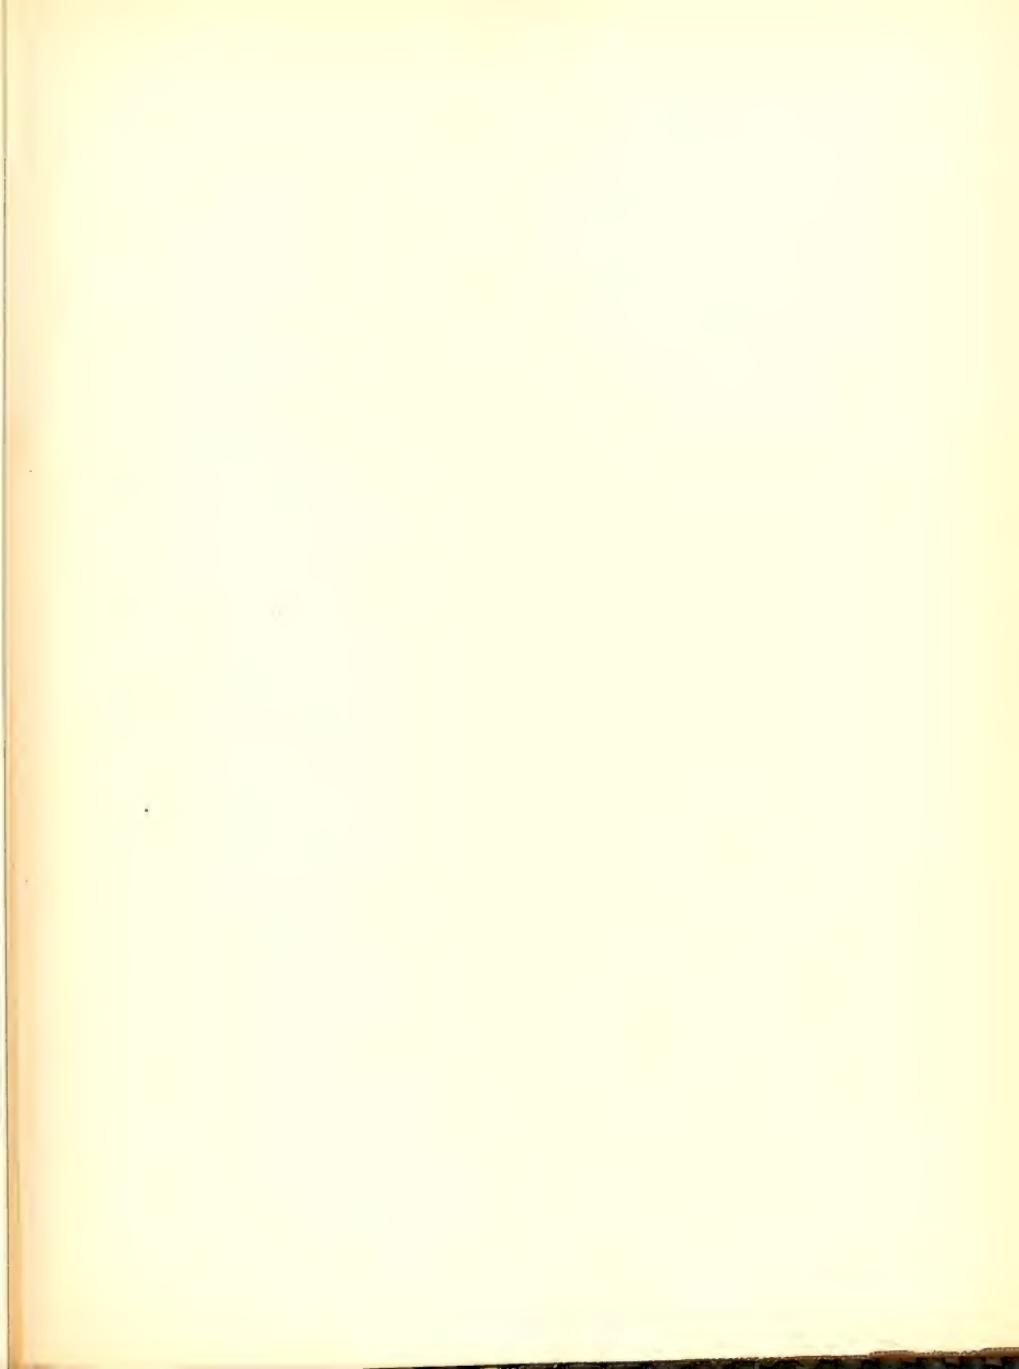

THE LITTLE NUT PLANAXIS. Shell ovate-acuminated, black-brown, deeply grooved near the suture, below the middle and behind the margin of the aperture, smooth in the middle; spire rather short, acuminated, whorls short, a little convex; aperture pyriform, rather long, strongly bicamaliculated, columella very broad, flattened, with a longitudinal groove in the middle, with rather round end; outer lip expanded, strongly crenulated.

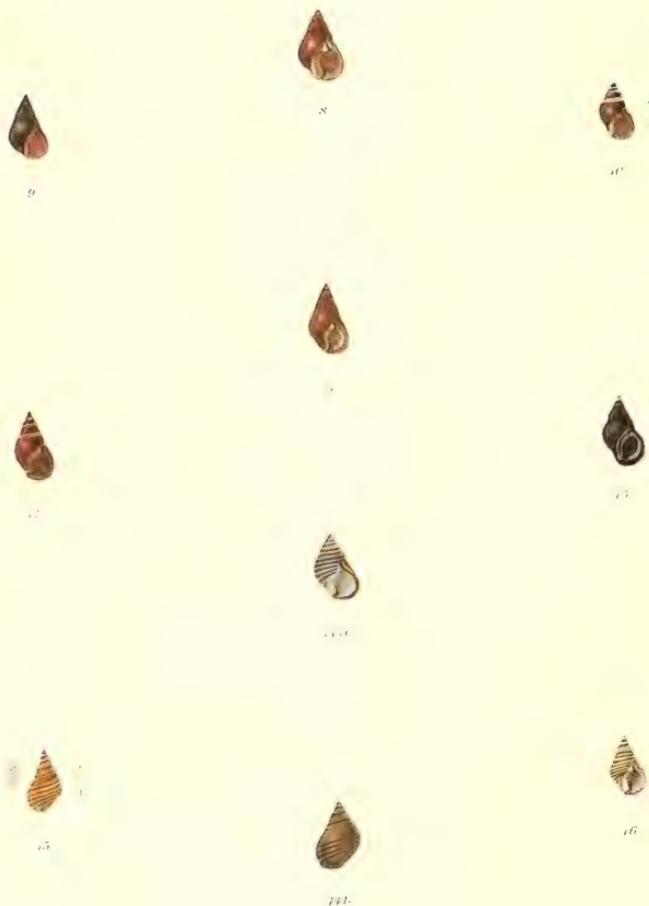

LAMARCK. Anim. s. Vert. Vol. VII. p. 249.

Planaxis semisulcata. Sowerby.

Hab. West Indies, Jamaica.

The grooves, which are deep at the margins and lower part of the last whorl, are obsolete in the middle of the whorls.

PLANAXIS.

PLATE II.

Species 8. (Mus. Hanley.)

PLANAXIS NIGRITELLUS. *Pla. testā brunneō-nigrescenti;*
spira obtusa, conica; anfractibus quinque, concavis;
distanter sulcata, ultimo magno, sulcis
media subcarinatis; columellā superne callosa,
arcuata; labro subpatulo, intus tenuiter lirato.

THE LITTLE BLACK PLANAXIS. Shell blackish brown; spire obtuse, conical; whorls five, rather convex, distantly sulcated; last large, with the sulci nearly obsolete in the middle; columella callous above, arched; outer lip rather patulous, finely ridged within.

FORBES. (*Nigritella.*) Proc. Zool. Soc. 1850. Pl. II. f. 6.

Planaxis acutus. Menke.

Planaxis obsoletus. Menke.

The above name is given to the species by Mr. Smith on account of the name *acutus* being previously applied to another species.

Hab. Mazatlan.

Species 9. (Mus. Brit.)

PLANAXIS ACUTUS. *Pla. testā brunneā, acutē pyramidalē; anfractibus septem, concavis, medianis levigatis,*
suprà infrō tenuiter sulcatis; aperturā brevissimā
columellā latā, subcarinata; columellā latā, labro intus
tenuiter lirato.

THE ACUTE PLANAXIS. Shell brown, sharply pyramidal; whorls seven, convex, smooth in the middle, finely sulcated above and below; aperture rather short, broad, slightly blue; columella broad; outer lip finely ridged within.

KRAUSS. Südafrikanischen Mollusken. Tab. VI, f. 2.

Hab. Natal.

Species 10. (Mus. Brit.)

PLANAXIS ATROPURPUREUS. *Pla. testā nigra-plumbea,*
oblonga, obtusa, levigata, anfractibus tribus, parum
concauis, ultimo infre sulcis tribus leviter sculpto;
aperturā subtrigonā, castaneā, labro intās levigato,
superne subdepresso.

THE PURPLE-BLACK PLANAXIS. Shell blackish, oblong, obtuse, smooth, whorls three, rather convex, last lightly sculptured below with three grooves; aperture subtrigonal, brown; outer lip smooth within, slightly depressed above.

RECLUZ. Revue Zoologique, 1843, p. 261.

Planaxis Albersii. Dunker.

Hab. South Seas.

Species 11. (Mus. Hanley.)

PLANAXIS SIMILIS. *Pla. testā subpyramidalē, brunnea,*
omnīs subdistanter sulcata, sulcis prope suturam
et infra medium fortioribus; spirā pyramidalē,
acutissimā; aperturā septem, superioris
concauisculis; aperturā purpurascens, labro
crasso, intus dentato-lirato, callo labiali postico
distincto, small; rimā angustā.

THE SIMILAR PLANAXIS. Shell rather pyramidal, brown, in every part rather distantly grooved; grooves stronger near the suture and below the middle; spire pyramidal, acuminate; whorls seven, upper rather convex; aperture purplish, lip thick, tooth-ridged within, posterior labial callus distinct, small; notch narrow.

SMITH. Proc. Zool. Soc. 1872, p. 41.

Hab. Sandwich Islands.

More conical than *Planaxis Henleyi*, with less expanded aperture, thicker outer lip and nearly equal grooves in every part.

Species 12. (Mus. Hanley.)

PLANAXIS HANLEYI. *Pla. testā subovata, brunnescens;*
spira convexo-conica; anfractibus sexis, moderatō
concauis, apicibus politis, exteris suprà infrō
spiraliter sulcatis; ultimo magno, infrā fortissimā
sulcato; aperturā magno, patula; labro tenuissimō
endo, intus tenuissime lirato, rimā suturali sub-
rotundā.

HANLEY'S PLANAXIS. Shell subovate, brown; spire convexly conical; whorls six, moderately convex;

PLANAXIS.—PLATE II.

apical polished, others spirally grooved above and below; last large, very strongly grooved below; aperture large, patentous; outer lip very thin, very finely ridged within, sutural notch rather rounded.

SMITH. Proc. Zool. Soc. 1872.

Hab. Sandwich Islands.

Mr. Smith mentions as a variety a specimen in which the posterior callus and inflected edge of the outer lip almost meet, so as to form a rounded hole like that in *Papina*. I regard this as only a slight malformation. Yet the slit in this species is generally rounder than in *Planaxis smallis*.

Species 13. (Mus. Hanley.)

PLANAXIS NIGER. *Pla. testū nigri, ovo-pyramidalitā, spirali acuminatā, aufractibus senis, apicibus albis, politis, ultimū margino, epidermide tenui, subrividi, infē angustō sulcato; aperturā solitrigonā, canali anticō rotundā, canali postico latō; labio expanso, patulo, intōs incrassato, tenuissimū crenulato.*

THE BLACK PLANAXIS. Shell black, ovately pyramidal, spire acuminated, whorls six, apical, white, polished, last large, covered with a greenish epidermis, narrowly grooved below; aperture rather trigonal, anterior canal rounded, posterior canal broad; outer lip expanded, patentous, thickened and very finely crenulated within.

QUOT. (*Nigra*.) Voyage de l'Astrolabe, p. 49.
Hab. New Ireland.

Species 14. (Mus. Hanley.)

PLANAXIS LABIOSUS. *Pla. testū obliquè subpyramidalitā, grisei, fasciis nigrescentiis, medio angustatis cincti, epidermide tenui ciliati intolitā, aufractibus quinque, apiculi necto, ultimo marino; apertura marginā intōs, prope marginem crassā, brevigata.*

THE LIPPED PLANAXIS. Shell obliquely subpyramidal, grey, and girt with blackish bands, narrow in the middle, covered with a thickly ciliated epidermis,

whorls five, apical sharp, last very large; aperture large, thick within, near the margin, smooth.

ADAMS (A.) Proc. Zool. Soc. 1851. p. 272.

Planaxis planbecki, Pease.

Planaxis Brouni, Dunker.

Planaxis pedicularis, Kusten.

Hab. Sandwich Islands.

Species 15. (Mus. Hanley.)

PLANAXIS CINGULATUS. *Pla. testū ovo-pyramidalitā, spirali celeri sulcata; aufractibus septentis, superne fuso latē fasciatā, medio angustō lineatā; aperturā brevissimā, purpurascēti, labio externo intōs lato dentato, margine lineo-punctato; columella & dorsum bistrigata.*

THE BELTED PLANAXIS. Shell sharply pyramidal, spirally closely grooved; whorls seven, broadly banded above with brown, narrowly lined in the middle; aperture rather short, purplish, outer lip tooth-ridged within, margin line-spotted; columella subnubilicated.

ADAMS (Arthur). Proc. Zool. Soc. 1851, p. 271.
Hab. China Seas.

Species 16. (Mus. Hanley.)

PLANAXIS STRIATUS. *Pla. testū ovo-pyramidalitā; fidei, levigata, rubro spiraliiter lineata; spirā acuminatā, conicā; aufractibus senis; aperturā brevissimā, columellā labroque purparē, labro intōs incrassato, cix latico.*

THE STRIATED PLANAXIS. Shell pyramidal; fulvous, smooth, spirally lined with red; spire acuminated, conical; whorls six; aperture rather short, columella and outer lip purple, outer lip thickened within, scarcely ridged.

PHILIPPI. Zeitschrift für Malak. 1851. p. 91.
Hab. — ?

The species is subject to some variation, one variety being nearly white and another (in the British Museum) with only a broad cerealean band in the middle of the whorls.

PLANAXIS.

PLATE III.

Species 17. (Mus. Hanley.)

PLANAXIS SUTURALIS. *Pla. testi parv., abbl. crassissimis culis, turreatis, pyramidalibus, apice acuminato; anfractibus septem, suturi excavatis separatis, spiraliter progradit, subelevatis, superne angulatis, inter sulas planatis, columellam superne breviter callosam, canali postico brevi, aperturam brevi; labro crasso, dentibus interius liriformibus decem.*

THE SUTURAL PLANAXIS. Shell small, white, rather thick, turreted, pyramidal; apex acuminate; whorls seven, separated by a deep suture, spirally deeply grooved, angular above, flat between the grooves; columnella shortly callous above, posterior canal short; aperture short; outer lip thick, inner ridge-shaped teeth ten.

SMITH. Proc. Zool. Soc. 1872.

Hab. Chinese Seas.

Species 18. (Mus. Brit.)

PLANAXIS ATER. *Pla. purp., oblongo-pyramidalis, fulvo vel griseo, varie spiraliter rubro vel nigro spiraliiter lineata et fasciata; spirae elongatae, acuminatae, anfractibus seuis ad septenos, quatuor primis saepe subelevatis; apertura brevi, subtrigonoid, intus distanter dentato-liratis; canali postico nullo.*

THE DARK PLANAXIS. Shell small, oblong-pyramidal, black, very obscurely banded; spire elongated, conical, whorls six, laterally rather flat, last rather large; aperture small, shortly subtrigonal, with seven internal ridges; no posterior canal.

PEASE. (*Itra.*) American Journ. of Conchology.

Hab. Marquesas Islands.

In the obscurity of the dark colouring, light interstices of dark lines can be traced; and the species somewhat resembles the more obscure varieties of *Planaxis lineata*.

Species 19. (Mus. Hanley.)

PLANAXIS ABBREVIATUS. *Pla. testi aigre, levigata, subovata, brevi; spirae brevissimae, anfractibus quaternis, ultimo motuum, infra quinque-sulcato, apertura purpureo-nigrescenti, rugosa, intus tenuiter lirata; canali postico latissimo.*

THE ABBREVIATED PLANAXIS. Shell black, smooth, subovate, short; spire very short, whorls four, last large, five-grooved below; aperture blackish-

purple, large, finely ridged within, posterior canal rather wide.

PEASE. (*Abbreviata.*) Proc. Zool. Soc. 1865, p. 515.
Hab. Sandwich Islands.

Considerably shorter in the spire than *Planaxis niger* of Gaoy, which it otherwise much resembles.

Species 20. (Mus. Hanley.)

PLANAXIS LINEATUS. *Pla. testi parv., oblongo-pyramidalis, fulvo vel griseo, varie spiraliter rubro vel nigro spiraliiter lineata et fasciata; spirae elongatae, acuminatae, anfractibus seuis ad septenos, quatuor primis saepe subelevatis; apertura brevi, subtrigonoid, intus distanter dentato-lirata; canali postico nullo.*

THE LINEATED PLANAXIS. Shell small, oblong-pyramidal, fulvous or grey, variously spirally lined and banded; spire elongated, acuminate, whorls six or seven, first four groove-ridged; aperture short, subtrigonoid, distantly tooth-ridged within, no posterior canal.

COSTA. (*Buccinum.*) Brit. Conch. p. 130.

Buccinum pediculare. Lamarck.

Hab. West Indies.

This well-known West Indian shell was first described by Da Costa as British. A foreign specimen must have come into his hands by mistake.

Species 21. (Mus. Hanley.)

PLANAXIS SUCCINCTUS. *Pla. testi parv., orato-pyramidalis, fulvo subdistanter tenuiter rubro-lineata; spirae subelevatae, acuminatae; anfractibus seuis, concerato-sulcatis, superioribus lirato-sulcatis; apertura brevissima, latd, intus lirata, canali postico nullo.*

THE LINE-GIRT PLANAXIS. Shell small, ovately pyramidal, fulvous, rather distantly, finely red-lined; spire slightly elevated, acuminate; whorls six, rather convex, upper groove-ridged; aperture rather short, broad, ridged within; no posterior canal.

A. ADAMS. Proc. Zool. Soc. 1851, p. 272.
Hab. West Indies.

The lines are thinner and more distant, the whorls are more rounded and the spire is shorter in pro-

PLANAXIS.—PLATE III.

portion to the aperture than in *Planaxis lineatus*. Yet the variations in individuals is such that the two species are determined with difficulty.

Species 22. (Mus. —? Copied)

PLANAXIS HERMANNSENI. *Testa parvā, solidā, ovato-oblongā, atro-fusēdā, lineis fulvis cinctā; spirā acuminatā, anfractibus senis, convergis, apicalibus sulcatis, ultimo infrā sulcato, ventricosā; caudā post columellam umbilicatā; aperturā ocatā, patulā, albā, lineatā, intus incrassatā, irratā.*

HERMANNSEN'S *PLANAXIS*. Shell small, solid, ovately oblong, black-brown, girt with fulvous lines; spire acuminate; whorls six, convex, apical, grooved, last grooved below, ventricose, cauda umbilicated behind the columella; aperture ovate, patentous; white, lineated, thickened within, ridged.

DUNKER. Ind. Moll. p. 16. Pl. II. f. 33.

Hab. Benguela.

Species 23. (Mus. Brit.—Hanley.)

PLANAXIS VARIABILIS. *Pla. testā pareā, elongatā, albā, lineis spiralib⁹ rufescētib⁹ ornatā, spirā conicā, rectilaterā, acuminatā; anfractibus superiorib⁹ sulcatis, ultimo suprā infrāque vallidē, medio leviter sulcato; aperturā pareā, brevi; columellā infrā brunneō tinctā, collo canalicule posticis nullis.*

THE VARIABLE *PLANAXIS*. Shell small, elongated, white, ornamented with spiral reddish lines, spire conical, straight-sided, acuminate; upper whorls grooved, last grooved strongly above and below, slightly in the middle; aperture small, short; columella tinged with brown below; no posterior callus or canal.

SMITH. Proc. Zool. Soc. 1872, p. 44.

Hab. Fiji Islands. Var. China Seas.

Figure b represents the variety in the Collection of Sylvanus Hanley, Esq.

Species 24. (Mus. Brit.)

PLANAXIS VIRGATUS. *Pla. testā elongatā, fulvā, lineis spiralib⁹ paucis, et strigis longitudinalib⁹ irregulatib⁹ ornatā; spirā acuminatim productā; anfractibus octonib⁹, convexiūculis, superiorib⁹ sulcatis, ultimo infrā sulcato; aperturā subovatā, parē; labro auctē marginato; intus incrassato, denticulato; collo canalicule posticis nullis.*

THE STRIPED *PLANAXIS*. Shell elongated, fulvous, ornamented with few spiral lines and longitudinal irregular stripes, spire acuminately produced; whorls eight, rather convex, upper grooved, last grooved below; aperture subovate, small; outer lip sharp-edged; thickened within, denticulated; no posterior callus or canal.

SMITH. Proc. Zool. Soc. 1872, p. 44.

Hab. Fiji Islands.

Species 25. (Mus. Hanley.)

PLANAXIS STRIGATUS. *Pla. testā pareā, albā, solidā, spiraliiter distanter rubro-linéatā; spirā acuminatā, anfractibus novenib⁹, superiorib⁹ sulcatis, penultimo tenaciter striato; ultimo infrā sulcato; aperturā spiram longitudinalē equanti; columellā labro albī vel pallide violaceis; labro intus incrassato, denticulato, margine aucto.*

THE STRICKLED *PLANAXIS*. Shell small, white, solid; spirally distantly red-lined; spire acuminate, whorls nine, upper grooved, last finely striated; last grooved below; aperture equaling spire in length; columella and lip white or pale violet, outer lip thickened within, denticulated, margin sharp.

HANLEY. MS. in Coll.

Hab. Pacific.

Neither the *P. virgatus* var. so marked in the British Museum, nor the "strigatus var." in Mr. Hanley's Collection seem to me to agree with the type of Mr. Smith's *P. virgatus*, but resemble each other, with the exception that the former has a little purple in the lips.

PLANAXIS.

PLATE IV.

Species 26. (Mus. Hanley.)

PLANAXIS PLATICOSTATUS. *Pla. testâ trochiformâ, magnâ, solidâ, fuscâ, epidermide tenuiter rugatâ indutâ; costis planitatis cinctâ, interstîtîis profundâ; spire conicâ, anfractilus septenîs ad suturam angustâ; suturâ profundi, ultimo marginâ infra medium obscurissimâ angulato; aperturâ subtriangulari, columellâ latâ planata, callo postico rotundâ, labro ad matrigineum tenui, crenulatâ, supercî depresso, intus lîcis dentiformibus septenî ornata, canali postico angusto elongato.*

THE FLAT-RIBBED PLANAXIS. Shell trochus-shaped, large, solid, brown, covered with a finely wrinkled epidermis, girt with flat, broad ribs; interstices deep; spire conical, whorls seven, narrowly angular at the suture; suture deep; last large, very obscurely angular below the middle; aperture subtriangular, columella broadly flattened, posterior callus very large, outer lip thin, crenulated at the margin, depressed above, strengthened within with seven tooth-like ridges; posterior canal narrow, elongated.

SOWERBY. Append. Tank. Cal. p. 13, 1825.

Planaxis crenulatâ. Dauval.

Planaxis cincinnata. Lessen.

Hab. Galapagos Island and Panama.

Species 27. (Mus. Hanley.)

PLANAXIS TENUIS. *Pla. testâ tenui, elongatâ, politâ, semipellucidâ, albidâ, lineis rubris punctis distan- tibus cinctâ; spire elongatâ; anfractilus octoang., concrecîsensilis, spiraliter leviter soleatâ, ultimo elongatâ, infre radiale soleato et ventricoso; aper- turâ brevi, angustâ, labro tenui, callo crenulatâ, postico nollis.*

THE THIN PLANAXIS. Shell thin, elongated, polished, semipellucid, whitish, girt with few distant red lines; spire elongated; whorls eight, rather

convex, spirally lightly grooved, last elongated, strongly grooved and ventricose below the middle, aperture short, narrow, outer lip thin, no posterior callus or canal.

SMITH. Proc. Zool. Soc. 1872. p. 45.

Hab. —?

Species 28. (Mus. Brit.)

PLANAXIS INEXPENSUS. *Pla. testâ purâ, pallidissimâ foliâ, supra suturam rubro lineatâ, spirâliter soleatâ; spire elongatâ, anfractilus septenîs, concrecîsensilis, ultimo ventricoso, medio bilineato; aperturâ brevi, subrotundâ.*

THE UNIMPORTANT PLANAXIS. Shell small, very pale fulvous, with a red line above the suture, spirally grooved; spire elongated, whorls seven, rather convex; last ventricose, with two lines in the middle; aperture short, rather rounded

GOULD. (*Inupta*). Proc. Boston. Soc. Nat. Hist. 1860.

Species 29. (Fig. a, b, Mus. Brit.)

PLANAXIS ZONATUS. *Pla. testâ parâ, politâ, solidi, albidâ, supra suturam et medio infrâtrō anfractilus ultimi lineâ rubro cinctâ; anfractilus septenîs, ultimo subventricoso; aperturâ latâ, brevi; labro postico matrigineum incrassatum, denticulatum.*

THE BANDED PLANAXIS. Shell small, polished, solid, whitish, girt with a red line above the suture and in the middle and below the middle of the last whorl; whorls seven, last rather ventricose; aperture broad, short; outer lip thickened near the margin, denticulated.

A. ADAMS. Proc. Zool. Soc. 1851, p. 271.
Hab. Calapan, Philippines.

Species 30. (Fig. a, b, Mus. Hanley.)

PLANAXIS SAVIGNYI. *Pla. testâ magnâ, erasâ, breviter trochiformâ, infra medium subangulatâ, omninâ*

PLANAXIS.—PLATE IV.

crebrè sulcâtâ, griseo-fuscâ; strigis numerosis angustis, undulatis, longitudinalibus ornatâ; spirâ brevi; anfractibus quinque, brevibus, convexiâsculis; ultimo magno, supra medium tumidiâsculo; aperturâ subtrigonâ, labro intus calidè dentato, lirato, margini fuso, tenu, crenato, columella breviâscula, callo postico conspicuo.

SAVIGNY'S PLANAXIS. Shell large, thick, shortly trochiform, slightly angular below the middle, numerously grooved all over, grey brown, ornamented with numerous narrow undulating longitudinal stripes; spire short; whorls five, short, rather convex; last large, rather tumid above the middle, aperture rather trigonal; outer lip strongly toothridged within, margin broad, thin, crenated, columella rather short; posterior callus conspicuous.

DESHAYES. Mag. Zool. 1844. Pl. CIX.

Hab. Red Sea.

The sulci are more numerous than in *Planaxis sulcatus*, and not deeply cut.

Species 31. (Mus. Brit.)

