The U.S. Department of the Interior protects and manages the Nation's natural resources and cultural heritage; provides scientific and other information about those resources; and honors its trust responsibilities or special commitments to American Indians, Alaska Natives, and affiliated Island Communities. The mission of the Department's U.S. Fish and Wildlife Service is working with others to conserve, protect, and enhance fish, wildlife, and their habitats for the continuing benefit of the American people. The Service is responsible for national programs of vital importance to our natural resources, including administration of the Wildlife and Sport Fish Restoration Programs. These two programs provide financial assistance to the States for projects to enhance and protect fish and wildlife resources and to assure their availability to the public for recreational purposes. Multistate grants from these programs fund the National Survey of Fishing, Hunting, and Wildlife-Associated Recreation.

# Foreword

When I was growing up, it was taken as a matter of faith that kids belonged outside. I grew up with 4 brothers, and during those long, hot Atlanta summers, it was common for our mom to holler, “You boys get outside, and don’t come back ‘til it’s dark.” It never occurred to me or my brothers to do anything else in our spare time but explore the world around us. The truth is, we had little else to do. But those experiences – waking up on frosty mornings and starting the campfire, scanning trees for a shot at a scampering gray squirrel in the dawn light, scouring creek beds for crawdads and other fishing bait, or simply of the fun we had tramping through the forest – shaped who I am, and drew me to a career in conservation.

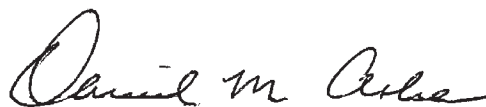

That’s why I’m excited by this 2011 National Survey of Fishing, Hunting, and Wildlife-Associated Recreation. This report, the 12th in a series that began in 1955, documents a significant resurgence in the number of people embracing America’s Great Outdoors. Hunting participation has increased by 9 percent, while angling participation grew by 11 percent. Nearly 38 percent of Americans participated in wildlife-related recreation, an increase of 2.6 million participants from the 2006 Survey.

In addition, wildlife-related recreation is a major driver of the nation’s economy. The 2011 Survey estimates that Americans spent \$145 billion on related gear, trips, licenses, land acquisition or leases, and other purchases, representing about one percent of the nation’s gross domestic product. This spending creates thousands of jobs, supports countless local communities and provides vital funding for conservation.

This year marks the 75th anniversary of the Wildlife and Sport Fish Restoration Program, a cornerstone of wildlife conservation in the United States. Through excise taxes on firearms, ammunition, archery and angling equipment, the U.S. Fish and Wildlife Service has distributed over \$14 billion for State and territorial wildlife conservation programs.

This report would not have been possible without the combined efforts of state wildlife agencies – which provided financial support through the Multi-State Conservation Grant Programs – the Association of Fish and Wildlife Agencies and a number of major national conservation organizations. We also owe our gratitude to the thousands of survey respondents from households across America. Because of you, this Survey is the nation’s definitive wildlife-related recreation database and information source concerning participation and purchases associated with hunting, fishing and other forms of wildlife-associated recreation nationwide.

The Fish and Wildlife Service is dedicated to connecting people and families with nature. We are proud to celebrate the good news in this report, and we look forward to continuing progress as we work with the States, and all our partners and the public to help keep recreational fishing, hunting, and wildlife watching growing and going strong.

Dan Ashe  
Director, U.S. Fish and Wildlife Service

# Survey Background and Method

The National Survey of Fishing, Hunting, and Wildlife-Associated Recreation (Survey) has been conducted since 1955 and is one of the oldest and most comprehensive continuing recreation surveys. The Survey collects information on the number of anglers, hunters, and wildlife watchers, how often they participate, and how much they spend on their activities in the United States.

Preparations for the 2011 Survey began in 2008 when the Association of Fish and Wildlife Agencies (AFWA) asked the Fish and Wildlife Service to coordinate the twelfth National Survey of wildlife-related recreation. Funding came from the Multistate Conservation Grant Programs, authorized by Wildlife and Sport Fish Restoration Acts, as amended.

Four regional technical committees were set up under the auspices of AFWA to ensure that State fish and wildlife agencies had an opportunity to participate in all phases of survey planning and design. The committees were made up of agency representatives.

We consulted with State and Federal agencies and nongovernmental organizations such as the American Sportfishing Association and National Shooting Sports Foundation to determine survey content. Other sportspersons' organizations and conservation

groups, industry representatives, and researchers also provided valuable advice.

Data collection for the Survey was carried out in two phases by the U.S. Census Bureau. The first phase was the screen which began in April 2011. During the screening phase, the Census Bureau interviewed a sample of 48,600 households nationwide, to determine who in the household had fished, hunted, or wildlife watched in 2010, and who had engaged or planned to engage in those activities in 2011. In most cases, one adult household member provided information for all members. The screen primarily covered 2010 activities while the next, more in-depth phase covered 2011 activities. For more information on the 2010 data, refer to Appendix B.

The second phase of data collection consisted of three detailed interview waves. The first wave began in April 2011 concurrent with the screen, the second in September 2011, and the last in January 2012. Interviews were conducted with samples of likely anglers, hunters, and wildlife watchers who were identified in the initial screening phase. Interviews were conducted primarily by telephone, with in-person interviews for respondents who could not be reached by phone. Respondents in the second survey phase were limited to those who were

at least 16 years old. Each respondent provided information pertaining only to his or her activities and expenditures. Sample sizes were designed to provide statistically reliable results at the state level. Altogether, interviews were completed for 11,330 anglers and hunters and 9,329 wildlife watchers. More detailed information on sampling procedures and response rates is found in Appendix D.

## Comparability With Previous Surveys

The 2011 Survey's questions and methodology were similar to those used in the 2006, 2001, 1996, and 1991 Surveys. Therefore, the estimates are comparable.

The methodology for these Surveys differs significantly from the 1955 to 1985 Surveys, so these estimates are not directly comparable to those of earlier surveys. Changes in methodology included reducing the recall period over which respondents had to report their activities and expenditures. Previous Surveys used a 12-month recall period which resulted in greater reporting bias. Research found that the amount of activity and expenditures reported in 12-month recall surveys was overestimated in comparison with that reported using shorter recall periods.

# *Highlights*

# Introduction

The National Survey of Fishing, Hunting, and Wildlife-Associated Recreation reports results from interviews with U.S. residents about their fishing, hunting, and wildlife watching. This report focuses on 2011 participation and expenditures of persons 16 years of age and older.

However, in addition to 2011 numbers, we also provide trend information in the Highlights sections and Appendix C of the report. The 2011 numbers reported can be compared with those in the 1991, 1996, 2001, and 2006 Survey reports because they used similar methodologies. However, the 2011 estimates should not be directly compared with results from Surveys conducted earlier than 1991 because of changes in methodology to improve accuracy.

The report also provides information on participation in wildlife-related recreation in 2010, particularly of persons 6 to 15 years of age. The 2010 information is provided in Appendix B. Information about the scope and coverage of the 2011 Survey can be found in Appendix D. The remainder of this section defines important terms used in the Survey.

## Wildlife-Related Recreation

Wildlife-related recreation is fishing, hunting, and wildlife-watching activities. These categories are not mutually exclusive because many individuals participated in more than one activity. Wildlife-related recreation is reported in two major categories: (1) fishing and hunting, and (2) wildlife watching, which includes observing, photographing, and feeding fish or wildlife.

## Fishing and Hunting

This Survey reports information about residents of the United States who fished or hunted in 2011, regardless of whether they were licensed. The fishing and hunting sections report information for three groups: (1) sportspersons, (2) anglers, and (3) hunters.

## Sportspersons

Sportspersons are those who fished or hunted. Individuals who fished or hunted commercially in 2011 are reported as sportspersons *only* if they also fished or hunted for recreation. The sportspersons group is composed of the three subgroups shown in the diagram below: (1) those that fished and hunted, (2) those that only fished, and (3) those that only hunted.

The total number of sportspersons is equal to the sum of people who only fished, only hunted, and both hunted and fished. It is not the sum of all anglers and all hunters because those people who both fished and hunted are included in both the angler and hunter population and would be incorrectly counted twice.

## Sportspersons

## Anglers

Anglers are sportspersons who only fished plus those who fished and hunted. Anglers include not only licensed hook and line anglers, but also those who have no license and those who use special methods such as fishing with spears. Three types of fishing are reported: (1) freshwater, excluding the Great Lakes, (2) Great Lakes, and (3) saltwater. Since many anglers participated in more than one type of fishing, the total number of anglers is less than the sum of the three types of fishing.

## Hunters

Hunters are sportspersons who only hunted plus those who hunted and fished. Hunters include not only licensed hunters using rifles and shotguns, but also those who have no license and those who engage in hunting with archery equipment, muzzleloaders, other primitive firearms, or pistols or handguns.

Four types of hunting are reported: (1) big game, (2) small game, (3) migratory bird, and (4) other animals. Since many hunters participated in more than one type of hunting, the sum of hunters for big game, small game, migratory bird, and other animals exceeds the total number of hunters.

## Wildlife Watchers

Since 1980, the National Survey has included information on wildlife-watching activities in addition to fishing and hunting. However, unlike the 1980 and 1985 Surveys, the National Surveys since 1991 have collected data only for those activities where the *primary* purpose was wildlife

watching (observing, photographing, or feeding wildlife).

The 2011 Survey uses a strict definition of wildlife watching. Participants must either take a “special interest” in wildlife around their homes or take a trip for the “primary purpose” of wildlife watching. Secondary wildlife watching, such as incidentally observing wildlife while pleasure driving, is not included.

Two types of wildlife-watching activity are reported: (1) away-from-home (formerly nonresidential) activities and (2) around-the-home (formerly residential) activities. Because some people participated in more than one type of wildlife watching, the sum of participants in each type will be greater than the total number of wildlife watchers. Only those engaged in activities whose

*primary* purpose was wildlife watching are included in the Survey. The two types of wildlife-watching activity are defined below.

### **Away-From-Home**

This group includes persons who took trips or outings of at least 1 mile from home for the primary purpose of observing, feeding, or photographing fish and wildlife. Trips to fish or hunt or scout and trips to zoos, circuses, aquariums, and museums are not considered wildlife-watching activities.

### **Around-The-Home**

This group includes those who participated within 1 mile of home and involves one or more of the following: (1) closely observing or trying to identify birds or other wildlife; (2) photo-

graphing wildlife; (3) feeding birds or other wildlife; (4) maintaining natural areas of at least 1/4 acre where benefit to wildlife is the primary concern; (5) maintaining plantings (shrubs, agricultural crops, etc.) where benefit to wildlife is the primary concern; or (6) visiting parks and natural areas within 1 mile of home for the primary purpose of observing, feeding, or photographing wildlife.

### **State-Level Estimates**

Only national-level estimates are included in this report. State-level estimates are available in the state reports which will be issued alphabetically, beginning in early 2013.

# Summary

The 2011 Survey revealed that over 90 million U.S. residents 16 years old and older participated in wildlife-related recreation. During that year, 33.1 million people fished, 13.7 million hunted, and 71.8 million participated in at least one type of wildlife-watching activity including observing, feeding, or photographing fish and other wildlife in the United States.

The focus of the National Survey is to estimate participation and expenditures of persons 16 years old and older in a single year. These estimates are based on data collected in the detailed phase of the 2011 Survey. They are comparable to the estimates of the 1991, 1996, 2001, and 2006 Surveys but not to earlier Surveys because of changes in methodology. A complete explanation is in Appendix C.

While the focus of the Survey is to estimate wildlife-related recreationists 16 years and older and their associated expenditures in a single year, information collected in the Survey screen can be used to estimate the number of anglers and hunters who were active over a five-year window of time. Because many do not participate every year, the following estimates may be more representative of the number of individuals considered to be anglers and hunters in the United States: 49.5 million individuals fished and 19.7 million hunted over the five-year period from 2007 to 2011.

The Survey screen also provides some information about 6- to 15-year olds' participation which was calculated by using data from the Survey screen. Assuming their proportions of participation were the same in 2011 as in 2010, the following estimates were calculated: Of the 6- to 15-year-olds in the U.S., 1.8 million hunted, 8.5 million fished, and 11.7 million wildlife

watched in 2011. More information about this age group is provided in Appendix B. For the rest of this report all information pertains to participants 16 years old and older, unless otherwise indicated.

There was a considerable overlap in activities among anglers, hunters, and wildlife watchers. In 2011, 69 percent of hunters also fished, and 28 percent of anglers hunted. In addition, 51 percent of anglers and 57 percent of hunters wildlife watched, while 29 percent of all wildlife watchers reported hunting and/or fishing during the year. Wildlife recreationists' avidity also is reflected in the \$144.7 billion they

spent in 2011 on their activities, which equated to 1 percent of the Gross Domestic Product. Of the total amount spent, \$49.5 billion was trip-related, \$70.4 billion was spent on equipment, and \$25.1 billion was spent on other items such as licenses and land leasing and ownership.

Sportspersons spent a total of \$89.8 billion in 2011—\$41.8 billion on fishing, \$33.7 billion on hunting, and \$14.3 billion on items used for both hunting and fishing. Wildlife watchers spent \$54.9 billion on their activities around the home and on trips away from home.

## Total Wildlife-Related Recreation

Participants . . . . .	90.1 million
Expenditures . . . . .	\$144.7 billion

### Sportspersons

Total participants* . . . . .	37.4 million
Anglers . . . . .	33.1 million
Hunters . . . . .	13.7 million

Total days . . . . .	836 million
Fishing . . . . .	554 million
Hunting . . . . .	282 million

Total expenditures . . . . .	\$89.8 billion
Fishing . . . . .	41.8 billion
Hunting . . . . .	33.7 billion
Unspecified . . . . .	14.3 billion

### Wildlife-watchers

Total participants** . . . . .	71.8 million
Around the home . . . . .	68.6 million
Away from home . . . . .	22.5 million

Total expenditures . . . . .	\$54.9 billion
------------------------------	----------------

\* 9.4 million both fished and hunted.

\*\* 19.3 million wildlife watched both around the home and away from home.

## Expenditures for Wildlife-Related Recreation

(Total expenditures: \$144.7 billion)

### Expenditures by Sportspersons

(Total expenditures: \$89.8 billion)

### Expenditures by Wildlife-Watching Participants

(Total expenditures: \$54.9 billion)

## Fishing and Hunting

In 2011, 37.4 million U.S. residents 16 years old and older went fishing and/or hunting. This includes 33.1 million who fished and 13.7 million who hunted—9.4 million both fished and hunted.

In 2011, expenditures by sportspersons totaled \$89.8 billion. Trip-related expenditures, including those for food, lodging, and transportation, were \$32.2 billion—36 percent of all fishing and hunting expenditures. Total equipment expenditures amounted to \$43.2 billion, 48 percent of the total. Other expenditures—magazines, membership dues, contributions, land leasing and ownership, and licenses, stamps, tags, and permits—accounted for \$14.3 billion, or 16 percent of all sportspersons' expenditures.

## Wildlife-Watching Recreation

Observing, feeding, or photographing wildlife was enjoyed by 71.8 million people 16 years old and older in 2011. Of this group, 22.5 million people took trips away from home for the purpose of enjoying wildlife, while 68.6 million stayed within a mile of home to participate in wildlife-watching activities.

In 2011, wildlife watchers spent \$54.9 billion. Trip-related expenses, including food, lodging, and transportation, totaled \$17.3 billion, 31 percent of all expenditures. A total of \$27.2 billion was spent on equipment, 49 percent of all wildlife-watching expenses. The remaining \$10.5 billion, 19 percent of the total, was spent on magazines, membership dues and contributions made to conservation or wildlife-related organizations, land leasing and owning, and plantings.

## 2006 and 2011 Comparison

A five-year comparison of estimates from 2006 to 2011 shows a 3 percent increase in the total number of people, 16 years of age and older, participating in wildlife recreation activities in the United States. The increase was primarily among those who fished and hunted.

Sportspersons rose from 33.9 million in 2006 to 37.4 million in 2011, and expenditures rose from \$85.5 billion (in 2011 dollars) in 2006 to \$89.8 billion in 2011.

In 2011, 33.1 million fished and 13.7 million hunted compared with 30.0 million who fished and 12.5 million who hunted in 2006. Although overall expenditures on fishing declined, expenditures for fishing equipment and trips were stable in 2011 compared to 2006. Expenditures for hunting

equipment (firearms, ammunition, archery equipment, etc.) increased by 17 percent and for trips by 40 percent. The increase in sportspersons' expenditures was largely due to trip-related expenses, which went up 18 percent.

Equipment expenditures went down 5 percent. From 2006 to 2011 the number of wildlife watchers and their expenditures did not change significantly.

