As a result of lichenological exploration in Bitlis province (Turkey), a total of 325 lichens and 21 lichenicolous fungi, which are belonging 113 genera in *Ascomycota* were determined from 92 different localities. *Buellia vouauxii*, a lichenicolous fungus, and is new to Turkey and also new for Asia. *Aspicilia glomerulans*, *Llimoniella muralicola*, *Myriolecis invadens*, *Ochrolechia subviridis*, *Placynthium hungaricum* and *Placynthium posterulum* were reported for the second time from Turkey. Collecting localities and their substrata are presented.

Especially in last years the knowledge about lichen flora and lichenicolous fungi of Turkey has significantly increased. Compared to eastern Anatolia, more studies have been carried out in the Aegean, Black Sea and Mediterranean regions (John and Türk 2017). However there are still many lichenologically unexplored parts of Turkey (e.g. Hakkari, Şırnak, Siirt). Bitlis is such a part: it has never been the subject of a detailed lichenologically study, and only 35 lichenized fungi have thus far been reported from this area (Çobanoğlu and Yavuz 2007, Vondrák et al. 2012, Krisai-Greilhuber et al. 2017, Yazıcı and Aptroot 2017).

Bitlis, a province located 38°59'26"–39°01'18"N and 41°32'41"–43°12'51"E in the east of Turkey, has a part of Van Lake in eastern Anatolia and is surrounded by Ağrı, Batman, Muş, Siirt and Van provinces. It is 8551 km² in area. The topography of the Bitlis province is determined by the mountains located on the south and north of Lake Van, which generally show a volcanic structure, and the flat areas above them. The mountains in the south of the province are in the form of the extension of the southeast Taurus. These were fragmented by river valleys that originate from the immediate vicinity of Lake Van.

Bitlis province constitutes one of the most mountainous regions of the Eastern Anatolia Region.

In Hizan and Mutki Districts there are no plains, 90% of its area is mountainous lands.

Nemrut and Suphan Mountains, which are among the few volcanic mountains of the world, are within the borders of Bitlis province. Nemrut Mountain, which is located in the north of the provincial territory, has the feature of being the last volcanic mountain in Turkey. It is located on the north of the provincial territory and on the west of the Mount Suphan mountain, in a regular mountain range. Plains cover only 10% of the provincial territory. There is no major river within the borders of the province of Bitlis (URL-1, 2, 3).

The common soil types are limeless brown soils, alluvial soils and regosols (Kaya 2001).

The area of in southern part of the Bitlis region, where Hizan, Mutki, Güroymak districts are located, have many hills, trees, valleys and slits, is the most rugged part. The northern part, which also includes Adilcevaz and Ahlat districts, has rough woodless and open areas. Seventy-one percent of the total area is mountains, 16% plateaus, which is situated on ridges amongst peaks of mountains and 13% plains (Baytop and Denizci 1963).

The main vegetation types are forests and anthropogenic steppes. The forest area is mainly characterized by *Quercus* L., in particular *Q. infectoria* subsp. *boissieri* Reuter in higher parts (over 1800 m) of the area. In lower parts and at stream-sides *Populus* L., *Salix* L. and *Ulmus* L. spp. form the main clumps of trees. Phytogeographically the area is in the Irano-Turanian flora sector. Vegetation in Bitlis varies depending on the climate. In some parts of the area, forest cover and steppe are seen side by side. The southern slopes of Mount Nemrut are covered with oak. The wide crater pit on the

mountain is covered with oak and wild fruit trees. Mount Suphan is completely dry and bare due to the absorbent soil covering that covers it. Forests in the mountainous area in the south of the province are sparse. The main tree species is oak in this region where forest undercover is made up of arid plants. In addition, cold resistant *Juniperus* and wild fruit trees are seen. The number of plant species increases in deep and wet valley bases in the region. There are especially willow, sycamore, poplar and walnut trees in these sections.

The climate is characterized by very cold snowy winters and hot dry short summers, with a temperature range of -21.3°C to 37°C , a mean annual rainfall is around 822.9 mm, and mean annual humidity of 61% (Akman 1999).

The present paper is a contribution to our knowledge of the lichen flora of Turkey and provides the first comprehensive checklist of lichens for Bitlis region.