PLANAXIS LINEOLATUS. *Pla. testa parvâ, densè spirâlitter sulcatâ, rubro lineatâ, subventricosâ, spirâ acuminatâ, anfractibus convexiâsculis; aperturâ subrotundâ, columellâ tenui, calidè arenatâ, labro intus dentato, prope marginem incassato, margine rotundo.*

THE FINE-LINED PLANAXIS. Shell small, closely spirally grooved, lined with red, rather ventricose; spire acuminated, whorls rather convex; aperture rather round, columella thin, much arched, outer lip denticulated within, thickened near the margin, margin rounded.

GOULD. Otia Conch. p. 60.

Hab. Wilson's Island, near the Sandwich Islands.

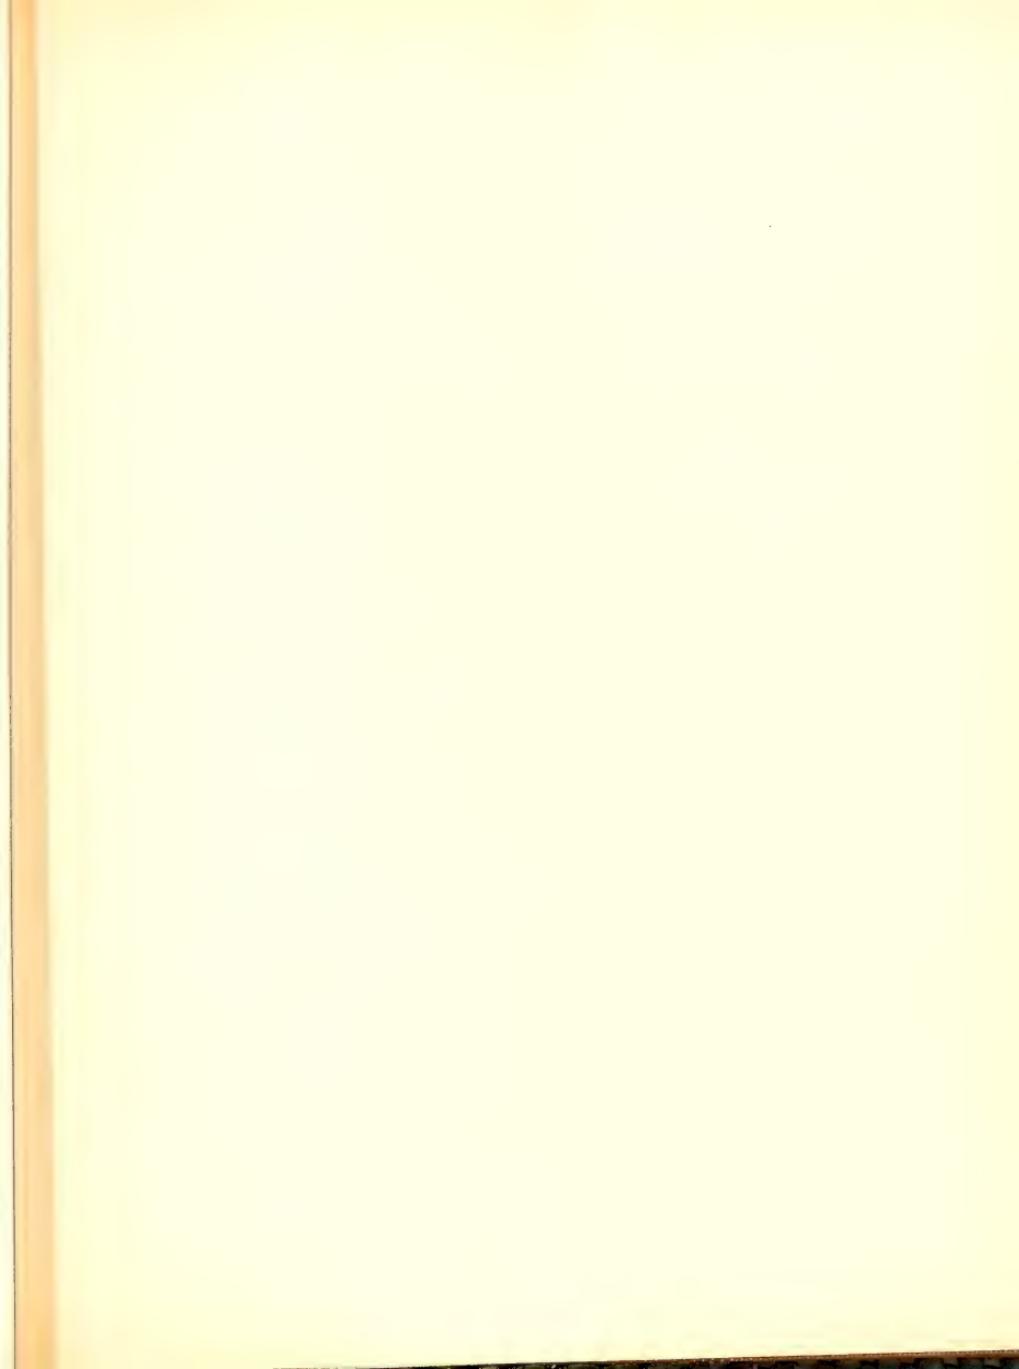

Species 32. (Mus. Hanley.)

PLANAXIS LONGISPIRA. *Pla. testâ parvâ, elongatâ, angustâ, albidiâ, medio ultimi anfractus et infra rubra bilingatâ; spirâ productâ, anfractibus convexiâsculis, levibus, politis, ultimo basi sulcato; aperturâ parvâ, quam spira longe breviori; columella levi, arematâ, pallide violacea; labro crassiâsculo, callo postico nulla.*

THE LONG-SPINED PLANAXIS. Shell small, elongated, narrow, whitish, with two red lines in the middle of the last whorl and below; spire produced, whorls rather convex, smooth, polished; last grooved at the base; aperture small, much shorter than spire; columella short, arched, pale violet; outer lip rather thick; no posterior callus.

Species 33. (Mus. Brit.)

PLANAXIS FROESEI. *Pla. testa albâ, parvâ, orato-*
anumimata; ad apicem fulvâ; spira elevatâ,
inversuatâ; anfractibus octo; inferioribus con-
vexis, spirali transversatis, costatis et sulcatis; i-
spertura subovata; labro ad marginem vento-
brownum maculatum, intus incrassatum, denticulatum;
columnellâ arcuata, callo postico parvo.

THE IVORY PLANAXIS. Shell white, small, ovately acuminate, fulvous at the apex; spire raised, mucronated; whorls eight, lower convex, spirally grooved, ribs between the grooves divided; aperture subovate, outer lip sharp at the margin, spotted with brown, thickened and denticulated within; columella arched, posterior callus small.

SMITH. Proc. Zool. Soc. 1872, p. 42.

Hab. St. Thomas and St. Vincent, West Indies.

The ribs are divided by a spiral line in the centre.

Species 34. (Fig. a, b, Mus. Brit.)

PLANAXIS PUNCTO-STRIATUS. *Pla. testâ angustâ pyra-*
mida; lineis minutissimis puncto-striatis spirali
cinctâ, brevi, pallidâ fulvâ, mucilis parvis sub-
quadratâ costatis securâ dispositis ornata;
spira elongatâ, anfractibus senis concavisculis,
ultimo subelevatâ; apertura brevi, subovata,
antice valde emarginata, margine labii maculata.

THE PUNCTURE-STRIATED PLANAXIS. Shell narrowly pyramidal, spirally encircled with very minute puncture-striated lines, smooth, pale fulvous, ornamented with small square chestnut spots; spire elongated, whorls six, rather convex, last rather ventricose; aperture short, subovate, anteriorly strongly notched, margin of the outer lip spotted.

SMITH. Ms. Mus. Brit.

Hab. —?

Species 35. (Fig. a, b, Mus. Hanley.)

PLANAXIS BRASILIANS. *Pla. testâ elongato-pyrami-*
dalis, brevi, albâ, crassissimâ, epidermide pilosâ
indulâ; spira elevatâ, anfractibus septenis, super-

riobus frequenter griseo fasciatâ, ultima infre-
midina obtusa angulata; apertura parvâ, ovalâ,
fulvâ; labro ad dorsum tumido, supra marginem
deflexo, intus rubore incrassato denticulato; columnellâ
brevi, incrassata, arcuata, antice productâ, canali
antice elongata, extremitate tumida.

THE BRAZILIAN PLANAXIS. Shell elongate-pyramidal, smooth, white, very thick, covered with a velvety epidermis; spire raised, whorls seven, upper often banded with grey, last obtusely angular below the middle; aperture small, oval, fulvous, outer lip tumid at the back, bent down above the margin, much thickened and denticulated within; columella short, thickened, arched, produced anteriorly, anterior canal lengthened, tumid outside.

Species 36. (Fig. a, b, Mus. Hanley and Brit.)

PLANAXIS (Quoyia) MICHAUDI. *Pla. testâ pyrami-*
datis, elevata, levigata, fissa, fulvo vel griseo
longitudinaliter fasciatâ; spira elongatâ, conicâ;
anfractibus septenis, concavisculis, ultimo infra
mediana angulata, supra carinem canalis leviter
spirale striata; apertura brevi, subtriangularis,
columnellâ supra quadratis excaesi, ante un-
dentalata, ad terminum truncata; labro intus tenue-
ter lirato-denticulato; canali antice brevi, rotundo.

MICHAUD'S PLANAXIS. Shell pyramidal, raised, smooth, brown, longitudinally striped with fawn or grey; spire elongated, conical; whorls seven, rather convex, last angular below the middle, lightly spirally striated above the varix of the canal; aperture short, subtriangular, columella cut out in a square above, with a sharp tooth, truncated at the end; outer lip finely ridge-toothed; anterior canal short, round.

CROSSE and FISCHER. Journ. Conch. Vol. XI, p. 375.
Hab. Eastern Seas.

PLANAXIS.—PLATE V.

The variety in the British Museum is banded longitudinally with light grey, and that in M. Hanley's collection is of a more uniform brown colour. The shell is more slender than *Quoyia decollata*, which is deeply grooved.

Species 37. (Fig. *a, b*, Mus. Hanley.)

PLANAXIS (Quoyii) DECGLUTA. *Pla. testi oblongo-pyramidalis, spiraliiter valde sudeatá, subviridē fulvo-fusco longitudinaliter strigatā, sulcis prope suturam et supra varicosa canalis majoribus; aufractibus lateraliter rectiusculis, superioribus deciduis; apertura brevi, subtriangulari, columella superne quadratum excisa, aucte undentata, ad terminum truncata; labro intus tenue lirato-denticulata; canali notico brevi, rotundo.*

THE DECGLUTATED PLANAXIS. Shell oblong-pyramidal, spirally strongly grooved, greenish-fawn, longitudinally striped with brown, grooves larger near the suture and above the canal varix; whorls laterally rather straight, upper deciduous;

aperture short, rather trigonal, columella cut out above in a square, with a sharp tooth; anterior canal short, rounded.

GRAY. Proc. Zool. Soc. 1847, p. 138.
Hab. New Guinea, Philippines.

Species 38. (Mus. Brit.)

PLANAXIS (Holcostoma) PILIGER. *Pla. testi ocuta, brevi, latè plumbeo fuscata; spirá brevissimá; apertura angustá, ocatá, canali postico elongato, sinuato, columella arcuata, infra latá, latè truncata, labro intus leviter dentata, marginé superne flexuosa.*

THE HAURY PLANAXIS. Shell ovate, smooth, broadly banded with plum-colour; spire very short; aperture large, oval, posterior canal elongated, sinuous, columnella arched, broad below, broadly truncated, outer lip lightly toothed, margin flexuous above.

VELORITA.

Genus VELORITA, Gray.

MOLLUSCA ACEPHALOPODA, BIMUSCULOSUM, FLUVIATILE.

Testa crassa, solidi, equivalve, epidermide crassa, nitenti indutâ; umbonibus a cardine separatis; exline crasso, atque valci dentibus tribus cardinalibus divergentibus; dentibus lateralibus, antea brevissimo, angulato, postio elongato. Pallii impressio posticè angulatim sinuosa. Ligamentum exterum, magnum.

MOLLUSCA ACEPHALOPODA, BIMUSCULOSUM, FLUVIATILE.

Shell thick, solid, equivalent, covered with a thick, shining epidermis; umboes separated from hinge. Hinge thick, with three diverging cardinal teeth in each valve; lateral teeth, anterior rather short, angular, posterior elongated. Impression of the mantle posteriorly, angularly sinnated. Ligament external, large.

The two species described are from Japan and Cochinchin, in India. The former is the well-known *Velorita cyprina*, and the latter recently described by Mr. Smith of the British Museum. We are unacquainted with the so-called *Velorita recurvata* of Valenciennes. The solidity of the shell, the very peculiarly angular front lateral tooth, and the separation by a small area of the umboes, are the characteristics of the genus.

Species 1. (Mus. Sowerby.)

VELORITA CYPRINA. *Vel. testa altissima, solidissima, tenuitessinâ, valde obliquâ, liris concentricis distantibus, plerùmque ad latera continua rugatâ, intus albo, vel roseo violaceoque lineatâ; latere antico brevissimo, perpendiculari, infra umboes areâ subrotundâ, planulatâ; latere postico producto, infra acuminato, angulato, subcarinato, post angulum planulato.*

THE CYPRINA-LIKE VELORITA. Shell very high, very solid, very tumid, very oblique, wrinkled with distant concentric ridges, for the most part continued to the sides, white, or tinged with rose or violet within; anterior side very short, perpendicular, with a rather rounded, flattened area; posterior side produced, acuminate below, angular, slightly keeled, flattened behind the angle.

GRAY. —? MS. Brit. Mus.

Hab. Japan.

Species 2. (Mus. Brit.)

VELORITA COCHINENSIS. *Vel. testa subovatâ, latâ, obliquâ, subcompressâ, liris concentricis distantibus, plerùmque posticè post medium discontinuâ rugatâ, intus salmonet et aurantiâ; latere antico brevî, jecrè perpendiculari, infra umboes planulatâ; latere postico obliquâ producto, vix carinato, angulato, post angulum planulato, ad terminum subtruncato.*

THE COCHIN VELORITA. Shell subovate, broad, oblique, subcompressed, wrinkled with distant concentric ridges, for the most part discontinued posteriorly behind the middle, salmon and orange within; posterior side obliquely produced, hardly keeled, angular, flattened behind the angle, truncated behind the middle.

HANLEY. Smith, Proc. Zool. Soc. 1875.

Hab. Cochinchin, Kinderpore, Madras.

The differences between this and the former species, consisting in the greater breadth and less elevated apex of the latter, the tendency of its wrinkles to stop near the anterior half of the shell, are more comparative than positive, and, in a number of specimens, some are found in which these characters are almost interchangeable.

PTEROPODA.

PLATE I.

Genus HYALEA. Lamarck.

Testa hyalina, tenuissima, subglobosa, lateraliiter appendiculata, symmetrica; apice non-spirali; aperture angusti; lateraliiter incisa; labro marginato, plurimaque in rostrum producto.

Shell glassy, very thin, subglobose, with lateral appendages, symmetrical; apex non-spiral; aperture narrow, laterally incised; outer lip bordered, generally produced into a beak.

SYNONYM. *Cavolina Gmelini.*

The Pteropoda are placed by authors, who have studied their peculiarities, between the Cephalopoda and the Gasteropoda. The name of the class is happily chosen to suggest the wing-like pair of flappers or fins which, placed on each side of the head, effect by their action the locomotion of the molluse. The greater part of the species are common to all seas; a few being perhaps peculiar to the Atlantic, and a few to the Pacific. They can be seen in the evening or at night floating at the surface of the water in great numbers, but at sunrise they sink to various depths, and are seen no more till the luminary of day disappears from the horizon. It is said that each species has its own precise moment for retiring, and its own appointed depth to which to sink.

The shells of some of the genera are obliquely spiral; as *Hemifusitus* and *Chelitropis*. Some are symmetrically spiral. Some have an operculum, *Cymbulia*, a boat-shaped symmetrical cartilage, but no shell. The form of the shell in *Hyalea* bears a considerable resemblance to a symmetrical bivalve shell with the valves soldered together at the dorsal hinge.

Species 1. (Mus. Brit.)

HYALEA UNCINATA. Hyta. testa tenuissimā, succinēd, tumidū, posticē trispinosa, spinis lateralibus triangulari, acutis, spinī terminali deflexi, uncinatā; aperture angustiōculā, labro angustē marginato, medio pecti producto.

THE HOOKED HYALEA. Shell very thin, amber,

tumid, posteriorly three-spined, lateral spines three-sided, sharp terminal spine bent downwards, curved; aperture rather narrow, outer lip narrowly bordered, a little produced in the middle.

RANG. D'Orbigny. Voy. Amér. Mérid. Pl. V. f. 11-15.
Hab. Atlantic Ocean.

Distinguished from *Hyalea Trispinosa* by the more pent-up form, and by the hooked character of the central spine.

Species 2. (Mus. —? Copied.)

HYALEA FLAVA. Hyta. testa flavidā, tenuissimā, oratā, subcompressā, posticē trispinosa, spinis lateralibus subapproximatīs, spinā centrali elongatā, aperture angustā, labro bilobato.

THE YELLOW HYALEA. Shell flavid, very thin, oval, subcompressed, three-spined posteriorly; lateral spines rather approximate, central spine long; aperture narrow, outer lip bilobate.

D'ORBIGNY. Voy. Amér. Mérid. Pl. V. f. 21-25.
Hab. Atlantic Ocean.

Distinguished from *Hyalea trispinosa* by its oval and more compressed form.

Species 3. (Mus. Brit.)

HYALEA AFFINIS. Hyta. testa densē fuscā, quam H. tridentata angustiorā, magis rotundā, rostro apertura producto, bilobato.

THE RELATED HYALEA. Shell deep brown, narrower than *Hyalea tridentata*, the rostrum of the mouth produced, bilobate.

D'ORBIGNY. Voy. Amér. Mérid. Pl. V. f. 6-10.
Hab. Atlantic Ocean.

By the character of the shell alone the species would scarcely be distinguishable from the common species, and for this reason the writer has confined himself to the above very short comparative description.

PTEROPODA.—PLATE I.

Species 4. (Mus. Brit., &c.)

HYALEA TRIDENTATA. *Hya. testā intenſe fuscā, tenui, infrā pallidiori, posticē acutē trispinosā; spinis lateralibus aliformibus, spinā terminali rectā, disco inferiori subtrigono, aperturam versus divaricatum subtrilobato; disco superiori globosa, ad latera marginato; aperturā trigonā, labro rostrato, marginē subquadribolato.*

THE THREE-SPIINED HYALEA. Shell deep brown, thin, rather paler underneath, posteriorly sharply three-spined, lateral spines wing-shaped, terminal spine straight, lower disc subtrigonal to subtrilobate towards the aperture; upper disc globose, bordered at the sides; aperture trigonal, outer lip beaked, margin slightly four-lobed.

FORSKAL (Cavolina).

Hyalea papilionacea. Bory St. Vincent.

Hyalea Forskalii. D'Orbigny.

Hyalea Pangii. Deshayes.

Hab. Mediterranean. Great Britain?

It is probable that the variety, fig. 6, with white border and appendages, may be the *H. papilionacea* of St. Vincent.

Species 5. (Mus. Brit.)

HYALEA CUMINGII. *Hya. testā trispinosā, pallidi, tenuissimā, iridescenti, nebulosā, vel pallidē succinē, quam H. trispinosa magis oblonga, spinis lateralibus magis approximatis, rostro subtrigono, producto.*

CUMING'S HYALEA. Shell three-spined, pale, very thin, iridescent, clouded, or pale amber, more oblong than *Helix trispinosa*, lateral spines more approximated, beak subtrigonal, produced.

DESHAYES. MS. Mus. Cuming.

Hyalea nebulosa. Deshayes (var.)

Hab. — ?

Of a more oblong form and lighter texture than *H. trispinosa*, but the difference is not very obvious. There is something in the texture of the pale variety

giving a cloudy iridescence, which may, however, indicate a real specific distinction.

Species 6. (Fig. a, b, Mus. Brit.)

HYALEA GLOBULOSA. *Hya. testā trispinosā, ovatā, ventricosā, albā, angustiōsculā, disco ventrali obliquè conico, ad apicem rotundè elevato, spinis lateralibus obtusis, subapproximatis, spinā apicali deflexa, truncatā, perforatā; aperturā angustè semilunari, labro breviter marginato.*

THE GLOBOSE HYALEA. Shell three-spined, ovate, ventricose, white, rather narrow; ventral disc obliquely conical, roundly raised at the apex, lateral spines obtuse, somewhat approximate, apical spine bent downwards, truncated, perforated; aperture narrowly semilunar, outer lip shortly margined.

RANG. Proc. Zool. Soc.

Hab. — ?

Species 7. (Fig. a, b, Mus. Brit.)

HYALEA GIBBOSA. *Hya. testā trispinosā, ovatā, ventri- cosā, albā, angustiōsculā, elongatā, disco ventrali obliquè conico, acuminate elevatā, ad angulum elevatum rugatā; spinis lateralibus approximatis, spinā centrali elongatā, leviter deflexā.*

THE GIBBOS HYALEA. Shell three-spined, ovate, ventricose, white, rather narrow, elongated; ventral disc obliquely conical, acuminate elevated, wrinkled at the raised angle; lateral spines approximated, central spine elongated, slightly deflected.

RANG. D'Orbigny, Voy. Amér. Mérid.

Hab. — ?

This and the preceding species are swelled and raised at the ventral disc, forming an oblique cone, leaning towards the aperture in each case. In *Hyalea globulosa* the apex of the cone is rounded. In *H. gibbosa* it is raised into an acuminate strongly-wrinkled beak.

PLATE II.

HYALEA.

Species 8. (Fig. *a, b*, Mus. Sowerby.)

HYALEA OBTUSA. *Hya. testā parēt, tenuissimā, pul-
lidissimō succinē, hyalīnā; disco ventrali brevi,
rotundo; spinis lateribus brevibus, duplicitis,
apice centrali truncato, utrinque vix dentato, oper-
tūrū trigonū, labro producto.*

THE OBTUSE HYALEA. Shell small, very thin, very pale amber, glassy; ventral disc short, rounded; lateral spines short, double, central apex truncated; just perceptibly dentated on each side; aperture trigonal, outer lip produced.

SOWERBY.

Hab. —?

The side appendages are smaller, and the bifid denticles more obtuse than in *Hyalina longirostris*, and the central apex broader and more truncated.

Species 9. (Mus. Sowerby.)

HYALEA MINUTA. *Hya. testā minantissimā, globosā, sub-
circularē, posticē angustatib; processibus lateribus
minutis unidentatis, apice centrali producto, latē
truncato, utrinque minantissimē unidentato; oper-
tūrū angustē semilunari; margine simplici, reflexo.*

THE MINUTE HYALEA. Shell very minute, globose, rather ashy, posteriorly narrowed, lateral processes with minute tooth, central apex produced, broadly truncate, with a single very minute tooth on each side; aperture narrowly semilunar, with a simple reflex margin.

SOWERBY.

Hab. —?

Species 10. (Mus. Sowerby.)

HYALEA INTERMEDIA. *Hya. testā parēt, latā, albā,
pellucidā, posticē subcompressa, quadridentata, den-
tibus lateribus trigonis, acutis, dentibus ad
apicem parcis, acuminatis; apice centrali subpro-*

*ducto, truncato; operaturā angustā, margine sim-
plici, reflexo.*

THE INTERMEDIATE HYALEA. Shell small, broad, white, pellucid, posteriorly rather compressed, with four teeth; lateral teeth trigonal, acute, teeth at the apex small, acuminate; central apex rather produced, truncated; aperture narrow, margin simple, reflected.

SOWERBY.

Hab. —?

Larger, more compressed at the sides, and less globose than *H. minuta*. Smaller, and more contracted anteriorly than *H. quadridentata*.

Species 11. (Fig. *a, b*, Mus. Brit.)

HYALEA LIMBATA. *Hya. testā pallidè lilioinā vel fuscā,
trigonā, disco ventrali tumido, tenuiter litato, apice
angustē subtruncato, processibus lateribus atabis,
acutis, acuminatis, acutis tridentatis; operari
subtrigonā, labio interno angustē reflexo; labio
longē producto, leviter elevato, rostrato; rostro al-
ternatum bilobato; margine media subcontracto.*

THE BORDERED HYALINA. Shell pale lilac or brown, trigonal, ventral disc tumid, finely ridged, apex narrowly rather truncated, lateral processes winged, trigonal, acuminate, sharply tridentate; aperture subtrigonal; inner lip narrowly reflected; outer lip much produced, slightly elevated, beaked, slightly contracted in the middle.

D'ORBIGNY. Voy. Amér. Mérid. Pl. VI. f. 11, 15.

Hab. Atlantic Ocean.

Species 12. (Fig. *a, b*, Mus. Brit.)

HYALEA LONGIROSTRIS. *Hya. testā jasca, vel albā,
versus operaram fuso suffusi, disco centrali
tumido, rotundo, tenuiter litato, apice angustē sub-
truncato, processibus lateribus atabis, trigonis,
bidentatis; operaturā subtrigonā, labio interno*

PTEROPODA.—PLATE II.

angustè reflexo, labro longè producto, validè elevato, rostrato, rostro ad terminum bilobato; margine medio contractato.

THE LONG-BEAKED HYALEA. Shell brown, or white, suffused with brown towards the aperture; ventral disc tumid, rounded, finely-ridged, apex narrowly subtruncated, lateral processes winged, trigonal, bidentate; aperture subtriangular; inner lip narrowly reflected, outer lip much produced, strongly raised, beaked; beak two-lobed at the end; margin strongly contracted in the middle.

LESUEUR. D'Orbigny, Voy. Amér. Mérid. Pl. VI. f. 12.

Hab. Atlantic Ocean.

It is with some hesitation that the writer adopts D'Orbigny's distinction between this and the preceding species. The rostrum seems to be more distinctly contracted at the base, and more suddenly upturned in *H. longirostris* than in *H. limbata*, while the lateral alæ are more spread and acuminate produced in the latter species, giving the shell altogether a more triangular appearance.

Species 13. (Fig. a, b, Mus. — ? Copied.)

HYALEA LEVIGATA. *Hya. testâ discoïdâ, compressâ, minuta, albâ; processibus lateralibus cuneatis, apice* | *Hab. — ?*

producto, acutè uncinato; apertura ad processus continuatâ, labiis subaequalibus.

THE SMOOTH HYALEA. Shell discoïdal, compressed, minute, white; lateral processes cornered, apex produced, sharply hooked; aperture continued to the processes, lips nearly equal.

D'ORBIGNY. Voy. Amér. Mérid. Pl. VII. f. 15–19.
Hab. — ?

A flat white species of *Hyalea* (?) very simple in form.

Species 14. (Fig. a, b, Mus. Brit.)

HYALEA QUADRIDENTATA. *Hya. testâ succinâ, oblongâ, tumida, posticè subangustata, processibus lateralibus acutè unidentatis, apice producto, angusto, ad terminum rotundo, utrinque propterminum unidentato, apertura angustâ, semi-lunari, margine simplici, reflexo.*

THE FOUL-TOOTHED HYALEA. Shell amber, oblong, tumid, posteriorly rather narrowed, lateral processes sharply unidentate, apex produced, narrow; rounded at the end, narrow, with a tooth at each side near the end; aperture narrow, semilunar, margin simple, reflected.