### 2006–2011 Wildlife-Associated Recreation Comparison of Participants

# *Fishing*

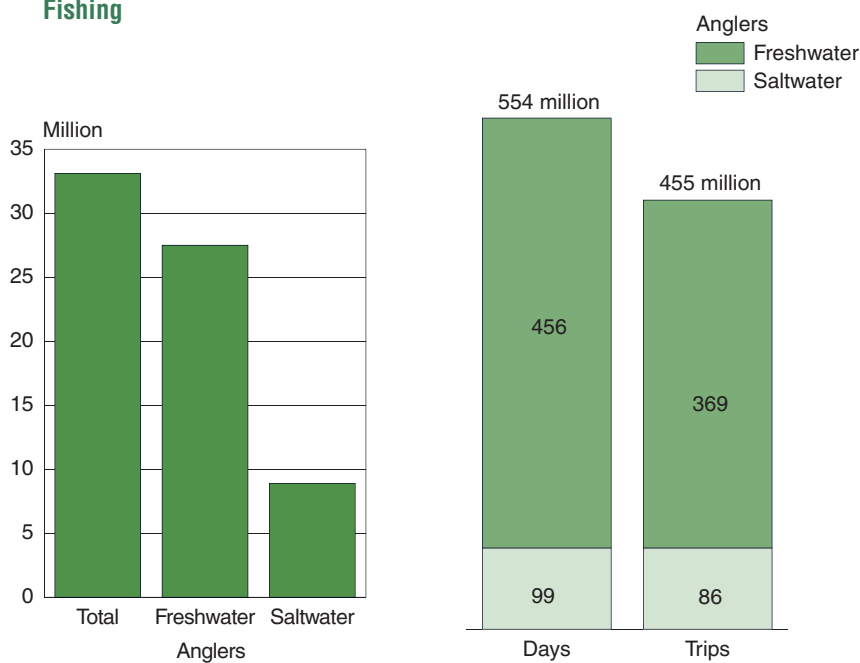

# Fishing Highlights

In 2011, 33.1 million U.S. residents 16 years old and older enjoyed a variety of fishing opportunities throughout the United States. Anglers fished 554 million days and took 455 million fishing trips. They spent \$41.8 billion

in fishing-related expenses during the year. Freshwater anglers numbered 27.5 million. They fished 456 million days and took 369 million trips to freshwater in 2011. Freshwater anglers spent \$25.7 billion on freshwater fishing trips and

equipment. Saltwater fishing attracted 8.9 million anglers who enjoyed 86 million trips on 99 million days. They spent \$10.3 billion on their trips and equipment.

## Fishing

## Fishing Expenditures

Anglers spent \$41.8 billion in 2011 including \$21.8 billion on travel-related items—52 percent of all fishing expenditures. Food and lodging accounted for \$7.7 billion, 35 percent of all trip-related costs. Spending on transportation totaled \$6.3 billion, 29 percent of trip-related expenditures. Other trip expenditures such as land use fees, guide fees, equipment rental, boating expenses, and bait cost anglers \$7.8 billion—36 percent of all trip expenses.

Fishing equipment expenditures totaled \$15.5 billion, 37 percent of all fishing expenditures. Anglers spent \$6.1 billion on fishing equipment such as rods, reels, tackle boxes, depth finders, and artificial lures and flies. This amounted to 40 percent of all equipment expenditures. Auxiliary equipment expenditures, which include camping equipment, binoculars, and special fishing clothing, totaled \$1.1 billion—7 percent of equipment costs. Expenditures for special equipment such as boats, vans, and cabins were \$8.3 billion—53 percent of all equipment costs.

Anglers also spent a considerable amount on other fishing-related items, such as land leasing and ownership, membership dues, contributions, licenses, stamps, and permits. Land leasing and ownership spending totaled \$3.4 billion, which is 8 percent of all expenditures. Expenditures on magazines, books, DVDs, membership dues and contributions, licenses, stamps, tags, and permits were \$1.1 billion.

## Freshwater Fishing Highlights

Freshwater fishing was the most popular type of fishing. In 2011, 27.5 million Americans fished 456 million days and took 369 million trips. Their expenditures for trips and equipment totaled \$25.7 billion for the year. Freshwater fishing can be separated into Great Lakes and freshwater other than the Great Lakes.

There were 27.1 million anglers who fished for 443 million days on 354 million trips to freshwater other than the Great Lakes. Trip and equipment expenditures for non-Great Lakes freshwater fishing totaled \$23.8 billion for an average of \$879 per angler for the year. Food and lodging comprised \$5.0 billion, 37 percent of total expenditures. Transportation costs were \$4.5 billion or 33 percent of trip costs. Other trip expenses, which include guide fees, equipment rental, and bait were \$4.0 billion for 30 percent.

(Total expenditures: \$25.7 billion)

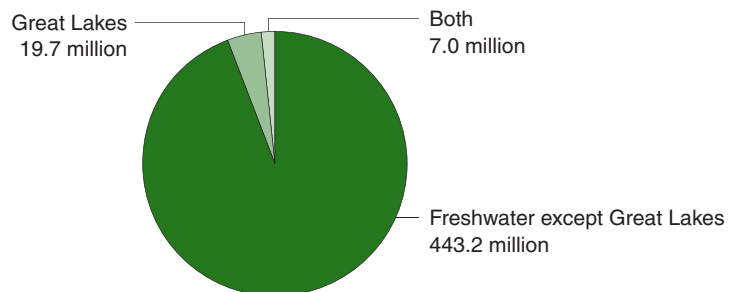

### Freshwater Fishing

### Days

(Total: 455.9 million)

### Trips

(Total: 368.8 million)

Note: Detail does not add to total because of multiple responses and nonresponse.

## Freshwater Fishing Expenditures

Anglers spent over \$10.4 billion on equipment for non-Great Lakes freshwater fishing. Expenditures for fishing equipment, such as rods and reels, tackle boxes, depth finders, and artificial lures and flies, totaled \$4.0 billion. Expenditures for auxiliary equipment such as binoculars and camping equipment were \$560 million. Expenditures for special equipment such as boats, vans, and cabins accounted for \$5.9 billion.

There were 1.7 million people who fished almost 20 million days on 15 million trips to the Great Lakes in 2011. Their Great Lakes-related expenditures totaled \$1.9 billion for an average of \$1,121 per angler for the year. Trip-

related expenditures totaled \$1.1 billion. Of these expenditures, \$374 million was spent on food and lodging, 34 percent of trip costs; \$252 million was spent on transportation, 23 percent of trip costs; and \$465 million, or 43 percent, was spent on other items such as guide fees, equipment rental, and bait. Equipment expenditures totaled \$777 million. Of this \$777 million, \$223 million was for fishing equipment (rods, reels, etc.), \$83 million was for auxiliary equipment (camping equipment, binoculars, etc.) and \$471 million was for special equipment (boats, vans, etc.).

## Saltwater Fishing Highlights

In 2011, 8.9 million anglers enjoyed saltwater fishing on 86 million trips

totaling 99 million days. Overall, they spent \$10.3 billion during the year on trips and equipment. Of their expenditures, trip-related costs garnered the largest portion, \$7.3 billion. Food and lodging cost \$2.4 billion, 32 percent of trip expenditures; transportation costs totaled \$1.5 billion, 21 percent of trip costs; and other trip costs such as equipment rental, bait, and guide fees were \$3.4 billion.

Anglers spent a total of \$2.9 billion on equipment for saltwater fishing. Of the \$2.9 billion, \$1.4 billion was for fishing equipment (rods, reels, etc.), \$217 million for auxiliary equipment (camping equipment, binoculars, etc.), and \$1.3 billion for special equipment (boats, vans, etc.).

### Comparative Trip and Equipment Expenditures

### Comparative Fishing by Type of Fishing

### Comparative Fishing Highlights

In 2011, anglers spent an average of 17 days fishing and took an average of 14 fishing trips. Freshwater, non-Great Lakes anglers averaged 16 days fishing and 13 trips while Great Lakes anglers averaged 12 days fishing and 9 trips. Saltwater anglers fished fewer days on average, 11, and averaged 10 trips.

Overall, anglers spent an average of \$1,262 on fishing-related expenses in 2011. They averaged \$658 per angler for their trip-related costs, a daily average of \$39. Freshwater anglers, excluding the Great Lakes, averaged \$494 per participant for their trips in 2011, equaling \$30 per day. Great Lakes anglers spent an average of \$655 on trip-related expenses, \$55 per day. Saltwater anglers experienced the highest average expenditure amount at \$824, an average of \$74 per day.

### Fishing for Selected Fish

The most popular fish species among the 27.1 million anglers who fished freshwater, other than the Great Lakes, was black bass. More than 10.6 million participants spent 171 million days fishing for black bass. Panfish were sought by 7.3 million anglers on 97 million days. Trout fishing attracted 7.2 million anglers on 76 million days. Catfish and bullheads drew 7.0 million anglers on 96 million days. Over 6.1 million anglers fished for crappie on 102 million days. Nearly 4.4 million anglers fished for white bass and striped bass on 61 million days. Freshwater anglers also commonly fished for walleye, northern pike, sauger, salmon, and steelhead.

In 2011, 1.7 million anglers fished the Great Lakes. Walleye and sauger, the most commonly sought fish for these waters, attracted 584 thousand anglers, fishing nearly 6 million days. Black bass attracted 559 thousand anglers who fished for them 5 million days. Perch, another popular fish, was fished for by 497 thousand anglers for 6 million days. Salmon drew 379 thousand anglers for almost 3 million days of fishing. Great Lakes anglers also commonly fished for northern

### Selected Fish by Type of Fishing

Salmon	0.7	4

\* Estimate based on a sample size of 10–29.

Source: Tables 3, 4, and 5.

pike, pickerel, and muskie, as well as steelhead and lake trout.

Among the nearly 8.9 million saltwater anglers, 2.1 million fished for striped bass for 18 million days. Two million anglers fished for flatfish, which includes flounder and halibut, on 22 million days. Also popular were red drum (redfish) and sea trout (weakfish) with 1.5 million and 1.1 million anglers who fished for 21 million and 15 million days, respectively. Other prominent saltwater species sought were mackerel with 650 thousand anglers, tuna with 564 thousand anglers, and mahi mahi (dolphinfish) with 538 thousand anglers.

### Participation by Geographic Region

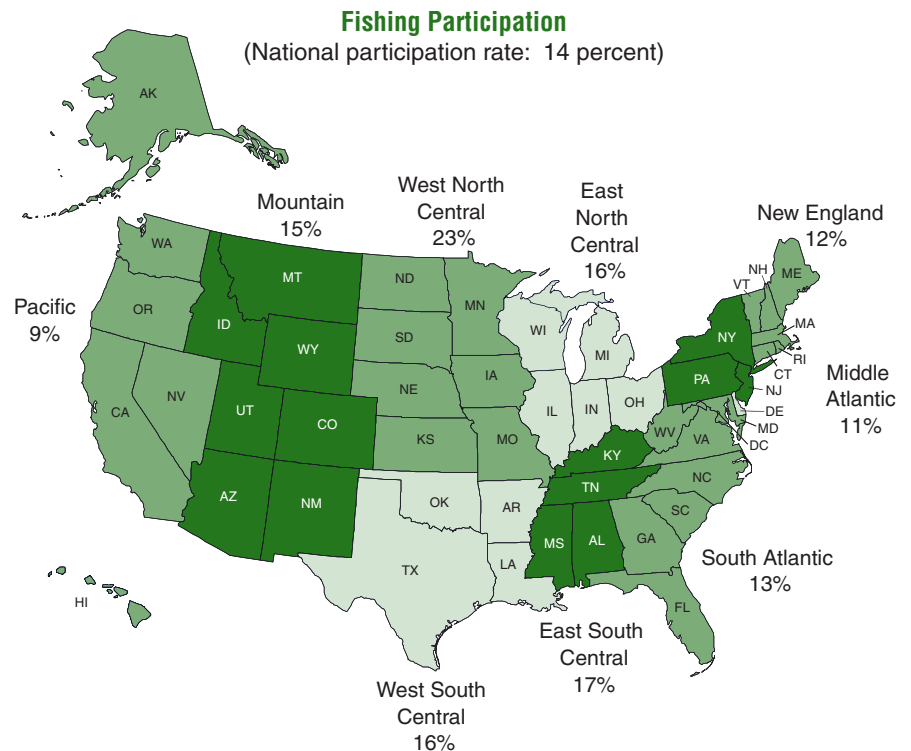

In 2011, 239 million people 16 years old and older lived in the United States and 1 in 7 of these U.S. residents went fishing. While the national participation rate was 14 percent, the regional rates ranged from 9 percent in the Pacific to 23 percent in the West North Central Region. The West North Central, East North Central, East South Central, West South Central, and Mountain Regions all reported participation rates above the national rate. The Middle Atlantic, South Atlantic, New England, and Pacific Regions fell below the national rate.

### Fishing in State of Residence and in Other States

A large majority of the 33.1 million anglers who fished in 2011 did so within their home state. Approximately 30.0 million participants, 91 percent of all anglers, fished in their resident state. Nearly 7.0 million, 21 percent, fished out-of-state. Percentages do not add to 100 because those anglers who fished both in-state and out-of-state were included in both categories.

Of the 27.1 million non-Great Lakes anglers, 92 percent, 24.9 million, fished within their resident state. Over 4.5 million, 17 percent, of these freshwater anglers fished out-of-state.

Ninety-two percent, 1.5 million, of all Great Lakes anglers enjoyed fishing

**Percent of All Fishing in State of Residence and in Other States**  
(Total: 33.1 million participants)

within their home state in 2011. Thirteen percent, 224 thousand, of all Great Lakes anglers fished out-of-state.

Of the three different types of fishing, saltwater fishing had both the highest percentage of anglers fishing outside their resident state, 31 percent, and the lowest percentage fishing within their resident state, 74 percent. Nonresident saltwater anglers numbered 2.8 million and resident anglers 6.6 million.

### Types of Freshwater Fished, Excluding Great Lakes (In millions)

### Types of Freshwater Fished, Excluding Great Lakes

Excluding the Great Lakes, 84 percent or 22.8 million of all freshwater anglers fished in reservoirs, lakes, and ponds. 44 percent or 11.9 million fished in rivers and streams. They spent 336 million days fishing in lakes, reservoirs, and ponds and 148 million days fishing in rivers and streams.

### Great Lakes Anglers

Great Lakes fishing includes not only the Great Lakes, but also their tributaries—bodies of water that connect the Great Lakes, and the St. Lawrence River south of the bridge at Cornwall. The most popular of the Lakes among anglers was Lake Erie, attracting 38 percent of all Great Lakes anglers. They averaged 13 days of fishing in Lake Erie during 2011. Lake Michigan ranked second in popularity, hosting 25 percent of Great Lakes anglers with an average of 6 days per angler. Lake Huron attracted 16 percent of Great Lakes anglers for an average of 17 days per angler. Lake Superior drew 9 percent, as did Lake Ontario, of all Great Lakes fishing in 2011. Anglers fished an average of 15 days in Lake Ontario and 10 days in Lake Superior. The tributaries to the lakes drew 10 percent, 159 thousand anglers, who averaged 8 days of fishing there.

### Great Lakes Fishing

## Sex and Age of Anglers

Although more men than women fished in 2011, a substantial number of women, 8.9 million, fished. Approximately 21 percent of all males 16 years old and older went fishing, while 7 percent of all females fished. Of the 33.1 million anglers who fished in the United States, 73 percent, 24.2 million, were male and 27 percent were female.

Of the age categories, 7.4 million anglers were 45 to 54 years old. They composed 22 percent of all anglers and had a participation rate of 16 percent. The 25- to 34-year-old age group accounted for 6.1 million anglers, 19 percent of all anglers. They had 15 percent participation. Six million anglers, 18 percent of all anglers, were 35 to 44 years old. Their participation rate was 15 percent of the U.S. population in that age group. The 5.9 million 55- to 64-year-olds who fished comprised 18 percent of all anglers and had a participation rate of 15 percent. The 2.7 million anglers 18 to 24 years old made up 8 percent of the angler population, and had a participation rate of 10 percent. Anglers 75 and older numbered 1.0 million, 3 percent of all anglers, and had a participation rate of 7 percent. The 16- and 17-year-olds added 942 thousand individuals to the angler population. They made up 3 percent of all anglers, and had a 12 percent participation rate.

Percent of Males and Females Who Fished in the United States

Percent of Anglers by Sex

Percent of Anglers by Age

Percent of U.S. Population Who Fished by Age

### Percent of Anglers by Residence

(Angler population: 33.1 million)

### Metropolitan and Nonmetropolitan Anglers

While residents of metropolitan statistical areas (MSA)<sup>1</sup> had lower participation rates in fishing than non-MSA residents, they still accounted for the majority of anglers. Thirteen percent of all MSA residents fished in 2011, but they composed 89 percent of all anglers. By comparison, non-MSA residents composed 11 percent of all anglers, but their participation rate was almost twice as high at 24 percent.

Larger MSAs had lower participation rates in fishing than smaller MSAs but composed more of the angler population. Large MSAs with populations of 1,000,000 or more had the lowest participation rate at 10 percent, but they made up 38 percent of all anglers. Medium MSAs with a population of 250,000 to 999,999 had a 15 percent participation rate and made up 21 percent of all anglers. Those MSAs with a population from 50,000 to 249,999 had a participation rate of 20 percent and composed 29 percent of all anglers.

### Percent of U.S. Population Who Fished by Residence

(Total U.S. population that fished: 14 percent)

### Percent of U.S. Population Who Fished by Household Income

### Household Income of Anglers

The participation rate in fishing tended to increase as household income increased. The participation rate is the percent of each income group that fished. The rate of those who reported incomes of \$75,000 to \$99,999 was the highest at 19 percent. Those with incomes of \$50,000 to \$74,999 and \$100,000 to \$149,999 had a slightly lower rate of 17 percent. Generally, the participation rate declined as income decreased with exception of those with incomes of \$150,000 or more which had the same participation rate, 16 percent, as those with incomes of \$40,000 to \$49,999. Those with incomes of \$25,000 to \$39,999 had a 13 percent participation rate. Those with incomes under \$20,000 had the lowest participation rate at 11 percent.

<sup>1</sup> See Appendix A for definition of metropolitan statistical area.

The majority of anglers had household incomes of \$50,000 or more. Among anglers who reported income, 60 percent were from households with incomes of \$50,000 or more and 40 percent were from households with incomes less than \$50,000.

### Education, Race and Ethnicity

People of all educational backgrounds had similar participation rates. Those with 11 years of education or less had a participation rate of 12 percent. Those with 12 years of education had a participation rate of 13 percent. Those with 1 to 4 years of college had the highest participation rate at 15 percent. The second highest participation rate, 14 percent, was held by those with 5 years or more of college.

While the highest participation rate is among those with 1 to 4 years of college, participants with 12 years of education made up the largest share of anglers. Thirty-two percent, 10.5 million anglers, had 12 years of education.

