## SRI983 Electro-Pneumatic Positioner

 - Explosion Proof / Intrinsically Safe

The SRI983 Positioner is for operation of pneumatic valve actuators from control systems and electrical controllers with electric control signals. It is used to reduce the adverse effects of valve friction, for higher thrust and shorter positioning time.

## FEATURES

- Independent adjustment of stroke range and zero
- Adjustable amplification and damping
- Split range up to 3-fold possible
- One version for 4-20 mA input
- Supply pressure up to 6 bar ( 90 psig)
- Low vibration effect in all directions
- Mounting according to IEC 534, part 6 (NAMUR)
- Rotation adapter for angles up to $120^{\circ}$
- Mounting onto any linear or rotary actuator
- Explosion protection:

II 2 G Exd and II 1 G Ex ia according to ATEX, or explosion proof, intrinsic safety acc. to FM and CSA, and CU TR

- EMC in accordance with the international standards and laws (CE)

## 1 GENERAL

The electro-pneumatic positioner is used for direct operation of pneumatic valve actuators by means of electrical controllers or control systems with an analog output signal of 4-20 mA or split ranges.

Fig. 1: Control circuit with single-acting positioner

### 1.1 Identification

The nameplate of the positioner is located at the side wall of the housing. Nameplates are in accordance with selected model. Examples:
Explosion protection acc. to ATEX

### 1.2 Additional equipment

Single acting positioners are available with two built-in gauges for the indication of the input value 10 and the actuating pressure 11 (output).
Fig. 4: Single-acting positioner with built-in gauges

Manual bypass switch 51 for single-acting positioner only

Positioner and pneumatic actuator form a control loop with the command variable ws (output signal y of the master controller), the correcting variable ys and the stroke position xs of the actuator.
In this manner disturbing influences such as gland friction and medium forces within the valve are compensated by the positioner.
In addition, the positioning force of the actuator can significantly be increased by an output pressure of max. 6 bar.
The electro-pneumatic positioner can be mounted on both diaphragm actuators and rotary actuators.
For spring loaded actuators a single-acting positioner is used, whilst for actuators without spring loading a double acting positioner is used.
The double acting positioner operates with two opposing control pressures.

Explosion protection EAC approved

For attachment to rotary actuators and rotary armatures an attachment-kit for rotary movement (Code EBZG-PN, -NN, -$\mathrm{JN},-\mathrm{ZN},-\mathrm{RN})$ is required.
Fig. 5: Housing of the attachment kit for rotary movements

By means of a total of five range springs the positioner can be matched to nearly all operating situations, such as up to 4way (or with 4 to 20 mA up to 3 -way) range subdivision, very high and very short strokes and angles of rotation or special cams. A standard range spring 420494019 is installed.
Other range springs are available (see pages 14 and 15).

### 1.3 Function

The positioner operates according to the force comparison principle:
The input current signal w flows through coil 93, which magnetizes the magnetic system 94. The resulting magnetic field in gap 95 enforces a permanent magnet 96 proportional to input current.
Magnet 96 forms the rotating system together with impact plate 97 . Impact plate 97 more or less covers nozzle 98 whereby the dynamic pressure at nozzle 98 pursues a restorable force equalizing the force at magnet 96 in balance. Nozzle 98 is supplied with air via throttle 92 from output pressure w' of the amplifier 99 driven by the change in pressure ahead of nozzle 98.
At the same time the pressure signal $w$ ' is passed to the input diaphragm 70. The stroke of the input diaphragm is transferred to the flapper lever 54. The resultant change in the distance between the nozzle 36 and the flapper 37 alters the back pressure at the nozzle. This pressure acts in a single acting positioner on an amplifier 40. Its output pressure y results in a stroke movement of diaphragm actuator with spring resetting (see Fig. 6).