LESUEUR. D'Orbigny, Voy. Amér. Mérid. Pl. V. f. 11–15.

PTEROPODA.

PLATE III.

HYALEA DIACRIA ATLANTA.

Species 15. (Fig. *a, b*, Mus. Brit.)

HYALEA (*Diacria*) *TRISPINOSA*. *Hya. testi compressa,* tenuissimā, albā, fuscō in partibus suffusā, obliquē subquadratā, trispinosa; spinis lateralis elevatis, brevibus; spinā apicali productā, uncinatā; aperturā usque ad spinas laterales incisa, latitudo ciliis, labio interno reflexo, labro producto, marginē lobato.

THE THREE-SPINED HYALEA. Shell compressed, very thin, white, suffused with brown in parts, oblique, rather square, three spined; lateral spines short, sharp, placed at the angle on each side, apical spine elongated, attenuated, acuminated; ventral disc convex, dorsal disc transversely ridged, trilobate; aperture narrow, margins somewhat reflected.

LESUEUR. D'Orbigny, Voy. Amér. Mérid. Pl. VII.
f. 17.

Hab. Atlantic Ocean.

Species 16. (Fig. *a, b*, Mus. Brit.)

HYALEA (*Diacria*) *MUCRONATA*. *Hya. testi lati, compressa,* alba, fuscō prope aperturam picti, latē subquadratā, trispinosa; spinis lateralis remotis, aliis, depressis, spinā apicali latiē ciliis, brevissimis; disco centrali ferè levigato, disco dorsali lobato, validē rugato; aperturā angustā, lobis reflexis, fusiis, angustis.

THE SHARP-POINTED HYALEA. Shell broad, compressed, white, painted with brown near the aperture, broadly subquadrate, three-spined; lateral spines remote, winged, depressed; apical spine rather wide, rather short, frequently truncated; ventral disc nearly smooth, dorsal disc lobed, strongly wrinkled; aperture narrow, lips reflected, brown, narrow.

LESUEUR. D'Orbigny, Voy. Amér. Mérid. Pl. VII. f. 6-10.

Hab. Atlantic Ocean.

With broader disc and wider ale than in *Hyalea trispinosa*. The apical spine is also broader and shorter.

Species 17. (Fig. *a, b*, Mus. Sowerby.)

HYALEA INFLEXA (*Diacria*). *Hya. testi pared, albd,* subtrigonā, trispinosa, spinis lateralis elevatis, brevibus; spinā apicali productā, uncinatā; aperturā usque ad spinas laterales incisa, latitudo ciliis, labio interno reflexo, labro producto, marginē lobato.

THE INBENT HYALEA. Shell small, white, subtrigonid, three-spined; lateral spines raised, short; apical spine produced, hooked; aperture slit as far as the lateral spines, rather broad; inner lip reflected, outer lip produced, margin lobed.

LESUEUR. D'Orbigny, Voy. Amér. Mérid. Pl. IX. f. 16-20.

Hab. Atlantic Ocean.

Species 18. (Fig. *a, b*, Mus. Brit.)

HYALEA LABIATA (*Diacria*). *Hya. testi albā, elongata,* subtrigonā, trispinosa, subcompressa; disco dorsali anticē producto, angustē rostrato, medio angulato; disco ventrali convexo, levigato, spinis lateralis retrosis, acutis, spinā apicali brevissimā, deflexa, uncinatā; aperturā trigonid, labro producto, angulato, labio interno elevatum reflexo.

THE LIFTED HYALEA. Shell white, elongated, subtrigonid, three-spined, subcompressed; dorsal disc produced anteriorly, narrowly beaked, with a central angle; ventral disc convex, smooth, lateral spines turned backwards, sharp, apical spine rather short, bent downwards, hooked; aperture three-cornered, outer lip produced, angular, inner lip raised or reflected.

D'ORBIGNY. Voy. Amér. Mérid. Pl. VI. f. 21-25.

Hab. Atlantic Ocean.

Species 19. (Fig. *a, b*, Mus. ? Copied.)

HYALEA DEPRESSA (*Diacria*). *Hya. testi minutā,* albd, subtrigonā, compressa, processus lateralibus ad rimam aperturā projectis; aperturā profundi semilunari, simplici; labro producto, labio interno leviter elevato, apice longē producto ad terminum acuminato, uncinata.

PTEROPODA.—PLATE III.

THE DEPRESSED HYALEA. Shell minute, white, sub-trigonal; compressed; lateral processes projected to the slit of the mouth; aperture deeply semi-lunar, simple; outer lip produced, inner lip slightly raised; apex much produced, acuminated at the end, and hooked.

D'ORDIGNY. Voy. Amér. Mérid. Pl. VII. f. 11–14.
Hab. —?

Genus ATLANTA, Lesueur.
(Limaicina, Cuvier.)

Testa nantiliformis, semicartilagineosa, spirâ planorhombâ, aufractibus partia cleftis, ultimo tenuiter carinato. Shell nautilus-shaped, half cartilaginous, spire flat-circular; whorls partly hidden, last with a thin keel.

Species 20. (Fig. a, b, Mus. Brit.)

ATLANTA PERONI. *Atl. testû compressâ, tenuissimâ, hyalinâ; aufractibus apparentibus acutè angulatis; aperturâ angustâ; margine externo acutissimè angulato; carinâ latâ, tenuissimâ.*

PERON'S ATLANTA. Shell compressed, very thin, hyaline; whorls visible, sharply angular; aperture narrow, its outer edge very acutely angular; keel broad, very thin.

LESUEUR. Les. et Blain. D'Orb. Amér. Mérid.
Hab. Atlantic.

Species 21. (Fig. a, b, Mus. Brit.)

ATLANTA (Oxygyrus) KERANDRENI. *Atl. testâ ventricosâ, membranaceâ; aufractibus paucis, apicalibus celatis, ultimo, extâ, versus apicem latè carinato; aperturâ latâ, marginâ externo rotundo.*

KERANDREN'S ATLANTA. Shell ventricose, membranaceous; whorls few, apical hidden, last towards the aperture outside broadly keeled; aperture broad, outer margin rounded.

RANG. Adams, Genera, p. 92.
Hab. —?

About 15 or 16 species of Atlanta and Oxygyrus have been described, but we have not the opportunity of presenting more than two representative species.

P T E R O P O D A.

PLATE IV.

Genus CLEODORA. *Péron and Lesueur.*

Testa lytina, pyramidata, band lateraliter appendiculata, tricuspidata; apertura trigonata, labro producto, rostrato.
 Shell hyaline, pyramidal, without lateral appendages, three-spined; aperture trigonal, outer lip produced, beaked.

Of the few species composing this genus the most exquisitely beautiful is the *Cleodora cuspidata*.

Species 22. (Fig. *a, b*, Mus. Brit.)

CLEODORA AUSTRALIS. *Cle. testa angusti pyramidata, trigonata, dorso lateribusque carinato-angulatis, spinis lateribus brevibus, versus aperturam elevatis, spinis apicali acuminatis, apertura trigonata, disco ventrali concava.*

THE AUSTRALIAN CLEODORA. Shell narrowly pyramidal, trigonal, back and sides with carinated angles, lateral spines short, raised towards the aperture, apical spine acuminated, aperture trigonal, ventral disc concave.

D'ORBIGNY. Voy. Amer. Mérid. T. VIII. f. 12-14.

Hab. Australia.

Much narrower than *Cleodora pyramidata*, which it otherwise resembles.

Species 23. (Fig. *a, b*, Mus. Brit.)

CLEODORA CUSPIDATA. *Cle. testa oblonga, trigonata, transversè sinuata lirata, lateribus dorsalibus trigonis, carinâ dorsali acutâ, in rostrum productâ, carinâ lateribus brevibus, longispinosis; spinis apicali acutissimâ, disco ventrali medio convexa.*

THE POINTED CLEODORA. Shell oblong, trigonal, transversely sinuously ridged, dorsal sides trigonal, dorsal keel sharp, produced into a beak, lateral keels short, with long spines; apical spine very sharp, ventral disc convex in the middle.

QUOT. Voy. Astro. II. Pl. 27, f. 1-5.
Hab. Atlantic Ocean.

The spines are long, and bend upwards from the inverted apex, rather near which they take their rise.

Species 24. (Mus. ——? Copied.)

CLEODORA LOBATA. *Cle. testa latè pyramidata, trigonata, transversè sinuata lirata; spinis lateribus supra medium elevatis sursum acclivibus; labro producto, marginè lobato.*

THE LOBED CLEODORA. Shell broadly pyramidal, trigonal, transversely sinuously ridged; lateral spines raised above the centre, sloped upwards; outer lip produced, margin lobed.

SOWERBY.

Hab. Atlantic Ocean.

From the figure in D'Orbigny's work the writer concludes this to be a distinct species, although given as a variety of *Cleodora pyramidata*. It has veritable spines at the sides, which are pointed upwards, and the dorsal surfaces are longitudinally ridged, with correspondingly lobed labial margin.

Species 25. (Fig. *a, b*, Mus. Sowb.)

CLEODORA PYRAMIDATA. *Cle. testa latissimè pyramidata, trigonata, levigatâ, facie ventrali ad latera concavâ, medio angustè tumidâ, carinâ dorsali acutâ, in rostrum acuminatum productâ, angulis lateribus expansis, acutè subspinosis, medianis, horizontalibus.*

THE PYRAMIDAL CLEODORA. Shell very broadly pyramidal, trigonal, smooth, ventral surface concave at the sides, narrowly tumid in the middle, dorsal keel sharp, produced into an acuminated rostrum; lateral angles expanded, sharply sub-spinose, central, horizontal.

QUOT. Voy. de l'Astrolabe, Vol. II. Pl. XXVII. f. 7-13.

Hab. Atlantic Ocean.

PTEROPODA.—PLATE IV.

Genus BALANTIUM. Leach.

Testa triangularis, hyalina, compressa, longitudinaliter undata, apertura angusta, transversa, ad angulos non rotata.

Shell triangular, hyaline, compressed, longitudinally waved, aperture narrow, transverse, not slit at the angles.

This genus does not appear to differ very essentially from *Cleodora*. The angles of the aperture are not slit, and the outer lip is not produced. Several species are enumerated by authors, but with the exception of the one given below they are not known to the present writer.

Species 26. (Fig. *a, b*, Mus. Brit.)

BALANTIUM RECURVUM. *Bal. testi oblongo-triangulari,*

utrinque transversè undulatim liratâ, facie dorsali longitudinaliter tri-liratâ; facie ventrali ad latera concavâ, medio latè tumido; marginibus laterali-bus acutè carinatis; spinâ apicali acutâ, recurvâ: aperturâ semilunarî, marginibus undulatis.

THE RECURVED BALANTIUM. Shell oblong-triangular, transversely wavy ridged across; dorsal surface with three longitudinal ridges; ventral surface concave at the sides, broadly swelled in the middle; lateral margins sharply keeled; apical spine sharp, bent backwards; aperture semi-lunar, with undulating margins.

PTEROPOD A.

PLATE V.

Genus TRIPTERA. Quoy.

Testa tubulosa, subcompressa, versus apicem leviter bulbiformis, ad apicem extini circulari cincta; apertura reniformis.

Shell tubular, rather compressed, slightly bulbiform towards the apex, surrounded at the apex with a circular keel; aperture reniform.

Synonym. *Ceratella*, Rang.

Species 27. (Mus. Brit.)

TRIPTERA COLUMNELLA. *Tri. testa albâ, semipellucida, versus apertura subconpressa, subangustata, apice rotundata.*

THE LITTLE PILAR TRIPTERA. Shell white, semipellucid, rather compressed and narrowed towards the aperture; apex rounded.

RANG. D'Orbigny, Voy. Amér. Mérid., t. 8, f. 35, 39
Creseis albula, Rang.

Hab. —?

The one or two other recorded species are not found in the collections.

Genus CRESEIS. Rang.

Testa elongata, tubularis, pyramidalis, spiniformis, hyalina.

Shell elongated, tubular, pyramidal, spine-shaped.

Synonym. *Stylaria*, Lesueur.

Species 28. (Fig. a, b, Mus. —?)

CRESEIS ROTUNDA. *Cre. testa subrotundata, latissimata, fere recta, transversè tenuissimè striata; apice attenuato, acuminato, leviter arcuato; apertura rotundata.*

THE ROUNDED CRESEIS. Shell rather rounded, rather wide, elongated, nearly straight, transversely very finely striated; apex attenuated, acuminated, slightly arched; aperture rounded.

SOWERBY.

Hab. —?

We do not find this species elsewhere described.

Species 29. (Fig. a, b, Mus. Brit.)

CRESEIS ACICULATA. *Cre. testa angusta, levigata, attenuata, acuminata, dorso angulata; apertura subtriangularis, labro prodacto, unispinoso.*

THE ACICULATED CRESEIS. Shell narrow, smooth, attenuated, acuminate, angular at the back; aperture rather trigonal, outer lip produced with a spine.

D'ORBIGNY, Tab. VIII., f. 29-31.

Hab. Atlantic Ocean.

Species 30. (Fig. a, b, Mus. Brit.)

CRESEIS STRIATA. *Cre. testa latissimata, transversè rugata; apertura subrotundata; apice retrocurvata, leviter arcuata, acuminata.*

THE STRIATED CRESEIS. Shell rather broad, transversely wrinkled; aperture rather round; apex slightly curved backwards, acuminate.

RANG. D'Orbigny, Voy. Amér. Mérid. Pl. VIII, f. 23-25.
Hab. Atlantic Ocean.

Species 31. (Fig. a, b, Mus. Sowerby.)

CRESEIS CORNIFORMIS. *Cre. testa brevissimata, rotundata, levigata; apertura rotundata, apice acuminata, validè recurvo, uncinata.*

THE HORN-SHAPED CRESEIS. Shell rather short, rounded, smooth; aperture rounded, apex acuminated, strongly recurved, hooked.

D'ORBIGNY, Voy. Amér. Mérid. Pl. VIII. f. 21.

Hab. Atlantic Ocean.

Species 32. (Fig. a, b, Mus. —?) Copied.)

CRESEIS VIRGULA. *Cre. testa latissimata, rotundata, levigata; apertura rotundata, apice attenuata, acuminata, leviter arcuata.*

THE TWIST CRESEIS. Shell rather broad, rounded, smooth; aperture rounded, apex attenuated, acuminated, slightly arched.

RANG. D'Orbigny, Voy. Amér. Mérid. Pl. VIII. f. 36.

Hab. Atlantic Ocean.

PTEROPODA.—PLATE V.

Species 33. (Fig. a, b, Mus. Brit.)

CRESEIS SPINIFERA. *Cre. testā elongatā, levigatā, acuminatā, dorso subspiraliter carinatā; carina ad aperturam in spinam desinēti; opice valde attenuata*.

THE SPINE-BEARING *CRESEIS*. Shell elongated, smooth, acuminate, with a subspiral keel at the back; keel ending in a spine at the aperture; apex much attenuated.

RANG. Sowerby, Gener. of Shells. Pteropoda, f. 4.
Cleodora subula. Quoy.

Hab. —?

In this species and in *Creseis aciculata* the dorsal keel crosses the tube diagonally, so as to indicate a slight tendency to the spiral form.

Genus SPIRALIS. Souleyet.

Testa lychnina, fusiformis, vel heliciformis, sinistralis. Operculum ovatum paucispire.

Shell glassy, fusiform or heliciform, sinistral. Operculum ovate, few-whorled.

Syn. (Pars.) *HETEROPUS*. Fleming.

Species 34. (Mus. Jeffreys.)

SPIRALIS FLEMINGI. *Spi. testā subheliciformi, albā, centricosā; spira conicā, anfractilobis quinīs, ultimo globoso; aperturā subpyriformi, antīcē productā, acuminatā, columellā rectiōsculā*.

FLEMING'S *SPIRALIS*. Shell subheliciform, white, ventricose; spire conical, whorls five, last globose, aperture somewhat pyriform, anteriorly produced, acuminate; columella rather straight.

FORBES. Forbes and Hanley, British Mollusca.
Hab. North British seas.

Species 35. (Mus. Jeffreys.)

SPIRALIS MACANDRELLI. *Spi. testā fusiformi, albā, levigatā; spira pyramidalitā, elevatā; anfractilobis septenīs, convexiōsculā; aperturā pyriformi, an-*

ticē acuminatā; columellā elongatā; leviter tortuosa.

MACANDRELL'S *SPIRALIS*. Shell fusiform, white, smooth, spire pyramidal, raised; whorls seven, rather convex; aperture pyriform, acuminate anteriorly; columella elongated, slightly tortuous.

FORBES and HANLEY. British Mollusca.

Hab. Ireland.

Species 36. (Mus. —?)

SPIRALIS ROTUNDA. *Spi. testā subdepressā, heliciformi, spirā brevi; anfractilobis trinīs, ultimo ventricoso, magno, latē umbilicato; aperturā obliquè ovatā*.

THE ROUNDED *SPIRALIS*. Shell subdepressed, heliciform, spire short, whorls three; last ventricose, large, broadly umbilicated; aperture obliquely oval.

D'ORBIGNY. Voy. Amér. Mérid. Moll., Pl. XIII. f. 16.
Hab. Atlantic Ocean.

Species 37. (Mus. —?)

SPIRALIS JEFFREYSII. *Spi. testā depressā, discoidea, spirā brevissimā, ultimo lato, rotundo, latē umbilicato*.

JEFFREY'S *SPIRALIS*. Shell depressed, discoidal; spire very short, last broad, rounded, broadly umbilicated.

FORBES and HANLEY. Brit. Moll.
Hab. British Channel.

Species 38. (Mus. —?)

SPIRALIS VENTRICOSA. *Spi. testā globosā, albā, anfractilobis quatercīs, ultimo maximo, haud umbilicato; aperturā breviter subpyriformi, antīcē angulatā; columellā tenuissima*.

THE VENTRICOSE *SPIRALIS*. Shell globose, white; whorls four, last very large, not umbilicated; aperture shortly rather pyriform; anteriorly angular; columella very thin.

SOULEYET. Voy. de la Bonite. Moll. Pl. XIII. f. 15.
Hab. Atlantic Ocean.

Pteropoda Pl.VI.

PLATE VI.

Species 39. (Mus. Sowerby.)

SPIRALIS AUSTRALIS. *Spī. testā fusiformi, hyalina, levigata; spīra oblonga, conica, unifasciatis quinque, ultimo ventricosa; apertura pyriformis; columella acuminata, producta; labo medio sinuato.*

THE AUSTRALIAN SPIRALIS. Shell fusiform, hyaline, smooth; spire raised, conical, whorls five, last ventricose; aperture pyriform, columella acuminated, produced; outer lip sinuated in the middle.

SOCLEYET. Voy. Bonite. Moll., Pl. XIII.

Hab. Australian seas.

Species 40. (Mus. Brit.)

SPIRALIS ARCTICA. *Spī. testā subdepresso-globosa, spirali parabolico-fusiformis, brevissimis, ultimo magno, umbilicato; apertura magna, columellā recta.*

THE ARCTIC SPIRALIS. Shell subdepressed-globose; spire small, whorls three, very short, last large, umbilicated; aperture large, columella straight.

FAERICUS. (Limacina.)

Limacina holocialis. Lamarck.

Hab. Greenland.

The writer scarcely sees any reason for separating the heliciform from the fusiform, sinistral, spiral shells of these Pteropoda.

Species 41. (Mus. — ?)

SPIRALIS CLATHRATA. *Spī. testā fusiformi, hyalina, obliquè puncturato-striatā, spīra brevissimā, unifasciatis paucis, ultimo inglata; apertura oblonga; columellā elongatā, tenui, acuminatā.*

THE LATICEA SPIRALIS. Shell fusiform, hyaline, obliquely puncture-striated; spire very short, whorls few, last inflated; aperture oblong, columella elongated, thin, acuminated.

SOCLEYET. Ed. et Soul. Voy. Bonite. Moll. Pl. XIII.

f. 17

Hab. Atlantic.

Species 42. (Mus. Brit.)

(Atlanta.)

ATLANTA INFLATA. *Alt. testā albā, nautilioidea, feri symmetrica, unifasciatis apicadibus celatis, ultimo umbilicato, extēs subcarinato; apertura subtriangularis, labo in processu elongato linguaformi desinuanti; operculo tenuissimo, hyalino.*

THE INFLATED ATLANTA. Shell white, nautilus-shaped, nearly symmetrical; apical whorls hidden; last umbilicated slightly, keeled on the outer side; aperture subtriangular; outer lip terminating in a long tongue-shaped process.

RANG and SOCLEYET. Mon. Pterop., Pl. XIV. f. 4.

Heliconides. D'Orbigny.

Hab. — ?

SINUSIGERA.

Genus SINUSIGERA. D'Orbigny.

TESTA subglobosa, medio unifasciatis ultimi subeata, apertura subovata, labo sinuato, reflexo, bilobato. Operculum ignotum.

Shell subglobose, sutured in the middle of the last whorl; aperture subovate, outer lip sinuated, reflected, bilobed. Operculum unknown.

Synonym. *Chelitropis.* Forbes.

Species 43. (Mus. Brit.)

SINUSIGERA CANCELLOATA. *Sig. testā subglobosa, obliquè cancellata; spīra subconica, unifasciatis quinque, rotundis; apertura subovata, labo sinuato, bilobato, validè reflexo; lobis productis, superiori ad terminalia expansis, divisis.*

THE CANCELLED SINUSIGERA. Shell subglobose, obliquely cancellated, spire rather conical; whorls five, rounded; aperture subovate, outer lip sinuated, bilobed, strongly reflected; lobes produced, upper expanded, divided at the end.

D'ORBIGNY. Adams. Genera, Plate CXXXVII. f. 4.

Hab. — ?

Hab. Atlantic.

PTEROPODA.—PLATE VI.

Species 44. (Mus. Sowerby.)

SINUSIGERA MICROSCOPICA. *Sinu.* testá subglobosá, spíraliter striatá; spiro brevi, subconicá; anfractibus quinque, rotundis, ultimo magno; apertura subrotundá, columellá tenui, ventú, rectilínguis, labo lobulato, lobis moderatè proctuelis.

THE MICROSCOPIC *SINUSIGERA*. Shell subglobose, spirally striated, spiro short, subconical; whorls five, rounded, last large; aperture rather rounded, columella thin, sharp, rather straight, outer lip two-lobed; lobes moderately produced.

GRAY. (*Struthiolaria*). Voyage of the Blossom.

Chelitropis Hanleyi. Forbes.

Hab. Atlantic Ocean.

The principal difference between this and the previous species is that the former is striated spirally only, and the latter is cancellated.

almost hooked; dorsal surface radiately slightly grooved; aperture broad, outer lip slightly lobed.

EYDOUN et SOULEYET. Voy. de la Bonite.
Hab. —— ?

Species 46. (Mus. —— ?)*

BALANTHUM AUSTRALE. *Bal.* testá angustá, versus terminum attenuatá, ad latera convexisentia; apertura subtriangularis, labo acuminato; apice in spiculum mamillatum producito.

THE AUSTRALIAN *BALANTHUM*. Shell narrow, attenuated towards the end; rather convex at the sides; aperture subtriangular, outer lip acuminated; apex produced into a mamillated spike.

D'ORBIGNY. Voy. Amér. Mérid.
Hab. —— ?

Species 47. (Mus. —— ?)*

Genus *BALANTHUM* (*continued*).

Species 45. (Fig. a, b, Mus. —— ?)*

BALANTHUM INFLATUM. *Bal.* testá utrinquè concavá, trigoná, versus apicem decurrens, ferè uncinatá; facie dorsali radiatum leviter sulcatá; apertura latá, labo leviter lobato.

THE INFLATED *BALANTHUM*. Shell convex on each side, trigonal, vent downwards towards the apex,

BALANTHUM CHAPTALE. *Bal.* testá trigoná, compressá, transversè sulcatá, ad latera subaustrinatá; angulis lateralis acutis; apice attenuato, acuminato.

CHAPTALE'S *BALANTHUM*. Shell trigonal, compressed, transversely grooved, slightly bordered at the sides; apex attenuated, acuminated.

EYDOUN et SOULEYET. Voy. de la Bonite.
Hab. —— ?

* The above three specimens of *Balantium* are not known in the principal collections, but are copied in order to make the interesting little genus as nearly complete as possible.

ANCYLUS.

PLATE I.

Genus ANCYLUS. *Geoffroy.*

MOLLUSCA AQUATICUM. *Testa patelliformis, plerumque sinistralis, non-symmetrica, epidermide induta, apice sublaterali, subspirali; operculum nullum.*
MOLLUSC, FRESHWATER. Shell patelliform, generally sinistral, non-symmetrical, covered with an epidermis, apex sublateral, subspiral; operculum, none.

Like the Limicadæ, the Aencyli are found in ponds and rivers of fresh water, and like them are capable of living at times uncovered by water. They are found in all climates. We have two well-known British species. Others exist eastward in India and westward in the United States; southwards, we have Brazilian and Peruvian species, and the first and finest species on our list, *A. Cummingianus*, dates from Van Diemen's Land.

Species 1. (Fig. *a, b, c*, Mus. Sowb.)

ANCYLUS CUMMINGIANUS. *Anc. testa profundi calyciformi, subovata, posticè angustâ, anticè ampliâ, epidermide olivaceo-indutâ; dorsocostato, rotundato, radiatum costato, apice posticè submarginali, lateraleri valde producto, unispirali.*

CUMMING'S ANCYLUS. Shell deeply cup-shaped, sub-ovate, narrow behind, full in front, covered with an olive epidermis; back elevated, rounded, radiately ribbed, apex posteriorly submarginal, laterally much produced, unispiral.

BOURGIGNONAT. Proc. Zool. Soc. 1853. Pl. XX. f. 1-9.

Hab. Van Diemen's Land.

Species 2. (Fig. *a, b*, Mus. Brit.)

ANCYLUS TEXTILIS. *Anc. testa depresso, epidermide straminea, ad marginem brunnescens indutâ, radiatum costato, concentricè tenuissime striatâ, intus castaneâ; dorso depresso, apice obtuso, sub-laterali.*

THE TEXTILE ANCYLUS. Shell depressed, covered with a straw-coloured epidermis, becoming brown at the margin, radiately ribbed, concentrically very finely striated; back depressed, apex obtuse, sublateral.

GUPPY. Proc. Zool. Soc. 1870. Pl. XVII. f. 9-11.
Hab. Trinidad.

Species 3. (Fig. *a, b, c, d*, Mus. Brit.)

ANCYLUS FLUVIAILIS. *Anc. testa ovato-subrotundata, tenui, pallidâ straminea, vel corrugata, subconica, dorso declivi; apice posticè submarginali, subcentrali.*

THE RIVER ANCYLUS. Shell ovate, rather round, thin, pale straw or blueish, subconical, back sloped; apex posteriorly submarginal, subcentral.

GMELIN. Linn. Syst. Nat.

Patella rostrata. D'Argenville.

Patella cornea. Poiret.

Patella meridionalis. Beck.

Ancylus simplex. Bourguignat.

Hab. Great Britain, and Europe generally.

Species 4. (Fig. *a, b*, Mus. Brit.)