#### Percent of U.S. Population Who Fished by Education

#### Percent of Anglers by Race

#### Percent of U.S. Population Who Fished by Race

#### Percent of U.S. Population Who Fished by Ethnicity

Fishing was most popular among Whites and African Americans. Whites participated at a 16 percent rate and African Americans participated at a 10 percent rate. Other races, which include Native Americans, Pacific Islanders, and those of mixed race, participated at a 7 percent rate. Asian Americans participated at a 6 percent rate. Of all anglers, 86 percent were White, 7 percent were African American, 5 percent were other races, and 2 percent were Asian Americans.

### 2001–2011 Comparison of Fishing Activity

In 2011 the number of people fishing was 11 percent higher than in 2006.

Specifically, participation in freshwater, except Great Lakes, and saltwater fishing were up significantly, 8 and 15 percent, respectively. The number of Great Lakes anglers did not undergo a significant change. Days fishing, however, did not have statistically significant changes for any type of fishing, which means average days per freshwater, except Great Lakes, and Great Lakes anglers were slightly down. Expenditures for trip-related items and equipment decreased 11 percent overall, primarily due to a 41 percent drop in big-ticket special equipment such as cabins and boats.

Comparing fishing in 2011 to that in 2001, there was no significant differ-

ence in either the number of participants or days for any type of fishing. The drop in fishing from 2001 to 2006 was reversed across the board by the increase from 2006 to 2011. Total expenditures also did not change significantly, although when expenditures are broken down into its two components, trip-related and equipment items, there were differences. Anglers spent significantly more in 2011 for trip-related expenses and less for equipment purchases, particularly the big-ticket items.

# *Hunting*

# Hunting Highlights

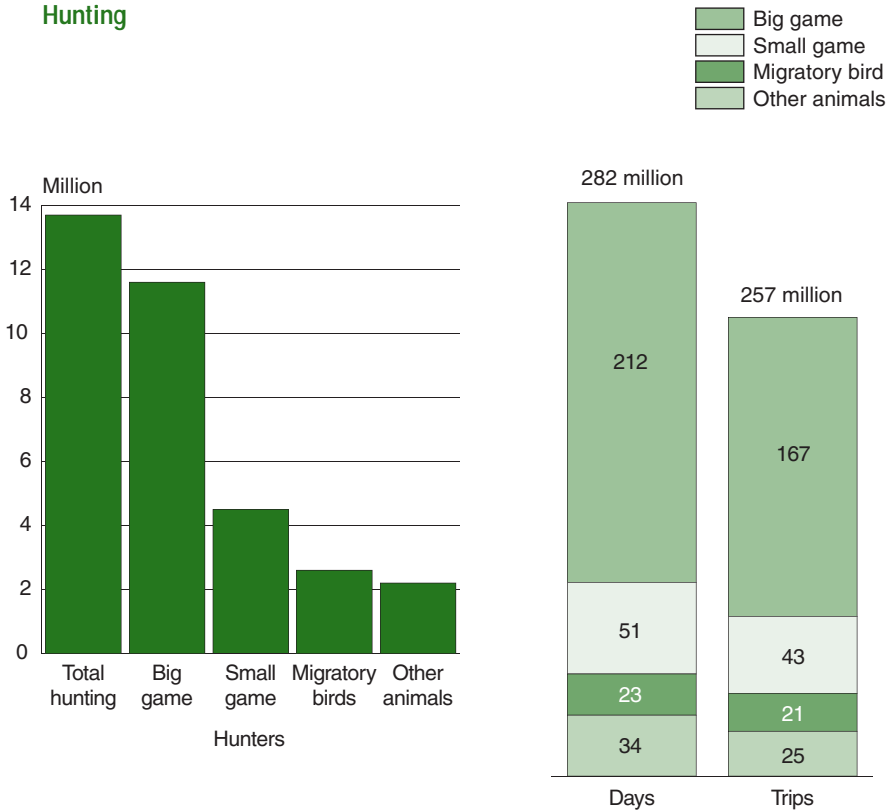

In 2011, 13.7 million people 16 years old and older enjoyed hunting a variety of animals within the United States. They hunted 282 million days and took 257 million trips. Hunting expenditures totaled \$33.7 billion.

Big game hunting was the most popular type of hunting. Almost 11.6 million hunters pursued big game such as

deer and elk on 212 million days. Big game-related expenditures for trips and equipment totaled \$16.9 billion. There were 4.5 million hunters of small game including squirrels and rabbits. They hunted small game on 51 million days and spent \$2.6 billion on small game hunting trips and equipment. Migratory bird hunters numbered 2.6 million. They spent 23 million days hunting

birds such as waterfowl and doves. Migratory bird-related trip and equipment expenditures totaled \$1.8 billion. Nearly 2.2 million hunters sought other animals such as raccoons and feral pigs on 34 million days, and their expenditures for trips and equipment were \$858 million.

## Hunting

Note: Detail does not add to total because of multiple responses and nonresponse.

Source: Tables 1 and 17–21.

## Hunting Expenditures

Of the \$33.7 billion spent by hunters in 2011, 31 percent, \$10.4 billion, was spent on trip-related expenses. Food and lodging totaled \$3.9 billion, 37 percent of all trip-related expenses. Transportation spending was \$4.8 billion, 46 percent of trip expenditures. Other trip expenses such as guide fees, land use fees, and equipment rental were \$1.8 billion or 17 percent of all trip-related expenses.

Total equipment expenditures for hunting were \$14.0 billion in 2011, 41 percent of all hunting expenses. Hunting equipment, such as guns and rifles, telescopic sights, and ammunition, composed \$7.7 billion, or 55 percent of all equipment costs. Expenditures for auxiliary equipment, including camping equipment, binoculars, and special hunting clothing, accounted for \$1.8 billion or 13 percent of all equipment expenses. Special equipment, such as campers or all-terrain vehicles, amounted to \$4.4 billion or 31 percent of all equipment expenditures.

Land leasing and ownership for hunting was a large expenditure category. Hunters spent \$7.1 billion on land leasing and ownership, which was 21 percent of all hunting-related expenditures. Expenditures for magazines, books, DVDs, membership dues, contributions, licenses, tags, and permits totaled \$1.5 billion or 4 percent. Expenditures for plantings, \$703 million, was 2 percent of all hunting expenditures.

## Hunting Expenditures by Type of Hunting

(Total expenditures: \$33.7 billion)

## Percent of Total Hunting Expenditures

(Total expenditures: \$33.7 billion)

## Big Game Hunting

In 2011, a majority of hunters, 11.6 million, devoted 212 million days to hunting big game including deer, elk, bear, and wild turkey. They took 167 million trips and spent an average of 18 days hunting big game.

Trip and equipment expenditures for big game hunting totaled \$16.9 billion. Trip-related expenses were \$7.3 billion. Of that amount, food and lodging accounted for \$2.6 billion or 37 percent of all trip-related costs. Transportation costs were \$3.4 billion, 46 percent of trip costs. Other trip-related expenses amounted to \$1.2 billion or 17 percent of trip costs.

Fifty-seven percent of big game-related expenditures were on equipment, which totaled \$9.6 billion. Hunting equipment, which includes firearms, ammunition, bows, and arrows, accounted for \$3.9 billion or 41 percent of all equipment. Purchases of auxiliary equipment such as tents and binoculars totaled \$1.5 billion (16 percent). Special equipment such as campers and all-terrain vehicles accounted for \$4.1 billion (43 percent).

million trips and averaged 11 days in the field hunting small game. These hunters spent \$2.6 billion on trips and equipment for small game hunting. Trip expenditures totaled \$1.6 billion. Spending on food and lodging was \$658 million or 42 percent of trip expenditures. Transportation costs totaled \$686 million or 43 percent of small game trip expenses. Other trip-related expenditures were \$233 million or 15 percent of all trip costs.

## Small Game Hunting

Small game such as rabbits, squirrels, pheasants, quail, and grouse was also popular with hunters. Just over 4.5 million hunters pursued small game for a total of 51 million days. They took 43

million trips and averaged 11 days in the field hunting small game. These hunters spent \$2.6 billion on trips and equipment for small game hunting. Trip expenditures totaled \$1.6 billion. Spending on food and lodging was \$658 million or 42 percent of trip expenditures. Transportation costs totaled \$686 million or 43 percent of small game trip expenses. Other trip-related expenditures were \$233 million or 15 percent of all trip costs.

Equipment expenditures for small game hunting were \$984 million. For the pursuit of small game, hunters spent \$854 million on hunting equipment (firearms, ammunition, etc.) and \$85 million on auxiliary equipment, 87 and 9 percent of equipment expenditures, respectively.

### Small Game Trip and Equipment Expenditures

(Total expenditures: \$2.6 billion)

## Migratory Bird Hunting

In 2011, 2.6 million migratory bird hunters devoted 23 million days on 21 million trips for hunting birds such as doves, ducks, and geese. Hunters averaged 9 days pursuing migratory birds for the year.

Migratory bird-related spending for trips and equipment was \$1.8 billion in 2011. Of this amount, \$942 million was spent on hunting trips. An estimated \$316 million or 34 percent of all trip expenditures were on food and lodging, and \$390 million (41 percent) were on transportation. Other trip expenses were \$235 million (25 percent) of the total trip-related expenditures for migratory bird hunters.

Equipment purchases for migratory bird hunting totaled \$866 million in 2011. Of this amount, \$767 million was spent on hunting equipment (firearms, ammunition, etc.) and \$59 million on auxiliary equipment, 89 and 7 percent of total equipment purchases, respectively.

## Hunting Other Animals

Nearly 2.2 million hunters reported spending 34 million days on 25 million trips pursuing other animals such as groundhogs, feral pigs, raccoons, foxes, and coyotes. They averaged 16 days of hunting.

These hunters spent \$858 million in 2011 on trips and equipment for the pursuit of other animals. Trip-related costs totaled \$653 million. Of that, food and lodging were \$259 million or 40 percent of all trip costs; transportation was \$324 million, 50 percent of trip expenses; and other trip expenses were \$70 million, 11 percent of all trip costs.

Equipment expenditures for hunting other animals totaled \$205 million. For the pursuit of other animals, hunters spent \$189 million on hunting equipment (firearms, ammunition, etc.) and \$6 million on auxiliary equipment, 92 and 3 percent of total equipment expenditures, respectively.

## Comparative Hunting Highlights

In 2011 big game hunters pursued big game an average of 18 days on 14 trips. Small game hunters pursued small game an average of 11 days on 10 trips. Migratory bird hunters hunted migratory birds an average of 9 days on 8 trips. Individuals hunting other animals did so an average of 16 days on 11 trips.

Average spending on trips and equipment was about twice as high for big game hunting than for any other type of hunting. For hunting big game, participants spent an average of \$1,457 for the year. By comparison, spending on small game hunting by participants averaged \$568, spending on migratory bird hunting by participants averaged \$700, and spending on other animal hunting averaged \$396.

During 2011 trip expenditures for all hunting averaged \$762 per hunter, a daily average of \$37. In pursuit of big game, hunters averaged trip expenditures of \$627, which was \$34 per day. Hunters spent an average of \$350 while

### Migratory Bird Trip and Equipment Expenditures

### Trip and Equipment Expenditures for Hunting Other Animals

(Total expenditures: \$0.9 billion)

### Comparative Hunting by Type of Hunting

seeking small game (\$31 per day) and spent an average of \$365 (\$40 per day) while pursuing migratory birds. Hunters averaged \$301 (\$19 per day) while pursuing other animals.

### Hunting for Selected Game

Among big game species, deer was the most popular animal pursued, attracting 10.9 million hunters for 168 million days. Wild turkey attracted 3.1 million hunters for 33 million days, while elk drew 867 thousand for 8 million days, and bear was hunted by 526 thousand for 5 million days. Moose was pursued by 106 thousand hunters for 1 million days. In addition, 305 thousand hunters spent 5 million days hunting other big game animals.

Among small game species, squirrels were the most popular quarry with 1.7 million small game hunters who hunted them 21 million days in 2011. Rabbits were hunted by 1.5 million participants for 17 million days, and pheasants attracted 1.5 million hunters for 10 million days. Quail was flushed by 841 thousand hunters on 9 million days, while grouse and prairie chicken were pursued by 812 thousand hunters on 8 million days. In addition, 299 thousand hunters spent 3 million days hunting other small game animals.

Among those hunting migratory birds, 1.4 million pursued ducks for 15 million days. There were 1.3 million hunters who pursued doves on 7 million days. On 9 million days, 781 thousand hunters hunted geese in 2011. Other migratory bird species attracted 227 thousand people who hunted for 2 million days.

## Participation by Geographic Region

Regionally, participation rates in hunting ranged from 3 percent in the Pacific Region to 11 percent in the East South Central Region. The East North Central, West North Central, and West South Central Regions also had participation rates above the national average of 6 percent. Regions with participation rates below the national rate were New England, Middle Atlantic, South Atlantic, and Pacific. The rate in the Mountain Region was equal to the average at 6 percent.

## Hunting in State of Residence and in Other States

A large majority of participants, 94 percent or 12.9 million, hunted within their resident state in 2011. Only 1.9 million, 14 percent, hunted in another state. Percentages do not add to 100 because those who hunted both in state and out of state were included in both categories.

The overall resident/nonresident pattern is relatively constant across all types of hunting. Eleven million big game hunters, 95 percent of all big game hunters, hunted within their state of residence, while 11 percent, 1.3 million

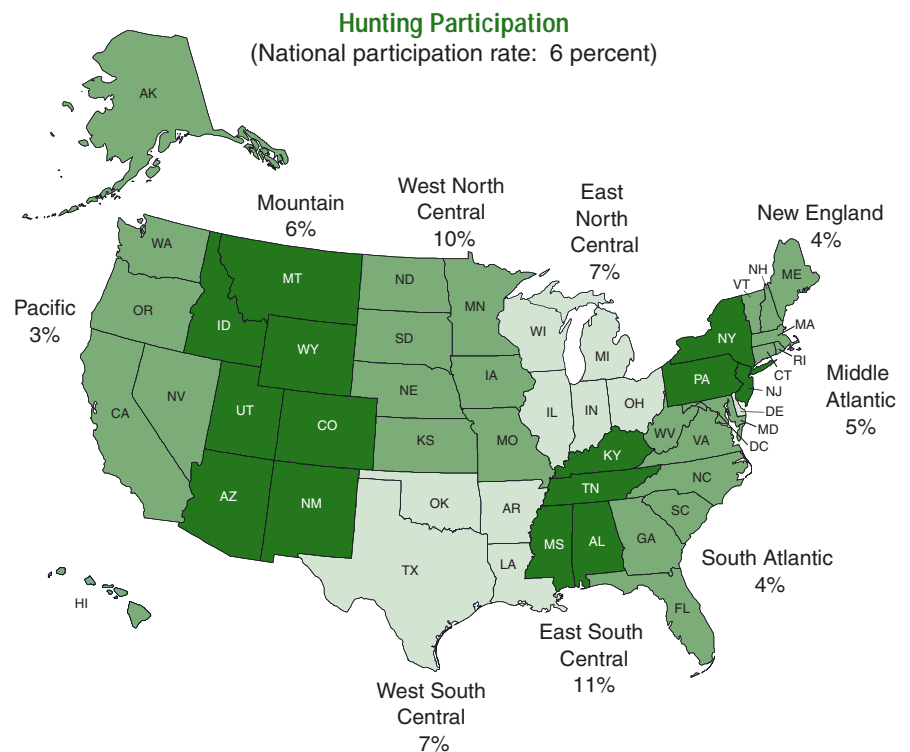

people, traveled to another state to hunt big game. Four million small game hunters, 90 percent of all small game hunters, pursued game in their resident state. An estimated 708 thousand small game hunters, 16 percent ventured across state lines to hunt small game. Over 2.4 million migratory bird hunters, 94 percent of all migratory bird hunters, hunted within their resident state. Eleven percent or 284 thousand hunted out of state. Among sportspersons who hunted other animals, 92 percent, 2 million, hunted in state and 10 percent, 224 thousand participants, hunted out of state.

## Hunting on Public and Private Lands

In 2011, 13.7 million hunters 16 years old and older hunted on public land, private land, or both. Of this number, 4.9 million or 36 percent hunted on publicly owned lands compared to 11.5 million or 84 percent who hunted on privately owned land. Some hunters hunted exclusively on public land and others hunted exclusively on private land—1.7 million, 13 percent of all hunters, used public lands only, and 8.4 million hunted only on private land, 61 percent of all hunters. Nearly 3.2

million hunters, 23 percent, hunted on both public and private lands.

During 2011, 4.9 million hunters used public lands on 61 million days, which represents 22 percent of all hunting days. Thirty-three percent of big game hunters pursued big game on public land for 39 million days. Thirty-one percent of all small game hunters, 1.4 million, pursued small game on public land for 14 million days. An estimated 923 thousand migratory bird hunters, 36 percent, hunted migratory birds on public lands for 8 million days. Twenty-four percent, 523 thousand,

of all hunters pursued other animals on public land for over 5 million days.

The percent of hunters on private land is similar among different types of hunting. Eighty-four percent of big game hunters hunted on private land, which compares to 83 percent seeking small game, 77 percent seeking migratory birds, and 87 percent seeking other animals.

Of all days hunting, 78 percent or 219 million were on private land. The percent of hunting days on private land varied slightly more among types of hunting than the percent of hunters. Seventy-nine percent of big game hunting days, 73 percent of small game hunting days, 57 percent of migratory bird hunting days, and 79 percent of other animal days were on private land. Total hunting days pursuing these species on private land were as follows: big game 167 million, small game 37 million, migratory bird 13 million, and other animals 27 million.