In the double acting positioner this pressure acts on a double acting amplifier 41 , where opposed output pressures y1 and y2 cause a stroke movement in the diaphragm actuator without spring resetting (see Fig. 7).
The stroke movement is tapped at the actuator spindle 16 of the feedback lever 9 and transferred to the stroke factor lever 31. The stroke factor lever 31 and the flapper lever 54 are connected by the range spring 34.
Equilibrium of forces is set at the flapper lever 54 if the torque produced at the input diaphragm 70 is equal to the torque reaction of the range spring 34 produced by the stroke setting. Thus an actuator setting proportional to the signal input is retained constantly.
A dynamic adaption to the actuator (sensitivity, stability) can be accomplished by the throttling screw 42 and the damping throttles 44, 44 and 45 in the double acting positioner. The stroke range and zero point are set via the zero screw 32 and the stroke factor screw 33.
A rising or falling actuator pressure at rising input signal is set in the single acting positioner by means of the changeover plate 50.

for attachment to valve stem

### 2.2.2 Determination of mounting side

## Single acting diaphragm actuators

Check whether the actuator is in the safety position required by the process (Does the actuator open or close with spring force?).
The mounting side is selected from the table below in accordance with the direction of action and the required direction of movement of the spindle for an increasing input signal.

The arrow indicates the direction of movement of the spindle at increasing input signal.
The direction of action of the input signal can be set on the changeover plate 50 (see page 23):
$\mathrm{N}=$ Normal direction of action (increasing input signal produces increasing control pressure to the actuator) $\mathrm{U}=$ Reverse direction of action (increasing input signal produces decreasing control pressure to the actuator)

## Double acting diaphragm actuators

For double acting positioners the changeover plate 50 always stays in the " $\boldsymbol{N}$ ' setting. The assignment of the input signal to the direction of movement of the actuator spindle is determined by the selection of the mounting side of the positioner and the piping of the positioner outputs to the actuator:
If the actuator spindle is to ascend with an increasing input signal, output y 1 is connected at top of the actuator and output y2 is connected at bottom.
The positioner is mounted at the right hand side. If the actuator spindle is to retract with an increasing input signal, output y 1 is connected at bottom and output y 2 at top of the actuator.
The positioner is mounted at the left hand side.

The arrow indicates the direction of movement of the spindle with an increasing input signal.

### 2.2.3 Attachment to diaphragm actuators

Attachment of the positioner is made using the attachment kit for diaphragm actuators according to DIN IEC 534-6 at right or left hand side of the actuator.
a) Screw the carrier bolt $\mathbf{1 6}$ into actuator coupling (see Fig. 12).
b) Screw mounting bracket 20 flush with the positioner with two M6 socket head cap screws ( $5 \mathrm{~mm} \mathrm{A/F}$ ).
c) Fasten positioner with mounting bracket 20 to the diaphragm actuator.
For diaphragm actuators with cast yokes:
Fasten mounting bracket 20 with screw M 8 to the threaded hole in the cast yoke.
This ensures that the feedback lever 9 is horizontal at 50 \% stroke.
For diaphragm actuators with pillars:
Fasten mounting bracket 20 with two U-bolts 21 to the pillar in such a manner that feedback lever 9 which is loosely attached to shaft 17 of positioner and carrier bolt 16 is horizontal at $50 \%$ stroke.
d) Set actuator to a $0 \%$ stroke position.

Attach feedback lever 9 to shaft 17 of the positioner and carrier bolt 16 in such a manner that compensating spring 14 is above carrier bolt 16 when the mounting side is on the right, or below carrier bolt 16 when the mounting side is on the left.
Align and lock carrier bolt.
e) Press stroke factor lever $\mathbf{3 1}$ against stop screw $\mathbf{3 0}$ and create a frictional connection between feedback lever 9 and shaft 17 of positioner by tightening hexagon cap screw 15 ( $10 \mathrm{~mm} \mathrm{A/F}$ ) of feedback lever.
f) Connect positioner output y1 to single acting diaphragm actuators and connect outputs y1 and y2 to double acting diaphragm actuators.
g) Set up electrical connections.
h) Connect supply air of min. 1.4 bar to max. 6 bar, but no more than the maximum permissible operating pressure of the diaphragm actuator.
i) Fasten housing cover in such a way that air vent of attached device faces downwards (see Mark 'Min Fig. 12).
Fig. 12: Actuator with pillars (mounting side left)

## ATTACHMENT KIT FOR ROTARY ACTUATORS

### 2.3.2 Attachment to rotary actuators

For attachment of the positioner to rotary actuators or rotary armatures an attachment kit is required. The linear cam enables sensing of rotation angles up to $120^{\circ}$, whereas the equal percentage and the inverse equal percentage cams sense rotation angles up to $90^{\circ}$ (linear characteristic between $70^{\circ}$ and $90{ }^{\circ}$.