Material and methods

The lichens and lichenicolous fungi were collected at 92 different localities in Bitlis province between 28 June 2016 and 12 April 2018 (Fig. 1, Table 1). Identification of lichens and lichenicolous fungi were carried out using a stereomicroscope and a light microscope with standard identification methods (Poelt 1969, Poelt and Vězda 1981, Hawksworth 1983, Mayrhofer 1984, Thomson 1984, Vitikainen 1994, Goward et al. 1995, Wirth 1995, Esslinger 1997, Brodo et al. 2001, Giralt 2001, Calatayud et al. 2002, Dobson 2005, Navarro-Rosinés et al. 2009, Smith et al. 2009, Darmostuk 2016). Vouchers are deposited in the herbarium of the

Results and discussion

Lichenological survey in Bitlis province yielded a total of 325 taxa in 113 genera of *Ascomycota*, of which 21 are lichenicolous fungi, and 6 varieties. *Buellia vouauxii*, a lichenicolous fungus, is new to Turkey and also Asia. All taxa are new for Bitlis province except 24 taxa (as shown in list).

The taxa are listed alphabetically. ‘*’ indicate new records for Turkey and Asia, ‘+’ lichenicolous fungus, ‘#’ lichenicolous lichen, while ‘-’ shows reported before from Bitlis.

List of taxa

Acarospora bullata Anzi – Loc. 39, 50, 79, 80, 82: on calcareous rock

Acarospora cervina A. Massal. – Loc. 1, 2, 3, 4, 7, 9, 11, 12, 13, 14, 21, 22, 23, 27, 29, 32, 33, 34, 38, 39, 40, 42, 44, 46, 49, 50, 53, 55, 61, 62, 64, 66, 67, 69, 70, 71, 72, 76, 78, 79, 80, 81, 10, 15, 17, 18, 26, 28, 28a, 28b, 28c, 51, 60, 77, 85, 87, 88, 89: on calcareous rock

Acarospora fuscata (Nyl.) Th. Fr. – Loc. 1, 7, 8, 9, 11, 12, 21, 22, 23, 27, 32, 33, 34, 40, 42, 43, 49, 50, 53, 55, 62, 78, 80, 82, 10, 15, 17, 18, 28, 35, 51, 59, 77, 83, 85, 87, 89: on siliceous rock

Acarospora glaucocarpa (Ach.) Körb. – Loc. 40, 72: on calcareous rock

Discussion

Five lichens, *Acarospora hospitans* (on *Aspicilia cinerea*), *Buelia badia* (on *Lecanora rupicola* and *Xanthoparmelia tinctina*), *Caloplaca grimmiae* (on *Candelariella vitellina*), *Endohyalina insularis* (on *Lecanora rupicola*), *Rinodina parasitica* (on *Aspicilia* sp.), were found to grow as lichenicolous lichen on some other lichens.

Excluding lichenicolous fungi and lichenicolous lichens, lichens were found to be growing on different substrates such as siliceous and calcareous rocks, mosses, soil, *Populus*, *Alnus glutinosa*, *Pyrus*, *Quercus*, *Juglans*, *Prunus*, *Berberis*, *Morus* and *Salix*.

Acarospora cervina, *A. fuscata*, *Aspicilia cinerea*, *A. desertorum*, *C. variabilis*, *C. vitellina*, *Gallowayella fulva*, *Lecanora rupicola*, *Lecidea fuscoatra*, *Lecidella carpathica*, *Lobothallia radiosa*, *Myriolecis hagenii*, *Protoparmeliopsis muralis*, *Rhizocarpon geographicum*, *Rhizoplaca melanophthalma*, *Rinodina bischoffii*, *Rinodina milvina*, *Verrucaria nigrescens* and *Xanthoparmelia verruculifera* were seen to grow plentifully in the study area.

Some corticolous and crustose lichen species such as *Calogaya lobulata*, *Caloplaca cerina*, *Candelariella aurella*, *Candelariella reflexa*, *Gallowayella fulva*, *Gyalolechia flavorubescens*, *Lecanora argentata*, *Myriolecis dispersa*, *Myriolecis hagenii*, *Oxneria fallax*, *Phaeophyscia orbicularis*, *Physcia adscendens*,

Physcia biziana, *Physcia dimidiata*, *Physcia dubia*, *Physconia distorta* are not very selective in terms of substrate selection compared to other species, but are very cosmopolitan.