**Percent of All Hunting in State of Residence and in Other States**  
(Total: 13.7 million participants)

**People Hunting on Public and Private Lands**

**Number of Hunters Who Target Shoot and Use Shooting Ranges**  
(Total hunters: 13.7 million)

## Participation in Target Shooting

In preparation for hunting, 7.2 million hunters, 52 percent of all hunters, went target shooting. Twenty-two percent of all hunters, 2.9 million, used shooting ranges. The most commonly used firearms at a shooting range were shotguns and rifles (2.3 million hunters) and handguns (1.1 million).

## Sex and Age

Of the U.S. population 16 years old and older, 11 percent of the males and 1 percent of the females enjoyed hunting in 2011. Of the 13.7 million participants who hunted, 89 percent (12.2 million) were male and 11 percent (1.5 million) were female.

The participation rate in hunting tended to increase with age until individuals reached 65 years of age, and thereafter it declined. During 2011, 5 percent or 419 thousand 16- and 17-year-olds hunted. The participation rate was also 5 percent for 18- to 24-year olds and 25- to 34-year olds. The participation rate climbed to 6 percent for 35- to 44-year olds, and then to 7 percent for 45- to 54-year olds and 55- to 64-year olds. People 65 and older had a participation rate of 4 percent. However, of the 65 and older age group, those who were 65 to 74 years of age had a 5 percent hunting participation rate, while those who were 75 and older had a 2 percent rate.

The age group that contributed the most hunters was 45 to 54 years old. About 3.1 million hunters, which was 23 percent of all hunters, were 45 to 54. Individuals 55 to 64 years old were close in total number of hunters at 2.8 million.

65 and older . . . . .	1.5 million

Source: Table 10.

### Percent of Hunters by Residence

(Hunter population: 13.7 million)

### Metropolitan and Nonmetropolitan Hunters

As was the case for fishing, participation rates for hunting were the lowest among residents of the largest metropolitan statistical areas (MSAs)<sup>1</sup> and were the highest among non-MSA residents. Residents of the MSAs with a population of 1 million or more hunted at a 3 percent rate, which compares to 18 percent of those who resided outside MSAs. Furthermore the smaller the MSA the higher the participation rate. The rate among residents of MSAs of 50,000 to 249,999 was 11 percent and among residents of MSAs with 250,000 to 999,999 inhabitants the rate was 5 percent.

Despite the lower participation rates among MSA residents, they still made up the majority of hunters. Over 10.9 million hunters were MSA residents, compared to 2.8 million who were non-metropolitan residents.

### Household Income of Hunters

The participation rate in hunting increased as household income increased until it reached incomes of \$100,000 or more. The participation was highest among those with incomes of \$75,000 to \$99,999 at 9 percent. Participation rates for those who reported incomes of \$50,000 to \$74,999 and \$100,000 to \$149,999 was slightly lower at 8 percent. The participation rate in hunting for household incomes of \$40,000 to \$49,999 was 7 percent. A participation rate of 5 percent was reported for the following four income groups: \$25,000 to \$29,999; \$30,000 to \$34,999; \$35,000 to \$39,999; and \$150,000 or more. The lowest participation rate was 3 percent reported for household incomes of less than \$20,000.

The majority of hunters had household incomes of \$50,000 or more. Among hunters who reported income, 64 percent had household incomes of \$50,000 or more, and 36 percent had household incomes of less than

<sup>1</sup> See Appendix A for definition of metropolitan statistical area.

### Percent of U.S. Population Who Hunted by Residence

(Total U.S. population that hunted: 6 percent)

### Percent of U.S. Population Who Hunted by Household Income

\$50,000. For the general population, 52 percent had incomes of \$50,000 or more and 48 percent had incomes less than \$50,000.

While people of all races participate in hunting, the majority are White. Seven percent of the nation's White population, 2 percent of the African American

population, 2 percent of those identified as other races, and less than 0.5 percent of the Asian American population went hunting in 2011.

### Education, Race, and Ethnicity of Hunters

Participation rates in hunting in 2011 varied little among people with different levels of educational attainment. The highest participation rate was 6 percent for the following three levels of attainment: 12 years, 1 to 3 years of college, and 4 years of college. The next highest rate, 5 percent, was reached by people with 11 years of education. The lowest rate, 4 percent, was for those people with an educational attainment of 5 years of college or more.

The two largest categories of education were 12 years and 1 to 3 years of college, composing 36 percent and 26 percent of all hunters, respectively. Those with 4 years of college composed 18 percent of all hunters, and those with 11 years or less composed 11 percent of all hunters. Individuals with 5 years or more of college made up 9 percent of all hunters.

\* Estimate based on a sample size of 10–29.

Percent of Hunters by Education

Percent of U.S. Population Who Hunted by Education

Percent of Hunters by Race

Percent of U.S. Population Who Hunted by Race

Percent of U.S. Population Who Hunted by Ethnicity

Hispanics, who represent a growing percentage of the U.S population, hunted at a much lower rate than non-Hispanics. One percent of all Hispanics hunted in 2011 compared to 6 percent of non-Hispanics. The 271 thousand Hispanics who hunted in 2011 made up 2 percent of all hunters.

### 2001–2011 Comparison of Hunting Activity

The number of hunters increased 9 percent from 2006 to 2011. Other animal hunters increased 92 percent in number and the other types of hunting stayed level at the 95 percent level of significance. Total days of hunting went up 28 percent, primarily due to a 29 percent increase in big game hunting days. Other animal

hunting days also went up significantly. Trip-related, equipment, and other expenditures went up 29 percent. Trip-related expenditures increased 39 percent, equipment expenditures did not increase significantly, and other expenditures such as land leasing and owning went up 40 percent.

Comparing 2001 and 2011 estimates reveals no statistically significant change in the number of overall hunters, but does show increases in the number of days and expenditures. Small game hunting participant numbers went down, while other animal participant numbers went up. Days of big game and other animal hunting went up significantly, while small game and migratory bird hunting

days did not have a significant change. Turning to expenditures, the comparison is similar to 2006–2011. Overall expenditures went up, with trip-related and other items undergoing an increase and equipment staying level.

The across-the-board increases in 2011 hunting participation, day, and expenditure estimates run counter to the downward trends documented in the preceding three FHWAR National Surveys. From 1991 to 2006, hunting participation had dropped 11 percent and the number of hunting days had not significantly changed. The 9 percent participant and 28 percent day increases puts the 2011 hunting status on par with that of 1991 hunting, the high point of hunting in the last twenty years.

# *Wildlife Watching*

# Wildlife Watching Highlights

Nearly a third of the U.S. population enjoyed wildlife watching in 2011. Wildlife watching is defined here as closely observing, feeding, and photographing wildlife, visiting public parks around the home because of wildlife, and maintaining plantings and natural areas around the home for the benefit of wildlife. These activities are categorized as around the home (within a mile of home) or away from home (at least one mile from home).

The 2011 Survey counts wildlife watching as recreational activities, as defined above, in which the primary objective was to watch wildlife. Secondary or incidental participation, such as observing wildlife while doing something else, was not included in the Survey.

During 2011, 71.8 million U.S. residents, 30 percent of the U.S. population 16 years old or older, participated

in wildlife-watching activities. People who took an interest in wildlife around their homes numbered 68.6 million, while those who took trips away from their homes to wildlife watch numbered 22.5 million people.

## Wild Bird Observers

Of all the wildlife in the United States, birds attracted the biggest following. Approximately 46.7 million people observed birds around the home and on trips in 2011. A large majority, 88 percent (41.3 million), observed wild birds around the home, while 38 percent, 17.8 million, took trips away from home to observe wild birds. Participants averaged a startling 110 days of birding in 2011, due to the 119 days by around-the-home birders. Away-from-home birders averaged 13 days.

## Wildlife-Watching Participants (In millions)

## Bird Watchers (In millions)

## Wildlife-Watching Expenditures

Thirty-eight percent of all the dollars spent in 2011 for wildlife-related recreation was due to wildlife watching.

Wildlife-watching participants 16 years old or older spent \$54.9 billion, an average of \$981 per spender. Seventy-eight percent of all wildlife watchers spent money on their avocation.

Wildlife watchers spent \$17.3 billion on trips pursuing their activities. Food and lodging accounted for \$9.3 billion (54 percent of all trip-related expenditures), transportation expenses totaled \$6.0 billion (35 percent), and other trip costs, such as land use fees and equipment rental, amounted to \$1.9 billion (11 percent) for the year.

These recreationists purchased \$27.2 billion worth of equipment for wildlife watching. They spent \$11.3 billion (42 percent of all equipment expenditures) on wildlife-watching equipment including binoculars, cameras, bird food, and special clothing. Expenditures for auxiliary equipment, such as tents and backpacking equipment, totaled \$1.6 billion (6 percent) for the year. Participants spent \$14.3 billion (53 percent) on special equipment, including off-road vehicles, campers, and boats.

Also for the year, wildlife watchers spent \$5.7 billion on land leasing and owning; \$2.2 billion on plantings for the benefit of wildlife; \$2.2 billion on membership dues and contributions; and \$0.4 billion on magazines, books, and DVDs.

### Wildlife-Watching Expenditures

(Total expenditures: \$54.9 billion)

### Trip-Related Expenditures

(Total expenditures: \$17.3 billion)

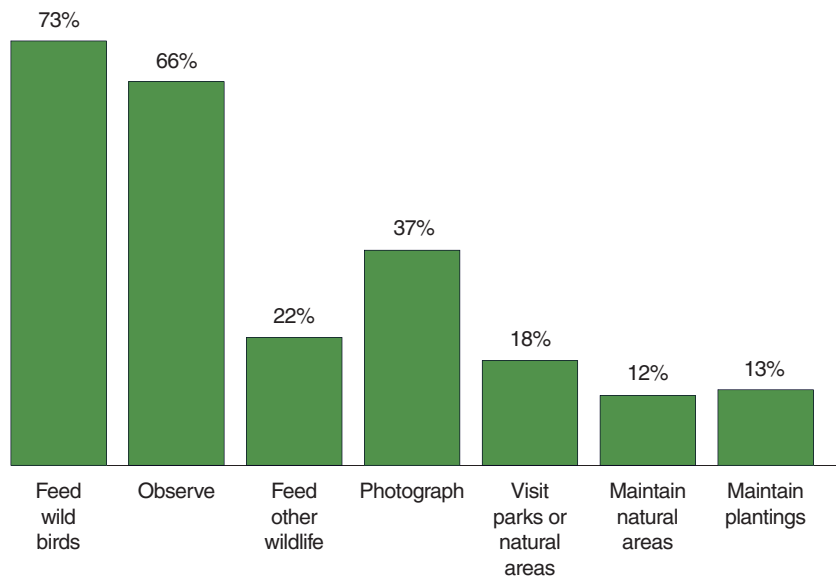

## Around-The-Home Wildlife-Watching Highlights

In 2011, around-the-home participants 16 years old and older numbered 68.6 million—96 percent of all wildlife-watching recreationists. The most popular activity, feeding birds and other wildlife, accounted for 52.8 million wildlife watchers—77 percent of all around-the-home participants. About 45 million people observed wildlife, representing 66 percent of all around-the-home participants.

Approximately 25.4 million recreationists (37 percent of all around-the-home wildlife watchers) photographed wildlife. About 13.4 million maintained plantings or natural areas for the benefit of wildlife. They made up 19 percent of all around-the-home participants. Finally, 12.3 million people visited parks or natural areas within one mile of their homes for wildlife watching. They comprised 18 percent of all around-the-home participants.

## Wildlife Fed, Observed, or Photographed by Around-The-Home Participants

Of the 52.8 million people feeding wildlife around their homes in 2011, 95 percent (50.2 million) fed wild birds, while 28 percent (14.8 million) fed other wildlife.

Approximately 45.0 million participants closely observed wildlife around their homes, of which 41.3 million observed birds. Observing mammals was undertaken by 35.9 million participants. Insects and spiders attracted the attention of 16.6 million people; 14.1 million observed amphibians or reptiles; and 8.4 million people observed fish and other wildlife. The median number of days for around-the-home observations for all animals was a little over 87 days in 2011.

About 25.4 million people photographed wildlife around their homes. The median number of days people took pictures of wildlife around their homes in 2011 was 4 days, although 3.7 million people (15 percent) photographed wildlife 21 days or more.

## Around-The-Home Wildlife Watchers by Geographic Region

In 2011, over 239 million people 16 years old or older lived in the United States. Of those, 29 percent wildlife watched around their homes. The participation rates of these around-the-home participants varied by region.

The percentages of regional populations that wildlife watched around their homes ranged from 24 percent in the Pacific Region to 35 percent in the East North Central Region. The New England, East North Central, West North Central, and East South Central had participation rates above the national average of 29 percent.

The regions making up the largest number of around-the-home wildlife watchers in the United States were the South Atlantic (12.8 million participants) and the East North Central Region (12.5 million participants).

## Percent of Around-The-Home Observers by Type of Wildlife Observed

(Total wildlife observers: 45.0 million)

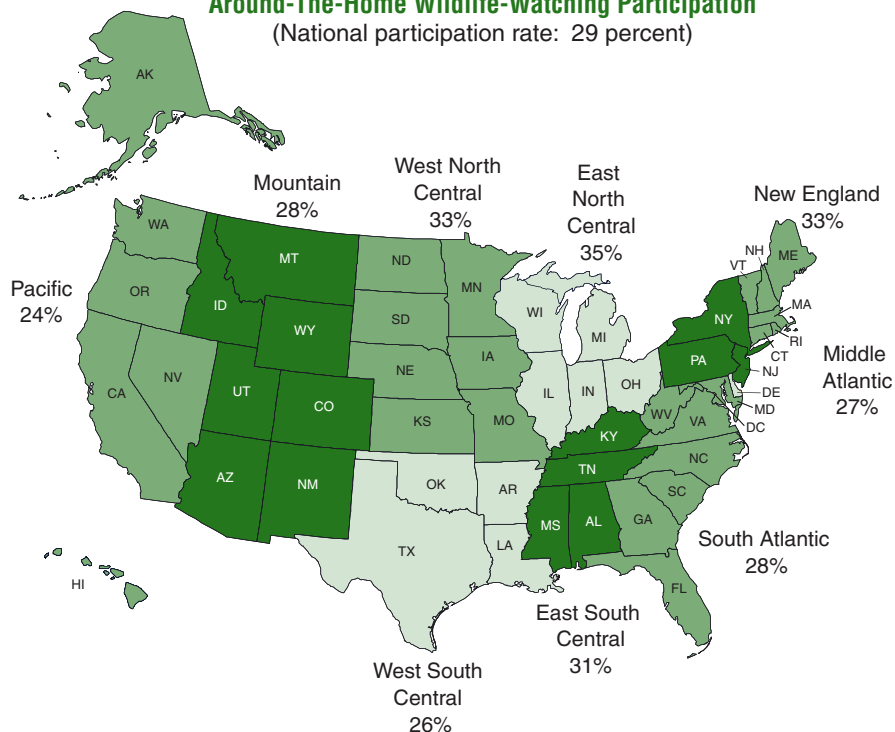

## Percent of Around-The-Home Photographers by Days Spent Photographing Wildlife

(Total wildlife photographers: 25.4 million)

## Around-The-Home Wildlife-Watching Participation

(National participation rate: 29 percent)

### Percent of Males and Females Who Participated Around-The-Home

### Percent of Around-The-Home Wildlife Watchers by Sex (Total participants: 68.6 million)

### Percent of Around-The-Home Wildlife Watchers by Age (Total participants: 68.6 million)

### Percent of U.S. Population Who Participated Around-The-Home by Age

### Sex and Age of Around-The-Home Wildlife Watchers

Females and males had similar participation rates for around-the-home wildlife watching. In 2011, 30 percent of females and 27 percent of males enjoyed around-the-home activities. Of the 68.6 million around-the-home wildlife watchers, 54 percent (37.3 million) were females and 46 percent (31.3 million) were males.

People in the 65- to 74-year-old age group were most likely to participate at 53 percent (11.9 million). People in the 18- to 24-year-old age group were the least likely to participate, with 9 percent (2.4 million). The disparity in participation rates between people 16 to 34 years old (14 percent) and those 35 years old and older (35 percent) is striking.

 65 and older . . . . . 18.1 million

Source: Table 42.

## Metropolitan and Nonmetropolitan Around-The-Home Participants

Approximately 91 percent of around-the-home wildlife watchers lived in metropolitan areas, as defined by the U.S. Census Bureau. Metropolitan statistical areas, or MSAs<sup>1</sup>, with populations of 1 million or more had a participation rate of 25 percent, lower than any smaller MSA or non-MSA. Nonetheless, recreationists from the most populous MSAs comprised 46 percent of all around-the-home wildlife watchers. In MSAs of 250,000 to 999,999, the participation rate was 33 percent and they made up 23 percent of all around-the-home recreationists. About 22 percent of around-the-home wildlife watchers lived in MSAs with a population from 50,000 to 249,999. The population of these areas had a participation rate of 32 percent.

The participation rate for nonmetropolitan populations was 38 percent, higher than for any MSA. Six percent of the total U.S. population lived outside MSAs in 2011 and represented 9 percent of all around-the-home wildlife watchers.

<sup>1</sup> See Appendix A for definition of Metropolitan Statistical Area.

**Percent of U.S. Population Who Participated Around-The-Home by Residence**

**Percent of Around-The-Home Wildlife Watchers by Residence**  
(Total participants: 68.6 million)

## Household Income of Around-The-Home Participants

Participation rates ranged from 22 percent among U.S. residents living in households earning less than \$20,000 per year and \$25,000 to \$29,999 per year to 36 percent of those living in households earning \$150,000 or more annually. These participants made up 10 percent, 3 percent, and 9 percent, respectively, of the 68.6 million

around-the-home wildlife watchers in 2011.