## Attachment

a) Remove the transparent cover plate from the housing 26 of the attachment kit.
b) Mount the housing of the attachment kit on rotary actuator or armature; use mounting hardware supplied by the actuator manufacturer if necessary.

c) Move actuator into the desired starting position (rotation angle $=0{ }^{\circ}$ ).
d) Mount cam 24 in accordance with the direction of rotation of the actuator (see Fig. 15). The linear cam is fastened to the actuator drive shaft in such a manner that the dimension x or y (Fig. 16) amounts 2 mm , whereas in case of equal percentage cam the dimension x is approx. 17.5 mm , and the dimension y is approx. 21.5 mm . In case of inverse equal percentage cam the dimension x is approx. 18 mm , and the dimension y is approx. 23 mm . When employing equal percentage and the inverse equal percentage cams, the range spring 420493013 (included in spring set FESG-FN) must be installed in the positioner.
Fig. 15: Mounting position of the cams
$A=$ Mounting position for actuator rotation $\downarrow$
$B=$ Mounting position for actuator rotation $\downarrow$

Fig. 16: Rotary actuator with attachment kit for rotary movement and double-acting positioner

Fig. 17: Attaching feedback lever to the positioner

e) Fasten feedback lever 9 for the rotary actuator onto shaft 17 of positioner as shown in Fig. 17.
f) Mount positioner on housing 26 of attachment kit. Attach spring 18 to feedback lever 9 and cam follower 19 against cam (see Fig. 18).

Screw positioner to housing of attachment kit. With the linear cam and the inverse equal percentage cam check whether mark 25 points to the center of the cam follower 19 (see Fig. 15); adjust if necessary.
With the equal percentage cam check whether the cam follower lies directly ahead of the start of the cam lobe; adjust if necessary.
g) Final mounting of feedback lever 9 on shaft of positioner is performed at a stroke of $0 \%$, i.e. a rotation angle of $0^{\circ}$. First loosen 5 mm A/F Allen screw 15 of feedback lever 9 through hole 29 (see Fig. 19), then press stroke factor lever 31 against stop screw 30 (see page 23) and tighten Allen screw 15 firmly.
h) With single acting actuators connect positioner output y1 to actuator; with double acting actuators connect y1 and y2 to actuator.
Connect chamber in which pressure is to build up with an increasing input signal to y1.
i) Connect command variable w (input, 4-20 mA).
k) Connect supply air of min. 1.4 bar to max. 6 bar, but do not exceed the maximum permissible operating pressure of the actuator.
Fig. 19: Tightening feedback lever

## Note!

If actuator moves to an end position, the mounting position of cam does not coincide with the direction of rotation of the actuator. In this case install the cam 24 in the reverse position.
I) Attach pointer $\mathbf{2 7}$ on the headed screw $\mathbf{2 8}$ in such a manner that $0^{\circ}$ is indicated when the rotary actuator is in its starting position ( $\mathrm{w}=0$ ).
m) Attach the transparent cover plate.

### 2.3.3 Reversing direction of rotation

Single acting actuator:
Move changeover plate 50 (see page 23) to ' $\mathbf{U}$ ' position and reverse cam 24.
Double acting actuators:
Exchange positioner outputs (see Fig. 16) and reverse cam. The changeover plate 50 (see page 23) remains in ' $\boldsymbol{N}$ ' position.

Fig. 20: Attachment kit for rotary movement and positioner

### 2.4 Manual bypass switch

The single acting pneumatic positioner can also be supplied with a bypass switch 51 (see page 23) if it is intended for use with actuators with a signal range of 0.2 to 1 bar. In the "ON" position the actuating signal of the master controller is supplied via the positioner; in the "OFF" position it is connected direct to the actuator.
Fig. 21: Bypass circuit

## Note!

The bypass switch may only be operated in the normal direction of action (changeover plate 50 in position " N ", see page 23), i. e. when the "OFF" position is set. It should also be noted that the stored pressure in the actuator chamber may have a feedback effect on the preceding controllers when the "OFF" position is set, and could overload them.
The pressure in the actuator chamber should therefore be reduced accordingly before the changeover. The spring range of the actuator should not exceed the maximum signal value of the master controller, in order to ensure that the valve can open and close fully.