ANCYLUS LACUSTRIS. *Anc. testa subovata, elongata, tenui, lateraleri subcompressa, anticè subattenuata, epidermide fusco-indutâ; dorso tenuissime radiatim striata; apice postero-laterali.*

THE LAKE ANCYLUS. Shell subovate, elongated, thin, laterally rather compressed, anteriorly sub-attenuated, covered with a brown epidermis; back very finely radiately striated; apex postero-lateral.

LINNEUS (Patella). Syst. Nat.

Patella oblonga. Dillwyn.

Hab. Great Britain, and Europe generally.

Species 5. (Mus. Brit.)

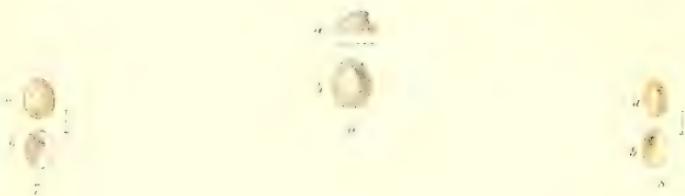

ANCYLUS CAFFRA. *Anc. testa suboliveo-cornuta, regulariter ovata, profundi calyciformi, levigata; dorso elevato, arcuato; apice postero-sublaterali, acuminato.*

THE CAFFER ANCYLUS. Shell subolive-horny, regularly oval, deeply cup-shaped, smooth; back raised, arched; apex posteriorly sublateral, acuminate.

KRAUSS. Süd-africanischen Mollusken. T. IV. Pl. XIII.

Hab. South Africa.

This has a much more pointed apex than *Ancylus Cummingianus*, which is the only other species with so rounded a back.

ANCYLUS.

PLATE II.

Species 6. (Fig. a, b, Mus. Brit.)

ANCYLUS JANII. *Anc. testā ovatā, subcentrali, albita, tearditer radiatim levigata, antice angustiori; apice acuminato, postice submarginali, lateraliiter subcentrali.*

JANII'S ANCYLUS. Shell ovate, somewhat conical, white, finely radially ridged; anteriorly narrower, acuminate, posteriorly submarginal, laterally subcentral.

BOURGUIGNAT. Proc. Zool. Soc. 1853, p. 83.

Hab. Italy.

Species 7. (Fig. a, b, Mus. Brit.)

ANCYLUS DIAPHANUS. *Anc. testā subdepressa, ovalis, pallidè falcata, semipellucida, levigata; apice obtuso, lateraliiter submarginali, postice paulo-postmediata.*

THE TRANSPARENT ANCYLUS. Shell rather depressed, ovate, pale fulvous, semi-pellucid, smooth; apex obtuse, laterally submarginal, posteriorly a little post-median.

HALDEMAN. New Freshwater Shells.

Hab. Ohio.

Species 8. (Fig. a, b, Mus. Brit.)

ANCYLUS BACONI. *Anc. testā parvā, vento-oblonga, depresso, transversaliter, nitenti, pallidè succinata; apice obtuso, lateraliiter submarginali, postice longè postmediata.*

BACON'S ANCYLUS. Shell small, ovate-oblong, depressed, translucent, shining, pale amber; apex obtuse, laterally submarginal, posteriorly far behind the centre.

BOURGUIGNAT. Proc. Zool. Soc. 1853, p. 89.

Hab. Bengal.

Species 9. (Fig. a, b, Mus. Brit.)

ANCYLUS VITELLUS. *Anc. testā lati, depresso, rotundata, diaphana; e falcata, proprie marginem cornuta, fasciis nigris variegata; apice obtuso, versus marginem lateraliater declivis.*

THE GLASSY ANCYLUS. Shell broad, depressed, rounded, transparent, pale fulvous, horny near the margin, variegated with blackish bands; apex obtuse, sloped towards the postero-lateral margin.

MORELET. Proc. Zool. Soc. 1853, p. 88.

Hab. Portugal.

Species 10. (Fig. a, b, Mus. Brit.)

ANCYLUS SPINA-ROSE. *Anc. testā dextrali, pallidè falcata, levigata, profundè calycinali, ovata, dorso arcuata, elevata, apice nucleus, postice et lateraliiter submarginali.*

THE ROSE-THORN ANCYLUS. Shell dextral, pale fulvous, smooth, deeply cup-shaped, ovate, back arched, raised; apex hooked, posteriorly and laterally submarginal.

DRAPEAUX. Hist. Moll. Pl. XIII. f. 10-12.

Aueglaus depertitus. Zeigler.

Aueglaus gibbosus. Bourguignat.

Hab. Germany.

Species 11. (Mus. Brit.)

ANCYLUS DROUETIANUS. *Anc. testā conicā, subviridi, levigata, radiation leviter salcata, ovata, postice angustiori, antice ampliata, marginē leviter undulata, apice acuminata, postice submarginali, lateraliiter subcentrali.*

DROUET'S ANCYLUS. Shell conical, greenish, smooth, radially slightly grooved, ovate, narrow posteriorly, full anteriorly, margin slightly undulating; apex acuminate, posteriorly submarginal, laterally subcentral.

BOURGUIGNAT. Proc. Zool. Soc. 1853, Pl. XX. f. 18-25.

Hab. Teneriffe.

Species 12. (Fig. a, b, Mus. Brit.)

ANCYLUS DESHAYESIANUS. *Anc. testā conicā, breviter ovata, tenui, pallidè cornuta, opaca, levigata, intus*

ANCYLUS.—PLATE II.

albâ, antîcè expansâ; apicè validâ retroso, acuminato, elevato, laterâliter subcentrali; dorso declivî.

DESHAYES'S ANCYLUS. Shell conical, shortly ovate, thin pale horn, opaque, smooth, white within, anteriorly expanded; apex much thrown backwards, acuminate, elevated, laterally subcentral; back sloped.

BOURGUIGNAT. Cat. esp. Journ. Conch.
Hab. Europe.

Species 13. (Fig. *a*, *b*, Mus. Brit.)

ANCYLUS RUPICOLA. *Anc. testâ oratâ, dextreâ, profundiâ calceiformi, cornuâ, levigatâ, pellucidâ, dorso arcuato, apicè subacuminato, ultra marginem posticâ-lateralēm producto.*

THE ROCK-INHABITING ANCYLUS. Shell ovate, dextral, deeply cup-shaped, horny, smooth, pellucid, back arched; apex slightly acuminate, produced beyond the postero-lateral margin.

SHUTTLEWORTH. — ?
Hab. Teneriffe (on moist rocks).

Species 14. (Fig. *a*, *b*, Mus. Brit.)

ANCYLUS SULLIVANII. *Anc. testâ depressâ, patulâ, cōfîdâ, costellâs crebrâs radiatis et striis minutissimis concentricis sculptâ, posticè angustâ, antîcè expansâ, marginâ dextrâlî rectâsculo; dorso obliquâ declivi, apicè depresso, posticè extra-marginali.*

SOULCT'S ANCYLUS. Shell depressed, patulous, coffee-coloured; sculptured with radiating very minute concentric striae, posteriorly narrow, anteriorly expanded, dextral margin rather straight; back obliquely sloped; apex depressed, posteriorly extra-marginal.

BOURGUIGNAT. Proc. Zool. Soc. 1853, Pl. XX, f. 26-33.

Hab. Venezuela.

A very oblique, sculptured species, with the small apex close to the margin and appearing beyond it.

ANCYLUS.

PLATE III.

Species 15. (Fig. a, b, Mus. Brit.)

ANCYLUS STRICTUS. *Anc. testā obscurā fuscā, conicā, angustā, elongatā, levigatā, lateribus compressis, intus carunculo-rasatā, dorso elevatā, apice areolato, longè post-mediano.*

THE NARROWED ANCYLUS. Shell dull brown, conical, narrow, elongated, smooth, with compressed sides, inside blueish pink, back elevated, apex arched, placed far backwards.

MOORE. —? MS. Mus. Brit.

Hab. —?

Species 16. (Fig. a, b, Mus. Brit.)

ANCYLUS BARILENSIS. *Anc. testā depresso, oblongā, angustā, costata, levigatā, intus cinasit; dorso dexteri; apice acuminato, posteriō et lateraliiter submarginali.*

BRAZIL. ANCYLUS. Shell depressed, oblong, narrow, chestnut, smooth, vittines within; back sloped; apex acuminated, posteriorly and laterally submarginal.

MORICAND. Coq. Ter. et Fluv. Bahia.

Hab. Brazil.

Species 17. (Mus. Brit.)

ANCYLUS KOOTANENSIS. *Anc. testā brevi, latā, subrotundā, depresso, coraco-rubescētā; apice obtuso, subcentrali, frequenter nigrescenti.*

THE KOOTAN ANCYLUS. Shell short, broad, rather round, depressed, reddish horn; apex obtuse, subcentral, often black.

BALDWIN. Proc. Zool. Soc. 1863, p. 69.

Hab. River Oregon.

Species 18. (Mus. Brit.)

ANCYLUS PARALLELUS. *Anc. testā compressā, oblongā, subrectangulari, translucida, pallidissimā cornē; dorso dexteri, apice posteriō et lateraliiter subcentrali.*

THE PARALLEL ANCYLUS. Shell compressed, oblong, rather straight-sided, transparent, very pale horn; back sloped, apex posteriorly and laterally subcentral.

HALDEMAN. Mon. Freshwater. Sh. Proc. Zool. Soc. 1859, §4.

Hab. New Orleans.

Species 19. (Mus. Brit.)

ANCYLUS CONCENTRICUS. *Anc. testā olivaceo-cornēd, subconica, sudeis inconspicuis undulatis radiati, concentrici lineati, oblongi, posteriō angustati, antīcē subexpanso; dorso versus apicem elevata; apice acuminato, uncinato, ad marginē postico-lateralēm approximato.*

THE CONCENTRIC ANCYLUS. Shell olive-horn, rather conical, rayed with indistinct undulating grooves, with concentric lines, oblong, posteriorly narrowed, anteriorly subexpanded; back raised towards apex; apex acuminated, hooked, approaching the postero-lateral margin.

D'ORBIGNY. Voy. Amér. Mérid. t. v. p. 354.
Hab. Montevideo.

Species 20. (Mus. Brit.)

ANCYLUS IRREGULARIS. *Anc. testā elongatā, angustā, compressā, punctulis nigrescentibus asperā, latere dexterali rectiōnē; apice sublatealē, a marginē posteriō subrectato.*

THE SPRINKLED ANCYLUS. Shell elongated, narrow, compressed, sprinkled with little blackish spots, left side rather straight; apex rather lateral, rather remote from the posterior margin.

GULDING. Proc. Zool. Soc. 1853.
Hab. Antilles.

Species 21. (Mus. Brit.)

ANCYLUS CHITTYI. *Anc. testā griseo-fuscā, obliquā, profundi calycinatā, subovata, antīcē subacuminata; dorso obliquā areolata; apice gibboso, extra marginē postico-lateralēm producta.*

CHITTY'S ANCYLUS. Shell grey-brown, oblique, deeply emp-shaped, subovate, anteriorly subacuminated; back obliquely arched, apex gibbous, produced beyond the postero-lateral margin.

ADAMS. (C. B.) —?
Hab. Jamaica.

Species 22. (Mus. Brit.)

ANCYLUS SIBIRICUS. *Anc. testā dextrali, obliquā conicā, fulva, rotata, intus albā; dorso alto, oblique, apice extra-marginali, obtusisulcato.*

THE SIBER ANCYLUS. Shell dextral, obliquely conical, fulvous, ovate, white within; back high, oblique, apex extra-marginal, rather obtuse.

GEESFELDI. Moll. Sibir. et Amur.
Hab. Sibir.

ANCYLUS.—PLATE III.

Species 23. (Mus. Brit.)

Ancylus Moricandi. *Anc. testâ angustâ, compressâ, elongatâ, ferruginosâ, opacâ, intûs subroseâ; dorso declivi, apice posticâ subcentrali, lateraliter submarginali.*

MORICAND'S ANCYLUS. Shell narrow, compressed, elongated, ferruginous, opaque, pinkish inside; back sloped, apex posteriorly subcentral, laterally submarginal.

D'ORBIGNY. Voy. Amér. Mérid. T. V. p. 355.

Ancylus Bahiensis. Moricand.

Ancylus Naciæula. Spix.

Hab. Lake Baril, Bahia.

Species 24. (Mus. Brit.)

Ancylus culicoides. *Anc. testâ depressâ, fidei, radiatâ, lateraliter striatâ, elongatâ, posticâ subcentrali, dorso lente declivi, apice subacuminato, subcentrali.*

THE HOOD-SHAPED ANCYLUS. Shell depressed, fulvous, radiately finely striated, elongated, posteriorly rather narrowed, back gently sloped, apex acuminate, subcentral.

D'ORBIGNY. Amér. Mérid. III. p. 355.

Hab. South America.

Species 25. (Mus. Brit.)

Ancylus filosus. *Anc. testâ ovatâ, conicâ, tenissimâ striatâ, semi-pellucidâ, roseo-fulvâ, apice posticâ et lateraliter subcentrali.*

THE THREADED ANCYLUS. Shell ovate, conical, very finely striated, semi-pellucid, rose-fulvous, apex posteriorly and laterally subcentral.

CONRAD. New Freshwater Shells. Haldeman's monograph.

Hab. Alabama.

Species 26. (Mus. Brit.)

Ancylus radiatus. *Anc. testâ parvâ, albâ, transversâ, subconicâ, striae tenissimâ radiatâ, oratâ, antice subangustatâ, apice versus marginem post-lateralem producta.*

THE RAYED ANCYLUS. Shell small, white, translucent, subconical, rayed with very fine striae, ovate, anteriorly rather narrowed, produced towards the post-lateral margin.

GUILLEMIN. Zool. Journ. Vol. III. p. 596.

Hab. St. Vincent.

Species 27. (Mus. Brit.)

Ancylus Havanensis. *Anc. testâ depresso, longissimâ, posticâ subangustatâ, cornutâ, intûs subroseâ; apice obtuso, posticâ subcentrali, lateraliter submarginâ.*

THE HAVANA ANCYLUS. Shell depressed, rather long, posteriorly rather narrow, horny, pinkish within; apex obtuse, posteriorly subcentral, laterally submarginal.

PEIFFER. Bourg. Proc. Zool. Soc. 1853.

Hab. Cuba.

Species 28. (Mus. Brit.)

Ancylus Beanii. *Anc. testâ parvâ, cornutâ, levigatâ, nitens, depresso, ovatâ, latero dextrâ rectissimâ; dorso declivi, apice obtuso versus marginâ postico-lateraliter elevata.*

BEAN'S ANCYLUS. Shell small, horny, smooth, shining, depressed, ovate, right side rather straight; back sloped, apex obtuse, raised towards postero-lateral margin.

BOURGUIGNAT. Proc. Zool. Soc. 1853, p. 81.

Hab. Guadalupe.

Species 29. (Mus. Brit.)

Ancylus obliquus. *Anc. testâ parvâ, fusco-cornutâ, obliquâ, profundiâ, subovatâ, levigatâ, postice pauci attenuatâ; apice producto, ad marginem postico-lateralem extenso.*

THE OBLIQUE ANCYLUS. Shell small, brownish horn, oblique, deep, subovate, smooth, posteriorly a little attenuated; apex produced, extended to the posterior-lateral margin.

BRODERIE. Proc. Zool. Soc. 1832, p. 202.

Hab. Chili.

Species 30. (Mus. Brit.)

Ancylus fuscus. *Anc. testâ auro-fuscâ, levigatâ, oblongâ, intûs jecâ albâ, lateribus subcompressis, rectissimâ; dorso subelevata, apice obtuso, laterâ alter et posticâ subcentrali.*

THE BROWN ANCYLUS. Shell golden brown, smooth, oblong, almost white within; sides rather compressed, rather straight; back rather raised, apex obtuse, laterally and posteriorly subcentral.

ADAMS (C. B.). Boston Journ. Nat. Hist. Vol. III., p. 329.

A LY CÆUS.

PLATE I.

Genus ALYCEUS. Gray.

Testa terestris, heliciformis; spira conica, sutura profunda; ultimus anfractus distortus, medio dorsum tumidus, callo retroverso suturam tegens, post marginem aperturam contractus. Operculum rotundum cornutum inconspicuum multispirale.

Shell terrestrial, heliciform; spire conical, suture deep; last whorl distorted, tumid at the middle of the back, covering the suture with a retroversal callus, contracted behind the margin of the aperture. Operculum rounded, horny, inconspicuously multispiral.

All the Alycæi browse in eastern pastures. A large numerical proportion of the species find their homes in India proper; but Borneo, Japan, and other eastern lands and islands produce their contingents. The typical species, *Alyceus gibbus*, the first type, belongs to Cochin-China.

The peculiarities which distinguish the Alycæi from other Cyclostomidae are very interesting. At first you have a more or less regular spire of several volutions; then, at the side of the last whorl, farthest removed from the aperture, the spiral tube begins to swell, increasing in volume to about the middle of the back, when it suddenly contracts, throwing back a narrow callus at the suture. Between this contraction and the back edge of the aperture, the tube is always narrow, but with various callosities, mouth rings, or other inequalities till the aperture itself is reached.

Species 1. (Fig. a, b, Mus. Brit.)

ALYCEUS CRENATUS. *Aly. testa conica, subcirculari, omnino minutè striata, ultimo anfractu ad dorsum moderatè tumido, tunc callo, breviter, contracto, deinde callo magno, obliquè cincto, ante callum subexpanso; callo retroverso rugoso, albo, inequali, elongato; apertura margine albo, latè laqueato; operculo lato.*

THE CRENATED ALYCEUS. Shell conical, greenish, all over minutely striated, last whorl moderately tumid at the back, then strongly, briefly, contracted, afterwards girt with a large, oblique callus, rather expanded in front of the callus; retroversal callus rough, white, unequal, long; aperture white at the margin, broadly fluted; operculum broad.

GODWIN AUSTIN. Journ. Asi. Soc. Bengal, 1871.

Hab. Burail Range, N. Cachar.

The white, oblique 'collar ruff' and the broadly fluted margin of the mouth distinguish this species, which is of small size.

Species 2. (Mus. Brit.)

ALYCEUS DIAGONUS. *Aly. testa minuta, pallide castanea, levigata, obliquè spirata; apertura crassa, margine duplicita, subcrenulata, umbilico mediore, tuuulo dorsali hanc magna.*

THE DIAGONAL ALYCEUS. Shell minute, pale chestnut, smooth, obliquely spiral; aperture thick, with a double rather crenulated margin; umbiliques middle-sized; dorsal swelling not large.

GODWIN-AUSTIN. Journ. Asi. Soc. Bengal, 1871.

Hab. Diyung Valley, N. Cachar.

Species 3. (Mus. Brit.)

ALYCEUS VESTITUS. *Aly. testa conica, pallide castanea, anfractibus ad suturam crenulata; ultimo ad dorsum moderatè tumescens; apertura ad anfractum penultimate emarginata; margine alto, crasso, simplici.*

THE INVESTED ALYCEUS. Shell conical, pale chestnut; whorls crenulated at the suture, last moderately swelling at the back; aperture emarginated at the penultimate whorl; margin white, thick, exstus declivi.

BLANFORD. Journ. Asi. Soc. Bengal, 1871.

Hab. Arakan Hills.

Species 4. (Mus. Brit.)

ALYCEUS GIBBUS. *Aly. testa conica, fulva; spirâ breviexcisa, apice rubro; ultimo anfractu lateraliè expaso, ad dorsum depresso-gibbosus, prepe aperturam angustissimum; callo suturali inconspicuo; apertura rotundata, margine tenuiter duplicita; umbilicus brevis.*

THE HUNCHBACK ALYCEUS. Shell conical, fulvous; spire rather short, with red apex; last whorl laterally expanded, depressed-gibbosus at the back, very narrow near the aperture; sutural callus inconspicuous; aperture rounded, margin thinly doubled; umbilicus short.

FERRISSÆ.

Hab. Cochin-China.

ALYCEUS.—PLATE I.

Species 5. (Mus. —? Copied.)

ALYCEUS MARGARITUS. *Aly. testā subglobosā, albida; aufractis tribus, rotundis, ultimo post aperturam moderatè (?) contracto, apertura marginē duplicito; marginē interno tenui, producto; marginē externo planato, expanso; umbilico parvo.*

THE PEARL ALYCEUS. Shell subglobose, whitish; whorls three, rounded, last moderately (?) contracted behind the aperture; margin of the aperture double; inner margin thin, produced; outer margin flattened, expanded; umbilicus small.

THEOBALD MSS. Hanley, Conch. Ind. Pl. 95, f. 10.
Hab. Shan provinces.

The second figure in the Indian Conchology (Pl. XCVII., f. 7), given as representing a variety of this species, has every appearance of belonging to another. I have therefore named it *Al. microstoma* in Plate IV.

Species 6. (Mus. —?)

ALYCEUS PYRAMIDALIS. *Aly. testā majuscūla, pyramidalis, rubro-fuscā, levī; ultimo anfractu lateraliē expanso, ad dorsum gibbosō, subtilē contracto, tum breiter continuo, callo suturali inconspicuo elongato; marginē apertura lato, planato; umbilico angustissimo.*

THE PYRAMIDAL ALYCEUS. Shell rather large, pyramidal, red-brown, smooth; last whorl laterally expanded, gibbons at the back, suddenly contracted, then shortly continued, sutural callus inconspicuous, long; margin of the aperture broad, flattened, rather narrow.

BENSON. Ann. Nat. Hist. 1856, Ser. 2, Vol. XVII.
225.

Hab. Therabu Hill, Teunasseri, Burmah.

Much resembling *Alyceus gibbus*, but more pyramidal.

Species 7. (Mus. Brit.)

ALYCEUS FUSILLUS. *Aly. testā parvā, albā, depresso, liratā; ultimo anfractu ad latū latē producto, ad dorsum inflate et profundè rugato; ad tumoris terminum leviter contracto, tum post aperturam subexpanso; callo suturali parvo, brevi, disticto; umbilico lato, marginē apertura crasso, subrotundo.*

THE DWARF ALYCEUS. Shell small, white, depressed, ridged; last whorl broadly produced at the side,

inflated and deeply-wrinkled at the back, slightly contracted at the end of the tumour, then a little expanded behind the aperture; sutural callus small, short, distinct; umbilicus broad, margin of the aperture thick, rather round.

GODWIN-AUSTIN. Journ. Asi. Soc. Beng.
Hab. Jawai to Asalu.

Species 8. (Mus. Godwin-Austin.)

ALYCEUS KHASIACUS. *Aly. testā depresso, fusco-rubescenti, profundè sulcati, anfractibus quaternis, depressis, apicali rubro, ultimo ad dorsum validè inglato, profundè sulcato, ad terminum tumoris subtilè profundè contracto, tum usque ad marginem aperturae expanso; callo suturali brevi, tenui, conspicuo, umbilico lato, marginē apertura crasso, subrotundo.*

THE KHASIAN ALYCEUS. Shell depressed, reddish brown, deeply grooved, whorls four, depressed, apical red, last much inflated at the back, suddenly and deeply contracted at the end of the tumour, then expanded to the margin of the aperture; sutural callus short, thin, conspicuous; umbilicus broad, margin of the aperture thick, rounded.

GODWIN-AUSTIN. Journ. Asi. Soc. Beng. 1871, Vol. XL.

Hab. Khasia and Jaintia Hills.

Species 9. (Mus. Godwin-Austin.)

ALYCEUS CONICUS. *Aly. testā solidā, subviridi, obtuse conicā, ad suturam crenulata; anfractibus quinatis, apicalibus rubescensibus, ultimo lato, tumore dorsali densè lirato-rugato, ad terminum tumoris breviter angusto, levī; marginē apertura crassissimā, retrorsim declivī, callo suturali elongato, angusto, rugoso; umbilico maximo.*

THE CONICAL ALYCEUS. Shell solid, greenish, obtusely conical, crenulated at the suture; whorls five, apical, reddish, last broad, dorsal tumor closely wrinkled in ridges, shortly narrow, smooth at the end of the tumor; margin of the aperture very thick, shelving backwards, sutural callus lengthened, narrow, rough; umbilicus, very large.

GODWIN-AUSTIN. Journ. Asi. Soc. Bengal, 1871, Vol. XL
Hab. East of Kopili River, North Cachar.

PLATE II.

Species 10.

ALYCEUS ANDAMANÆ. *Aly. testâ subdepressâ, latâ concentricâ distanter liratâ, inter lineas spiraliiter striatâ, anfractibus trinîs, ultimo ad dorsum moderatâ iugato, post marginem aperturâe moderate contracto; umbilicus latissimâ; aperturâ ad antructum subemarginatâ, margine alto, tenuiter duplicito.*

THE ANDAMAN ALYCEUS. Shell subdepressed, broad, concentrically distantly ridged, spirally striated between the ridges; whorls three, last very broad, moderately inflated at the back, moderately contracted behind the margin of the aperture; umbilicus very broad, aperture rather emarginated at the last whorl; margin white, thinly duplicate.

BENSON. Ann. Nat. Hist. 1861, Ser. 3, Vol. VII.

Hab. Port Blair, Andaman Islands.

Species 11. (Mus. Brit.)

ALYCEUS POLYGONUS. *Aly. testâ conicâ, fuscâ, horizontâ; anfractibus quateris, ultimo ad medium dorsi breviter iugato, tum breviter contracto, et marginâ alto, lato expedito, deinde ante aperturâ marginâ breviter angusto; callo suturali elevato, longiservente; umbilico parvo, margine aperturâe alto, polygono.*

THE POLYGONAL ALYCEUS. Shell conical, brown, smooth; whorls four, last shortly inflated at the middle of the back, then briefly contracted, sutural callus raised, rather long; umbilicus small, margin of the aperture white, polygonal.

BLENNARD. Journ. Asi. Soc. Beng. 1862.

Hab. —

Species 12. (Mus. Hanley.)

ALYCEUS CUCULLATUS. *Aly. testâ depresso, albâ, concentricâ regulariter sulcatâ; anfractibus trinîs, ultimo latissimâ, ad dorsum breviter tumido, semi-truncato, ante tumorem brevissimâ contracto; margine aperturâe externo latè expanso, albo interno, |*

longè producto, plicato et laqueato; umbilicus latissimâ, callo suturali concavo, brevissimo.

THE HOODED ALYCEUS. Shell depressed, white, concentrically regularly grooved; whorls three, last very broad, shortly tumid at the back, half-truncated, very shortly contracted in front of the tumor; external margin of the aperture broadly expanded, white, internal lengthily plaited and fluted; umbilicus very broad; sutural callus neat, rather short.

THEERALD. Journ. Asi. Soc. Vol. III. p. 51.

Hab. Shan States.

Species 13. (Mus. Brit.)

ALYCEUS URNULA. *Aly. testâ albâ, altâ, leri; anfractibus quateris prominentibus, supra medianum subangulatis, ultimo alto, post apertoram breviter angustissimo; tumor dorsali magno, in marginem contractum concavum designati; callo suturali distincto, brevissimo; umbilico parvo, marginie aperturâe angusto, rotundo.*

THE URN ALYCEUS. Shell white, high, smooth; whorls four, prominent, rather angular above the middle, last high, shortly very narrow behind the aperture; dorsal tumor large, ending in a contracted neat margin; sutural callus distinct, rather short, umbilicus small, margin of the aperture narrow, round.