Participants in households earning \$50,000 to \$74,999 a year constituted the largest number, 11.7 million, and had a 35 percent participation rate. The next two income groups with the largest numbers of participants had household incomes of \$75,000 to \$99,999 and \$100,000 to \$149,999. The former contributed 8.6 million participants

and had a 34 percent participation rate, while the latter contributed 8.3 million and had a 35 percent participation rate. The number of around-the-home recreationists contributed by other income groups ranged from 2.2 million participants with \$25,000 to \$29,999 household incomes and 22 percent participation rates to 6.1 million participants with \$150,000 or more incomes and 36 percent participation rates.

## Percent of U.S. Population Who Participated Around-The-Home by Household Income

## Education, Race, and Ethnicity of Around-The-Home Participants

Looking at the educational background of participants, it was found that the rate of participation in around-the-home wildlife watching increased with the increase in educational attainment. The highest participation rate was among recreationists with 5 years or more of college, 43 percent. They made up 18 percent of all around-the-home wildlife watchers. The lowest participation rate, 17 percent, was among people with 11 years or less of education—8 percent of all participants. Recreationists with 12 years of education, 30 percent of all around-the-home participants, had a participation rate of 25 percent. Participants with 1 to 3 years of college, 22 percent of all participants, had a participation rate of 28 percent. Recreationists with 4 years of college, 23 percent of all participants, had a participation rate of 36 percent.

A wide range of participation rates were found among the different races and ethnic groups. About 34 percent of the White population engaged in

around-the-home wildlife watching, contrasted with 11 percent of the African American population, 8 percent of the Asian American population, and 12 percent of individuals comprising other races. Of the total number of around-the-home participants, 91 percent were White, 4 percent were African Americans, 1 percent was Asian American, and 4 percent were all other races.

Ten percent of the U.S. Hispanic population engaged in wildlife watching around their homes in comparison with 32 percent of the non-Hispanic population. The 65.2 million non-Hispanic participants comprised 95 percent of all around-the-home wildlife watchers and

the 3.4 million Hispanic participants made up 5 percent.

### Away-From-Home Wildlife-Watching Highlights

In 2011, 22.5 million people 16 years old and older took trips away from home to feed, observe, or photograph wildlife. They comprised 31 percent of all wildlife watchers. Most popular with away-from-home participants was closely observing wildlife. About 19.8 million participants, 8 percent of the U.S. population 16 years old and older, observed wildlife an average of 14 days in 2011. Photographing wildlife was enjoyed by 12.4 million people, 5 percent of the U.S. population. They averaged 9 days per photographer.

Approximately 5.4 million people fed wildlife an average of 11 days and comprised 2 percent of the U.S. population.

About 82 percent of all away-from-home participants took trips within their resident state to participate in wildlife watching. Approximately 70 percent took trips only in their resident state, 12 percent took trips both inside and outside their resident state, and 18 percent took trips only to other states. Altogether, 30 percent of all away-from-home participants took at least some of their trips to other states.

### Wildlife Observed, Fed, or Photographed by Away-From-Home Participants

Wild birds attracted the most interest from wildlife watchers on their trips—18.9 million people or 84 percent of all away-from-home participants. The most-watched birds, waterfowl (ducks and geese, primarily), were watched by 13.3 million people. Next on the list of most-watched were birds of prey which drew 12.9 million trip-takers, followed by songbirds with 12.1 million watchers. Herons, shore birds, and other water birds attracted 10.6 million recreationists. Lastly, other birds, such as road runners and turkeys, attracted 6.9 million wildlife watchers.

Land mammals, such as deer, bears, and coyotes, were observed, fed, or photographed by 13.7 million people—61 percent of all away-from-home participants. Fish attracted the attention of 6.4 million people or 28 percent of all away-from-home recreationists.

About 4.0 million people or 18 percent of all away-from-home participants observed, fed, or photographed marine mammals, such as whales, seals, and dolphins. Other wildlife, such as butterflies, snakes, and turtles, appealed to 10.1 million people or 45 percent of all away-from-home wildlife watchers.

**Percent of Away-From-Home Wildlife Watchers Who Observed, Fed, or Photographed Wildlife**  
(Total: 22.5 million participants)

## Area Visited by Away-From-Home Participants

In 2011, the most visited areas for Americans to observe, feed, or photograph wildlife were publicly owned. Approximately 82 percent of all trip-taking wildlife watchers used public areas while just 34 percent used private areas. About 25 percent of all away-from-home participants, 5.5 million, visited both public and private areas. Approximately 12.8 million, 57 percent, visited only public areas to engage in their activities while 2.0 million, 9 percent, visited only private areas.

## Away-From-Home Wildlife Watchers by Geographic Region

In 2011, 239 million people 16 years old and older lived in the United States—9 percent of whom took trips to wildlife watch.

Away-from-home participation rates ranged from 6 percent in the West South Central Region to 13 percent in the Mountain Region. The regions that had participation rates higher than the national average were New England, West North Central, East South Central, Mountain, and Pacific.

### Percent of Males and Females Who Participated Away-From-Home

### Percent of Away-From-Home Wildlife Watchers by Sex

### Percent of Away-From-Home Wildlife Watchers by Age

### Percent of U.S. Population Who Participated by Age

## Sex and Age of Away-From-Home Wildlife Watchers

A similar number of males and females participated in away-from-home wildlife watching in 2011. Fifty-one percent (11.5 million) of all participants were males and 49 percent (11.0 million) were females. Ten percent of males and 9 percent of females in the United States enjoyed observing, feeding, or photographing wildlife away from home.

The 45- to 54-year-old age group had the most away-from-home recreationists, 5.8 million. This age group, the 55- to 64-year-olds, and the 65- to 74-year olds had the highest participation rate, 12 percent. Another age group that had a high participation rate was the 35- to 44-year-old age group, 11 percent. The 18- to 24-year-olds had the lowest participation rate, at 3 percent.

## Metropolitan and Nonmetropolitan Away-From-Home Participants

In 2011, 9 percent of all people living in MSAs<sup>2</sup> took trips primarily to enjoy wildlife. MSA residents comprised 92 percent of all away-from-home participants. In contrast, 12 percent of all people outside an MSA watched wildlife away from home.

As was the case with around-the-home wildlife watching, the biggest MSA had both the lowest participation rate and the highest number of participants. Residents of non-MSAs made up 8 percent of away-from-home participants and 9 percent of around-the-home participants.

## Household Income of Away-From-Home Participants

Participation rates ranged from 5 percent for those in households earning less than \$20,000 per year to 15 percent for those in households earning \$75,000 to \$99,999. There was a strong correlation between income and the likelihood to wildlife watch away from home, with an increase in one matched by an increase in the other. The income group that had the most participants was \$50,000 to \$74,999, with 4.8 million recreationists.

Median income was higher for away-from-home participants than for Americans as a whole, slightly under \$68,000 for recreationists compared to about \$52,000 for the U.S. population.

<sup>2</sup> See Appendix A for definition of Metropolitan Statistical Area.

**Percent of Away-From-Home Wildlife Watchers by Residence**  
(Total participants: 22.5 million)

**Percent of U.S. Population Who Participated by Residence**

**Percent of U.S. Population Who Participated Away-From-Home by Household Income**

## Education, Race, and Ethnicity of Away-From-Home Participants

As in the case of household income, educational achievement and participation in away-from-home wildlife watching have a direct correlation. About 4 percent of the U.S. population with 11 years of education or less participated, compared to 19 percent of the population with 5 years or more of college. The educational cohort with the most participants was 4 years of college, with 5.4 million recreationists. The educational cohort with the fewest recreationists was 11 years or less, with 1.2 million.

The participation rates by race varied greatly. Approximately 11 percent of Whites and 5 percent of other races except African Americans and Asian Americans took trips to wildlife watch. In contrast, 3 percent of African Americans and 2 percent of Asian Americans participated. Of the total 22.5 million away-from-home participants, 92 percent were White, 3 percent were African Americans, 1 percent were Asian Americans, and 4 percent were other races.

About 1.4 million recreationists were Hispanic, 6 percent of all participants. Approximately 4 percent of the U.S. Hispanic population took trips to engage in wildlife watching. Of the

non-Hispanic population, 10 percent (21.1 million participants) took trips to wildlife watch. They were 94 percent of all away-from-home wildlife watchers.

**Percent of Away-From-Home Wildlife Watchers by Education**

## 2001–2011 Comparison of Wildlife-Watching Participation

Comparing 2006 and 2011 wildlife-watching measures finds no statistically significant change in the number of total participants, days, or expenditures. The increase in people photographing wildlife around the home was partially balanced by the decrease in people feeding wildlife. Away-from-home observers and feeders decreased in number, but not enough to affect overall away-from-home wildlife watching. The number of days of away-

from-home wildlife watching did not change for any category. Similarly, the amount spent for wildlife watching was stable for all categories in 2006 and 2011.

From 2001 to 2011 the number of participants increased 9 percent. All categories of around-the-home wildlife watching increased or stayed level, led by the 82 percent increase in photographing wildlife. Overall away-from-home wildlife watching participant numbers stayed level, with the increase in photographers somewhat

countered by the decrease in feeding wildlife. Similarly, the overall number of away-from-home days did not significantly change, with the increase in photographing days and decrease in feeding days roughly balancing each other. Trip-related expenditures increased significantly, but not enough to propel overall expenditures significantly higher. Equipment purchases, the largest component of wildlife-watching expenditures, did not increase or decrease significantly.

# *Tables*

# Guide to Statistical Tables

## Purpose and Coverage of Tables

The statistical tables of this report were designed to meet a wide range of needs for those interested in wildlife-related recreation. Special terms used in these tables are defined in Appendix A.

The tables are based on responses to the 2011 Survey, which was designed to collect data about participation in wildlife-related recreation. To have taken part in the Survey, a respondent must have been a U.S. resident (a resident of one of the 50 states or the District of Columbia). No one residing outside the United States (including U.S. citizens) was eligible for interviewing. Therefore, reported national totals do not include participation by those who were not U.S. residents or who were U.S. citizens residing outside the United States.

## Comparability With Previous Surveys

The numbers reported can be compared with those in the 1991, 1996, 2001, and 2006 Survey Reports. The methodology used in 2011 was similar to that used in those Surveys. These results should not be directly compared to results from Surveys earlier than 1991 since there were major changes in methodology. These changes were made to improve accuracy in the information provided. Trends further back than 1991 are presented in Appendix C. These trends were developed using parts of the Surveys that were comparable.

## Coverage of an Individual Table

Since the Survey covers many activities in various places by participants of different ages, all table titles, headnotes, stubs, and footnotes are designed to identify and articulate each item being reported in the table. For example, the title of Table 1 shows that data about anglers and hunters, their days of participation, and their number of trips are reported by type of activity. By contrast, the title of Table 3 indicates that it contains data on freshwater anglers and the days they fished for different species.

## Percentages Reported in the Tables

Percentages are reported in the tables for the convenience of the user. When exclusive groups are being reported, the base of a percentage is apparent from its context because the percents add to 100 percent (plus or minus a rounding error). For example, Table 1 reports the number of trips taken by big game hunters (65 percent), those taken by small game hunters (17 percent), those taken by migratory bird hunters (8 percent), and those taken by hunters pursuing other animals (10 percent). These comprise 100 percent because they are exclusive categories.

Percents should not add to 100 when nonexclusive groups are being reported. Using Table 1 as an example again, note that adding the percentages associated with the total number of big game hunters (85 percent), total small game hunters (33 percent), total migratory bird hunters (19 percent), and total hunters of other animals (16 percent) will not yield total hunters (100 percent) because respondents could hunt for more than one type of game.

When the base of the percentage is not apparent in context, it is identified in a footnote. For example, Table 6 reports three percentages with different bases: one for the number of hunters, one for the number of trips, and one for days of hunting. Footnotes are used to clarify the bases of the reported percentages.

## Footnotes to the Tables

Footnotes are used to clarify the information or items that are being reported in a table. Symbols in the body of a table indicate important footnotes. The following symbols are used in the tables to refer to the same footnote each time they appear:

- \* Estimate based on a sample size of 10–29.
- ... Sample size too small to report data reliably.
- Z Less than 0.5 percent.

X Not applicable.

NA Not available.

Estimates based upon fewer than ten responses are regarded as being based on a sample size that is too small for reliable reporting. An estimate based upon at least 10 but fewer than 30 responses is treated as an estimate based on a small sample size. Other footnotes appear, as necessary, to qualify or clarify the estimates reported in the tables. In addition, these two important footnotes appear frequently:

- Detail does not add to total because of multiple responses.
- Detail does not add to total because of multiple responses and nonresponse.

“Multiple responses” is a term used to reflect the fact that individuals or their characteristics fall into more than one category. Using Table 2 as an example, those who fished in saltwater and freshwater appear in both of these totals. Yet each angler is represented only once in the “Total, all fishing” column. Similarly, in Table 6, those who hunt for big game and small game are counted only once as a hunter in the “Total, all hunting” column. Therefore, totals will be smaller than the sum of subcategories when multiple responses exist.

“Nonresponse” exists because the Survey questions were answered voluntarily, and some respondents did not or could not answer all the questions. The effect of nonresponse is illustrated in Table 27, where the total days of hunting is greater than the sum of hunting days on private land and hunting days on public land. This occurs because some respondents did not answer the days hunted on private/public land questions. As a result, it is known how many days hunters hunted but not known if those days were on public or private land. In this case, totals are greater than the sum of subcategories when nonresponses have occurred.

\* Estimate based on a sample size of 10–29. ... Sample size too small (less than 10) to report data reliably. (Z) Less than 0.5 percent.

Note: Percent who participated columns show the percent of each row's population who participated in the activity named by the column. Percent columns show the percent of each column's participants who are described by the row heading. Demographic variables we could include but haven't are (1) relationship to head of household, (2) marital status, (3) population size of area participant grew up, (4) years participant lived in resident state, (5) whether or not participant has a job, and (6) whether or not participant is going to school, keeping house, or retired.

<sup>1</sup> Hunters on public land include those who hunted on both public and private land.

<sup>2</sup> Days of hunting on public land includes both days spent solely on public land and those spent on public and private land.

Note: Percent of total hunters and percent of total days are based on the total hunters and total days columns for each row. Percent of hunters using public land and percent of days on public land are based on the total numbers of hunters on public land and total numbers of days on public land, respectively.

<sup>1</sup> Hunters on private land include those who hunted on both private and public land.

<sup>2</sup> Days of hunting on private land includes both days spent solely on private land and those spent on private and public land.

Note: Percent of total hunters and percent of total days are based on the total hunters and total days columns for each row. Percent of hunters using private land and percent of days on private land are based on the total Numbers of hunters on private land and total Numbers of days on private land, respectively.

\* Estimate based on a sample size of 10–29. ... Sample size too small (less than 10) to report data reliably. (Z) Less than 0.5 percent.

Note: Detail does not add to total because of multiple responses. Percent who participated columns show the percent of each row's population who participated in the activity named by the column. Percent columns show the percent of each column's participants who are described by the row heading.

National reports for previous Surveys included tables that had estimates for all fifty states. In order to expedite release of the 2011 National Report, state estimates have been deleted. To find state estimates, go to <http://wsfrprograms.fws.gov/Subpages/NationalSurvey/NatSurveyIndex.htm>. State reports will be issued alphabetically, beginning in early 2013.

*Appendix A*

# Appendix A.

## Definitions

**Annual household income**—Total 2011 income of household members before taxes and other deductions.

**Around-the-home wildlife watching**—Activity within 1 mile of home with one of six primary purposes: (1) taking special interest in or trying to identify birds or other wildlife; (2) photographing wildlife; (3) feeding birds or other wildlife; (4) maintaining natural areas of at least one-quarter acre for the benefit of wildlife; (5) maintaining plantings (such as shrubs and agricultural crops) for the benefit of wildlife; and (6) visiting parks and natural areas to observe, photograph, or feed wildlife.

**Auxiliary equipment**—Equipment owned primarily for wildlife-associated recreation. For the sportspersons section, these include sleeping bags, packs, duffel bags, tents, binoculars and field glasses, special fishing and hunting clothing, foul weather gear, boots and waders, maintenance and repair of equipment, and processing and taxidermy costs. For the wildlife-watching section, these include tents, tarps, frame packs, backpacking and other camping equipment, and blinds. For both sportspersons and wildlife watchers, it also includes electronic auxiliary equipment such as Global Positioning Systems.

**Away-from-home wildlife watching**—Trips or outings at least 1 mile from home for the primary purpose of observing, photographing, or feeding wildlife. Trips to zoos, circuses, aquariums, and museums are not included.

**Big game**—Bear, deer, elk, moose, wild turkey, and similar large animals that are hunted.

Texas

**Day**—Any part of a day spent participating in a given activity. For example, if someone hunted two hours one day and three hours another day, it would be reported as two days of hunting. If someone hunted two hours in the morning and three hours in the afternoon of the same day, it would be considered one day of hunting.

**Education**—The highest completed grade of school or year of college.

**Expenditures**—Money spent in 2011 for wildlife-related recreation trips in the United States, wildlife-related recreational equipment purchased in the United States, and other items. The “other items” were books, magazines, and DVDs; membership dues and contributions, land leasing or owning; hunting and fishing licenses; and plantings, all for the purpose of wildlife-related recreation. Expenditures included both money spent by participants for themselves and the value of gifts they received.

**Fishing**—The sport of catching or attempting to catch fish with a hook and line, bow and arrow, or spear; it also includes catching or gathering shellfish (clams, crabs, etc.); and the noncommercial seining or netting of fish, unless the fish are for use as bait. For example, seining for smelt is fishing, but seining for bait minnows is not included as fishing.