## 3 ELECTRICAL CONNECTIONS

During installation, the installation requirements by DIN VDE 0100 and/or DIN VDE 0800, as well as locally applicable requirements must be observed.
In addition, the requirements of VDE 0165 must be observed for systems associated with hazardous areas. Further important instructions are mentioned in page 22 (safety requirements, explosion protection).
If an earth connection or potential equalization is required, connect to earth connection 3.
The units must be operated in a stationary position.
The line (cable) is guided through a screwed gland. This is suitable for line diameters of 6 to 12 mm .
The electrical connections for the command variable $w$ is made at the + and - screw terminals 2 , which are suitable for wire cross-sections of up to $2.5 \mathrm{~mm}^{2}$ (see Fig. 22).

Fig. 22: Electrical connections 2 and earth connection 3

## 4 START-UP

Before commissioning electro-pneumatic positioners must be matched to the stroke and rotation angle of the actuator and to the input signal range.
The instruments can be connected to the 4 to 20 mA input signals or split ranges.
The supply air connected should be min. 1.4 bar and max. 6 bar, but should not exceed the maximum operating pressure of the diaphragm actuator.

### 4.1 Setting the gain

(see page 23)
The gain and thus the sensitivity of the positioner are set by means of the throttling screw 42. The throttling screw is screwed in all the way in the factory, i.e. it is set to maximum gain. This gain varies with the supply air pressure, as shown in the following table:

| Supply air | max. gain |  |
| :---: | :---: | :---: |
|  | Single-acting <br> positioner | Double-acting <br> positioner |
| 1.4 bar | approx. 150 | approx. 100 |
| 4 bar | approx. 90 | approx. 150 |
| 6 bar | approx. 60 | approx. 180 |

The linear gain is indicated. These values are based on the built-in range spring 420494019.
From this basic setting the gain can be matched to the dynamic requirements of the control system (counter-clockwise rotation of the throttling screw 42 results in less gain).

## Note:

The zero point must be adjusted following each change of gain.
In order to ensure reliable pressure reduction in the actuator, the throttling screw 42 should not be opened beyond $1 / 4$ turn at 6 bar. A limiting screw 43 is therefore incorporated.
The basic setting at the factory permits a maximum opening of the throttling screw 42 of approx. 1 turn.

### 4.2 Setting of zero point and stroke

## (see page 23)

Before commencing settings press the flapper lever 35 several times alternately to the left and right in order to align the flappers correctly.
a) Set the minimum value of the command variable w (start of stroke).
b) Turn zero screw $\mathbf{3 2}$ until actuator just begins to move from its end position.
c) Set maximum value of the command variable w (end of stroke).
d) Turn the stroke factor screw $\mathbf{3 3}$ until actuator precisely reaches its end position:

Right turn: decrease of travel
Left turn: increase of travel
Recheck zero and stroke settings.

## Note:

When stop screw 30 is correctly positioned and feedback lever is correctly mounted, there is no interaction between the adjustments of zero and stroke.
If the stroke cannot be adjusted with the installed spring, the correct spring can be approximately determined in accordance with the following criteria:

There are 5 differently rated springs available for matching the stroke and input signal range.
The particular spring 34 required can be determined precisely via stroke factor Ux.

### 4.3 Setting the damping

(see page 23)
The air output capacity of the positioner can be reduced by means of the damping throttle 44.
Double-acting positioners are equipped with a damping throttle 44 for correcting the variable y 1 and a damping throttle 45 for correcting the variable y2.
In its normal setting the damping throttle is approximately flush with the amplifier housing.
The air output capacity is reduced by a factor of approx. 2.5 when the damping throttle is turned completely in. A reduction of the air output capacity should only be done for very small actuator volumes since the control system would otherwise be too slow.

### 4.4 Subdivision of input range (split-range)

If several actuators are to be controlled by the same command variable and the complete stroke is to be executed in only one specific sub range of this command variable at a time, a positioner, the zero point and stroke range of which must be set to the desired sub-range of the command variable, must be provided for each actuator.
For actuation of several positioners by a master controller the positioners are connected in series.

Fig. 24: Example of 2-way sub division

It should be noted that the permissible load of the controller may not be exceeded.
The input resistance of the positioner at $20^{\circ} \mathrm{C}$ is approx. 200 Ohms.
Selection of the correct range spring can be made in accordance with the stroke factor range or the graph of the range springs (see page 15).

If the zero point has to be increased by more than 10 mA in case of multiple subdivision the adjustment must be made as follows: (see page 23)
a) Shut off supply air.
b) Remove tension from range spring 34 by turning zero screw 32.
c) Loosen hexagon cap screw (A/F 10) of feedback lever and turn stroke factor lever 31 away from stop screw 30. This applies pretension to range spring 34. In this position retighten hexagon cap screw of feedback lever.