BENSON. Ann. Nat. Hist. Ser. 2, Vol. II.

Hab. Darjeeling, Himalaya.

Species 14. (Fig. a, b, Mus. Brit.)

ALYCEUS PLECTOCHEILUS. *Aly. testâ minutâ, albâ, subcompressâ, tenuisimâ striatâ; anfractibus quateris angustis, ultimo ad dorsum breviter tumido, tum coarctato, deinde callo flexuoso cincto; margine aperturâe producto, quinqueplicato; callo suturali subelongato; umbilico mediocri.*

THE PLAITED ALYCEUS. Shell minute, white, rather compressed, very finely striated; whorls four, narrow, last with short nucleus at the back, then narrowed, afterwards girt with a flexuous

ALYCÆUS.—PLATE II.

callus; margin of the aperture produced, five-plaited; sutural callus rather lengthened; umbilicus middle-sized.

BENSON. Ann. Nat. Hist. Ser. 3, Vol. III, p. 180.

Hab. Rungun Valley.

The margin of the aperture in this interesting little shell is curiously produced and plaited like a frieze.

Species 15. (Mus. Brit.)

ALYCÆUS AMPHORA. *Aly. testâ altâ, albida, levî, lateraliiter subcompressâ; anfractibus quinque, superioribus rubescens, brevibus; ultimo alto, ventricoso, superiori subangulato, infra lateraliter angustato et angulato; ad dorsum valde inflato, tunc subito contracto, breviter angustissimo, post aperturam expanso; callo suturali angusto, elongato; umbilico parvo; apertura latâ, reflexâ, marginie ad anfractas juncturam semi-interrupta.*

THE VASE ALYCÆUS. Shell high, whitish, smooth, laterally subcompressed; whorls five, upper rather red; last high, ventricose, somewhat angular above, narrow and angular below, much inflated at the back, then suddenly contracted, very narrow for a short distance, expanded behind the aperture; sutural callus narrow, elongated; umbilicus small; aperture broad, reflected; margin half interrupted at the juncture of the whorls.

BENSON. Ann. Nat. Hist. 1856, Ser. 2, Vol. XVII.

Hab. Moulinmein and Tennasserim.

Species 16. (Mus. —?)

ALYCÆUS SUCCEUS. *Aly. testâ subdepressâ, succineo-fusca; anfractibus quaternis regulariter rugatis, ultimo ad dorsum breviter gibbosâ, tunc angustissimo, levâ, medio partis angusto marginie albo extanti interrupto; apertura marginie albo, polygono; callo suturali obliquo, albo, conspicuo, breviunculo; umbilico mediocri.*

THE AMBER ALYCÆUS. Shell subdepressed, amber-brown; whorls four, regularly wrinkled, last shortly gibbous at the back, then very narrow, smooth, interrupted in the middle of the narrow

part by a thick, outstanding white margin; margin of aperture white, polygonal; sutural callus oblique, white, conspicuous, rather short; umbilicus medium-sized.

BLANFORD. Journ. Asi. Soc. Bengal, 1862, Vol.

XXXI.

Hab. Aracan Hills.

Species 17. (Mus. Brit.)

ALYCÆUS VULCANI. *Aly. testâ fusca, subdepressâ; anfractibus quaternis, regulariter rugatis; ultimo ad dorsum lateraliterque latè tumido, post medium dorsi subito contracto, tunc angusto levî; medio partis anguste callis duobus annularibus interrupto; callo suturali breviunculo, marginie apertura subhexagonalis.*

VULCAN'S ALYCÆUS. Shell brown, subdepressed; whorls four, regularly wrinkled; last broadly tumid at the back and laterally, suddenly contracted past the middle of the back, then narrow, smooth; interrupted in the middle of the narrow part with two annular calli; sutural callus rather short; margin of the aperture nearly hexagonal.

BLANFORD. Journ. Asi. Soc. Bengal, 1863, Vol.

XXXII. p. 323.

Hab. Peak of Puppa in Ava.

Species 18. (Mus. —?)

ALYCÆUS FEDDENIANUS. *Aly. testâ altâ, levî, fusca; anfractibus quaternis, tertio inflato, subangulato, ultimo lateraliter subcompresso, alto, triangulato; versus aperturam gradatim angustato; callo suturali elongato, levâ; umbilico latiunculo, marginie apertura alto, posteri planitudo.*

THE FEDDEN ALYCÆUS. Shell high, smooth, brown; whorls four, third inflated, slightly angular; last laterally subcompressed, high, triangular; gradually narrowed towards the aperture; sutural callus elongated, smooth; umbilicus rather broad; margin of aperture white, flattened behind.

THEOBALD. Journ. Asi. Soc. Bengal, 1870.

ALYCEUS MONTFORT. *Aly. testi glaciida, ventricosa, loci; anfractibus quinque, superioribus parvis, ultimo ventricoso, lateraleriter et infra ad dorsum inflato; post aperturam breviter angusto, aperture marginae expansa, planata; umbilico brevissimum.*

MONTFORT'S **ALYCEUS**. Shell yellow, ventricose, smooth ; whorls five, upper small; last inflated laterally and below at the back, shortly narrowed behind the aperture; margin of the aperture expanded, flattened; umbilicus very short.

ADAMS. Proc. Zool. Soc. 1862, p. 275.

Hab. Isl. Formosa.

Species 20. (Mus. Brit.)

ALYCEUS AVE. *Aly. testi parvi, depresso, albidus, regulariter rugosus; anfractibus angustis, ultimo tumori dorsali magno, subito ad terminum contracto; anfractus pars inter tumorem et apertura marginem brevissimam, medio igitur; callo suturali brevi, distincto; umbilicus latus.*

THE AVA **ALYCEUS**. Shell small, depressed, white, regularly wrinkled; whorls narrow, last with large dorsal tumour, suddenly contracted at the end; part of the whorl between the tumour and the margin of the aperture rather short, inflated in the middle; sutural callus short, distinct; umbilicus broad.

BLANFORD. Journ. Asi. Soc. 1863,

Hab. Hills of Mandelay and Ava.

Species 21. (Mus. Brit.)

ALYCEUS SWINHOE. *Aly. testa elevata, conica, albido-glaucida, levi, anfractibus quinque, sutura profundus separatis; ultimo centrico, latu, tumori lateraliter subinglato, tum brevissime angustato; callo dorso minuto, distincto, apertura marginae tenui, planata.*

SWINHOE'S **ALYCEUS**. Shell raised, conical, whitish-yellow, smooth, whorls five, separated by a deep suture; last ventricose, broad, distinct, swelled

by a lateral tumour, then very shortly narrowed : dorsal callus minute, distinct, margin of aperture thin, flattened.

H. ADAMS. Proc. Zool. Soc. 1866, p. 319.

Hab. Isl. Formosa.

Species 22. (Mus. Theobald.)

ALYCEUS KÜTZIANUS. *Aly. testa depressa, fulva, tenue, sulcata, anfractibus quinque, depressis, ultimo ad dorsum medio inflato, valide rugato, tum breviter contracto et callo annulari cincto, post aperturam marginem crassitudine crescenti; apertura marginata, alba, infra cuneata, cunatiformis; marginem columellaris rectiuncula, margine externo crenulata; callo suturali minutus; umbilicus latissimus.*

KURZ'S **ALYCEUS**. Shell depressed, fulvous, finely grooved, whorls five, depressed, last dorsally inflated in the middle, strongly wrinkled, then shortly contracted and girt with an annular callus, increasing in thickness behind the margin; aperture rather large, white, cuneate below, with a canal; columellar margin rather straight, outer margin crenulated; sutural callus minute; umbilicus very broad.

THEOBALD. Journ. Asi. Soc. Bengal.

Hab. Nattarina, Borneo.

Species 23. (Mus. Hanley.)

ALYCEUS RICHTOFENI. *Aly. testa subdepressa, albida, regulariter sulcata; spira acuminata, anfractibus angustibus, ultimo medio dorsi infuso tunc contracto, pars inter tumorem et apertura marginem angustat, herigat, per callum annularem in medio divisi; marginem apertura duplicita, pars exterior latè plumbata, pars interna producta, angustata, subcrenata; callo suturali tenui, angustato; umbilicus magno.*

RICHTOFEN'S **ALYCEUS**. Shell subdepressed, whitish, regularly grooved; spire acuminated, whorls narrow, last inflated in the middle of the back, then contracted, the part between tumour and edge of aperture narrow, smooth, divided in the middle by an annular callus; margin of aper-

ALYCEUS.—PLATE III.

ture double, outer part broadly flattened, inner part produced, narrow, slightly crenated; sutural callus thin, narrow; umbilicus large.

BLANFORD. Journ. Asi. Soc. Bengal, 1863, Vol. XXXII. p. 324.

Hab. Moulmein.

tumour medium sized, deeply wrinkled, dorsal callus elongated, distinct; margin of aperture double, inner part rather round, produced; outer part flattened, angular below; umbilicus small.

BLANFORD. Journ. Asi. Soc. Bengal, 1863.

Hab. Aracan.

Species 24. (Mus. Brit.)

ALYCEUS DISTORTUS. *Aly. testā breviter conicā, griseo-fulvā, levā; anfractibus quaternis, rotundis; ultimo alto, post aperturam brevissimè angusto, ad dorsum et lateraleriter latè inflato, tumore dorsali prope aperturam in marginem concinnum desinēt; umbilico parvo, margine apertura rotundo; callo suturali angusto, elongato.*

THE DISTORTED ALYCEUS. Shell shortly conical, greyfulvous, smooth; whorls four, rounded; last high, behind the aperture very shortly narrow; dorsal tumour ending near the aperture in a neat margin; umbilicus small, margin of aperture round; sutural callus narrow, long.

HAINES. MS. Brit. Mus.

ALYCEUS GRAPHICUS. Aly. testū pallidō fulvā, conicā, altā; anfractibus quinīs, apicalibus levibus, penultimo lirato; ultimo et penultimo acutē liratis, ultimo post aperturam marginā loci, gradatim angustato; tumore dorsali inconspicuo; callo suturali brevi, conspicuo; umbilico minuto; apertura marginē duplicito, parte extero ad suturem anfractūs interrupto, subtritū, parte interno tenui, paulo producto.

THE GRAPHIC ALYCEUS. Shell pale fulvous, conical, high; whorls five, apical smooth, last and last

before sharply ridged, last smooth, gradually narrowed behind the margin of the aperture; dorsal tumour inconspicuous; sutural callus short, conspicuous; umbilicus minute; margin of aperture double, outer part interrupted at the juncture of the whorl, slightly aurited; inner part thin, a little produced.

BLANFORD. Journ. Asi. Soc. Bengal, 1862.
Hab. Aracan Hills.

Species 35. (Mus. Brit.)

ALYCEUS FOOTEI. Aly. testē depressā, albidā, loci; anfractibus quaternis; ultimo post marginem aperturā breviter angustato; tumore dorsali moderatè inflato, concinē marginato, rugato; apertura marginē extē annulis tribus plicato, infra columellā cuneato.

FOOTE'S ALYCEUS. Shell depressed, whitish, smooth; whorls four; last shortly narrowed behind the margin of the aperture; dorsal tumour moderately inflated, neatly bordered, wrinkled; margin of aperture plaited in three rings outside, cornered under the columella.

BLANFORD. —?
Hab. S. India.

Species 36. (Mus. Hanley.)

ALYCEUS UMBRONALIS. Aly. testē majuscūlā, depressā, fulvā, loci; anfractibus quinīs, apicalibus rubris; ultimo extenso, post aperturā marginē angusto; tumoris; marginē expanso, ad suturem elevato callo suturali elongato; marginē apertura transversē ovato, latē planato, reflexo; umbilico maximō.

THE UMBRAL ALYCEUS. Shell rather large, depressed, fawn, smooth; whorls five, apical red; last extended, elongated behind the aperture; margin of tumour expanded, raised at the suture; sutural callus elongated; margin of aperture transversely ovate, broadly flattened, reflected.

BENSON. Ann. Nat. Hist. 1856, Ser. 2, Vol. XVII.
p. 225.

Hab. Akauktoung, near Irawaddy, Burmah.

PLATE V.

Species 37. (Mus. Brit.)

ALYCEUS GEMMULUS. *Aly. testū minuta, albida, depresso, tenuiter striata; ultima anfractu post aperturam marginem angusto, medio crassiusculo, tumori dorsali concinē marginato, moderate inflato, rugato; callo suturali brevi, conspicuo; apertura marginē duplice, parte exterior planata, parte interior protracta.*

THE LITTLE GEM ALYCEUS. Shell minute, whitish, depressed, finely striated; last whorl behind margin of aperture narrow, thickish in the middle, dorsal tumour neatly bordered, moderately inflated, wrinkled; sutural callus short, conspicuous; margin of aperture double, outer part flattened, inner part produced.

BENSON. Ann. Nat. Hist. Ser. 3, Vol. III, 1859.

Hab. Rungun Valley.

Species 38. (Mus. Brit.)

ALYCEUS ARMILLATUS. *Aly. testū loci, depresso-conicā, albida; ultima anfractu, post aperturam breviter angustissima, tum latè calluso, inflata; tumore dorsali subrecto, marginē crasso, colloso; callo suturali conspicuo, brevissimo, apertura marginē angusto; umbilico latissimo.*

THE COLLARED ALYCEUS. Shell smooth, depressed conical whitish; last whorl shortly very narrow, callous behind the aperture, then broadly callous, inflated; dorsal tumour backward, margin thick, callous; sutural callus conspicuous, rather short, margin of the aperture narrow; umbilicus very broad.

BENSON. Ann. Nat. Hist. 1856, Ser. 2, Vol. XVII, p. 227.
Hab. Thyet Myo near river Irawaddy, Burmah.

Species 39. (Mus. Brit.)

ALYCEUS POLITUS. *Aly. testū depresso, polita, castanea, subtus albida; ultima anfractu post aperturam constricta, tum longè inflata, ad marginem tumoris depresso et colloso, tumore dorsali inconspecta, callo suturali albo, brevissimo; umbilico lato; apertura marginē infra columellam cuneata.*

THE POLISHED ALYCEUS. Shell depressed, polished, chestnut, whitish underneath; last whorl constricted behind the aperture, then with a long swelling, depressed and callous at the margin of the dorsal tumour; dorsal tumour inconspicuous; sutural callus white, very short, umbilicus broad; margin of aperture cornered below columella.

BLANFORD. Journ. Asi. Soc. Bengal, 1865.

Hab. Arakan.

Species 40. Fig. a, b. (Mus. Brit.)

ALYCEUS HUMILIS. *Aly. testū parvū, griseo-albida, subcato-striatā, depresso; ultima anfractu inter aperturam et tumorem dorsalem inflata; tumore dorsali breviter conspicuo inflata, callo suturali brevissimo; umbilico lato; marginē apertura infra cuneata.*

THE HUMBLE ALYCEUS. Shell small, grey-white, groove-striated, depressed; last whorl inflated between aperture and dorsal tumour; dorsal tumour shortly conspicuously inflated, sutural callus rather short, umbilicus broad; margin of aperture cornered below.

BLANFORD. Journ. Asi. Soc. Bengal, 1862.

Hab. Akaouktonng, banks of Irawaddy.

Species 41. (Mus. Hanley.)

ALYCEUS CONSTRICTUS. *Aly. testū conicā, alta, fulvo-tincta; anfractibus quatuor, elevatis, testio distante breviter levato; ultima post aperturam breviter angustissima; tumore dorsali brevi, conspicuo marginato, callo suturali brevi; umbilico parvo; marginē apertura latè reflexa.*

THE CONSTRICTED ALYCEUS. Shell conical, high, tallowy, rather smooth; whorls four, elevated, third distantly, slightly ridged; last shortly very narrow behind the aperture; dorsal tumour short, neatly bordered; sutural callus short; umbilicus small; margin of aperture broadly reflected.

BENSON. Ann. Nat. Hist., Ser. 2, Vol. VIII, p. 272.
Hab. Sikkim, Himalaya.

ALYCEUS.—PLATE V.

Species 42. (Mus. Brit.)

ALYCEUS BEMBEX. *Aly. testá albá, conicá, altá, luei; anfractibus quinque, ultimo post aperturam constricto tum inflato et constricto; tumore dorsali rubro inflato; callo suturali conspicuo, elongato; apertura marginé duplicito; umbilico parvo.*

THE BEMBEX ALYCEUS. Shell white, conical, high, smooth; whorls five, last constricted, then inflated and constricted behind the aperture; dorsal tumour much inflated; sutural callus conspicuous, elongated; margin of aperture doubled; umbilicus small.

BENSON. Ann. Nat. Hist., Ser. 3, Vol. III. 1859.

Hab. Darjeeling, Himalayas.

Species 43. (Mus. Hanley.)

ALYCEUS CRENULATUS. *Aly. testá subdepressa, griseo-albii; anfractibus quaternis, ultimo post marginem apertura breviter, profunde constricto, tum valde inflato, rugato; marginé apertura crenulato; umbilico majuscule.*

THE CRENULATED ALYCEUS. Shell subdepressed, grey-white; whorls four, last shortly, deeply, constricted, then much inflated, wrinkled; margin of aperture crenulated; umbilicus rather large.

BENSON. Ann. Nat. Hist., Ser. 3, Vol. III. 1859.

Hab. Rungan Valley.

Species 44. (Mus. Brit.)

ALYCEUS THEOBALDI. *Aly. testá conicá, subdepressa, distanter liratá, griseo-albidi; ultimo anfractu-*

crassiōsculo, post aperturam breviter angusto, callo crasso annulato; tumore dorsali moderatè inflato, rugato; callo suturali elongato, angusto; umbilico latissculo; marginé apertura polygono.

THEOBALD'S ALYCEUS. Shell conical, subdepressed, distantly ridged, grey-white; last whorl rather thick, shortly narrow behind the aperture, ringed with a thick callus; sutural callus long, narrow; umbilicus rather broad; margin of aperture polygonal.

BLANFORD. Journ. Asi. Soc. Bengal. 1862.

Hab. Khasi Hills.

Species 45. (Mus. Brit.)

ALYCEUS EXPATRIATUS. *Aly. testá depresso-ovalis, fulci, tenuiter sulcata; anfractibus apicalibus rubris, ultimo longè extuso, post aperturam marginem callo approximato et altero albo mediano extanti exerto; tumore dorsali albomarginato, valde inflato; callo suturali breviōsculo, conspicuo; umbilico late; apertura marginé teneriter duplicito.*

THE EXPATRIATED ALYCEUS. Shell very depressed, fulvous, finely grooved; apical whorls red, last considerably extended, girt behind the margin of the aperture with an approximate callus and another white medial, outstanding; dorsal tumour white-edged, strongly inflated; sutural callus rather short, conspicuous, umbilicus broad; margin of aperture thinly doubled.

Species 46. (Mus. Brit.)

ALYCEUS STYLIFER. *Aly. testi compressa, pallide fulva, lateraler distincta; apice acuminata; ultima anfracta distanter hemisphaerio, tumore dorsaliter latè inflata, engata; callo suturali brevissimo; umbilicus latissimus.*

THE STYLIFER ALYCEUS. Shell compressed, pale fulvous, laterally distorted; apex acuminate; last whorl with two distant margins; dorsal tumour broadly inflated, wrinkled; sutural callus rather short; umbilicus very broad.

BENSON. Ann. Nat. Hist. Ser. 2, Vol. XIX. 1857.

Hab. Sikkim, Himalaya.

Species 47. (Mus. Brit.)

ALYCEUS STRANGULATUS. *Aly. testi depresso-conica, pallide fulva, transversiter striata; ultimo anfractu post marginem aperturam profundè constricto, tumulo callo crasso prominenti irregulariter armato; tumore dorsaliter brevi; callo suturali brevissimo; umbilicus latissimum; marginis aperturæ duplicitate.*

THE STRANGLLED ALYCEUS. Shell depressed, fulvous, finely striated; last whorl deeply contracted behind margin of aperture, then armed with a prominent irregular callus; dorsal tumour short; sutural callus rather short; umbilicus rather broad; margin of aperture double.

HUTTON. MSS. Pfcr. Zeitschrift Malak. 1846.

Hab. Landour.

Species 48. (Mus. Theobald.)

ALYCEUS BIFERNS. *Aly. testi pallide fulvi, depresso, brevi; anterius apicibus rubris; ultimo anfractu post aperturam longè angustato, callo angustato, et callo albo irregulari prominenti interrupto; tumore dorsaliter brevi; callo suturali brevissimo; umbilico lato; marginis aperturæ tenuisculo.*

THE TWO-LEAVED ALYCEUS. Shell pale, fulvous, depressed, smooth; apical whorls red; last whorl with a narrow length behind the aperture, inter-

rupted by an annular and irregular, prominent callus; dorsal tumour short; sutural callus rather short; umbilicus broad; margin of aperture rather thin.

THEOBALD. Journ. Asi. Soc. Bengal, 1870, Vol. XXXIX. Pl. 2, p. 396.

Hab. Shan States.

Species 49. (Mus. Brit.)

ALYCEUS PROSECTUS. *Aly. testi depresso-conica, pallide fulva, irregulariter sulcata et lirata; ultimo anfractu distorto subgloboso, post aperturam marginem breviter angustato, declivis, carinato; tumore dorsaliter longè inflato; apertura marginis albo, latè reflexo supra, inférieure subaurito; umbilico lato; callo suturali longissimo.*

THE SLASHED ALYCEUS. Shell depressed, conical, pale fulvous, irregularly grooved and ridged; last whorl distorted, subglobose, shortly narrowed behind margin of aperture, sloped, keeled; dorsal tumour lengthily swelled; margin of aperture white, broadly reflected, subaurited above and below; umbilicus broad; sutural callus rather long.

BENSON. Ann. Nat. Hist. Ser. 2, Vol. XIX. 1857.

Hab. Khasi Hills.

Species 50. (Fig. a, b, Mus. Brit.)

ALYCEUS FUGORI. *Aly. testi conica, acuminata, sulphurea, ultimo anfractu ventricoso, lateraler et dorso valde inflato; post aperturam breviter angustato, tumori dorsaliter subito et conspicuo; callo suturali brevissimo; aperturā angustè reflexo.*

THE FUGOR ALYCEUS. Shell conical, acuminate; sulphur, last whorl ventricose laterally at the back, much inflated, shortly narrowed behind the aperture; dorsal tumour sudden and conspicuous; sutural callas very short; aperture narrow, reflected.

MARTENS. —? MS. Mus. Brit.

Hab. —?

ALYCEUS.—PLATE VI.

Species 51. (Mus. Brit.)

ALYCEUS PHYSIS. *Aly. testá majusculá, depresso-conicá, griseo-albida, levi, ultimo anfractu laterali extenso; post aperturam distorto, breviter angustato; tumore dorsali concinuè marginudo, latè inflato; callo suturali elongato; umbilico macímo; margine apertura angustè reflexo.*

THE PHYSIS ALYCEUS. Shell rather large, depressed-conical, greyish white, smooth, last whorl laterally distorted, shortly narrowed behind the aperture; dorsal tumour neatly bordered, broadly inflated; sutural callus elongated; umbilicus very large; margin of aperture narrowly reflexed.

BENSON. Ann. Nat. Hist. Ser. 3, Vol. III. p. 179.
Hab. Rungun Valley, near Darjeeling.

Species 52. (Mus. Hanley.)

ALYCEUS HEbes. *Aly. testá, depresso-conicá, levi, pallidè castanea; ultimo anfractu post marginem apertura constricto, callo irregulari retrorsum tortuo munito; tumori dorsali breviuscólo, margine albo; callo suturali longiusculo; umbilico majusculo; apertura margine angusto.*

THE DULL ALYCEUS. Shell depressed-conical, smooth, pale chestnut; last whorl constricted behind margin of aperture, strengthened with an irregular backward twisted callus; dorsal tumour rather short, with white margin; sutural callus rather long; umbilicus rather large; margin of aperture narrow.

BENSON. Ann. Nat. Hist. Ser. 2, Vol. XIX, 1857.
Hab. Khasia Hills.

Species 53. (Mus. Brit.)

ALYCEUS STOLITZKII. *Aly. testá albida, tenuissimè striatá, subdepressa; ultimo anfractu post marginem bilirato, tum longè angustissimo; tumore dorsali concinuè marginato; callo suturali conspicuo, elongato; umbilico magno.*

STOLITZSKI'S ALYCEUS. Shell whitish, very finely striated, subdepressed; last whorl with double ridge behind aperture, then with a lengthened very narrow space; dorsal tumour neatly bordered; sutural callus conspicuous, elongated; umbilicus large.

GONWIN AUSTIN. —? MS. Brit. Mus.
Hab. Nogor Hills.

Species 54. (Mus. Brit.)

ALYCEUS INGRAMI. *Aly. testá depressa, albida; ultimo anfractu laterali extenu, post aperturam brevisimè contracto; tumore dorsali ad aperturam subapproximato; callo suturali elongato, conspicuo; umbilico latissimo.*

INGRAM'S ALYCEUS. Shell depressed, whitish; last whorl laterally extended, very shortly contracted behind the aperture; dorsal tumour rather near the aperture; sutural callus lengthened, conspicuous; umbilicus very wide.

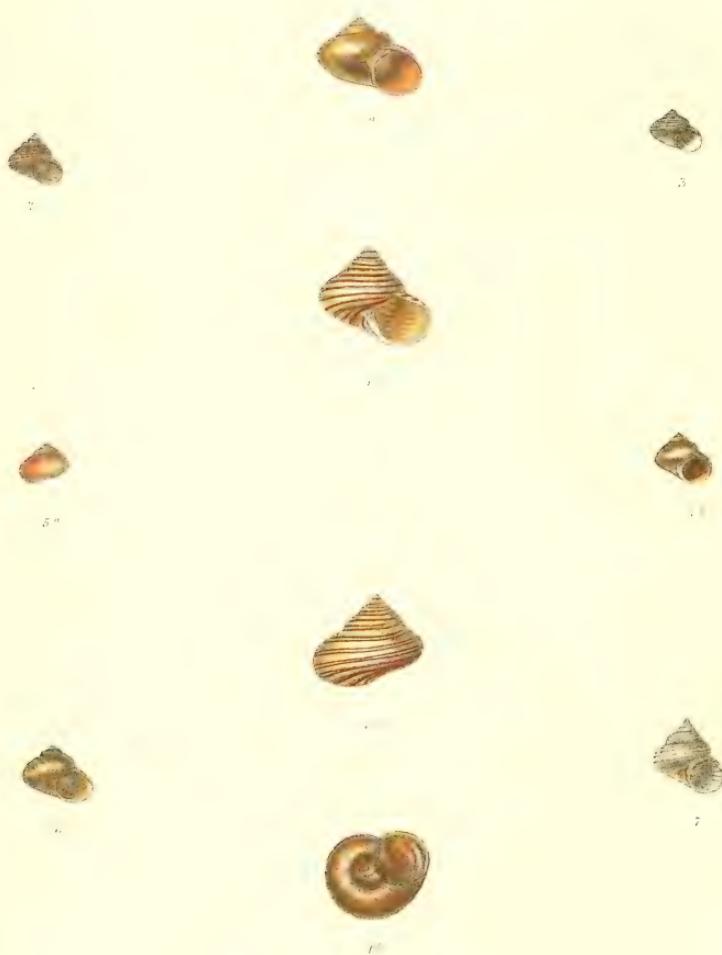

BLANFORD. Journ. Asi. Soc. Bengal, 1862.