The main vegetation types are forests and steppes. The forest area is mainly characterized by *Quercus* spp. in higher parts (over 1800 m) of the area. Along the stream *Populus*, *Salix* and *Ulmus* are mainly seen.

The vegetation change in Bitlis is caused by the climate. In some areas, forest and steppe vegetations can be found side by side on the research area. In Bitlis because of hard winter and dry summer, low precipitation, soft and anhydrous soil, scarce forest area, the lichens, most of which are crustose, preferred to grow and aggregate on mostly siliceous and calcareous rocks. So terricolous and muscicolous lichens such as *Catapyrenium*, *Cladonia*, *Collema*, *Endocarpon*, *Peltigera*, *Psora* and *Toninia*, which can grow easily on mosses and soil widespreadly, were not found plentifully on these substrata as expected. On the other hand *Gallowayella*, *Caloplaca*, *Lecanora*, *Phaeophyscia*, *Physcia*, *Physconia*, cosmopolitan epiphytic lichens, were found just on some trees of *Quercus*, *Pyrus*, *Prunus* and *Morus*.

Seventy-nine lichen taxa were defined to grow epiphytic. On the other hand 44 species were found on mosses. Two-hundred-twenty-two lichen taxa were found growing on rocks while 32 lichen species preferred to grow on soil. Twenty-one lichenicolous fungi were found to be on different hosts, such as *Aspicilia* sp., *Aspicilia* cf. *calcarea*, *Aspicilia cinerea*, *Candelariella vitellina*, *Immersaria athroocarpa*, *Lecanora rupicola*, *Lecidea tessellata*, *Lecidella carpathica*, *Phaeophyscia orbicularis*, *Physcia* sp., *Physcia dubia*, *Protoparmeliopsis muralis*, *Rhizocarpon geographicum*, *Rhizoplaca melanophthalma*, *Squamarina cartilaginea*, *Umbilicaria crustulosa*, *Xanthoparmelia pulla*, *Xanthoparmelia tinctina* and *Xanthoria elegans*, of these *Carbonea vorticosa* and *Carbonea vitellinaria* are the most common taxa.

Some crustose lichen and lichenicolous species of genera *Aspicilia*, *Llimoniella*, *Placopyrenium*, *Placynthium* and *Rinodina* are known to grow rarely in Turkey, and of these *Aspicilia glomerulans*, *Llimoniella muralicola*, *Myriolecis invadens*, *Ochrolechia subviridis*, *Placynthium hungaricum* and *Placynthium posterulum* were reported for the second time from Turkey (Halıcı 2008, Oran and Öztürk 2010, Aslan and Yazıcı 2013, Aptroot et al. 2015, Yazıcı and Aslan 2016).

In Bitlis province, in a total of 113 genera (excluding lichenicolous fungi), *Lecanora* (20 taxa), *Caloplaca* (18 taxa), *Rinodina* (16 taxa), *Acarospora* (13 taxa), *Verrucaria* and *Physcia* (10 taxa) are the most common genera in the study area respectively.

Localities in south, north and northwest of Güroymak district are very rich about lichen biodiversity and localities in Hizan and Mutki districts are situated near a lime pit in where *Verrucaria baldensis*, *V. calciseda* and *V. nigrescens* are found, they are identified as an indicator species of lime and calcareous substratum (Fig. 1, Table 1).

It has been determined that soil and mosses are not suitable for the development of lichens in Bitlis province. Therefore, it was observed that lichens developed more on rocks and tree trunks and bodies throughout the province. It is observed that lichens can develop very weakly on soil since it is not suitable for soil lichen development. In addition it has

been observed that lichens were determined less on mosses which are not developed much throughout the province.

In the northern part of the province of Bitlis, it has been observed that lichens can mostly develop on the rocks. Therefore, in the northern parts of the province, it has been determined that lichens generally develop on the rocks in Ahlat, Adilcevaz and Güroymak (northern part) districts. Since the southern part of the province is richer in terms of tree than the northern part, we see more lichens on tree trunks and rocks.