Fig. 25: Pretension of the range spring

e) Set the minimum value of command variable w (start of stroke).
f) Turn zero screw 32, until the actuator begins to move from its end position. If this is not possible, the pretension of the range spring must be increased as described in c).
g) Set maximum value of command variable w (end of stroke).
h) Turn stroke factor screw $\mathbf{3 3}$ until the actuator precisely reaches its end position.

## Note!

With this setting the zero point and stroke range are mutually dependent. Settings e) to h) must therefore be repeated as often as necessary until both settings are correct.
Furthermore it should be noted that the deflection of the stroke factor lever 31 from the starting position may not exceed a maximum of $39^{\circ}$, since the stroke factor lever might otherwise touch the housing cover before reaching its end value.

### 4.5 Determination of rotation angle factor $\mathrm{U} \varphi$

In conjunction with the attachment kit for rotary actuators (Code EBZG-PN, -MN, -JN, -ZN, -RN) the rotation angle factor $U \varphi$ can be determined as follows:
$\mathrm{U} \varphi=\varphi / \Delta \mathrm{w}=$ Rotation angle / Input signal range [mA]
The rotation angle factors $\mathrm{U} \varphi$ of the individual range springs are stated in the following table.
The rotation angles are also taken into account in the graph of the range springs (see page 15).

### 4.6 Determination of stroke factor Ux

The stroke factor $U x$ is the ratio of the entire range of the output variable (stroke $x$ ) to the entire range of the input variable (command variable w).
For diaphragm actuators PA-200 to PA700/702:
$\mathrm{U} \varphi=\mathrm{x} / \Delta \mathrm{w}=$ Stroke in $\mathrm{mm} /$ Input signal range [mA]

The stroke factor can be used to determine for each application whether or with which spring the desired setting can be made.
Five different range springs are available for matching to the stroke and input signal range.

### 4.6.1 Stroke factor ranges of the range springs

The stroke factor Ux determined as described above should lie within the ranges of the respective range springs indicated in the following table, as close as possible to the lower value.

|  |  | spring |  |  |  | Stroke f | r ranges |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Ident No . | old ID | Color | linear | Equal perc. and inverse equal perc. | Stroke factor Ux | Stroke Range <br> 2) | Remarks |
|  |  |  |  | $\max .120^{\circ}$ | max. $90^{\circ}$ | mm/mA | mm |  |
| 1 | 420493013 | FES 627/1 | yellow | $\begin{aligned} & 1.7 \text { to } 4.7 \\ & (\max .7) \\ & \hline \end{aligned}$ | $\begin{gathered} \hline 2.4 \text { to } 8 \\ (\max .10) \\ \hline \end{gathered}$ | $\begin{gathered} \hline 0.4 \text { to } 1.2 \\ (\max .1 .7) \\ \hline \end{gathered}$ | 8 to 34 | 2) |
| 2 | 420494019 | FES 628/1 | green | $\begin{aligned} & 3.5 \text { to } 9.5 \\ & (\max .14) \\ & \hline \end{aligned}$ | $\begin{gathered} 5 \text { to } 15 \\ (\max .20) \\ \hline \end{gathered}$ | $\begin{aligned} & 0.85 \text { to } 2.3 \\ & \text { (max. } 3.35 \text { ) } \\ & \hline \end{aligned}$ | 17 to 68 | built-in |

[^0]
### 4.6.2 Characteristics of the range springs

The stroke xo is based on the standard feedback lever $\mathrm{l}=117.5 \mathrm{~mm}$.

Fig. 26: Feedback lever

If another length (Is) is used, the actual stroke xs must be converted to stroke xo:

$$
\mathrm{xo}=117.5 \cdot \mathrm{xs} / \mathrm{ls} \quad[\mathrm{~mm}]
$$

## Selection of measuring spring and setting of measuring span

Determination of suitable spring for split range:
a) Enter desired set point value w for travel start in the diagram field.
b) Determine xo if Is unequal 117.5 mm .
c) Enter intersection w/xo .
d) Connect points determined at a) and c). This results in a straight line.
e) If the straight line does not run through the origin, move this parallel here.
f) Use the spring the characteristic line (a) of which is located directly below the presently determined characteristic line.