MONOGRAPH
OF THE GENUS
M A R G A R I T A.

Of Nature's gifts thou may'st with lilies boast,
And with the half-blown rose.—*Shakspeare*.

M A R G A R I T A.

PLATE I.

Genus MARGARITA. *Loach.*

Testa trochiformis, vel heliciformis, intus et subtegumentum exterum marginatum, interdum umbilicata, interdum clausa. Apertura magna, simplex. Operculum cornutum, subovatum, punctispirale.

Shell trochus- or helix-shaped, pearly inside and beneath the external tegument, sometimes umbilicated, sometimes closed. Aperture large, simple. Operculum horny, subovate, few-whorled.

This genus consists of a few shells that have been grouped together, as having some affinities, but no very definite uniting characters. In the work by Messrs. Adams they are separated into two genera, and other species have been added to each. In the original genus there are umbilicated and non-umbilicated examples; the former are allowed in that work to retain the name now used, while the latter are named 'Photinula.' This plate having been published in a former number, the writer now completes the monograph, including both sections, as left by his late father, in the Conchological Illustrations, with a few additions from specimens in the collection of the British Museum.

Species 1. (Fig. *a, b*, Mus. Brit.)

MARGARITA UMBILICALIS. *Mar. testa magnâ, tenui levigatâ, fulvâ, obliquâ; umbilicus latissimus, aperturâ maximâ, obliquâ, intus splendidè iridescentâ; ultimo angustâ lato, obscurissimâ angulato.*

THE UMBILICAL MARGARITA. Shell large, thin, smooth, fulvous, oblique, umbilicus very broad, aperture very large, oblique, splendidly iridescent within; last whorl broad, very obscurely angular.

BRODERIP. Sowerby Conch. Ill., p. 13.

Hab. —?

Species 2. (Mus. Brit.)

MARGARITA UNDULATA. *Mar. testa fulvâ, parvâ, depresso, spiraller striatâ, ad suturem undulatâ; ultimo angustâ lato; aperturâ magnâ, obliquâ; umbilico angusto, albo.*

THE WAVY MARGARITA. Shell fulvous, small, depressed, spirally striated, waved at the suture; last whorl broad; aperture large, oblique; umbilicus narrow, white.

SOWERBY. Mal. and Conch. Mag. Conch. Ill. Species 12, f. 4.

Hab. Massachusetts Bay.

Species 3. (Mus. Brit.)

MARGARITA SULCATA. *Mar. testa albâ, depressâ subtus levâ, suprâ spiraller liratâ; aperturâ latâ; umbilicus lato, subcarinato.*

THE GROOVED MARGARITA. Shell white, depressed, smooth beneath, spirally ridged above; aperture broad; umbilicus broad, subcarinated.

SOWERBY. Mal. and Conch. Mag. p. 26.

Hab. —?

Species 4. (Fig. *a, b*, Mus. Brit.)

MARGARITA TENIATA. *Mar. testa trochiformi, fulvâ, fasciis rubris teniatâ, levigatâ; spirâ conicâ, anfractibus quinilâ, rapidâ crescentibus, ultimo magno; aperturâ magnâ, columellâ albâ, crassi obliquâ, infra subcuneata.*

THE BANDED MARGARITA. Shell trochus-shaped, fulvous, banded with red stripes, smooth, spire conical, whorls five, rapidly increased, last large; aperture large, columella white, thick, oblique, slightly cuneate below.

SOWERBY. Conch. Illus. Species 1, fig. 2.

Hab. Falkland Islands.

Species 5. (Fig. *a, b*, Mus. Brit.)

MARGARITA VIOLEACEA. *Mar. testa crassiusculâ, rubrâ, obliquâ, levâ, non umbilicata; anfractibus trinâ, rapidâ crescentibus; ultimo magno, subdepresso, infra planissima; aperturâ magnâ, obliquâ.*

THE VIOLET MARGARITA. Shell rather thick, red, oblique, smooth, not umbilicated; whorls three, rapidly enlarged; last large, somewhat depressed, rather flattened below; aperture large, oblique.

KING. Zool. Journ. Vol. V. p. 346.

Hab. —?

MARGARITA.—PLATE I.

Species 6. (Mus. Brit.)

MARGARITA GREENLANDICA. *Mar. testa subdepressa, albida, levigata; anfractibus triuis, depressis; ultimo expanso; apertura magna, columellam tenui, umbilico lato.*

THE GREENLAND MARGARITA. Shell rather depressed, whitish, smooth; whorls three, depressed; last expanded; aperture large, columella thin, umbilicus broad.

BECK. Sowerby, Conch. Ill. f. 10.
Hab. Greenland.

Species 7. (Mus. Brit.)

MARGARITA STRIATA. *Mar. testa trocheiformi, fulva, spiraliiter striata, supra lirata; spiri conici, anfractibus quinque, ultimo magno; apertura rotunda; umbilico parvo.*

THE SIRIATED MARGARITA. Shell trochus-shaped, fulvous, spirally striated; ridged above; spire conical, whorls five, last large; aperture rounded; umbilicus small.

BISCHERIP. Zool. Journal IV. Con. Ill. f. 3.
Hab. Northern Ocean?

The larger figure in the Conchological Illustrations, fig. 18, represents a different species, which will be found under the name, *Margarita maxima* in Plate III.

M A R G A R I T A.

PLATE II.

Species 8. (Mus. Brit.)

MARGARITA SANDWICHIANA. Mar. testā subglobosā, griseo-fulvā, spirāliter striatā, maculis fuscis nigrescentibus tessellatā variegatā; anfractibus trinis, ultimo magno, subgloboso; aperturā subrotundā, columellā crassiunculā, obliquā; umbilico lato.

THE SANDWICH ISLANDS MARGARITA. Shell subglobose, greyish fulvous, spirally striated, variegated with blackish-brown tessellated spots; whorls three, last large, subglobose; aperture rather round; columella rather thick, oblique; umbilicus broad.

A. ADAMS. —? MS. Mus. Brit.

Hab. Sandwich Islands.

Species 9. (Mus. Brit.)

MARGARITA VULGARIS. Mar. testā parvā, obliquā, depresso, albida, heri; anfractibus trinis, ultimo rapide crescatis; aperturā magnā, declivi; columellā tenui; umbilico parvo.

THE COMMON MARGARITA. Shell small, oblique, depressed, whitish, smooth; whorls three, last quickly increased; aperture large, sloped; columella thin; umbilicus small.

LEACH, SOWERBY. Conch. Ill. Sp. 5. f. 13.

Hab. Northern Seas.

Species 10. (Mus. Brit.)

MARGARITA SIGARETTINA. Mar. testā obliquē depresso, crassiunculā, subballistoidea, rubra, levigata, intus splendido iridescenti; aperturā obliquē ovata, maximā; columellā albā, latā, planulatā, perobliquā.

THE SIGARETTA-LIKE MARGARITA. Shell obliquely depressed, rather thick, rather halioëtis-shaped, red, smooth, splendidly iridescent within; aperture obliquely ovate, very large; columella white, broad, flattened, very oblique.

SOWERBY. Mal. and Conch. Mag. p. 24; Con. Ill. f. 14.
Hab. —?

Possibly a further knowledge of this species may lead to its placement in the GENA group.

Species 11. (Mus. Brit.)

MARGARITA PULCHERRIMA. Mar. testā altā, trochiformis, subdissimiliter spirāliter liratā, inter liris regulariter striatis; liris minūtē moulliferis, rubro unicoloratis; umbilico magno, curvato; columellā obliquā.

THE VERY PRETTY MARGARITA. Shell raised, trochus-shaped, rather distantly spirally ridged, between the ridges regularly striated; ridges minutely beaded, spotted with red; umbilicus large, keeled; columella oblique.

A. ADAMS. —? MS. Mus. Brit.

Hab. Japan.

Species 12. (Mus. Brit.)

MARGARITA CERULESCENS. Mar. testā cineresē, depresso, non umbilicata, levigata, angustē teniōtē; spirā depresso-conicā; aperturā obliquē subquadratā; columellā crassi, latā, superne validē arcuata.

THE EEL-EISH MARGARITA. Shell ash-coloured, depressed, not umbilicated, smooth, narrowly banded; spire depressed - conical, aperture obliquely squarish; columella thick, broad, strongly arched above.

KING. —? MS. Brit. Mus.

Hab. —?

This species belongs to the Photinula group.

Species 13. (Mus. Brit.)

MARGARITA ACUMINATA. Mar. testā cinereo-albā, altā, conicā, acuminatā; anfractibus quinque; ultimo maximo, subangulato; aperturā magno, columellā tenui, umbilico angustissimo.

THE ACUMINATED MARGARETINA. Shell ashy white, high, conical, acuminated; whorls five; last very large, slightly angular; aperture large; columella thin; umbilicus very narrow.

SOWERBY. Mal. and Conch. Mag. p. 26. Con. Ill. f. 7.
Hab. —?

Species 14. (Mus. Brit.)

MARGARITA FUNCTATA. Mar. testā elevatā, conicā, fulcēd: anfractibus sensim turritis, suturi profundi:

MARGARITA.—PLATE II.

separatis, ultimo supernè bicostato, costis rubro maculatis, infrà striato; umbilico maximo; costato, aperturâ parvâ.

THE SPOTTED MARGARITA. Shell raised, conical fulvous; whorls six, turreted, separated by a deep suture, last with two ribs above, ribs spotted with red; striated below; umbilicus very large, ribbed; aperture small.

A. ADAMS. —? MS. Brit. Mus.
Hab. Japan.

Species 15. (Mus. Brit.)

MARGARITA HELICINA. *Mar. testâ parvâ, tenui, roseofulvi, subdepressâ, aperturiâ magnâ, umbilico angustissimo, columellâ arcuati.*

THE HELICINA MARGARITA. Shell small, thin, pinky-fulvous, rather depressed, aperture large; umbilicus rather narrow, columella arched.

FABRICIUS. Vide Proc. Zool. Soc. 1851.
Hab. —

Species 16. (Mus. Brit.)

MARGARITA ARGENTATA. *Mar. testâ depresso-globosâ, albida, levâ; anfractibus triâ, ultimo maximo, supernâ subcarinato; aperturâ magnâ, umbilico majuscule, columellâ arcuata.*

THE SILVERY MARGARITA. Shell depressed-globose, whitish smooth; whorls three, last large, with a slight keel above; aperture large, umbilicus rather large, columella arched.

GOULD. Invert. Mass. p. 256, f. 164.
Hab. Cape Ann.

Species 17. (Mus. Brit.)

MARGARITA ZELANDICA. *Mar. testâ depresso-conicâ, spiraliiter sulcata, rubro punctata; ultimo anfractu subtus complanata; umbilico latâ, carinata; aperturâ parvâ, columellâ validâ, infrâ subcuneatâ.*

THE ZEALAND MARGARITA. Shell depressed-conical, spirally grooved, spotted with red; last whorl flattened beneath; umbilicus broad, keeled; aperture small, columella strong, slightly cuneate below.

HUTTON. —? MS. Mus. Brit.

Species 18. (Mus. Brit.)

MARGARITA INCARNATA. *Mar. testā depresso-conica, rubescēti, lēris monilifēris sculpta; ultimo anfractu magno, prop̄ suturam concentricè rugato; aperturā rotundā; umbilico mediorci.*

THE FLESH-COLOURED MARGARITA. Shell depressed-conical, reddish, sculptured with beaded ridges; last whorl large, concentrically wrinkled near the suture; aperture large; umbilicus middle-sized.

COUTIQUY. —? (Ms. Brit. Mus.)

Hab. N. America.

Species 19. (Mus. Brit.)

MARGARITA ARCTICA. *Mar. testā parrū, lori, depresso, fulvo-griseo-fulvo; ultimo anfractu obliquō, expusō, aperturā maxima, obliquē orata; umbilico magno.*

THE ARCTIC MARGARITA. Shell small, smooth, depressed, greyish-fulvous; last whorl oblique, expanded; aperture very large, obliquely ovate; umbilicus large.

LEACH. Sowerby. Conch. Ill. fig. 6.

Hab. Plymouth, Massachusetts.

Species 20. (Mus. Brit.)

MARGARITA COSTELLATA. *Mar. testā depresso, subaurata; anfractibus subturritis, ultimo biangulato, inter angulos spiraliiter striato, infre subplanulato; aperturā subquadratā; umbilico parvo, angulato, obliquē carinato.*

THE RIBBED MARGARITA. Shell depressed, slightly gold-tinted; whorls subturreted, last biangular, spirally striated between the angles, rather flattened below; aperture rather square; umbilicus small, angular, obliquely keeled.

SOWERBY. Mal. & Conch. Mag. p. 26.

Hab. —? —

Species 21. (Mus. Brit.)

MARGARITA CORNEA. *Mar. testā trochoformi, acuminatā, fulvo-albido, spiraliiter lirata; anfractibus senis, altis, angulatis, ultimo obscurè biangulato, umbilico spiraliiter costato, late; aperturā subrotundā, margine crenato; columella arcuata.*

THE HONRY MARGARITA. Shell trochus-shaped, acuminate, whitish-buff, spirally ridged; whorls six, raised, angular, last obscurely biangular; umbilicus spirally ribbed, broad; aperture rather rounded, margin crenulated; columella arched. KIENER Icon. pl. 196, fig. 2.

Hab. —?

Species 22. (Mus. Brit.)

MARGARITA CARINATA. *Mar. testā roseo-fulvā, elevatā, conicā, acuminatā; anfractibus senis, elevatis, angulatis; ultimo prop̄ suturam concentricè lirato, tunc tricaricato, inter carinas lirato; infre subplanulato; umbilico magno, margine carinato; aperturā subtriangulo; columellā obliquā.*

THE KEELLED MARGARITA. Shell pinkish-fulvous, raised, conical, acuminate; whorls six, raised, angular; last concentrically ridged near the suture, then with three keels, rather flattened below; umbilicus large, margin keeled; aperture rather trigonal; columella oblique.

A. ADAMS. Proc. Zool. Soc. 1851, 190.

Hab. Calbalonga, Philippines.

Species 23. (Mus. Brit.)

MARGARITA NOVESTA. *Mar. testā trochoformi, pallidō carnō, carinatā, subtilis striatā; anfractibus quarternis, ultimo magno, angulato; umbilico parvo; aperturā mediorci, columellā subobliquā, tenuiusecula.*

THE MODEST MARGARITA. Shell trochus-shaped, pale flesh-coloured, keeled, striated below. Whorls four, last large, angular; umbilicus small; aperture middle-sized, columella rather oblique, rather thin.

MIDDENDORF. —? Ms. (Brit. Mus.)

Hab. —?

Species 24. (Ms. —? copied).

MARGARITA MAXIMA. *Mar. testā magnā, trochoformi, fulvā; spirid conicā; anfractibus senis, ultimo maximo, superne quinque-carinato, infre striato, umbilico lato, margine carinato; aperturā obliquā quadrilaterali, columellā arcuata, infre carinatā, crenulata.*

MARGARITA.—PLATE III.

THE VERY LARGE MARGARITA. Shell large, trochus-shaped, fulvous; spire conical, whorls six; last very large, five-keeled above, striated below; umbilicus broad, margin keeled; aperture obliquely four sided, columella arched, cuneate below, crenulated.

SOWERBY.

Hab. ——?

The writer has not seen the specimen since first figuring it in the Conchological Illustrations, but is of opinion that it must be distinct from *M. stricta*.

Species 25. (Mus. Brit.)

MARGARITA ASPECTA. *Mar. testā conicā, acuminatā, fulvo-rubescētī, spiraliētē multi-carinatā, inter carinas concentricē minutē liratā, carinis moniliōris; anfractibus angulatis; umbilico latō.*

THE PRESENTABLE MARGARITA. Shell conical, acuminate, reddish fulvous, spirally, many-keeled, concentrically minutely ridged between the keels; keels headed; whorls angular; umbilicus broad.

A. ADAMS. Proc. Zool. Soc. 1854, p. 40.

Hab. Australia.

A very beautifully sculptured, trochus-shaped shell.

Species 26. (Mus. Brit.)

MARGARITA TRIANGULOSA. *Mar. testā crassā, subroseo-albida, fuscō variegatā; anfractibus subdepressis, angulatis, ultimo propè suturam et medio angulato; umbilico latō, marginē carinato; aperturā supernā et medio angulata.*

THE TRIANGULAR MARGARITA. Shell thick, pinkish-white, variegated with brown; whorls somewhat depressed, angular, last angular near the suture, and in the middle; umbilicus broad, margin keeled; aperture angular above and in the middle.

A. ADAMS. Proc. Zool. Soc. 1854, p. 40.

Hab. Siam.

Species 27. (Fig. a, b, Mus. ——? copied.)

MARGARITA SOLARIIFORMIS. *Mar. testā parvā, depresso-fulvā, angulatā; anfractibus trinīs, ultimo depresso, medio angulato; umbilico angulato, marginē carinato; aperturā latā, columellā albā, rectiōsculā.*

THE SOLARIUM-SHAPED MARGARITA. Shell small, depressed, angular; whorls three, last depressed, angular in the middle; umbilicus angular, margin keeled; columella white, rather straight.

SOWERBY. Mal. and Conch. Mag. p. 26. Con. Ill. f. 8.

Hab. ——?

It has very much the appearance of a miniature solarium.

ROTELLA.

PLATE I.

Genus ROTELLA. Lamarck.

Testa trochiformis, depresso, orbicularis, solidi, superne conica, infra lenticularis, intus nucra; umbilicus per callum obecto; apertura subtriangularis, transversa, operculum cornutum, multispirale planorbicularium.

Shell trochiform, depressed, orbicular, solid, conical above, lenticular beneath, pearly within; umbilicus covered in by a callus; aperture rather trigonal, transverse, operculum horny, planorbicular.

SYN. *Umbonium*, Link.

The few species to be found towards the end of this monograph which are placed in the British Museum collection under the generic heading of *Ethalia*, do not so well agree with the above description as the more typical *R. vesticularis*. Yet the passage is not very abrupt, and it seems hardly necessary to keep up a distinction upon characters of so little generic importance. The species alluded to are *R. grotensis*, and several others allied to it. The East Indies appear to be the home of the *R. vesticularis*, although varieties of that species are quoted from the Mediterranean. *R. elegans* is from the Philippines, and a variety from the Martinique. *R. gigantea* and other fine species are from Japan.

Species 1. (Mus. Brit.)

ROTELLA CONICA. *Rot. testa fuscopurpurascens, crassula, conica, callo ventrali parvo, fuscopurpureo, spiraliter disposita, medio depresso, ultimo anfractu circa callum centrale depresso.*

THE CONICAL ROTELLA. Shell purplish-brown, thick, conical; ventral callus small, smoky-brown, spirally deposited, depressed in the middle; last whorl depressed round the ventral callus.

ADAMS & REEVE. Voy. Samarang. Proc. Zool. Soc. 1854.

Hab. ——?

In this dark but richly-coloured shell the form of the callus is peculiar, being formed of semicircular layers placed spirally. It is small, defined, and does not quite occupy the central hollow of the shell.

Species 2. (Fig. a, b, [c, in Plate II.], Mus. Brit.)

ROTELLA DEPRESSA. *Rot. utrinque lenticulari, depresso; anfractibus rapidi crescentibus, ultimo ad marginem rotundo, superne medio latè fasciato, fascia unicolor regulariter punctata, vel fasciis radiatis variegata; callo expanso, griseo, lenticulari.*

THE DEPRESSED ROTELLA. Shell lenticular on both sides, depressed; whorls rapidly increased, last rounded at the margin, with a broad band in the middle above, margin of band regularly spotted, or variegated with rayed bands; callus expanded, grey, lenticular.

A. ADAMS ——? MS. Cum. Coll.

Hab. ——?

Like *Rotella vesticularis*, but with the last whorl more spread.

Species 3. (Fig. a, b, c, Mus. Brit. and Sowerby.)

ROTELLA GIGANTEA. *Rot. testa altissimula, superne conica, infra subconplanata; supra medium tenuiter spiritaliter striata, grisea, maculis magis obliquis nigrescentibus ad suturam et ad angulum ornata, aut grisea immutata; anfractibus propriis suturam depresso, sutura profunda; callo irregulari, roseo, post columellam angulatim tuenda; columella crassissima, lata; labio externo superne producto et depresso.*

THE GIGANTIC ROTELLA. Shell rather high, conical above, rather flattened below; above the middle, thinly spirally striated, grey, ornamented with large oblique black spots at the suture and at the angle, or grey without spots; whorls near the suture depressed, suture deep; callus irregular, pink, angularly tumid behind the columella; columella very thick, broad; outer lip produced and depressed above.

LESSON. Illust. Zool. Pl. 17.

Hab. Japan.

Species 4. (Fig. a, b, Mus. Brit.)

ROTELLA COSTATA. *Rot. testa superne conica, altissimula, infra planissimula, anfractibus ad suturam leviter elevatis tum subdepressis, sulcis spiralibus*

ROTELLA.—PLATE I.

incisis sculptis fusco-grisecenti fasciatis variegatis; infrà angulum levigatis; callo rubescenti, columellâ crassâ.

THE RIBBED ROTELLA. Shell conical, rather high above, rather flat below; whorls slightly elevated at the suture, then rather depressed; sculptured with spiral incised grooves, variegated with greyish brown in bands; smooth beneath the angle, callus pink; columella thick,

VALENCIENNES. Kiener, Icon. Coq. Viv. Pl. II. f. 5.
Hab. Japan.

Species 5. (Fig. a, b. Mus. Brit.)

ROTELLA MONILIFERA. *Rot. testâ supernè conicâ altâ, anfractibus spiraliter costatis, ad suturam in costam noduliferam elevatis, griseis fusco variegatis; callo pleno, grisecenti, columellâ obliquâ.*

THE BEADED ROTELLA. Shell conical above, high, whorls spirally ribbed, raised at the suture into a beaded rib, grey, varied with brown; callus full, greyish, columella oblique,

ROTELLA.

PLATE II.

(Fig. 3, c, Mus. Brit.)

ROTELLA DEPRESSA. Var. See Plate I.

Species 6. (Fig. a, b, c, d, Mus. Brit. & Sowerby.)

ROTELLA ELEGANS. *Rot. testū superū, alti, conicā; aufractibus obliquū planatis, varie fasciis maculatisque pectis, subtus planisculis; callo crasso, subequaliter convexo.*

THE ELEGANT ROTELLA. Shell high, conical above; whorls obliquely flattened, variously painted with bands and spots, rather flat beneath; callus thick, rather equally convex.

BECK. Kiener Icon. Coq. Viv. Pl. II. f. 5.
Hab. Philippines.

Most varieties of this species show a black spiral line on the edges of the whorls, and the whorls are slightly flattened. In *Rotella vestiaria* the black line does not occur, and the whorls are fewer and a little convex.

— — —

Species 7. (Mus. Brit.)

ROTELLA SUTURALIS. *Rot. testū depresso-conicā, lineis strigisque fasciis variegatā, spiritaliter sulcī numerosis sculpti; aufractibus superū planatis, ad suturam in costam elevatis; sutura profundā; callo late, rubro.*

THE SUTURED ROTELLA. Shell depressed conical, variegated with brown lines and stripes, spirally sculptured with numerous grooves; whorls flattened above, raised in a rib at the suture; suture deep; callus broad, red.

| LAMARCK. Chenu Conch. Cab. Pl. 19. f. 186-7.
Hab. Indian Seas.

More closely sculptured than *Rotella costata*, and with the whorls more raised at the suture.

Species 8. (Mus. Brit.)

ROTELLA JAVANICA. *Rot. testū alti, conicā, ad suturam moniliferā; aufractibus superū subcomplanatis, supra angulum lineis spiritalibus ornatis, subtus angulum interruptum fasciatā; callo ventrali crasso, griseo-fusco.*

THE JAVA ROTELLA. Shell high, conical, beaded at the suture; whorls rather flattened above, ornamented with spiral lines above the angle, and an interrupted band below the angle; ventral callus thick, greyish-brown.

LAMARCK. Anim. S. Vert.
Hab. Java.

Species 9. (Mus. Brit.)

ROTELLA SAGITTATA. *Rot. testū subdepressā, superū conicā, maculis sagittatis nigris in series spirales dispositis ornatā, subtus vix convexa; callo parvo, albo, circumscripto.*

THE ARROW-HEADED ROTELLA. Shell sub-depressed, conical above, ornamented with arrow-head black spots placed in spiral rows, hardly convex below; callus small, white, circumscribed.

HINDS. Voy. Sulphur.
Hab. — ?

This pretty little shell differs from *R. elegans* chiefly in the arrow-headed markings and the circumscribed callus.

PLATE III.

Species 10. (Fig. a, b, c, Mus. Sowerby.)

ROTELLA INFRAPLANATA. *Rot. testā supernē concād, alld, infī subconcavā; aufractibus supernē planatis, carī pīctis, infī angulum circā callūnū centraleū grīso variegatā; callo paro, subconcavo; columnellā obliquā, ad terminū angulatum.*

THE FLAT-BOTTOMED ROTELLA. Shell conical above, high, almost concave; whorls flattened above, variously painted, variegated with gray; callus small, rather concave; columnella oblique, angular at the end.

SOWERBY.

Hab. *?*

We have several varieties of this conical shell. The upper part is like *R. elegans*, with greater elevation, but the lower is much more flattened than that of any other species.

Species 11. (Mus. Brit.)

ROTELLA ZELANDICA. *Rot. testā altā, conicā, rubescētī, fuso-rubescētī radiatim strigatā, ad angulūnū spiraliter tri-liratā; aufractibus infī suturam subconcavā, subtūs convexissimul; callo ventrali grīso-rubescētī, purpuro circumscripto.*

THE NEW ZEALAND. Shell high, conical, reddish, radiately striped with reddish-brown, spirally three-ridged at the angle; whorls rather concave below the suture, rather convex underneath; ventral callus reddish-grey, circumscribed with purple.

A. ADAMS.

Hab. New Zealand.

Species 12. (Mus. Brit.)

ROTELLA VESTIARIA. *Rot. testā depresso, fuselī, strīgiā, maculisque rariē pīctā; aufractibus supernē subconcavis; callo centrali crasso, lenticulari.*

THE WARDROBE ROTELLA. Shell depressed, variously painted with bands, stripes, and spots; whorls rather concave above; ventral callus thick, lenticular.

SOWERBY. Genera of Shells.

Rotella lineolata (var.) Lamarek.

Rotella rosea, Chemnitz?

Hab. East Indies.

The upper part of the whorls are a little convex, while those of *R. elegans* are quite flattened.

PLATE IV.

Species 13. (Mus. Brit.)

ROTELLA STRIOLATA. *Rot. testa cinnamonacea, fuscovenigata, spiraliiter striata, supra infrafusca sub-equaliter concava; callo ventrali angusto, trilobato.*

THE STRIATED ROTELLA. Shell cinnamon variegated with brown, spirally striated, nearly equally convex above and below; ventral callus narrow, trilobate.

A. ADAMS. (*Ethalia*), Proc. Zool. Soc. 1853.
Hab. —?

The callus is in three parts, one rounded above, one spread circularly over the umbilicus, and the third forming a thickened margin to the columella.