**Fishing equipment**—Items owned primarily for fishing:

Rods, reels, poles, and rodmaking components

Lines and leaders

Artificial lures, flies, baits, and dressing for flies or lines

Hooks, sinkers, swivels, and other items attached to a line, except lures and baits

Tackle boxes

Creels, stringers, fish bags, landing nets, and gaff hooks

Minnow traps, seines, and bait containers

Depth finders, fish finders, and other electronic fishing devices

Ice fishing equipment

Other fishing equipment

**Freshwater**—Reservoirs, lakes, ponds, and the nontidal portions of rivers and streams.

**Great Lakes fishing**—Fishing in Lakes Superior, Michigan, Huron, St. Clair, Erie, and Ontario, their connecting waters such as the St. Mary's River system, Detroit River, St. Clair River, and the Niagara River, and the St. Lawrence River south of the bridge at Cornwall, New York. Great Lakes fishing includes fishing in tributaries of the Great Lakes for smelt, steelhead, and salmon.

**Home**—The starting point of a wildlife-related recreational trip. It may be a permanent residence or a temporary or seasonal residence such as a cabin.

**Hunting**—The sport of shooting or attempting to shoot wildlife with firearms or archery equipment.

**Hunting equipment**—Items owned primarily for hunting:

Rifles, shotguns, muzzleloaders, and handguns

Archery equipment

Telescopic sights

Decoys and game calls

Ammunition

Hand loading equipment

Hunting dogs and associated costs

Other hunting equipment

**Land leasing and owning**—Leasing or owning land either singly or in cooperation with others for the primary purpose of fishing, hunting, or wildlife watching on it.

**Maintain natural areas**—To set aside 1/4 acre or more of natural environment, such as wood lots or open fields, for the primary purpose of benefiting wildlife.

**Maintain plantings**—To introduce or encourage the growth of food and cover plants for the primary purpose of benefiting wildlife.

**Metropolitan Statistical Area (MSA)**—A Metropolitan Statistical Area is a grouping of one or more counties or equivalent entities that contain at least one urbanized area of 50,000 or more inhabitants. The "Outside MSA" classification include census-defined Micropolitan Statistical Areas (or Micro areas). A Micro area is defined as a grouping of one or more counties or equivalent entities that contain at least one urban cluster of at least 10,000 but less than 50,000 inhabitants. Refer to <[www.census.gov/population/metro/about/](http://www.census.gov/population/metro/about/)>, for a more detailed definition of the Metropolitan Statistical Area.

**Migratory birds**—Birds that regularly migrate from one region or climate to another such as ducks, geese, and doves and other birds that may be hunted.

**Multiple responses**—The term used to reflect the fact that individuals or their characteristics fall into more than one reporting category. An example of a big game hunter who hunted for deer and elk demonstrates the effect of multiple responses. In this case, adding the number of deer hunters (one) and elk hunters (one) would overstate the number of big game hunters (one) because deer and elk hunters are not

mutually exclusive categories. In contrast, for example, total participants is the sum of male and female participants, because "male" and "female" are mutually exclusive categories.

**Nonresidents**—Individuals who do not live in the State being reported. For example, a person living in Texas who watches whales in California is a nonresidential wildlife-watcher in California.

**Nonresponse**—A term used to reflect the fact that some Survey respondents provide incomplete sets of information. For example, a Survey respondent may have been unable to identify the primary type of hunting for which a gun was bought. Total hunting expenditure estimates will include the gun purchase, but it will not appear as spending for big game or any other type of hunting. Nonresponses result in reported totals that are greater than the sum of their parts.

**Observe**—To take special interest in or try to identify birds, fish or other wildlife.

**Other animals**—Coyotes, crows, foxes, groundhogs, prairie dogs, raccoons, alligators, and similar animals that can be legally hunted and are not classified as big game, small game, or migratory birds. They may be classified as unprotected or predatory animals by the State in which they are hunted. Feral pigs are classified as "other animals" in all States except Hawaii, where they are considered big game.

**Participants**—Individuals who engage in fishing, hunting, or a wildlife-watching activity. Unless otherwise stated, a person has to have hunted, fished, or wildlife watched in 2011 to be considered a participant.

**Plantings**—See "Maintain plantings."

**Primary purpose**—The principal motivation for an activity, trip, or expenditure.

**Private land**—Land owned by a business, nongovernmental organization, private individual, or a group of individuals such as an association or club.

**Public land**—Land that is owned by local governments (such as county parks and municipal watersheds),

State governments (such as State parks and wildlife management areas), or the federal government (such as National Forests, Recreational Areas, and Wildlife Refuges).

**Residents**—Individuals who lived in the State being reported. For example, a person who lives in California and watches whales in California is a residential wildlife watcher in California.

**Rural**—All territory, population, and housing units located outside of urbanized areas and urban clusters, as determined by the U.S. Census Bureau.

**Saltwater**—Oceans, tidal bays and sounds, and the tidal portions of rivers and streams.

**Screening interviews**—The first Survey contact with a sample household. Screening interviews are conducted with a household representative to identify respondents who are eligible for in-depth interviews. Screening interviews gather data such as age and sex about individuals in the households. Further information on screening interviews is available on page vii in the “Survey Background and Method” section of this report.

**Small game**—Grouse, pheasants, quail, rabbits, squirrels, and similar small animals for which States have small game seasons and bag limits.

**Special equipment**—Big-ticket equipment items that are owned primarily for wildlife-related recreation:

Bass boats

Other types of motor boats

Canoes and other types of nonmotor boats

Boat motors, boat trailer/hitches, and other boat accessories

Pickups, campers, vans, travel or tent trailers, motor homes, house trailers, recreational vehicles (RVs)

Cabins

Off-the-road vehicles such as trail bikes, all terrain vehicles (ATVs), dune buggies, four-wheelers, 4x4 vehicles, and snowmobiles

Other special equipment

**Spenders**—Individuals who spent money on fishing, hunting, or wildlife-watching activities or equipment and also participated in those activities.

**Sportspersons**—Individuals who engaged in fishing, hunting, or both.

**Trip**—An outing involving fishing, hunting, or wildlife watching. A trip may begin from an individual’s principal residence or from another place, such as a vacation home or the home of a relative. A trip may last an hour, a day, or many days.

**Type of fishing**—There are three types of fishing: (1) freshwater except Great Lakes, (2) Great Lakes, and (3) saltwater.

**Type of hunting**—There are four types of hunting: (1) big game, (2) small game, (3) migratory bird, and (4) other animal.

**Unspecified expenditure**—An item that was purchased for use in both fishing and hunting, rather than primarily one or the other. Auxiliary equipment, special equipment, magazines and books, and membership dues and contributions are the items for which a purchase could be categorized as “unspecified.”

**Urban**—All territory, population, and housing units located within boundaries that encompass densely settled territory, consisting of core census block groups or blocks that have a population density of at least 1,000 people per square mile and surrounding census blocks that have an overall density of at least 500 people per square mile. Under certain conditions, less densely settled territory may be included, as determined by the Census Bureau.

**Visit parks or natural areas**—A visit to places accessible to the public and that are owned or leased by a governmental entity, nongovernmental organization, business, or a private individual or group such as an association or club.

**Wildlife**—Animals such as birds, fish, insects, mammals, amphibians, and reptiles that are living in natural or wild environments. Wildlife does not include animals living in aquariums, zoos, and other artificial surroundings or domestic animals such as farm animals or pets.

**Wildlife observed, photographed, or fed**—Examples of species that wildlife watchers observe, photograph, and/or feed are (1) *Wild birds*—songbirds such as cardinals, robins, warblers, jays, buntings, and sparrows; birds of prey such as hawks, owls, eagles, and falcons; waterfowl such as ducks, geese, and swans; other water birds such as shorebirds, herons, pelicans, and cranes; and other birds such as pheasants, turkeys, road runners, and woodpeckers; (2) *Land mammals*—large land mammals such as bears, bison, deer, moose, and elk; small land mammals such as squirrels, foxes, prairie dogs, and rabbits; (3) *Fish* such as salmon, sharks, and groupers; (4) *Marine mammals* such as whales, dolphins, and manatees; and (5) *Other wildlife* such as butterflies, turtles, spiders, and snakes.

**Wildlife-related recreation**—Recreational fishing, hunting, and wildlife watching.

**Wildlife watching**—There are six types of wildlife watching: (1) closely observing, (2) photographing, (3) feeding, (4) visiting parks or natural areas, (5) maintaining plantings, and (6) maintaining natural areas. These activities must be the primary purpose of the trip or the around-the-home undertaking.

**Wildlife-watching equipment**—Items owned primarily for observing, photographing, or feeding wildlife:

Binoculars and spotting scopes

Cameras, video cameras, special lenses, and other photographic equipment

Film and developing

Commercially prepared and packaged wild bird food

Other bulk food used to feed wild birds

Food for other wildlife

Nest boxes, bird houses, feeders, and baths

Day packs, carrying cases, and special clothing

Other items such as field guides and maps

*Appendix B*

## Appendix B.

# 2010 Participation of 6- to 15-Year-Olds and Historical Participation of Sportspeople: Data From Screening Interviews

The 2011 National Survey of Fishing, Hunting, and Wildlife-Associated Recreation was carried out in two phases. The first (or screening) phase began in April 2011. The main purpose of this phase was to collect information about all persons 16 years old and older in order to develop a sample of potential sportspeople and wildlife watchers for the second (or detailed) phase. However, information was also collected on the number of persons 6 to 15 years old who participated in wildlife-related recreation activities in 2010.

It is important to emphasize that the information reported from the 2011 screen relates to activity only up to and including 2010. Also, these data are reported by one household respondent speaking for all household members rather than the actual participants. In addition, these data are based on

long-term recall (at least a 12-month recall), which has been found in Survey research (see *Investigation of Possible Recall/Reference Period Bias in National Surveys of Fishing, Hunting and Wildlife-Associated Recreation, December 1989, Westat, Inc.*) to add bias to the resulting estimates. In many cases, longer recall periods result in overestimating participation and expenditures for wildlife-related recreation.

Tables B-1 through B-4 report data on first-time participation and the most recent year of hunting and fishing for participants 6 years of age and older. Tables B-5 through B-8 report data specifically on 6- to 15-year-old participants in 2010. Detailed expenditures and recreational activity data were not gathered for the 6- to 15-year-old participants. Table B-9 lists the trend data for 6- to 15-year-old participants.

Because of differences in methodologies of the screening and the detailed phases of the 2011 Survey, the estimates of the two phases are not comparable. Only participants 16 years old and older were eligible for the detailed phase. The screening phase covered activity for 2010 or earlier; the detailed phase has estimates for only 2011. The detailed phase was a series of interviews of the actual participants conducted at 4- and 8-month intervals. The screening phase was a single interview of one household respondent who reported household events with one year or more recall. The shorter recall period of the detailed phase enabled better data accuracy.

**Table B-1. Anglers and Hunters Participating for the First Time in 2010 by Age Group**

(Population 6 years old and older. Numbers in thousands)

Age group	Total anglers in 2010	Fishing for first time		Total hunters in 2010	Hunting for first time	
		Number	Percent of anglers in age group		Number	Percent of hunters in age group
<b>Total, all ages</b> .....	<b>55,792</b>	<b>4,261</b>	<b>8</b>	<b>17,060</b>	<b>1,365</b>	<b>8</b>
6 to 8 years .....	3,103	938	30	174	108	62
9 to 11 years .....	3,825	646	17	533	154	29

\* Estimate based on a sample size of 10–29.   ... Sample size too small (less than 10) to report reliably.   (Z) Less than 0.5 percent.

Note: Percent who participated columns show the percent of each row's population who participated in the activity named by the column (the percent of those living in urban areas who fished only, etc.). Percent columns show the percent of each column's participants who are described by the row heading (the percent of those who fished only who lived in urban areas, etc.). Data reported on this table are from screening interviews in which one adult household member responded for all household members. The screening interview required the respondent to recall 12 months worth of activity.

*Appendix C*

## Appendix C.

# Significant Methodological Changes From Previous Surveys and Regional Trends

The 2011 National Survey of Fishing, Hunting, and Wildlife-Associated Recreation (FHWAR) was designed to continue the data collection of the 1955 to 2006 Surveys. While complete comparability between any two Surveys cannot be achieved, this appendix compares major findings of all the Surveys and presents trends for the major categories of wildlife-related recreation where feasible. Differences among the Surveys are discussed in the following two sections.

The principal characteristics of the 1955 to 2011 Surveys are summarized in Table C-1. The table shows the scope and design of all 12 Surveys.

This appendix provides trend information in two sections (1991 to 2011 and 1955 to 1985). A significant change was made in 1991 in the recall period used in the detailed phase of the FHWAR Surveys. The recall period in 1991 was shortened from the 12 months used in previous Surveys to 4 months in order to improve the accuracy of the data collected. As a result of that change, the Surveys conducted since 1991 cannot be compared with those conducted earlier.

The 1955 to 1985 Surveys required respondents to recall their recreation activities for the survey year at the beginning of the following year. The 1991 to 2011 Surveys went to the respondents two or three times during the survey year to get their activity information. The change in the recall period was due to a study<sup>1</sup> of the effect of the respondent recall length

<sup>1</sup> Investigation of Possible Recall/Reference Period Bias in National Surveys of Fishing, Hunting and Wildlife-Associated Recreation, December 1989, Westat, Inc.

on survey estimates. The study found significant differences in FHWAR Survey results using annual recall periods versus shorter recall periods. Longer recall periods lead to higher estimates. Even when everything else was held constant, such as questionnaire content and sample design, increasing the respondent's recall period resulted in significantly higher estimates for the same phenomenon.

The recall study also found that the extent of recall bias varied for different types of fishing and hunting participation and expenditures. For example, annual recall respondents gave an estimate of average annual days of saltwater fishing that was 46 percent higher than the trimester recall estimate, while the annual recall estimate of average annual saltwater fishing trips was 30 percent higher than the trimester recall estimate. This means there is no single correction factor for all survey estimates when calculating trends from Surveys using different recall periods.

Reliable trends analysis needs to use data compiled from surveys in which the important elements, such as the sample design and recall period, are not significantly different.

### 1991 to 2011 Significant Methodological Differences

The most significant design differences in the five Surveys are as follows:

1. The 1991 Survey data was collected by interviewers filling out paper questionnaires. The data entries were keyed in a separate operation after the interview. The 1996, 2001, 2006, and 2011 Survey data were collected by the use of computer-assisted interviews. The

questionnaires were programmed into computers, and the interviewer keyed in the responses at the time of the interview.

2. The 1991 Survey screening phase was conducted in January and February of 1991, when a household member of the sample households was interviewed on behalf of the entire household. The screening interviews for the 1996, 2001, and 2006 Surveys were conducted April through June of their survey years in conjunction with the first wave of the detailed interviews. The 2011 Survey also conducted screening interviews and the first detailed interviews April through June of 2011, but furthermore had an additional screening and detailed effort from February 2012 to the end of May 2012. The April–June 2011 screening effort had a high noncontact rate because of poor results using sample telephone numbers obtained from a private firm. Census went back to the noncontacted component of the original sample in February–May 2012 and interviewed a subsample, requiring annual recall for those respondents. The Wave 3 screen sample was 12,484 of the total 48,600 household screen sample. A modification of the 2011 sampling scheme was to oversample counties that had relatively high proportions of hunting license purchases.

The screening interviews for all five Surveys consisted primarily of demographic questions and wildlife-related recreation questions concerning activity in the previous year (1990, 1995, etc.) and intentions for recreating in the survey year.

(NA) Not available. (X) Not applicable; wildlife-watching (nonconsumptive) interviews were not conducted prior to 1980.

<sup>1</sup> Spent \$5.00 or more or participated 3 days or more during the year.

<sup>2</sup> Spent \$7.50 or more or participated 3 days or more during the year.

<sup>3</sup> Termed “nonconsumptive” in 1980, 1985, and 1991 Surveys.

In the 1991 Survey, an attempt was made to contact every sample person in all three detailed interview waves. In 1996, 2001, 2006, and 2011 respondents who were interviewed in the first detailed interview wave were not contacted again until the third wave (unless they were part of the other subsample, i.e., a respondent in both the sportsperson and wildlife watching subsamples could be in the first and third wave of sportsperson interviewing and the second and third wave of wildlife watching interviewing). Also, all interviews in the second wave were conducted only by telephone. In-person interviews were only conducted in the first and third waves. The 2011 wave 3 screen phase was composed of both telephone and in-person interviews.

### Section I. Important Instrument Changes in the 1996 Survey

1. The 1991 Survey collected information on all wildlife-related recreation purchases made by participants without reference to where the purchase was made. The 1996 Survey asked in which state the purchase was made.
2. In 1991, respondents were asked what kind of fishing they did, i.e., Great Lakes, other freshwater, or saltwater, and then were asked in what states they fished. In 1996, respondents were asked in which states they fished and then were asked what kind of fishing they did. This method had the advantage of not asking about, for example, saltwater fishing when they only fished in a noncoastal state.
3. In 1991, respondents were asked how many days they “actually” hunted or fished for a particular type of game or fish and then how many days they “chiefly” hunted or fished for the same type of game or fish rather than another type of game or fish. To get total days of hunting or fishing for a particular type of game or fish, the “actually” day response was used, while to get the sum of all days of hunting or fishing, the “chiefly” days were summed. In 1996, respondents were asked their total days of hunting or fishing in the country and each state, then how many days they hunted or fished for a particular type of game or fish.
4. Trip-related and equipment expenditure categories were not the same for all Surveys. “Guide fee” and “Pack trip or package fee” were two separate trip-related expenditure items in 1991, while they were combined into one category in the 1996 Survey. “Boating costs” was added to the 1996 hunting and wildlife-watching trip-related expenditure sections. “Heating and cooking fuel” was added to all of the trip-related expenditure sections. “Spearfishing equipment” was moved from a separate category to the “other” list. “Rods” and “Reels” were two separate categories in 1991 but were combined in 1996. “Lines, hooks, sinkers, etc.” was one category in 1991 but split into “Lines” and “Hooks, sinkers, etc.” in 1996. “Food used to feed other wildlife” was added to the wildlife-watching equipment section, “Boats” and “Cabins” were added to the wildlife-watching special equipment section, and “Land leasing and ownership” was added to the wildlife-watching expenditures section.
5. Questions asking sportspersons if they participated as much as they wanted were added in 1996. If the sportspersons said no, they were asked why not.
6. The 1991 Survey included questions about participation in organized fishing competitions; anglers using bows and arrows, nets or seines, or spearfishing; hunters using pistols or handguns and target shooting in preparation for hunting. These questions were not asked in 1996.
7. The 1996 Survey included questions about catch and release fishing and persons with disabilities participating in wildlife-related recreation. These questions were not part of the 1991 Survey.
8. The 1991 Survey included questions about average distance traveled to recreation sites. These questions were not included in the 1996 Survey.
9. The 1996 Survey included questions about the last trip the respondent took. Included were questions about the type of trip, where the activity took place, and the distance and direction to the site visited. These questions were not asked in 1991.
10. The 1991 Survey collected data on hunting, fishing, and wildlife watching by U.S. residents in Canada. The 1996 Survey collected data on fishing and wildlife-watching by U.S. residents in Canada.