Example (shown in graph)
Split range operation
Valve 1:

$$
\begin{aligned}
& \mathrm{w}=0 \ldots 10 \mathrm{~mA} \\
& \mathrm{xs}=30 \mathrm{~mm}(\text { stroke range }) \\
& \mathrm{Is}=140 \mathrm{~mm} \\
& \mathrm{xo}=117.5 \cdot 30 / 140=25.2 \mathrm{~mm}
\end{aligned}
$$

Intersection $\mathrm{w}=10 \mathrm{~mA}$ with $\mathrm{xo}=25.2 \mathrm{~mm} \rightarrow \mathrm{~S} 1$
Selected: Spring 4 (FES 715/1) because the characteristic curve based on the beginning of the determined straight line located directly below.

Valve 2:

$$
\begin{aligned}
& \mathrm{w}=10 \ldots 20 \mathrm{~mA} \\
& \mathrm{xs}=50 \mathrm{~mm} \text { (stroke range) } \\
& \mathrm{Is}=140 \mathrm{~mm} \\
& \quad \mathrm{xo}=117.5 \cdot 50 / 140=42 \mathrm{~mm}
\end{aligned}
$$

Intersection $\mathrm{w}=20 \mathrm{~mA}$ with $\mathrm{xo}=42 \mathrm{~mm} \rightarrow \mathrm{~S} 2$
Selected: Spring 5 (FES 629/1) because the characteristic curve based on the beginning of the determined straight line located directly below.

Lifting up of zero point for 4-20 mA and split range
$1 \mathrm{a}, 2 \mathrm{a}, 3 \mathrm{a}, 4 \mathrm{a}, 5 \mathrm{a}=$ stroke starting of the respective spring
1b, 2b, 3b, 4b, 5b = max. stroke

1) $\mathrm{lo}=$ Standard feedback effective length
2) For feedback effective length $\mathrm{Is}=117.5 \mathrm{~mm}$ and $\Delta \mathrm{w}=20 \mathrm{~mA}$
3) Theoretical value

## 5 MAINTENANCE

### 5.1 Basic Adjustment of Single-acting Positioner (pneumatic part)

Basic setting is only necessary after dismantling the device or changing modules.
All the settings for adapting the positioner to the actuator are described in page 12 (start-up).
The following tools are required for basic adjustment:
Screwdriver
1 open-end spanner $7 \mathrm{~mm} \mathrm{~A} / \mathrm{F}$
1 feeler 0.6 mm
1 test gauge 1.6 bar
1 DC signal generator
The feedback lever must be detached from the shaft of positioner if adjustment is done in the attached state. For the following adjustments see page 23.
a) Set changeover plate $\mathbf{5 0}$ to " N ".
b) Turn throttling screw 42 to the right as far as possible (maximum boost).
c) Unhook range spring 34 from flapper lever 35.
d) Check whether the flappers 37 are concentric with the nozzles 36. If not, align booster 40. The fastening screws of the booster are accessible at the rear side of the positioner.
e) Push flapper lever $\mathbf{3 5}$ alternately to the left and right several times to align the ball-guided flappers parallel to the nozzles.
f) Push flapper lever 35 to the left. By turning the hexagonal rod $387 \mathrm{~mm} \mathrm{~A} / \mathrm{F}$ set the distance between the right-hand nozzle and the right-hand flapper to approx. 0.6 mm with the aid of a feeler. Then fasten the hexagonal rod tight.
g) Connect the positioner as shown in the test circuit, fig. 28, and preset supply air to 1.4 bar.
h) Press flapper lever 35 to the left. If the output $y$ does not rise to supply air pressure, there are leaks or the flapper is not correctly positioned (repeat 'e').
i) Hook range spring 34 into flapper lever and preset DC signal $w=10 \mathrm{~mA}$. Proceed as follows to make zero setting independent of the stroke setting:
k) Press stroke factor lever 31 against stop screw 30.
l) Set a large stroke factor (approx. 2 mm in front of top stop) with stroke factor screw 33.
m) Set zero screw 32 so that the output pressure $y=$ approx. 0.6 bar and note this value.
n) Set a small stroke factor (approx. 2 mm in front of bottom stop) with the stroke factor screw 33. The output pressure y may not change by more than $\pm 150$ mbar in relation to setting m ).
o) The stop screw $\mathbf{3 0}$ should be adjusted in case of greater deviations. Repeat settings I) to n) after every adjustment of the stop screw $\mathbf{3 0}$ until the deviation is less than $\pm 150$ mbar.
p) Secure stop screw 30 with varnish.