Species 14. (Mus. Brit.)

ROTELLA CANDEMA. *Rot. testa parva, subglobose, levigata, albida, opaca; callo ventrali parvum, rotundatum; columella latissimata; apertura magna.*

THE WHITE ROTELLA. Shell small, rather globose, smooth, white, opaque; ventral callus small, round; columella rather broad; aperture large.

A. ADAMS. (*Ethalia*), Proc. Zool. Soc. 1862, p. 296.
Hab. Goto Islands, Japan.

This minute species is less like a *Rotella* than other species of *Ethalia*.

Species 15. (Mus. Brit.)

ROTELLA PERSICA. *Rot. testa minutissima, albida, compressa, lenticulari; apertura transverso-ovata; callo ventrali semilunari.*

THE PERSICOID ROTELLA. Shell minute, white, compressed, lenticular; aperture transversely ovate; ventral callus semilunar.

A. ADAMS. (*Ethalia*), Annals of Natural History, 1861.

Hab. China.

Very simple in form and character.

Species 16. (Mus. Brit.)

ROTELLA BRAZIERI. *Rot. testa transverso-ovata, depresso, minutissima, albida, semipellucida; callo ventrali parvo, rotundo, ad columellam continuo; apertura magna.*

BRAZIER'S ROTELLA. Shell transversely ovate, depressed, minute, white, semipellucid; ventral callus small, rounded, continued at the columella; aperture large.

ANGUS. (*Ethalia*), Proc. Zool. Soc. 1877, p. 39, Pl. 5, f. 17.

Hab. Sow and Pigs Reef, Port Jackson, Australia.

Species 17. (Mus. Brit.)

ROTELLA POLITA. *Rot. testa subglobosa, alba, polita; spirae conicae, unifasciatae, paucis; callo ventrali ferme obsoleta.*

THE POLISHED ROTELLA. Shell subglobose, white, polished; spire conical, whorls few; ventral callus almost obsolete.

A. ADAMS. (*Ethalia*), Annals of Nat. Hist. 1862, p. 296.

Hab. Goto, Japan.

Species 18. (Fig. a, b, Mus. Brit.)

ROTELLA GUAMENSIS. *Rot. testa altiuscula, subglobosa; variae picta, levigata; unifasciata superne versis suturam tumidum; angulo ventrali rotundato, infra convexis, callo reniformi, roseo; columella latissimata, callosa.*

THE GUAM ROTELLA. Shell rather high, subglobose; variously painted, smooth; whorls above towards the suture tumid; central angle rounded, convex below, callus kidney-shaped, pinky; columella broadly callous.

QUOT. Voy. Astrolabe, Pl. 61, f. 32-33.

Hab. Isl. Guam. — Luxor; Philippines.

This is the type of the genus *Ethalia*, which, however little like *Rotella* in general form, has the same essential characters.

ROTELLA.—PLATE IV.

Species 19. (Fig. *a, b*, Mus. Brit.)

ROTELLA SOBRINA. *Rot. testâ minutâ, planorbulari, compressâ, albâ, opacâ; infrâ umbilicatâ, anfractibus rotundis.*

THE RELATED ROTELLA. Shell minute, planorbular, compressed, white, opaque; umbilicated below, whorls rounded.

A. ADAMS. (*Ethalia*), Ann. of Nat. Hist. 1861, Vol. VIII. 306.

Species 20. (Mus. Brit.)

ROTELLA TRILOBATA. *Rot. testâ pallidâ griseo-olivaceâ, subdepressâ, maculis strigisqâ varia pictâ; anfractibus superne convexisculis; umbilico infundili-*

buliformi; callo parvo in partes tres semicirculares diviso.

THE TRILOBATE ROTELLA. Shell pale grey-olive, sub-depressed, variously painted with spots and stripes; whorls rather convex above; umbilicus funnel-shaped; callus small, divided into three semicircular parts.

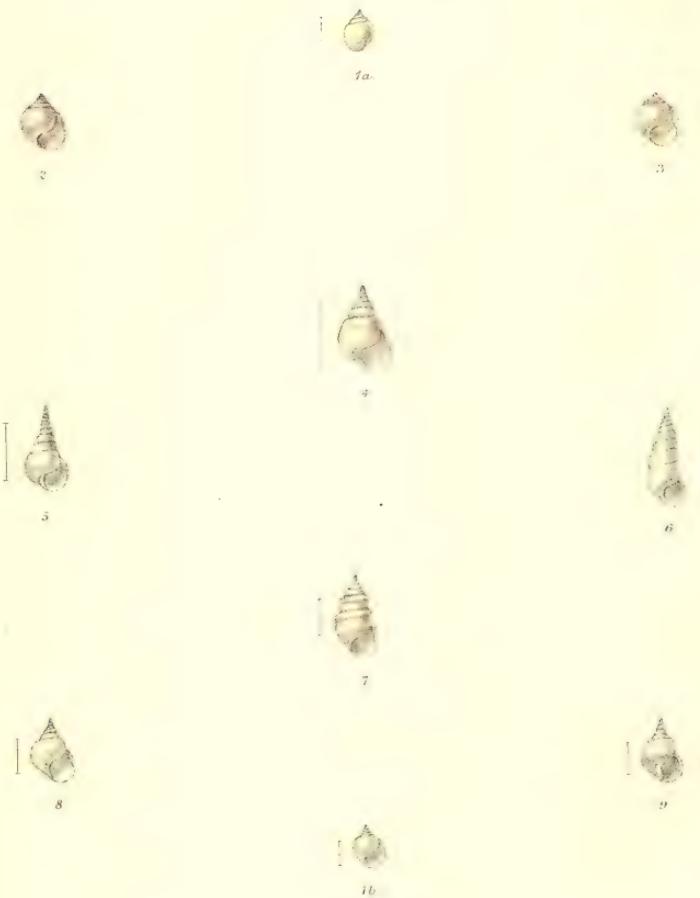

SOWERBY.

Hab. —?

In this species, the form of the callus is very peculiar, resembling that of *R. striolata*, but more pronounced in character. In rotundity of whorls the species is midway between the latter and *R. Guamensis*.

MONOGRAPH
OF THE GENUS
S T Y L I F E R.

Fair Nature, rather curious than in haste,
Hath well compos'd thee.—*Shakspeare.*

STYLIFER.

PLATE I.

Genus STYLIFER. Broderip.

Testa levissima, plerumque pellucida aut semi-pellucida, levis, polita, multispiralis, subulata vel subglobosa; apice oblique, styliformi; labio externo sinuositatem producta.

Shell very thin, generally pellucid or semi-pellucid, smooth, polished, multispiral, subulate or subglobose; apex oblique, styliform; outer lip sinuously produced.

The mollusca secreting these glassy little shells are parasitic on star-fishes and Echini, burrowing under the skin, and forming tumours which appear externally. One species is found among the spines of our common Echini, and the first species described by Mr. Broderip infects a starfish of the shores of Galapagos islands.

Species 1. (Fig. a, b. Mus. Brit.)

STYLIFER TURTONI. *Sty. testa subglobosa, parca, spiri acuminata, producta, aufrectibus superne angulis, apicalibus minutis papillosis, ultimo magno, subrectilaterali.*

TURTON'S STYLIFER. Shell subglobose, small, spire acuminate, produced, whorls angular above, apical minute papillose, last large, subrectilateral.

BRODERIP. Proc. Zool. Soc. 1832, p. 61.

Hab. On British Echini.

Species 2. (Mus. Brit.)

STYLIFER OVOIDEA. *Sty. testa subglobosa, spiri moderatè producta, aufrectibus subrotundis, apicalibus minutissimis; aperturā pyriformi, labio externo superne subcompresso, sinuositatem producta.*

THE EGG-SHAPED STYLIFER. Shell subglobose, spire moderately produced, whorls rather round, apical very minute; aperture pyriform, outer lip slightly compressed above, sinuously produced.

A. ADAMS. Proc. Zool. Soc.

Hab. ——

Species 3. (Mus. Brit.)

STYLIFER ASTERICOLA. *Sty. testa ovato-globosa, spiri brevi acuminata; aufrectibus paucis, apicali minutis aperturā angustisquamata, infra subaristata; labio externo superne sinuositatem producta.*

THE STARFISH STYLIFER. Shell ovate-globose; spire short, acuminate, whorls few, apical minute; aperture rather narrow, slightly pointed below, outer lip sinuously produced above.

BRODERIP. Sowerby's Conchological Manual, f. 12-13: *Stylifer Broderipi.* Adams.

Hab. Galapagos.

Species 4. (Mus. —?)

STYLIFER GUNTHERI. *Sty. testa magnitudine, verrita, pyramidata; apice producto, acuminata, aufrectibus gradatim, superne angulata, ultimo rotunda, globosa, inflata; sinus columellaris retrorsum extensus.*

GUNTHER'S STYLIFER. Shell rather large, turreted pyramidal; apex produced, acuminate, whorls step-like, angular above; last large, globose, inflated; columellar sinus extended backwards.

ANGAS (Apicalia). Proc. Zool. Soc. 1877, Pl. V. f. 6. Hab. New South Wales.

A singularly formed shell, partaking the characters of the globose and subulate sections

Species 5. (Mus. Brit.)

STYLIFER CUMINGIANA. *Sty. testa pyramidata, spiri altè, acuminata; aufrectibus numerosis, depressis, apicalibus trinūs und quaternis attenuatis, styliformibus, ultimo inflato, rotundo, aperturā brevi, columella rectissimata.*

CUMING'S STYLIFER. Shell pyramidal, spire raised, acuminate; whorls numerous, depressed, three or four apical attenuated, styliform, last inflated, round, aperture short, columella rather straight.

ADAMS —? MS. Cum. Coll.

Hab. —?

STYLIFER.—PLATE I.

Species 6. (Mus. Brit.)

STYLIFER SOLIDA. *Sty. testā subulatā, solidūscula, opacā; spirā altissimā, anfractibus numerosis, apicalibus parvis; apice tortuo; aperturā breviusculā, infrā acuminatā.*

THE SOLID STYLIFER. Shell subulate, rather solid, opaque; spire very high, whorls numerous, apical small; apex tortuous; aperture rather short, acuminate below.

A. ADAMS, MS. Cum. Coll.
Hab. —?

Species 7. (Mus. Brit.)

STYLIFER BAERONI. *Sty. testā breviusculā, spirā acuminatā, anfractibus ultimo et penultimo cylindricis, superne angulatis; aperturā oblongā, infrā subexpansā, columellā crassiuscula.*

BAERON'S STYLIFER. Shell rather short, spire acuminate, last whorl and last but one cylindrical, angular above; aperture oblong, slightly expanded below; columella rather thick.

A. ADAMS. Proc. Zool. Soc. 1854, p. 137.
Hab. —?

Species 8. (Mus. Brit.)

STYLIFER DUBIA. *Sty. testā globosā, spirā productā, pyramidalitā, acuminatā, anfractibus apicibus attenuatis, penultimo subinflatō, ultimo valde inflato, rotundo; aperturā pyriformi, labio extero flexuoso.*

THE DOUBTFUL STYLIFER. Shell globose, spire produced, pyramidal, acuminate, apical whorls attenuated, last but one slightly inflated, last much inflated, rounded; aperture pyriform, outer lip flexuous.

BAIRD, MS. Brit. Mus.
Hab. New Caledonia.

Species 9. (Mus. Brit.)

STYLIFER JAPONICA. *Sty. testā solidūscula, globosā, brevi; spirā productā, attenuatā, acuminatā; ultimo anfractu globoso, aperturā breviusculā, infrā acuminatā, columellā tortuā, solidūscula.*

THE JAPAN STYLIFER. Shell rather solid, globose, short; spire produced, attenuated, acuminate, last whorl globose, aperture rather short, acuminate below; columella tortuous, rather solid.

THE SPECIOUS STYLIFER. Shell subulate, hyaline; spire elevated, styliform attenuated, tortuous above; lower whorls inflated, rather straight-sided; aperture short, columella rather straight.

A. ADAMS. Proc. Zool. Soc. 1868.

Hab. Mauritius.

Species 11. (Mus. Brit.)

STYLIFER ATTENTATA. *Sty. testā angustā pyramidatā, spirā altissimā, apice obliquè distorta, acutissima; anfractibus numerosis, rectilaterialibus, ultimo infra medium subangulato; aperturā angusta, infra acuminata.*

THE ATTENED STYLIFER. Shell narrowly pyramidal, spire very high, apex obliquely distorted, very sharp; whorls numerous, straight-sided, last rather angular below the middle; aperture narrow, acuminate below.

SOWERBY.

Hab. St. Thomas.

Species 12. (Mus. Brit.)

STYLIFER CORALLINA. *Sty. testā pyramidatā, angustiūscula; apice acuminato, obliquè subinclinato; anfractibus quaterdecenī ad suturam subangulatis, aperturā parvā, infra subangulata.*

THE CORALLINE STYLIFER. Shell pyramidal, rather narrow; apex acuminate, slightly inclined obliquely; whorls fourteen, slightly angular at the suture; aperture small, slightly angular below.

CHEMNITZ — :

Hab. — ?

Species 13. (Mus. Brit.)

STYLIFER SUBANGULATA. *Sty. testā pyramidatā, allisimā; apice acuminato, lateraliter obliquè inclinato; anfractibus quaterdecenī, apicalibus angustissimis, ultimo infra medium subangulatis; aperturā ovatā, labio externo supernè sinuatum produtto.*

THE SUBANGULAR STYLIFER. Shell pyramidal, very high, apex acuminate; laterally obliquely inclined; whorls fourteen, apical very narrow, last rather angular below the middle; aperture ovate, outer lip sinuously produced above.

A. ADAMS. Proc. Zool. Soc. 1855, p. 122.

Hab. — ?

Species 14. (Mus. Brit.)

STYLIFER EXARATA. *Sty. testā solidūscula, altā, attenuatā, anfractibus altiūsculis, convexis, obscurè, rugatis ultimo elevato; aperturā subquadratā, parvā columellā rectiūscula.*

THE PLOUGHED STYLIFER. Shell rather solid, high, attenuated, whorls rather high, convex, obscurely wrinkled, last raised; aperture rather square, small; columella rather straight.

A. ADAMS — ?

Hab. — ?

Species 15. (Mus. Brit.)

STYLIFER THOMASÆ. *Sty. testā altissimā, pyramidatā, versus apicem subito contracto, attenuato; apice acuminato, rectiūscula, anfractibus medianis altis, subcylindricis, ultimo obtuse angulato; aperturā obliquā subquadratā, columellā rectiūscula, infra acuminata.*

THE ST. THOMAS STYLIFER. Shell very high, pyramidal, contracted suddenly towards the apex, attenuated; apex acuminate, rather straight, middle whorls high, rather cylindrical, last obtusely angular; aperture obliquely subquadrate, columella rather straight, acuminate below.

SOWERBY.

Hab. Isl. St. Thomas.

STYLIFER.—PLATE II.

Species 16. (Mus. Brit.)

STYLIFER FASTIGIATA. *Sty. testā pyramidalī, ventricosā, subperforatā, altā; spirā acuminatā, apice attenuatā, obliquè inclinato; anfractibus numerosis, converviscalulis, ultimo magno, rotundo; aperturā angustā, columellā tenūi, infrā acuminatā.*

THE SHARP-POINTED STYLIFER. Shell pyramidal, ventricose, slightly perforated, high; spire acuminate, apex attenuated, obliquely bent; whorls numerous, rather convex, last large, round; aperture narrow, columella thin, acuminate below.

A. ADAMS —? MS. Cam. Coll.

Hab. —?

Species 17. (Mus. Brit.)

STYLIFER SUBULATA. *Sty. testā tenuissimā, pellucidā, pyramidalitā, versū apicem subito in stylum contractā et obliquè inclinatā; anfractibus concaviscalulis, ultimo magno, rotundo; aperturā breviscalulis, labio externo suprā medium flexuoso producto.*

THE SUBULATE STYLIFER. Shell very thin, pellucid, pyramidal, suddenly contracted to a style towards the apex, and obliquely bent; whorls rather convex, last large, rounded; aperture rather short, outer lip flexuously produced above the middle.

BRODERIP. Pro. Zool. Soc. 1832, p. 61.

Hab. W. Indies.

Species 18. (Mus. Brit.)

STYLIFER EUDIIFORMIS. *Sty. testā subpedat, breviscalula, spirā pyramidatā, apice attenuatā, acuminata, obliquè distorta; ultimo anfractu magno, rotundo, inflato; aperturā brevi, pyriformi; columellā crassiscalula, labio externo flexuoso.*

THE BULB-SHAPED STYLIFER. Shell rather short, subopaque, spire pyramidal, apex attenuated, acuminate, obliquely distorted; last whorl large, round, inflated; aperture short, pyriform; columella rather thick, outer lip flexuous.

SOWERBY.

Hab. — Isl. St. Thomas.

Species 19. (Mus. Brit.)

STYLIFER GLAURATA. *Sty. testā parvā, albā, politā, ovato-oblongā; aperturā oblongā longitudine spirā aequanti; spirā paucispirali; ultimo anfractu subrotato, elongato; columellā rectiangularē.*

THE POLISHED STYLIFER. Shell small, white, polished, ovate-oblong; aperture oblong, equalling spire in length; spire with few whorls, last whorl subovate, elongated; columella rather straight.

A. ADAMS. (Amaurella) MS. Brit. Mus.

Hab. Japan.

Species 20. (Mus. Brit.)

STYLIFER SEMISTRITATA. *Sty. testā parvā, ovatā, albā, partim tenuissimā striatā; spirā quam aperturā longiorcula, anfractibus quaternis, ultimo ovato, oblonga; aperturā ovalē, breviscalula.*

THE HALF-STRITATED STYLIFER. Shell small, ovate, white, partly very finely striated; spire rather longer than aperture; whorls four, last ovate, oblong; aperture ovate, rather short.

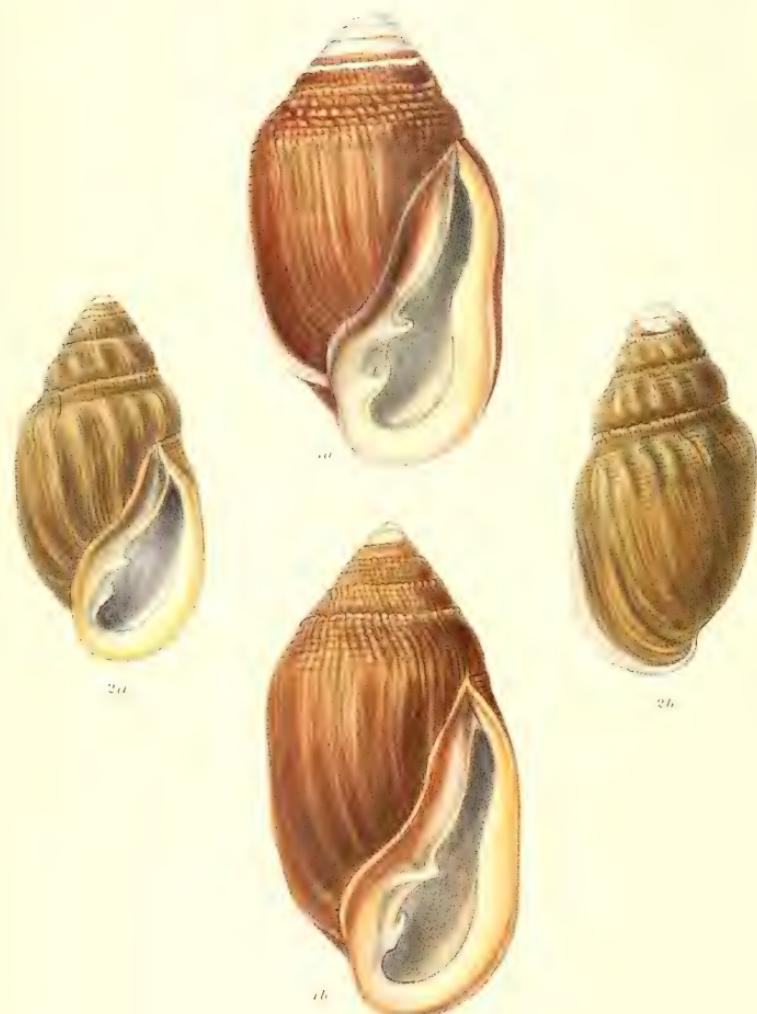

A. ADAMS. (Amaurella) MS. Brit. Mus.

Hab. Japan.

This and the previous species are of very doubtful generic attributes. Quite possibly they may be Styliifers, but on the other hand, they may belong to a different part of the system.

MONOGRAPH
OF THE GENUS
A U R I C U L A.

Nothing we see, but means our good,
As our delight, or as our treasure;
The whole is either our cupboard of food,
Or cabinet of pleasure.—*George Herbert.*

AURICULA.

PLATE I.

Genus AURICULA. Lamarck.

Testa oblonga, breviter spiralis, epidermide fusca induta; aperturā elongatā, margine infrā integrō, labio interno plicato et calloso; labio extero interdūm interne, interdūm ad marginem plicato; operculum nullum.

Shell oblong, briefly spiral, covered with a brown epidermis; aperture elongated, margin entire below, inner lip plaited and callous; outer lip sometimes plaited internally, sometimes at the margin; operculum none.

Including *Ellobium*, *Bolten*; *Cassidula*, *Fer.*; *Plectotrema*, *Adams*; *Alexia*, *Leach*; *Trochaea*, *Gray*; *Maelampus*, *Montf.*; *Marinula*, *King*.

The Auriculae are found in salt-marshes, on mud-banks, among the roots of mangrove-trees, and at the mouths of rivers, principally in tropical countries, particularly those of the eastern hemisphere. China, Borneo, Malacca, the Philippines, and the more southern parts of Australia produce many of the species. A few are found in W. Columbia and the South Sea Islands. The West India Islands produce several well-known species. With regard to the various genera into which the different forms have been divided, it is probable that some of them may be usefully retained, but they are difficult to define, and require entire revision.

Species 1. (Fig. *a*, *b*, Mus. Sowerby.)

AURICULA MIDRE. *Aur. testa magno, cylindrica, crassa, epidermide fusca induta; spira conica, brevi; anfractibus granosis sculptis; ultimo cylindrico, laxe, lateraliiter unicoloriso, rufè suprā infrâque*

granoso; aperturā elongatā, auriformi, medio contracto, labio interno longitudinaliter calloso, infrā biplicato, labio extero crasso, latè planato, cum columellā confluenti.

Malpus' AURICULA. Shell large, cylindrical, thick, covered with a brown epidermis; spire conical, short; whorls sculptured in grains; last cylindrical, smooth, with a lateral varix, coarsely granular above and below. Aperture elongated, ear-shaped, contracted in the middle, inner lip longitudinally callous, with two plaits, outer lip thick, broadly flattened, confluent with columella.

LAMARCK. Nat. Hist. An. s. Vert.

Voluta auris Midre. Linnaeus.

Hab. Indian Seas.

Figures *a* and *b* represent two prevailing forms of this familiar shell.

Species 2. (Fig. *a*, *b*, Mus. Brit.)

AURICULA MALCHI. *Aur. testa oblongo-subovata, epidermide fusca induta, longitudinaliter rugata; spira producta, anfractibus superne subangulatis, distanter nodosa, ad suturam marginatis et crenulatis; aperturā breviuscula, infrā latissulca, columella biplicata; labio crasso, intus declivis.*

MALCHUS' AURICULA. Shell oblong-subovate, covered with a brown epidermis, longitudinally wrinkled; spire produced, whorls somewhat angular above, distantly nodose, bordered and crenulated; aperture rather short, rather broad below; lip thick, sloped within.

MÜLLER. Chemn. Conch. Vol. IX. Pl. CXXI. f. 1037.

AURICULA.

PLATE II.

Species 3. (Mus. Sowerby.)

AURICULA STAGNALIS. *Aur. testâ angustâ, elongatâ, tenui, epidermide pallidâ tenui indutâ; spira productâ, unfractibus quaternis, penultimo alto, convexa, superne granosa, ultimo infra latiuncula, columellâ triplicatâ, labio externo angusto, depresso.*

THE STILL-WATER AURICULA. Shell narrow, elongated, thin, covered with a pale, thin epidermis; spire produced, whorls four, last high, convex, granular above, last rather broad below, columella three-plaited, outer lip narrow, depressed.

D'ORBIGNY. Voy. Amér. Mérid. p. 325, Pl. XLII. f.
7. s

Hab. S. America.

Species 4. (Mus. Brit.)

AURICULA GANGETICA. *Aur. testâ subcylindricâ, tenuiunculâ, epidermide stramineâ tenui indutâ; spira breviunculâ, unfractibus tumidis, subdepressa, ultimo supra aperturam elevata; aperturâ infra subexpansa; columellâ biplicatâ.*

THE GANGES AURICULA. Shell rather cylindrical, rather thin, covered with a thin straw-coloured epidermis; spire rather short, whorls tumid, slightly depressed, last raised above the aperture; aperture slightly expanded below; columella with two plaits.

BENSON. Ann. Mag. Nat. Hist.

Hab. Bombay.

Species 5. (Mus. Brit.)

AURICULA CETYLONICA. *Aur. testâ subcylindricâ, spira breviunculâ, infra subangulatâ, subpyramidalatâ; ultimo unfracta superne latiunculâ, angulatâ; aperturâ elongatâ, angustiunculâ; columellâ biplicatâ, labio externo superne angulatâ.*

THE CEYLON AURICULA. Shell subcylindrical, spire rather short, rather angular below, subpyramidal; last whorl rather broad above, angular; aperture elongated, rather narrow; columella with two plaits; outer lip angular above.

A. ADAMS. Proc. Zool. Soc. 1854, p. 10.

Hab. Ceylon.

Species 6. (Mus. Brit.)

AURICULA TORNATELLINIFORMIS. *Aur. testâ subcylindrica, tenuiunculâ, epidermide tenui pallidâ indutâ; spira pyramidalis, ultimo supernâ tumido, infra subgibbosâ; aperturâ breviunculâ, infra rotundâ, supernâ angulatâ; margine crassâ, planulatâ; columellâ biplicatâ.*

THE TORNATELLA-LIKE AURICULA. Shell subcylindrical, rather thin, covered with a thin, pale epidermis; spire pyramidal, last tumid above, rather gibbos below; aperture rather short, rounded below, slightly angular above; margin thick, flattened; columella two-plaited.

PETIT. Proc. Zool. Soc. 1854, p. 7.

Hab. —?

A peculiar roundness at the confluence of the two sides of the aperture suggests the form of tornatella.

Species 7. (Mus. Brit.)

AURICULA HELVACEA. *Aur. testâ tenui, pallidi rubri; spira brevi, obtusa, ultimo unfracta cylindrica, supernâ tenuiter litatâ; aperturâ infra latiunculâ, columellâ triplicatâ, labio externo angusto, planulato.*

THE PALE RED AURICULA. Shell thin, pale red; spire short, obtuse, last whorl cylindrical, finely ridged above; aperture rather broad below, columella three-plaited, outer lip narrow, flattened.

PHILIPPI. Proc. Zool. Soc. 1854, p. 8.

Hab. Malacca.

Shaped something like *Auricula Juddi*, but without the same solidity of substance and epidermis, and broadness of outer lip.