### Section II. Important instrument changes in the 2001 Survey

1. The 1991 and 1996 single race category “Asian or Pacific Islander” was changed to two categories “Asian” and “Native Hawaiian or Other Pacific Islander”. In 1991 and 1996, the respondent was required to pick only one category, while in 2001 the respondent could pick any combination of categories. The next question stipulated that the respondent could only be identified with one category and then asked what that category was.
2. The 1991 and 1996 land leasing and ownership sections asked the respondent to combine the two types of land use into one and give total acreage and expenditures. In 2001, the two types of land use were explored separately.
3. The 1991 and 1996 wildlife-watching sections included questions on birdwatching for around-the-home participants only. The 2001 Survey added a question on birdwatching for away-from-home participants. Also, questions on the use of birding life lists and how many species the respondent can identify were added.
4. “Recreational vehicles” was added to the sportspersons and wildlife-watchers special equipment section. “House trailer” was added to the sportspersons special equipment section.
5. Total personal income was asked in the detailed phase of the 1996 Survey. This was changed to total

household income in the 2001 Survey.

6. A question was added to the trip-related expenditures section to ascertain how much of the total was spent in the respondent's state of residence when the respondent participated in hunting, fishing, or wildlife watching out-of-state.
7. Boating questions were added to the fishing section. The respondent was asked about the extent of boat usage for the three types of fishing.
8. The 1996 Survey included questions about the months around-the-home wildlife watchers fed birds. These questions were not repeated in the 2001 Survey.
9. The contingent valuation sections of the three types of wildlife-related recreation were altered, using an open-ended question format instead of 1996's dichotomous choice format.

### Section III. Important instrument changes in the 2006 Survey

1. A series of boating questions was added. The new questions dealt with anglers using motorboats and/or nonmotorboats, length of boat used most often, distance to boat launch used most often, needed improvements to facilities at the launch, whether or not the respondent completed a boating safety course, who the boater fished with most often, and the source and type of information the boater used for his or her fishing.
2. Questions regarding catch and release fishing were added. They were whether or not the respondent caught and released fish and, if so, the percent of fish released.
3. The proportion of hunting done with a rifle or shotgun, as contrasted with muzzleloader or archery equipment, was asked.
4. In the contingent valuation section, where the value of wildlife-related recreation was determined, two quality-variable questions were added: the average length of certain fish caught and whether a deer, elk, or moose was killed. Plus the

economic evaluation bid questions were rephrased, from "What is the most your [species] hunting in [State name] could have cost you per trip last year before you would NOT have gone [species] hunting at all in 2001, not even one trip, because it would have been too expensive?" for the hunters, for example, to "What is the cost that would have prevented you from taking even one such trip in 2006? In other words, if the trip cost was below this amount, you would have gone [species] hunting in [State name], but if the trip cost was above this amount, you would not have gone."

5. Questions concerning hunting, fishing, or wildlife watching in other countries were taken out of the Survey.
6. Questions about the reasons for not going hunting or fishing, or not going as much as expected, were deleted.
7. Disability of participants questions were taken out.
8. Determination of the types of sites for wildlife watching was discontinued.
9. The birding questions regarding the use of birding life lists and the ability to identify birds based on their sight or sounds were deleted.
10. Public transportation costs were divided into two sections, "public transportation by airplane" and "other public transportation, including trains, buses, and car rentals, etc."

### Section IV. Important instrument changes in the 2011 Survey

1. The series of boating questions added in 2006 was deleted.
2. Questions about target shooting and the usage of a shooting range in preparation for hunting were added. The types of weapon used at the shooting range were quantified.
3. Questions about plantings expenditures for the purpose of hunting were added.

4. "Feral pig" was recategorized from big game to other animals for all states except Hawaii.
5. "Ptarmigan" was included as its own small game category, instead of lumped in "other."
6. In previous Surveys, "Moose" was included as its own category only for Alaska. For 2011, "Moose" was included as its own big game category, instead of lumped in "other," for all fifty states.
7. In previous Surveys, "Wolf" was included as its own category only for Alaska. For 2011, "Wolf" was included as its own other animal category, instead of lumped in "other," for all fifty states.
8. The household income categories were modified. The top categories were changed from "\$100,000 or more" to "\$100,000 to \$149,999" and "\$150,000 or more."
9. The "Steelhead" category was deleted from the saltwater fish species section, with the idea that it would be included in "other."
10. The 2006 around-the-home wildlife-watching category that quantified visitors of "public parks or areas" was rewritten to wildlife watching at "parks or natural areas." This change was to make clear that respondents should include recreating at quasi-governmental and private areas.
11. The 2006 wildlife watching equipment category "Film and developing" was rewritten to "Film and photo processing."

## 1955 to 1985 Significant Methodological Differences

### 1955 to 1970 Surveys

The 1955 to 1970 Surveys included only substantial participants. Substantial participants were defined as people who participated at least three days and/or spent at least \$5 (the 1955–1965 Surveys) or \$7.50 (the 1970 Survey) during the surveyed year. Under most circumstances, the Surveys may be compared for totals, but the effects of differences should be considered when comparing the details of the Surveys.

The 1960, 1965, and 1970 Surveys differed from the 1955 National Survey in classification of expenditures as outlined below:

1. Alaska and Hawaii were not included in the 1955 Survey.
2. Expenditure categories were more detailed in 1970 than in earlier Surveys.
3. The 1960 to 1970 classification of some expenditures differs from the 1955 Survey in the following respects:
  - a. "Boats and boat motors" shown under "auxiliary equipment" were included in "equipment, other" in 1955.
  - b. "Entrance and other privilege fees" asked separately were included in "trip expenditures, other" in 1955.
  - c. "Snacks and refreshments" not included with "food" expenditures in the 1960 to 1970 reports were under "trip expenditures, other" in 1955.
  - d. Starting in 1960, expenditures on equipment, magazines, club dues, licenses, and similar items were classified by the one sport activity for which expenditures were chiefly made. In 1955, these expenditures were evenly divided among all the activities in which the sportsperson took part.
  - e. Compared with 1955, the 1960 to 1970 Surveys reported fewer expenditures within the "other" category because selected items were transferred to more appropriate categories.
  - f. Expenditures on alcoholic beverages were reported separately in the 1970 Survey.
4. The number of waterfowl hunters in the 1970 Survey is not comparable with those reported in the 1960 and 1965 Surveys. In 1960 and 1965, respondent sportspersons were not included in the waterfowl hunter total if they reported that they went waterfowl hunting but

did not take the trip chiefly to hunt waterfowl. In 1970, all respondents who reported that they had hunted waterfowl during 1970, regardless of trip purpose, were included in the total. The number of hunters who did not take trips chiefly to hunt waterfowl in 1970 was 1,054,000.

### 1975 Survey

In contrast to previous Surveys which covered substantial participants 12 years old and older, the 1975 Survey based all the estimates on responses from individuals 9 years of age and older and did not select respondents based upon substantial participation as defined above. As a result, individuals who participated fewer than three days or spent less than \$7.50 on hunting or fishing were included in the estimates of participants, days of activity, and expenditures.

Categories of hunting and fishing expenditures differed from the previous four Surveys in that only major categories were reported. For example, hunting equipment expenditures were not further delineated by subcategory. Similarly, no detail was provided within the category of fishing equipment expenditures. Expenses for items such as daily entrance fees, magazines, club dues, and dogs were categorized as "other" in the 1975 report.

In addition to the above differences, the 1975 Survey gathered data on species sought for the favorite hunting and fishing activity. This data replaced the "chiefly" category where hunting or fishing was the primary purpose of the trip or day of activity. Data omitted in the 1975 Survey that were included in previous Surveys include the respondents' population density of residence, occupation, and level of education.

### 1980 to 1985 Surveys

The 1980 and 1985 Surveys were similar. Each measured participants, rather than substantial participants. Questions were incorporated into the 1980 and 1985 Survey questionnaires to facilitate the construction of categories of data for comparisons with earlier Surveys. The use of "chiefly" to delimit primary purpose appeared in the 1970 and prior Surveys, and its use was continued in the 1980 and 1985

Surveys. The expenditure categories in 1980 and 1985 are similar to the 1970 categories with the addition of fish finders, motor homes, and camper trucks as separate categories. The definition of fishing included the use of nets or seines and spearfishing. An extensive wildlife watching section was added in 1980, necessitating a separate detailed phase subsample.

As in the 1970 and 1975 Surveys, the 1980 and 1985 Surveys used a two-phase process to gather information from households and individuals. In the first phase, household respondents were asked to identify each participant six years of age and older who resided in their household. In comparison, the 1975 and 1970 Surveys screened households for participants who were nine years of age and older. In the second phase, the detailed interview phase, interviews were conducted in person for the 1985, 1980, and 1970 Surveys and were conducted by mail for the 1975 Survey. Participants were included in the detailed phase of the Survey if they were at least 12 years old in 1970, 9 years old in 1975, and 16 years old in 1980 and 1985. As a result, the population of hunters and anglers was more narrowly defined in 1980 and 1985. However, estimates of sportspersons 6 years old and older, 9 years old and older, and 12 years old and older, derived from the screening phase, are available for comparison with past Surveys.

## Regional Trends

### Section I. Most recent trends

This trends section covers the period from 1991 to 2011. The 1991, 1996, 2001, 2006, and 2011 Surveys used similar methodologies, making all published information for the five Surveys directly comparable.

### Section II. Historical trends

This trends section covers the period from 1955 to 1985. The methodology of these Surveys differed (see above), but approximate correction factors were estimated.

*Appendix D*

# Appendix D.

## Sample Design and Statistical Accuracy

This appendix is presented in two parts. The first part is the U.S. Census Bureau Source and Accuracy Statement. This statement describes the sampling design for the 2011 Survey and highlights the steps taken to produce estimates from the completed questionnaires. The statement explains the use of standard errors and confidence intervals. It also provides comprehensive information about errors characteristic of surveys and formulas and parameters to calculate an approximate standard error or confidence interval for each number published in this report. The second part, Tables D-1 to D-5, reports approximate standard errors and 95-percent confidence intervals for selected measures of participation and expenditures for wildlife-related recreation.

### Source and Accuracy Statement for the 2011 National Survey of Fishing, Hunting, and Wildlife-Associated Recreation

#### SOURCE OF DATA

The estimates in this report are based on data collected in the *2011 National Survey of Fishing, Hunting, and Wildlife-Associated Recreation* (FHWAR) conducted by the Census Bureau and sponsored by the U.S. Fish and Wildlife Service.

The eligible universe for the FHWAR is the civilian noninstitutionalized and nonbarrack military population living in the United States. The institutionalized population, which is excluded from the population universe, is composed primarily of the population in correctional institutions and nursing homes (98 percent of the 4 million institutionalized people in Census 2010).

The 2011 Survey was designed to provide state-level estimates of the

number of participants in recreational hunting and fishing and in wildlife watching activities (e.g., wildlife observation). Information was collected on the number of participants, where and how often they participated, the type of wildlife encountered, and the amounts of money spent on wildlife-related recreation.

The survey was conducted in two stages: an initial screening of households to identify likely sportspersons and wildlife-watching participants and a series of follow-up interviews of selected persons to collect detailed data about their wildlife-related recreation during 2011.

#### SAMPLE DESIGN

The 2011 FHWAR sample was selected from the Census Bureau's master address file (MAF).

The FHWAR is a multistage probability sample, with coverage in all 50 states and the District of Columbia. In the first stage of the sampling process, primary sampling units (PSUs) are selected for sample. The PSUs are defined to correspond to the Office of Management and Budget definitions of Core Based Statistical Area definitions and to improve efficiency in field operations. The United States is divided into 2,025 PSUs. These PSUs are grouped into 824 strata. Within each stratum, a single PSU is chosen for the sample, with its probability of selection proportional to its population as of the 2000 decennial census. This PSU represents the entire stratum from which it was selected. In the case of strata consisting of only one PSU, the PSU is chosen with certainty.

Within the selected PSUs, the FHWAR sample was selected from the MAF.

#### FHWAR Screening Sample

The total screening sample in the United States consisted of **48,600** households. Interviewing for the screen was conducted during April, May, and June 2011. Due to a high noncontact rate, an additional personal visit screening interview, for a subsample of noncontact cases, occurred again in February, March, April, or May 2012. Of all housing units in sample, about **42,800** were determined to be eligible for interview. Interviewers obtained interviews at **30,400** of these units for a national response rate of **71** percent.<sup>1</sup> The national weighted response rate was **77** percent. The interviewers asked screening questions for all household members 6 years old and older. Noninterviews occur when the occupants are not found at home after repeated calls or are unavailable for some other reason.

Data for the FHWAR sportspersons sample and wildlife-watchers sample were collected in three waves.<sup>2</sup> The first wave started in April 2011, the second in September 2011, and the third in January 2012. In the sportspersons sample, all persons who hunted or fished in 2011 by the time of the screening interview were interviewed in the first wave. The remaining sportspersons in sample were interviewed in the second wave. The reference period was the preceding 4 months for waves 1 and 2. In wave 3, the reference period was either 4, 8, or 12 months depending on when the sample person was first interviewed.

<sup>1</sup> Response rates are calculated by using APPOR's RR2 formula.

<sup>2</sup> The sample cases selected due to high noncontact rates were only interviewed once. They received a screener and, if they had some form of participation, a detailed questionnaire. These participants did not get three waves of interviewing. The reference period for these sampled cases was between 13 and 16 months.

## Detailed Samples

Two independent detailed samples were chosen from the FHWAR screening sample. One consisted of sportspersons (people who hunt or fish) and the other of wildlife watchers (people who observe, photograph, or feed wildlife).

### A. Sportspersons

The Census Bureau selected the detailed samples based on information reported during the screening phase. Based on information collected from the household respondent, every person 16 years old and older in the FHWAR screening sample was assigned to a sportspersons stratum. The criteria for the strata included time devoted to hunting or fishing in previous years, participation in hunting or fishing in 2011 by the time of the screening interview, and intentions to participate in hunting and fishing activities during the remainder of 2011.<sup>3</sup> The four sportspersons categories were:

1. *Active*—a person who had already participated in hunting or fishing in 2011 at the time of the screener interview.
2. *Likely*—a person who had not participated in 2011 at the time of the screener, but had participated in 2010 OR was likely to participate in 2011.
3. *Inactive*—a person who had not participated in 2010 or 2011 AND was somewhat unlikely to participate in 2011.
4. *Nonparticipant*—a person who had not participated in 2010 or 2011 AND was very unlikely to participate in 2011.

Due to the high noncontact rates in wave 1, all persons in the active, likely, and inactive groups were selected with certainty.

Active sportspersons were given the detailed interview twice—at the time of the screening interview (in April, May, or June 2011) and

<sup>3</sup>The sample cases selected due to high noncontact rates were not assigned a sportsperson stratum.

again in January or February 2012.<sup>4</sup> Likely sportspersons and inactive sportspersons were also interviewed twice—first in September or October 2011, then in January or February 2012. Persons in the nonparticipant group were not eligible for a detailed interview. About 16,400 persons were designated for interviews in the United States. The detailed sportspersons sample sizes varied by state to get reliable state-level estimates. During each interview period, about 31 percent of the designated persons were not found at home or were unavailable for some other reason. Overall, about **11,300** detailed sportspersons interviews were completed at a response rate of **69** percent.

### B. Wildlife Watchers

The wildlife-watching detailed sample was also selected based on information reported during the screening phase. Based on information collected from the household respondent, every person 16 years old and older was assigned to a stratum. The criteria for the strata included time devoted to wildlife-watching activities in previous years, participation in wildlife-watching activities in 2011 by the time of the screening interview, and intentions to participate in wildlife-watching activities during the remainder of 2011. The five wildlife-watching categories were:

1. *Active*—a person who had already participated in 2011 at the time of the screening interview.
2. *Avid*—a person who had not yet participated in 2011, but in 2010 had taken trips to participate in wildlife-watching activities for 21 or more days or had spent \$300 or more.
3. *Average*—a person who had not yet participated in 2011, but in 2010 had taken trips to wildlife watch for less than 21 days and had spent less than \$300 OR had not participated in wildlife-watching activities but was very

<sup>4</sup>The sample cases selected due to high noncontact rates were given the detailed sportsperson interview once.

likely to in the remainder of 2011.

4. *Infrequent*—a person who had not participated in 2010 or 2011, but was somewhat likely or somewhat unlikely to participate in the remainder of 2011.
5. *Nonparticipant*—a person who had not participated in 2010 or 2011 AND was very unlikely to participate during the remainder of 2011.

Persons were selected for the detailed sample based on these groupings, but persons in the nonparticipant group were not eligible for a detailed interview.