Put changeover plate 50 back in its original position. Reinstall positioner or reattach the feedback lever to positioner shaft.

See page 12 for start-up.

Fig. 28: Test circuit for single acting positioner

### 5.2 Basic Adjustment of the Double-acting Positioner (pneumatic part)

Basic setting is only necessary after dismantling the device or changing modules.
All settings for adapting the positioner to the actuator are described in page 12 (start-up).
The following tools are required for basic adjustment:
Screwdriver
1 open end spanner $7 \mathrm{~mm} \mathrm{~A} / \mathrm{F}$
1 feeler 0.6 mm
2 test gauges 6 bar
1 DC signal generator
The feedback lever must be detached from the shaft of the positioner if adjustment is done in the attached mode.
For the following adjustments see page 23.
a) Leave changeover plate 50 set to " N ".
b) Turn throttling screw $\mathbf{4 2}$ to the right as far as possible (maximum boost).
c) Unhook range spring 34 from flapper lever 35.
d) Check whether flappers $\mathbf{3 7}$ are concentric with nozzles 36. If not, align booster 41. The fastening screws of the booster are accessible at the rear side of the positioner.
e) Push flapper lever 35 alternately to the left and right several times to align ball-guided flappers parallel to nozzles.
f) Push flapper lever 35 to the left. By turning the hexagonal rod $387 \mathrm{~mm} A / F$ set the distance between the right-hand nozzle and the right-hand flapper to approx. 0.6 mm with the aid of a feeler. Then fasten hexagonal rod tight.
g) Connect positioner as shown in the test circuit, fig. 29, and preset supply air to 6 bar.
h) Press flapper lever 35 to the right and left. The pressures y1 and y2 must change in opposition between 0 and supply air pressure.
i) Hook range spring $\mathbf{3 4}$ into flapper lever and preset DC signal $w=10 \mathrm{~mA}$.
k) Set zero screw 32 so that pressures y1 and y2 are equal.
I) Set adjustment screw 47 so that pressures $y 1$ and y2 are set to approx. 4.2 bar ( $70 \%$ of the supply air pressure). Repeat settings k) and I) alternately if necessary.
m) Preset 1.4 bar supply air. Set zero screw 32 so that pressures y1 and y2 are equal. They should be approx. 0.7 bar ( $50 \%$ of the supply air pressure) (check measurement only).

Proceed as follows to make the zero setting independent of the stroke setting:
n) Press stroke factor $\mathbf{3 1}$ lever against the stop screw 30.
o) Set a large stroke factor (approx. 2 mm in front of the top stop) with the stoke factor screw 33.
p) Set the zero screw 32 so that output pressures $y 1$ and y2 are equal.
r) Set a small stroke factor (approx. 2 mm in front of the bottom stop) with the stroke factor screw. The output pressures y1 and y2 may not change by more than $\pm 150 \mathrm{mbar}$ in relation to setting p ).
s) The stop screw 30 should be adjusted in case of greater deviations. Repeat settings o) to r) after every adjustment of stop screw $\mathbf{3 0}$ until the deviation is less than $\pm 150$ mbar.
t) Secure stop screw $\mathbf{3 0}$ with varnish.

Reinstall the positioner or reattach the feedback lever to positioner shaft.

See page 12 for start-up.

Fig. 29: Test circuit for double acting positioner

### 5.3 Cleaning the throttle

(see page 23)
a) Remove the limiting screw 43.
b) Pull the throttling screw $\mathbf{4 2}$ down out of the limiting screw.
c) Place the throttling screw 42 in a solvent (e. g. benzene) and blow through it carefully. It is still better to clean it in an ultrasonic bath.
d) Turn the throttling screw 42 right in again as far as its stop (clockwise).
e) Turn the limiting screw 43 right in as far as its stop (clockwise) and then back again counterclockwise by about half a turn.
f) Secure the limiting screw 43 with sealing paint.