Species 8. (Mus. Brit.)

AURICULA SEMISCULPTA. *Aur. testâ oblongâ, angustâ, pallida, cylindrica; spira brevi, unfractibus supernâ densè saginatis; aperturâ supernâ angustâ, infra latiunculâ, labio externo angusto, supra medium sinuatum contracto; pliis columellaribus duabus, prominentibus.*

THE HALF-SCULPTURED AURICULA. Shell oblong, narrow, pale, cylindrical; spire short, whorls closely

AURICULA.—PLATE II.

shagreened above; aperture narrow above, rather broad below, outer lip narrow, sinuously contracted above the middle; columellar plaits two, prominent.

A. ADAMS. —?

Hab. Gambier's Island.

The sculpture on the upper part of the whorls is very beautiful, observed through a lens.

Species 9. (Mus. Brit.)

AURICULA DUNKERI. *Aur. testā cylindricā, subpyramidalē, pallidē rubescēti; spirā productā, angustiā subturritis, convexisculis; apertura brevissimā, subpyriformi, margine latissimē planatā, castaneā, columellā trīplāta.*

DUNKER'S AURICULA. Shell cylindrical, rather pyramidal, pale reddish; spire produced, whorls rather turreted, rather convex, aperture rather short, rather pyriform, margin very broadly flattened, chestnut, columella with three plaits.

PFEIFFER. —?

Hab. —?

Species 10. (Mus. Brit.)

AURICULA PALLESCENS. *Aur. testā cylindricā, tenui, pallidē; spirā acuminatā, productā; ultimo angustiā superne angulatā; apertura brevissimā; columellā infreā bispiculatā; labio externo superne angulata, medio et infreā incrassata.*

THE PALE AURICULA. Shell cylindrical, thin, pale; spire acuminated, produced; last whorl angular above; aperture rather short; columella with

two plaits below, outside lip rather angular above, thickened at the middle and under.

PETIT. —? Proc. Zool. Soc. 1854, p. 10.

Hab. —?

Species 11. (Mus. Sowerby.)

AURICULA CHINENSIS. *Aur. testā elongatā, crassā; epidermide levi, crassā pallidē castaneā indutā; spirā productā, convexā, obtusā; apertura brevissimā, columellā crassā, infreā callosā, plieis duabus validis numerū; labio externo crasso, lato, supra medium tumido, suturam versus angulato et sinuato.*

THE CHINESE AURICULA. Shell elongated, thick; covered with a smooth, thick pale chestnut epidermis; spire produced, convex, obtuse; aperture rather short, columella thick, callous below, guarded with two strong plaits; outer lip thick, broad, tumid above the middle, angular and sinuated towards the suture.

PFEIFFER. Proc. Zool. 1854, p. 152.

Hab. Chinese Seas.

Species 12. (Mus. Sowerby.)

AURICULA SUBULA. *Aur. testā elongatā, angustā, olivaceā, tenui; spirā elongatā, attenuatā; apertura brevi, labio externo tenui, columellā infreā subarcuata, truncata.*

THE AWL AURICULA. Shell elongated, narrow, olive, thin; spire elongated, attenuated; aperture short, outer lip thin, columella rather arched below, truncated.

PLATE III.

Species 13. (Mus. Brit.)

AURICULA SACRATA. *Aur. testa cylindrica, angustâ, epidermide fusca, crassa, leviter sulcata indutâ; spira productâ, anfractibus rectilateris, ultimo oblonga; infrâ tumido, subrenato; apertura brevissimâ, angustâ; margine carno, labio externo supra medium inflexo; columella infra crassa, leviter bidentata, prope medium acute undulata.*

THE RAGGED AURICULA. Shell cylindrical, narrow, covered with a brown, thick, slightly grooved epidermis; spire produced, whorls straight-sided, last oblong, swelled, rather truncated below; aperture rather short, narrow; margin flesh-coloured, outer lip bent inwards above the middle; columella thick below, with two slight teeth and one sharp near the middle.

PFEIFFER. Proc. Zool. Soc. 1854, p. 121.

Hab. Bay of Manilla.

Species 14. (Mus. Brit.)

AURICULA SEMPLICATA. *Aur. testa tenui, angustâ, olivacea; spirâ attenuata, elongata; anfractibus supra suturam arcuatum liratis, ultimo medio et infra levigata; apertura brevissimâ, pyriformi, columellâ infra medium plies prominenti armata.*

THE HALF-PLAITED AURICULA. Shell thin, narrow, olive; spire attenuated, elongated; whorls archridged above the suture, last smooth at the middle and below; aperture rather short, pyriform, columella armed with a prominent plait below the middle.

H. and A. ADAMS. MS. Brit. Mus.

Auricula sculpta. —?

Hab. Sandwich Islands, &c.

Distinguished by curved plaits or ridges on the upper part of the whorls.

Species 15. (Mus. Brit.)

AURICULA ELONGATA. *Aur. testa subfusiformi, angustâ, nitenti; spirâ conicâ, subproductâ; apertura*

angustâ, labio externo tenui, labio interno arcuato, infra medium unidentato, ad terminum truncato.

THE ELONGATED AURICULA. Shell rather fusiform, narrow, smooth; spire conical, rather produced; aperture narrow, outer lip thin, inner lip arched, with a single tooth below the middle, truncated at the end.

PARETUS. —? MS. Mus. Brit.

Hab. Mediterranean.

Species 16. (Fig. a, b, Mus. Sowerby.)

AURICULA JUDÆ. *Aur. testa solidâ, oblongo-cylindrica, epidermide fusca, densâ liratâ indutâ; spirâ acuta, obtusa; apertura elongata, supra medium subcontracta; labio interno valido, medio et infra pluris duabus munito; labio externo lato, planato, supra medium tumido, versus suturam angulato et sinuato.*

THE JEWESS'S AURICULA. Shell solid, oblong-cylindrical, covered with a brown, closely-ridged epidermis; spire produced, obtuse; aperture elongated, rather contracted above the middle; inner lip strong, garnished with two teeth above the middle and below; outer lip broad, flattened, swelled above the middle, sinuous and angular towards the suture.

LINNEUS. (*Voluta auris Judæ*)

Hab. India.

Species 17. (Mus. Brit.)

AURICULA INCRASSATA. *Aur. testa crassâ, angustâ, spirâ attenuata, productâ, anfractibus subangulatis, ultimo cylindrica; apertura auriformi, medio sinuatim contracto, margine crassissimo, columellâ biplicata.*

THE THICKENED AURICULA. Shell thick, narrow, spire attenuated, produced; whorls slightly angular, last cylindrical; aperture auriform, sinuously contracted in the middle, margin very thick, columella with two plaits.

AURICULA KRAUSSI. *Aur. testâ fusco-fumosâ, levî, supermâ tenuilâ sulcatâ, ovatâ, spirâ pyramidatâ; ultimo anfractuâ infrâ carinato; aperturâ angustâ, supermâ subdepressâ, labio interno triplicato, labio externo lato, medio prominenter unidentato, supra medianâ angulatum sinuato.*

KRAUSS'S AURICULA. Shell smoky brown, smooth, finely grooved above, ovate, spire pyramidal; last whorl keeled below; aperture narrow, somewhat depressed above, inner lip with three plaita, columella with three plaita, outer lip broad, middle with a prominent tooth, angularly sinuous above the middle.

KÜSTER. Proc. Zool. Soc. 1854. p. 11.

Hab. —?

Species 33. (Mus. Sowerby.)

AURICULA PEPITA. *Aur. testâ obliquè ovalâ, fused; spirâ brevissimâ, anfractibus tribus, rapidè crescentibus, ultimo anguso; aperturâ patulâ, latâ, antice obliquè protractâ, columellâ rectâ sulcâ, dentibus duobus prominentibus albis armata.*

THE PIP AURICULA. Shell obliquely oval, brown; spire rather short, whorls three, quickly increased, last large; aperture patulous, broad, anteriorly obliquely produced, columella rather straight, armed with two prominent white teeth.

KINA. (*Mariolina*). Zool. Journ. Vol. V. p. 34.

Auriacula nigra. Philippi.

Hab. —?

Species 34. (Mus. —? Copied.)

AURICULA AUSTRALIS. *Aur. testâ ovatâ, pallidâ olivaceâ, fusco longitudinaliter strigatâ, medio albomaculatâ, infra spiraliter carinatâ; spirâ productâ, obtusa; aperturâ brevi ovatâ, columellâ triplicatâ, labio externo tenuissimâ.*

THE AUSTRALIAN. Shell ovate, pale olive, longitudinally striped with brown, with a single white band in the middle, spirally keeled below; spire produced, obtuse; aperture short, oval, columella with two plaita, outer lip rather thin.

QUOY. Voy. Astr. Vol. II. p. 169. Pl. XIII. f. 34-38.
Hab. Australia.

Species 35. (Mus. Sowerby.)

AURICULA SULCULOSA. *Aur. testâ caffâ, tenuissimâ striatâ; spirâ brevissimâ, oblongâ, anfractibus rotundatis; labio externo planudato, medio angulatum unidentato, supra medianâ sinuato, labio interno tenui, biplicato, columellâ latâ, concavâ, valdâ unidentato.*

THE SULCATED AURICULA. Shell coffee-coloured, very finely striated; spire rather short, obtuse, whorls rounded; outer lip flattened, with angular tooth at the middle, sinuous above the middle, inner lip thin, two-plaited, columella broad, concave, with one strong tooth.

MOUSSON. Journ. Conch. Paris.

Hab. Port Natal.

Resembles *Auricula decussata*, less angular and with the folds of the outer lip much less produced.

Species 36. (Mus. Sowerby.)

AURICULA SANDWICHENSIS. *Aur. testâ intenâ fuscâ, medio albo cingulatâ, levâ, subcylindrice, infrâ leviter carinatâ, spirâ pyramidatâ, aperturâ brevi, labio interno biplicato; columellâ inconspicuâ uniplicata.*

THE SANDWICH ISLAND AURICULA. Shell deep brown, with a white band in the middle, smooth, sub-cylindrical, slightly keeled below, spire pyramidal, aperture short, inner lip with two plaita; columella with an inconspicuous plait.

EDETOUX.—? Proc. Zool. Soc. 1854. p. 34.

Auriacula Browni. Philippi.

Hab. Sandwich Islands.

Species 37. (Mus. Brit.)

AURICULA BROTIANA. *Aur. testâ badiâ, griseo pallidâ fasciatâ, oculosubglobosâ, utrinque acuminatâ; aperturâ angustâ, dentibus prominentibus acutis utrinque armatâ, columellâ infrâ uniplicata.*

BROT'S AURICULA. Shell bay, banded with pale grey, oval-subglobose, acuminate at each end; aperture narrow, armed on both sides with sharp, prominent teeth, columella with one plait below.

PFEIFFER.—? MS. Brit. Mus.

eylon.

AURICULA.—PLATE V.

Species 38. (Mus. Brit.)

AURICULA ZONATA. *Aur. testā oblongā, conicā, luteā, irvi, fusco-fuscata; spirā pyramidali, brevissimula, ultimo anfractu obtuse angulato; aperturā elongatā, columellā biplicatā, labio externo tenue, intus maculato, transversē plicato.*

THE BANDED AURICULA. Shell oblong, conical, yellowish, smooth, banded with brown; spire pyramidal; rather short, last whorl obtusely angular; aperture elongated, columella with two plaits, outer lip rather thin, spotted inside, with transverse plaits.

MÜHLEFELDT. — ? MS. Brit. Mus.

Auricula monile. Lamarck.

Auricula fasciata. Deshayes.

Voluta flava. Gmel.

Auricula mustellina. Deshayes.

Species 39. (Mus. Sowerby.)

AURICULA QUOYI. *Aur. testā parvā, fusco fasciatā, ovatā, superne acuminatā; spirā productā, pyramidatā; aperturā brevissimula; columellā biplacatā, labio externo tenui.*

QUOY'S AURICULA. Shell small, banded with brown, ovoid, acuminate above; spire produced, pyramidal; aperture rather short; columella with two plaits, outer lip thin.

A. ADAMS. (Laminodonta).

Hab. New Zealand.

Species 40. (Mus. Brit.)

AURICULA OENZA. *Aur. testā angustā, fusiformi, lavi, albā; spirā elata, pyramidatā; aperturā parvā, columellā biplicatā.*

THE RICE AURICULA. Shell narrow, fusiform, smooth, white; spire raised, pyramidal; aperture small, columella with two plaits.

H. & A. ADAMS — ? MS. Brit. Mus.

Hab. — ?

Species 41. (Mus. Brit.)

AURICULA NITIDULA. *Aur. testā parvā, nitenti, castaneā, fasciatā, fusiformi, angustā, spirā elatā, subacuminatā, ultimo anfractu infrā tumidiūsculā; aperturā angustā, labio externo tenui, labio interno biplicato, columellā arcuatā, infrā truncatā.*

THE NEAT LITTLE AURICULA. Shell small, shining, chestnut, banded, fusiform, narrow, spire raised, slightly acuminate, last whorl rather tumid below; aperture narrow, outer lip thin, inner lip with two plaits; columella arched, truncated below.

H. & A. ADAMS — ? MS. Brit. Mus.

Species 42. (Mus. Brit.)

AURICULA COSTELLARIS. *Aur. testā olivaceo-fusca, oblique longitudinaliter costatā, latā, brevi; spira conica, ultimo anfractu breviter cylindrico, infra rariante, infra carinam umbilicata; apertura angusta, labio interno areato, triplicata.*

THE SMALL RIBBED AURICULA. Shell olive-brown, obliquely longitudinally ribbed, broad, short; spire conical; last whorl shortly cylindrical, keeled below, umbilicated below the keel; aperture narrow, inner lip arched, with three plaita.

H. & A. ADAMS. MS. Brit. Mus.
Hab. New Zealand

Species 43. (Mus. Brit.)

AURICULA GLOBOUS. *Aur. testā brevi, ovato-globosa, utrinque acuminata, olivacea, fasciata; apertura angustissima, semilunari; columella biplicata, labio externo levigato.*

THE GLOBE AURICULA. Shell short, ovate-globose, acuminate at each end, olive, banded; aperture very narrow, semilunar; columella with two plaita, outer lip rather thin.

D'ORMIGNY—? MS. Brit. Mus.
Hab. S. America.

Species 44. (Mus. Brit.)

AURICULA STRIATA. *Aur. testā pecti, conica, coffea, spiraliter sulcata, superne tenuer longitudinaliter plicata; spira brevissima; anfractibus ad suturam crenulato-erectis; ultimo infrā angusto, truncato; apertura angusta, labio interno tenui, inconspicue plicata, columella solidè uniplicata, labio externo incrassata, superne angulata.*

THE STRIATED AURICULA. Shell small, conical, coffee-coloured, spirally grooved, finely longitudinally plaited above; spire very short; whorls with a crenulated crest at the suture; last narrow below, truncated; aperture narrow, inner lip thin, inconspicuously plaited, columella with a strong plait, outer lip thickened, angular above.

PEASE—? MS. Brit. Mus.
Hab. South Sea Islands.

Species 45. (Mus. Sowerby.)

AURICULA SULCATA. *Aur. testā subcylindrica, intus fusca, albo angustè trifasciata, superne spirali ter lirata, infra crebre sulcata; spira pyramidata, ultimo anfractu infra obvius cincinato; apertura senectuata, labio interno biplicato, labio externo reflexo, albo, subincrustato.*

THE GROOVED AURICULA. Shell rather cylindrical, deep brown, with three narrow white bands, spirally ridged above, closely grooved below; spire pyramidal, last whorl obtusely keeled below; aperture half-oval, inner lip with two plaita, outer lip reflected, white, rather thickened

H. & A. ADAMS. MS. Brit. Mus.
Auricula Stutchburyi. Pfeiffer.
Hab. New Zealand.

Species 46. (Mus. Brit.)

AURICULA CINGULATA. *Aur. testā subcylindrica, utrinque acuminata, angusta, castaneo-fasciata, spiri fascio-nigrescens, elevata, laterali ter convexa-culata; ultimo anfractu cylindrico; apertura, intus dentata; labio columellar i. sinuata, con-spira uniplicata.*

THE BANDED AURICULA. Shell subcylindrical, acuminate at each end, narrow, banded with chestnut, spire blackish brown, raised, rather convex laterally; last whorl cylindrical; aperture toothed within; columellar lip sinuous below, with a conspicuous plait.

PFEIFFER. MS. Brit. Mus.
Melampus variabilis. Gassies.
Hab. Cuba, New Caledonia.

Species 47. (Mus. Brit.)

AURICULA TABOGENSIS. *Aur. testā conica, fusca, solidà, ventricosa, levii; spira breviter conica; ultimo anfractu infra angustato, acuminato, columella radice biplicata, apertura angusta, intus transversè crebere plicata.*

THE TABOGA AURICULA. Shell conical, brown, solid, ventricose, smooth; spire shortly conical; last whorl narrow below, acuminate, columella

AURICULA.—PLATE VI.

with two strong plaits, aperture narrow, closely transversely plaited within.

C. B. ADAMS. Zool. Proc. 1854. p. 9.
Hab. Jamaica.

Species 48. (Mus. Brit.)

AURICULA UMLASSIANA. *Aur. testá conicá, latissimá, olivaceá, pallidé fusco-fasciatá; spírá brevissimá, subplanata, ultimo anfractu infrá angustissimum; labio interno infrá uniplacato; columellá uniplacata; labio externo int'ōs multiplicato.*

THE UMLASSIAN AURICULA. Shell conical, very broad, olive, banded with pale brown; spire very short, rather flat, last whorl very narrow below; inner lip with one plait below, columella with one plait; outer lip numerously plaited within.

KRAUSS—? MS. Mus. Brit.
Hab. S. Africa.

Species 49. (Mus. Brit.)

AURICULA COSTATA. *Aur. testá castaneá, brevi, ovatá, longitudinaliter costatá, costis obliquis, undulatis, spírá conicá, anfractibus ad suturam cristatá; aperturá semirotundá, marginé crassissimum, labio interno rectiūsculo, marginé quinque-placato; labio externo superne angulatum subsinuato.*

THE RIBBED AURICULA. Shell chestnut, short, ovate, longitudinally ribbed, ribs oblique, undulated, spire conical, whorls crested at the suture; aperture half-oval, margin very thick, inner lip rather straight; margin with five plaits; outer lip rather angularly sinuous above.

QUOY. Voy. Astrolabe. Proc. Zool. Soc. 1854.
Hab. Isl. Masbate, Philippines.

Species 50. (Mus. Brit.)

AURICULA GUNDLACHI. *Aur. testá subconicá, obtusè angulatá, pallidá, fasciis castaneis interruptis plecta; spírá brevissimá, ultimo anfractu infrá subtruncato; aperturá angustá, int'ōs multiplicata; labio interno biplicato.*

GUNDLACH'S AURICULA. Shell rather conical, obtusely angular, pale, painted with interrupted chestnut bands; spire very short, last whorl slightly truncated below; aperture narrow, numerously plaited within; inner lip with two plaits.

PFEIFFER. MS. Brit. Mus.
Hab. Cuba.

Species 51. (Mus. Brit.)

AURICULA OLIVACEA. *Aur. testá convexo-conicá, olivaceá, griseo-fasciatá, fasciis strigatis; spírá brevissimá, ultimo anfractu ventricoso, superne angulato, infrá angustato; labio interno biplicato; labio externo int'ōs multiplicato, ad marginem densè castanea.*

THE OLIVE AURICULA. Shell convexly conical, olive, banded with grey, bands striped; spire very short, last whorl ventricose, angular above, narrow below; inner lip with two plaits; outer lip many-plaited within, deep chestnut at the margin.

CARPENTER. MS. Brit. Mus.
Hab. California.

Species 52. (Mus. Brit.)

AURICULA REDFIELDI. *Aur. testā parvā, conicā, obtusā angulatā, infrā obliquē subtruncatā, albida, castaneo interrumpitā fasciatā; aperturā angustissimā, intū seriatim plicatā; labio interno uniplicato; columellā uniplicatā.*

REDFIELD'S AURICULA. Shell small, conical, obtusely angular, obliquely subtruncated in front, whitish, with interrupted chestnut bands; aperture very narrow, plaited in rows within, inner lip single-plaited, columella single-plaited.

PFEIFFER. MS. Brit. Mus.
Hab. Bermuda.

Species 53. (Mus. Brit.)

AURICULA CAFFRA. *Aur. testā ovato-conicā, olivaceo-fuscā, concolori vel fasciatā; spirā brevissimā; ultimo anfractu ad suturam suberistato, infrā post columellam concavo; columellā uniplicatā; aperturā intū validē plicatā.*

THE CAFFER AURICULA. Shell ovately-conical, olive-brown, uniform or banded; spire very short; last whorl somewhat crested at the suture, concave below, behind the columella; columella with one plait, aperture with strong plaits within.

KÜSTER. Conch. p. 36, Pl. V. f. 6.
Auricula ater. Mühlfeldt.
Hab. S. Africa.

Species 54. (Mus. Brit.)

AURICULA BIDENTA. *Aur. testā ovato-conicā, obtusā, olivaceā, interrumpitā pallidē trifasciatā; spirā brevi, conicā, ultimo anfractu superiō obtusè angulato, infrā acuminato; aperturā angustā, intū edentulā, labio interno bidentato.*

THE DOUBLE-TOOTHED AURICULA. Shell ovate-conical, obtuse, olive, with three pale interrupted bands; spire short, conical; last whorl obtusely angular above; acuminate below; aperture narrow, without teeth inside, inner lip with two teeth.

SAY. Invertebrata of Massachusetts.

Auricula cornuta. Deshayes.
Hab. N. America.

Species 55. (Mus. Brit.)

AURICULA CRISTATA. *Aur. testā subcylindricā, pallidē castanā; spirā brevissimā, ultimo anfractu ad suturam elevatā, tumidā, infrā spirātiler tumidā; aperturā angustā, labio interno triplicato, infrā concavo, ad terminum subtruncato.*

THE CRESTED AURICULA. Shell rather cylindrical, pale chestnut; spire very short, last whorl raised at the suture, tumid, spirally tumid below; aperture narrow, inner lip with three plaits, concave below, rather truncated at the end.

PFEIFFER. MS. Brit. Mus.
Hab. Philippines.

Species 56. (Mus. Brit.)

AURICULA BOREALIS. *Aur. testā conicā, lori, pallidē fulvo fuscā; spirā elevatā, conicā, ultimo anfractu obtusissimā angulatā, prope terminum angustē carinato, labio interno prope medium uniplicato, columellā infrā uniplicatā; labio externo incrassato.*

THE BOREAL AURICULA. Shell conical, smooth, banded with pale brown; spire elevated, conical, last whorl very obtusely angular, narrowly keeled near the end, inner lip with a single plait near the middle, columella with a single plait below; outer lip thickened.

CONRAD. (Melampus.)
Hab. North America.

Species 57. (Mus. Sowerby.)

AURICULA CONIFORMIS. *Aur. testā conicā, luteā, griseo-olivaceo latē fasciatā; spirā brevi, ultimo anfractu obtusē angulato, infrā acuminato, columellā uniplicatā; aperturā intū seriatim plicatā, labio externo tenui, intū fasciatā.*

AURICULA.—PLATE VII.

THE CONE-SHAPED AURICULA. Shell conical, yellow, broadly banded with olive-grey; spire short, last whorl obtusely angular, acuminate below, columella with one fold; aperture with a row of teeth inside, outer lip thin, banded within.

LAMARCK. Anim. s. Vert.

Voluta minuta. Gmel.

Hab. Barbadoes.

Species 58. (Mus. Brit.)

AURICULA LIVIDA. *Aur. testā obsoē, subconicā, griseo-oliveacē; spirā brevissimā, anfractib⁹ novulari⁹, ultimo infrā subtruncatā, post columellam concavā; aperturā striatim denticulatā.*

THE LIVID AURICULA. Shell stout, rather conical, olive-grey, spire very short, whorls spotted, last subtruncated below, concave below the columella; aperture toothed on both sides.

LINNÆUS. Syst. Nat.

Auricula Liberiana? Adams.

Hab. —?

Species 59. (Mus. Brit.)

AURICULA PANAMAENSIS. *Aur. testā elongatā, fusiformi⁹, intensē fuscā, levī, infrā tumidissimā; spirā producti⁹, anfractibus quateris, ultimo oblongu⁹; aperturā auriformi⁹, infrā suberpaosa, medio contractā; labio externo ad medium sinuato; labio interno quadruplicato, columellā infrā rectifasciatā.*

THE PANAMA AURICULA. Shell elongated, fusiform, deep brown, smooth, rather tumid below; spire produced, whorls four, last oblong; aperture auriform, rather expanded below, contracted in the middle; outer lip sinuous in the middle, inner lip with four plaits; columella rather straight.

C. B. ADAMS. Shells of Jamaica.

Hab. Jamaica.

Species 60. (Mus. Brit.)

AURICULA PYRIFORMIS. *Aur. testā conicā, subattenuatā, spirā brevi⁹, subrotundatā, ultimo anfractu⁹ olivaceo pallidē maculata, infrā attenuata, nenuciata, columellā conspicue biplicata.*

THE PYRIFORM AURICULA. Shell conical, rather attenuated, spire short, rather rounded, last whorl

olive with pale spots, attenuated below, attenuated with two conspicuous plaits.

PETIT. Proc. Zool. Soc. 1842, p. 202.

Hab. Tumao, West Columbia.

Species 61. (Mus. Brit.)

AURICULA DENTICULATA. *Aur. testā fulvā, fusiformi⁹; spirā elongatā, pyramidatā, ultimo anfractu⁹ ventricosā, ovato, labio columellari conspicue triplicato, labio externo intus incrassato, obtuse bidentato.*

THE TOOTHED AURICULA. Shell fulvous, fusiform; spire elongated, pyramidal, last whorl ventricose, ovate; columellar lip conspicuously three-plaited, outer lip thickened within, with two conspicuous teeth.

D'ORBIGNY. Voy. Amér. Mérid. Pl. XLII. f. 4, 5.

Hab. Bermuda.

Species 62. (Mus. Brit.)

AURICULA SIAMENSIS. *Aur. testā obtusè conicā, castaneo quadriseriata; spirā brevissimā, ultimo anfractu⁹ superne obtusè angulato, infrā subtruncata; aperturā intus fasciatā, columellā conspicue biplicata; labio externo incrassato.*

THE SIAMESE AURICULA. Shell obtusely conical, with four chestnut bands; spire rather short; last whorl obtusely angular above, slightly truncated below; aperture banded within; columella conspicuously two-plaited; outer lip thickened.

MARTENS. MS. Brit. Mus.

Hab. Siam.

Species 63. (Mus. Brit.)

AURICULA MITRALIS. *Aur. testā oliveriformi⁹, angusti⁹, loci; spirā elevatā, obtusā, concexiācula; ultimo anfractu⁹ cylindrica, pallidē fuscā, superne maculata; aperturā pyriformi⁹, infrā rotundā, columellā brevi⁹, rectā, uniplicata.*

THE MITRE-LIKE AURICULA. Shell olive-shaped, narrow, smooth; spire raised, obtuse, rather convex; last whorl cylindrical, pale brown, spotted above; aperture pyriform, round below; columella short, straight, with one plait.

ADAMS. MS. Brit. Mus.

Hab. Mogadore.