A subsample of each of the other groups was selected to receive a detailed interview with the chance of selection diminishing as the likelihood of participation diminished. Wildlife-watching participants were given the detailed interview twice.<sup>5</sup> Some received their first detailed interview at the same time as the screening interview (in April, May, or June 2011). The rest received their first detailed interview in September or October 2011. All wildlife-watching participants received their second interview in January or February 2012. Some respondents were given the screener and detailed interview in February, March, April, or May 2012. About **13,900** persons were designated for interviews in the United States. The detailed wildlife-watching sample sizes varied by state to get reliable state-level estimates. During each interview period, about 33 percent of the designated persons were not found at home or were unavailable for some other reason. Overall, about **9,300** detailed wildlife watcher interviews were completed at a response rate of **67** percent.

## ESTIMATION PROCEDURE

Several stages of adjustments were used to derive the final 2011 FHWAR person weights. A brief description of the major components of the weights is given below. All statistics for the popu-

<sup>5</sup>The sample cases selected due to high noncontact rates were given the detailed wildlife-watching interview once.

lation 6 to 15 years of age were derived from the screening interview. Statistics for the population 16 years old and older come from both the screening and detailed interviews. Estimates that come from the screening sample are presented in Appendix B.

### A. Screening Sample

Every interviewed person in the screening sample received a screening weight that was the product of the following factors:

1. *Base Weight.* The base weight is the inverse of the household's probability of selection.
2. *Household Noninterview Adjustment.* The noninterview adjustment inflates the weight assigned to interviewed households to account for households eligible for interview but for which no interview was obtained.
3. *First-Stage Adjustment.* The 824 areas designated for our samples were selected from 2,025 such areas of the United States. Some sample areas represent only themselves and are referred to as self-representing. The remaining areas represent other areas similar in selected characteristics and are thus designated non-self-representing. The first-stage factor reduces the component of variation arising from sampling the non-self-representing areas.
4. *Second-Stage Adjustment.* This adjustment brings the estimates of the total population into agreement with census-based estimates of the civilian noninstitutionalized and nonbarrack military populations for each state.

### B. Sportspersons Sample

Every interviewed person in the sportspersons detailed sample received a weight that was the product of the following factors:

1. *Screening Weight.* This is the person's final weight from the screening sample.
2. *Sportspersons Stratum Adjustment.* This factor inflates the weights of persons selected for the detailed sample to account for the subsampling done within each sportsperson stratum.
3. *Sportspersons Noninterview Adjustment.* This factor adjusts the weights of the interviewed sportspersons to account for sportspersons selected for the detailed sample for whom no interview was obtained. A person was considered a noninterview if he or she was not interviewed in the third wave of interviewing.
4. *Sportspersons Ratio Adjustment Factor.* This is a ratio adjustment of the detailed sample to the screening sample within the sportspersons sampling stratum. This adjustment brings the population estimates of persons aged 16 years old and older from the detailed sample into agreement with the same estimates from the screening sample, which was a much larger sample.

### C. Wildlife-Watchers Sample

Every interviewed person in the wildlife-watchers detailed sample received a weight that was the product of the following factors:

1. *Screening Weight.* This is the person's final weight from the screening sample.
2. *Wildlife-Watchers Stratum Adjustment.* This factor inflates the weights of persons selected for the detailed sample to account for the subsampling done within each wildlife watcher stratum.
3. *Wildlife-Watchers Noninterview Adjustment.* This factor adjusts the weights of the interviewed wildlife-watching participants to account for wildlife watchers

selected for the detailed sample for which no interview was obtained. A person was considered a noninterview if he or she was not interviewed in the third wave of interviewing.

4. *Wildlife-Watchers Ratio Adjustment Factor.* This is a ratio adjustment of the detailed sample to the screening sample within wildlife-watchers sampling strata. This adjustment brings the population estimates of persons aged 16 years old and older from the detailed sample into agreement with the same estimates from the screening sample, which was a much larger sample.

## ACCURACY OF THE ESTIMATES

A sample survey estimate has two types of error: sampling and nonsampling. The accuracy of an estimate depends on both types of error. The nature of the sampling error is known given the survey design; the full extent of the nonsampling error is unknown.

## NONSAMPLING ERROR

For a given estimator, the difference between the estimate that would result if the sample were to include the entire population and the true population value being estimated is known as nonsampling error. There are several sources of nonsampling error that may occur during the development or execution of the survey. It can occur because of circumstances created by the interviewer, the respondent, the survey instrument, or the way the data are collected and processed. For example, errors could occur because:

- The interviewer records the wrong answer, the respondent provides incorrect information, the respondent estimates the requested information, or an unclear survey question is misunderstood by the respondent (measurement error).
- Some individuals who should have been included in the survey frame were missed (coverage error).

- Responses are not collected from all those in the sample or the respondent is unwilling to provide information (nonresponse error).
- Values are estimated imprecisely for missing data (imputation error).
- Forms may be lost; data may be incorrectly keyed, coded, or recoded, etc. (processing error).

The Census Bureau employs quality control procedures throughout the production process, including the overall design of surveys, the wording of questions, the review of the work of interviewers and coders, and the statistical review of reports to minimize these errors. Two types of nonsampling error that can be examined to a limited extent are nonresponse and undercoverage.

*Nonresponse.* The effect of nonresponse cannot be measured directly, but one indication of its potential effect is the nonresponse rate. For the FHWAR screener interview in the United States, the household-level nonresponse rate was 29 percent. The person-level nonresponse rate for the detailed sportsperson interview in the United States was an additional 31 percent and for the wildlife watchers it was 33 percent. Since the screener nonresponse rate is a household-level rate and the detailed interview nonresponse rate is a person-level rate, we cannot combine these rates to derive an overall nonresponse rate. Since it is unlikely the nonresponding households to the FHWAR have the same number of persons as the households successfully interviewed, combining these rates would result in an overestimate of the “true” person-level overall nonresponse rate for the detailed interviews.

*Coverage.* Overall screener undercoverage is estimated to be about 13 percent. Ratio estimation to independent population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics from those of interviewed persons in the same age group.

*Comparability of Data.* Data obtained from the 2011 FHWAR and other sources are not entirely comparable. This results from differences in interviewer training and experience and in differing survey processes. This is an example of nonsampling variability not reflected in the standard errors. Therefore, caution should be used when comparing results from different sources. (See Appendix C.)

*A Nonsampling Error Warning.* Since the full extent of the nonsampling error is unknown, one should be particularly careful when interpreting results based on small differences between estimates. The Census Bureau recommends that data users incorporate information about nonsampling errors into their analyses, as nonsampling error could impact the conclusions drawn from the results. Caution should also be used when interpreting results based on a relatively small number of cases. Summary measures (such as medians and percentage distributions) probably do not reveal useful information when computed on a subpopulation smaller than 90,000 for screener data, 100,000 for the detailed sportsperson data, and 235,000 for the wildlife-watchers data.

## SAMPLING ERROR

Since the FHWAR estimates come from a sample, they may differ from figures from an enumeration of the entire population using the same questionnaires, instructions, and enumerators. For a given estimator, the difference between an estimate based on a sample and the estimate that would result if the sample were to include the entire population is known as sampling error. Standard errors, as calculated by methods described in “Standard Errors and Their Use,” are primarily measures of the magnitude of sampling error. However, they may include some nonsampling error.

*Standard Errors and Their Use.* The sample estimate and its standard error enable one to construct a confidence interval. A confidence interval is a range that has a known probability of including the average result of all possible samples. For example, if all possible samples were surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then

approximately 95 percent of the intervals from 1.96 standard errors below the estimate to 1.96 standard errors above the estimate would include the average result of all possible samples. A particular confidence interval may or may not contain the average estimate derived from all possible samples. However, one can say with specified confidence that the interval includes the average estimate calculated from all possible samples. Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common type of hypothesis is that the population parameters are different. An example would be comparing the proportion of anglers to the proportion of hunters. Tests may be performed at various levels of significance. A significance level is the probability of concluding that the characteristics are different when, in fact, they are the same. For example, to conclude that two characteristics are different at the 0.05 level of significance, the absolute value of the estimated difference between characteristics must be greater than or equal to 1.96 times the standard error of the difference. This report uses 95-percent confidence intervals and 0.05 level of significance to determine statistical validity. Consult standard statistical textbooks for alternative criteria.

*Estimating Standard Errors.* The Census Bureau uses replication methods to estimate the standard errors of FHWAR estimates. These methods primarily measure the magnitude of sampling error. However, they do measure some effects of nonsampling error as well. They do not measure systematic biases in the data associated with nonsampling error. Bias is the average over all possible samples of the differences between the sample estimates and the true value.

*Generalized Variance Parameters.* While it is possible to compute and present an estimate of the standard error based on the survey data for each estimate in a report, there are a number of reasons why this is not done. A presentation of the individual standard errors would be of limited use, since one could not possibly predict all of the combinations of results that may be of interest to data users. Additionally, data users have access to FHWAR microdata files, and it is impossible to

compute in advance the standard error for every estimate one might obtain from those data sets. Moreover, variance estimates are based on sample data and have variances of their own. Therefore, some methods of stabilizing these estimates of variance, for example, by generalizing or averaging over time, may be used to improve their reliability. Experience has shown that certain groups of estimates have similar relationships between their variances and expected values. Modeling or generalizing may provide more stable variance estimates by taking advantage of these similarities. The generalized variance function is a simple model that expresses the variance as a function of the expected value of the survey estimate. The parameters of the generalized variance function are estimated using direct replicate variances. These generalized variance parameters provide a relatively easy method to obtain approximate standard errors for numerous characteristics. Table D-5 provides the generalized variance parameters for FHWAR data. Methods for using the parameters to calculate standard errors of various estimates are given in the next sections.

*Standard Errors of Estimated Numbers.* The approximate standard error,  $s_x$ , of an estimated number shown in this report can be obtained using the following formulas. Formula (1) is used to calculate the standard errors of levels of sportspersons, anglers, and wildlife watchers.

$$s_x = \sqrt{ax^2 + bx} \quad (1)$$

Here,  $x$  is the size of the estimate and  $a$  and  $b$  are the parameters in the tables associated with the particular characteristic.

Formula (2) is used for standard errors of aggregates, i.e., trips, days, and expenditures.

$$s_x = \sqrt{ax^2 + bx + \frac{cx^2}{y}} \quad (2)$$

Here,  $x$  is again the size of the estimate;  $y$  is the base of the estimate; and  $a$ ,  $b$ , and  $c$  are the parameters in the tables associated with the particular characteristic.

#### Illustration of the Computation of the Standard Error of an Estimated Number

Suppose there were an estimated 37,397,000 persons age 16 years old and older who either fished or hunted in the United States in 2011. Using formula (1) with the parameters  $a = -0.000070$  and  $b = 16,823$  from table D-5, the approximate standard error of the estimated number of 37,397,000 sportspersons age 16 years old and older is

$$s_x = \sqrt{-0.000070 * 37,397,000^2 + 16,823 * 37,397,000} = 728,857$$

The 95-percent confidence interval for the estimated number of sportspersons 16 years old and older is from 35,968,000 to 38,826,000, i.e.,  $37,397,000 \pm 1.96 \times 728,857$ . Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 95 percent of all possible samples.

Suppose there were an estimated 13,674,000 hunters age 16 years old and older who engaged in 281,884,000 days of participation in 2011. Using formula (2) with the parameters  $a = -0.000284$ ,  $b = -127,863$ , and  $c = 46,699$  from table D-5, the approximate standard error on 281,884,000 estimated days on an estimated base of 13,674,000 hunters is

$$s_x = \sqrt{-0.000284 * 281,884,000^2 - 127,863 * 281,884,000 + \frac{46,699 * 281,884,000^2}{13,674,000}} = 14,586,000$$

The 95-percent confidence interval on the estimate of 281,884,000 days is from 253,295,000 to 310,473,000, i.e.,  $281,884,000 \pm 1.96 \times 14,586,000$ . Again, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 95 percent of all possible samples.

*Standard Errors of Estimated Percentages.* The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on the size of the percentage and its base. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and the denominator of the percentage are in different categories, use the parameter in the tables indicated by the numerator.

The approximate standard error,  $s_{x,p}$ , can be obtained by use of the formula

$$s_{x,p} = \sqrt{\frac{bp(100-p)}{x}} \quad (3)$$

Here,  $x$  is the total number of sportspersons, hunters, etc., which is the base of the percentage;  $p$  is the percentage; and  $b$  is the parameter in the tables associated with the characteristic in the numerator of the percentage.

### Illustration of the Computation of the Standard Error of an Estimated Percentage

Suppose there were an estimated 13,674,000 hunters age 16 years old and older of whom 18.9 percent hunted migratory birds. From table D-5, the appropriate  $b$  parameter is 15,798. Using formula (3), the approximate standard error on the estimate of 18.9 percent is

$$s_{x,p} = \sqrt{\frac{15,798 * 18.9 * (100 - 18.9)}{13,674,000}} = 1.33$$

Consequently, the 95-percent confidence interval for the estimate percentage of migratory bird hunters 16 years old and older is from 16.3 percent to 21.5 percent, i.e.,  $18.9 \pm 1.96 \times 1.33$ .

*Standard Error of a Difference.* The standard error of the difference between two sample estimates is approximately equal to

$$s_{x-y} = \sqrt{s_x^2 + s_y^2} \quad (4)$$

where  $s_x$  and  $s_y$  are the standard errors of the estimates  $x$  and  $y$ . The estimates can be numbers, percentages, ratios, etc. This will represent the actual standard error quite accurately for the difference between estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same area. However, if there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

### Illustration of the Computation of the Standard Error of a Difference

Suppose there were an estimated 13,608,000 females in the age range of 18-24 of whom 726,000 or 5.3 percent were sportspersons. Similarly, suppose there were an estimated 12,909,000 males in the same age range of whom 2,160,000 or 16.7 percent were sportspersons. The apparent difference between the percentage of female and male sportspersons is 11.4 percent. Using formula (3) and the appropriate  $b$  parameter from table D-5, the approximate standard errors of 5.3 percent and 16.7 percent are 0.79 and 1.35, respectively. Using formula (4), the approximate standard error of the estimated difference of 11.4 percent is

$$s_{x-y} = \sqrt{0.79^2 + 1.35^2} = 1.56$$

The 95-percent confidence interval on the difference between 18- to 24-year-old female and male sportspersons is from 8.3 to 14.5, i.e.,  $11.4 \pm 1.96 \times 1.56$ . Since the interval does not contain zero, we can conclude with 95 percent confidence that the percentage of 18- to 24-year-old female sportspersons is less than the percentage of 18- to 24-year-old male sportspersons.

*Standard Errors of Estimated Averages.* Certain mean values for sportspersons, anglers, etc., shown in the report were calculated as the ratio of two numbers. For example, average days per angler is calculated as:

$$\frac{x}{y} = \frac{\text{total days}}{\text{total anglers}}$$

Standard errors for these averages may be approximated by the use of formula (5) below.

$$s_{x/y} = \frac{x}{y} \sqrt{\left[\frac{s_x}{x}\right]^2 + \left[\frac{s_y}{y}\right]^2 - 2r \frac{s_x s_y}{xy}} \quad (5)$$

In formula (5),  $r$  represents the correlation coefficient between the numerator and the denominator of the estimate. In the above formula, use 0.7 as an estimate of  $r$ .

### Illustration of the Computation of the Standard Error of an Estimated Average

Suppose that the estimated number of the average days per angler age 16 years old and older for all fishing was 16.7 days. Using formulas (1) and (2) above, we compute the standard error on total days, 553,841,000, and total anglers, 33,112,000, to be 20,329,124 and 693,033, respectively. The approximate standard error on the estimated average of 16.7 days is

$$s_{x/y} = \frac{553,841,000}{33,112,000} \sqrt{\left[\frac{20,329,124}{553,841,000}\right]^2 + \left[\frac{693,033}{33,112,000}\right]^2} - 2 * 0.7 \frac{20,329,124 * 693,033}{553,841,000 * 33,112,000} = 0.45$$

Therefore, the 95-percent confidence interval on the estimated average of 16.7 days is from 15.8 to 17.6, i.e.,  $16.7 \pm 1.96 \times 0.45$ .

Plantings .....	2,203,920	254,626	1,704,853	2,702,987

**Table D-5. Parameters a, b, and c for Calculating Approximate Standard Errors for United States Screener Sample, Detailed Sportsperson Sample, and Wildlife-Watching Sample for Levels, Expenditures, and Days or Trips**

Sample	Parameters		
	a	b	c
<b>Screener Sample</b>			
Sportspersons, anglers, hunters, and wildlife-watching participants—6 years old and older .....	-0.000043	12,272	—
Sportspersons, anglers, hunters, and wildlife-watching participants—6 to 15 years old .....	-0.000387	15,783	—
<b>Detailed Sportsperson Sample</b>			
Sportspersons and anglers 16 years old and older .....	-0.000070	16,823	—
Hunters 16 years old and older .....	-0.000066	15,798	—
Expenditures for sportspersons and anglers 16 years old and older .....	0.001159	-575,615	45,670
Expenditures for hunters 16 years old and older .....	0.001923	-978,460	44,416
Days or trips for sportspersons and anglers 16 years old and older .....	0.000068	-160,414	51,951
Days or trips for hunters 16 years old and older .....	-0.000284	-127,863	46,699
<b>Wildlife-Watching Sample</b>			
Levels of wildlife-watching—away-from-home participants .....	-0.000134	32,078	—
Levels of wildlife-watching—wildlife-watching participants <sup>1</sup> .....	-0.000119	28,477	—
Expenditures for wildlife-watching .....	0.001308	-1,548,024	112,362
Days or trips for wildlife-watching .....	0.002307	826,023	54,100

<sup>1</sup> Use these parameters for total wildlife-watching participants and around-the-home participants.
