Daffodils and Narcissi

The beauty of Daffodils and Narcissi is unquestioned and these flowers now form a leading feature in almost every Spring garden. Every Gardener should realize the enormous amount of intense pleasure that can so easily be obtained from the cultivation of a batch of Daffodils or Narcissi.

Indication and origin of the name Daffodil and Narcissus. The use of the terms Narcissus and Daffodils is being confused a great many times. There is a tendency to apply "Daffodil" to varieties of which the trumpet or cup is as large or larger than the perianth, while the name Narcissus indicates varieties having small cups. The term Narcissus however, is correct for all different types of Daffodils and Narcissi. The name Daffodil is from an interesting origin. In the fifteenth century, the words affadile and affodylle applied for asphodel, a Narcissus with a large cup. In 1538 Turner writes about affadyll and daffadilly. Ten years later he says in his "Names of Herbes" that an English whyte affodil is a Duche Daffodil. He uses the forms affodil and daffodil in 1551. The name Daffodil was then used by Gerarde, when he used this term in his Herbal.

Other forms of Daffodil have been: aphrodillus, affodillus, daffodilly, daffadyl, affodyll, daffodyll, pseudo-narcissus and bastarde-narcissus.

The origin of the term Narcissus has not been connected with so much variance. It is accepted that the name has been deduced from the Greek verb Narkao (Lat. obtorpesco), which means to narcotize, as the flower was considered to do so. There is also a Greek mythe that accounts for the name, in which Narkissos is the chief character.

Naturalizing Daffodils and Narcissi in Grass etc. All Daffodils and Narcissi are suitable for naturalizing but in very heavy soils, preference should be given to stronger growing sorts e.i. Trumpet varieties and many Large Cupped sorts. They are all admirably adaptable for grassy slopes and banks, where they should be freely planted. A splendid effect is obtained when Trumpet and other varieties are grouped separately, scattered on the ground and planted where they fall.

Soil and its Treatment. Daffodils and Narcissi will thrive in any well cultivated and drained garden soil. In preparing the ground for planting, dig deeply and if well rotted stable or cow manure is available this may advantageously be dug in 18 to 20 inches deep so as not to come into immediate contact with the bulbs. Never use fresh manure of any kind at planting time. On poor and dry sandy soils we recommend a dressing of sulphate of potash at a rate of about 1 oz. per square yard to be sprinkled over the surface of the ground after planting.

Growing Daffodils in the greenhouse or indoors. All types of Daffodils and Narcissi are suitable for this purpose. Pot up the bulbs on arrival and if ordinary pots are used take a good loamy soil, adding sufficient sand and peat to keep the mixture open. A light dusting of bone meal is also useful. Pot firmly in well crocked pots. For bowls without drainage holes use a good fibre. Plunge the pots and/or bowls in the coolest place of your garden and in the absence of garden space the pots may be placed in a cool cellar (35-40° F.) where watering from time to time is necessary. When the shoots are about 4 inches long and the flower buds well out of the neck of the bulbs, the pots may be removed into a warm room. Heat should be gradually increased from 50° to max. 60° F.

It is advisable to remove the foliage of the sideshoots, if these do not show a flower bud. Just before the buds are open water lightly, when they are in bloom less water should be applied.

Revision of the Classification of Daffodils. In this catalogue we have adopted the revised system for the new R.H.S. classification of Daffodils and Narcissi formally approved by the General Bulb Growers Society of Haarlem (Holland) and the Daffodil Societies of America, Canada, Australia, Tasmania and New Zealand.

The principal changes on comparing the old system with the new one are as follows:

The former Leedsii, Incomparabilis and Barrii Divisions are transferred into two Divisions: viz. Division II Large-Cupped Narcissi with its sub-divisions a, b, c, d and Division III Small-Cupped Narcissi with its sub-divisions a, b, c and d.

The whole Genus is now classified in eleven Divisions as follows:

Ia. Yellow Trumpets – Ib. Bicolor Trumpets – Ic. White Trumpets – IIa. Large-Cupped, yellow perianth, coloured cup or corona – IIb. Large-Cupped, white perianth, coloured cup or corona – IIc. Hyacinths

The best hand-picked quality, choice bulbs selected from healthy stocks, adopted for Bowls, Pots, Glasses and for Exhibition. We include only valuable varieties in our Collections.

CULTURE IN POTS

Hyacinths should be potted early in September for Christmas flowering and every fortnight thereafter for succession. Plunge pots in the coolest place of the garden, or place in a dark, cool cellar.

After three or four months, remove to the forcing house as required, but care should always be taken that the bulbs are well rooted and the buds well out of the neck of the bulbs before beginning to force, as successful cultivation depends almost completely on these points. To keep the foliage dwarf and to assist the perfect colouring of the flowers, they should have occasionally a supply of liquid manure during the growing period. Always use clean old pots.

HYACINTHS ON GLASSES

Fill the glass with water (rainwater preferred) so as almost to touch the base of the bulbs, a few pieces of charcoal should be put in the glass, as this keeps the water pure. The next procedure is the simple one of placing the glasses in any dark cool room, cellar or cupboard until the sprouts are about 3 inches high, then they may be brought gradually to the full light. Although this system of culture is very simple, it is of the first importance that suitable bulbs should be obtained.

OUTDOOR CULTURE

For successful cultivation in the open air, Hyacinths may be planted any time from September to December. September and October being the best months; they like a light rich soil, the ground should be sufficiently drained to prevent it becoming too retentive of moisture; plant the bulbs at equal distances apart in circles or straight lines and about 5 inches deep. Never plant the bulbs when the ground is wet. They require a little covering of straw or a thin layer of leaves during the winter to protect them from frost.

Those marked* are easy forcing varieties and especially suitable for indoor culture