### 5.4 Check and adjust l-p converter

An adapter is required for checking and adjusting the I-p converter which can be done by you as shown in Fig. 32.
The following tools are required:
Screw driver,
5 mm A/F Allen keys,
1 test gauge 0 to 1.4 bar,
1 DC signal generator 4 to 20 mA ,
Supply air $1.4 \pm 0.1$ bar.
a) Remove the l-p converter 91 from connecting manifold 90 (two screws M 6), connect it to the adapter Fig. 32 and wire as shown in Fig. 30.
b) Preset supply air $1.4 \pm 0.1$ bar.
c) The test gauge must read 0.2 bar at current signal 0 mA . Otherwise set the adjustment screw 92 so that this value is indicated.
d) Increase the current signal slowly from 4 to 20 mA . The test gauge reading must change proportionately to the current signal.

| Current signal | Test gauge reading |
| :---: | :---: |
| 0 mA | approx. 0.2 bar |
| 20 mA | approx. 1 bar |

e) Adjust range with potentiometer 93 .

If these values are not achieved, there is a defect and the I-p converter should be replaced. Please contact the customer support for repair.
Fig. 30: Test circuit for I-p converter

Supply air
$1.4 \pm 0.1 \mathrm{bar}$

Fig. 31: I-p converter, cover removed

Fig. 32: Test adapter for I-p converter

## 6 TROUBLESHOOTING

| Fault | Possible causes | Remedies |
| :---: | :---: | :---: |
| Actuator does not react to the applied input signal nor to a change in the input signal. | pneumatic connections switched | check connections |
|  | electrical connections switched | reverse electrical connections |
|  | feedback lever loose | tighten feedback lever |
|  | Positioner mounted on the wrong side | check mounting side see table section 2.2.2 |
|  | changeover plate in the wrong position | check position see table in section 2.2.2 |
|  | booster defective | change booster (see 7.1) |
|  | I-p converter defective | See note in section 5.4 and proceed accordingly |
| Output pressure does not reach full value | supply pressure too low | check supply air |
|  | flappers not parallel to nozzles | align flappers <br> (see $5.1 \mathrm{~d}, \mathrm{e}$ or $5.2 \mathrm{~d}, \mathrm{e}$ ) |
|  | pre-throttle in booster blocked | clean pre-throttle (see 5.3) |
|  | I-p converter defective | see note in section 5.4 and proceed accordingly |
|  | filter in supply connection blocked | change filter |
| Actuator runs to the end position | positioner mounted on wrong side | check mounting side see table section 2.2.2 |
|  | feedback lever loose | tighten feedback lever |
|  | pneumatic connections switched (double-acting version) | check connections (see 2.2.2 or 2.3.2) |
| Unstable behavior positioner circuit oscillates | boost too high | reduce boost (see 4.1) |
|  | gland friction on valve too great | loosen gland slightly or renew |
|  | for piston actuators: static friction on cylinder too great | reduce boost (see 4.1) |
| Stroke range cannot be set | range spring unsuitable | change range spring (see 4.5 and 4.6) |
|  | positioner does not exhaust pressure completely | check supply air (max. 6 bar) |
|  |  | check boost (see 4.1) |
|  |  | adjust distance between nozzle and flapper (see $5.1 \mathrm{e}, \mathrm{f}$ or $5.2 \mathrm{e}, \mathrm{f}$ ) |

## 7 REPLACING SUBASSEMBLIES

### 7.1 Replacing the amplifier

(see page 23)
a) Remove the housing cover.
b) Unhook the range spring 34 from the flapper lever 35.
c) Unscrew and remove the amplifier 40 or dual amplifier 41. The two mounting bolts are accessible from the rear of the positioner.
d) Install a new amplifier.

Do not forget the O-rings between the amplifier and the base plate (manifold).
Before tightening the mounting bolts align the amplifier in such a way that the flappers 37 are concentrically aligned with the nozzles 36 .
e) Hook the range spring 34 onto the flapper lever 35.
f) Perform a basic adjustment (see 5.1 or 5.2 ).

### 7.2 Replacing the amplifier diaphragm in the single acting positioner

a) Remove the amplifier 40 (see 7.1)
b) Dismantle the amplifier.

Remove the screw 54.
Remove the two screws 56.
Remove the strip 55 and flapper lever 35.
Fig. 33: Amplifier

When the four screws 63 are removed, the amplifier can be dismantled into the following components:
64 Housing block A
65 Pipe
66 Spring
67 Diaphragm disk subassembly
68 Amplifier diaphragm
69 Housing block B
70 Input diaphragm subassembly
71 Cover
c) Reassembly of amplifier:

Reassemble the components and subassemblies in the correct position in the sequence specified. Replace faulty parts.
Put housing block A 64 with the open side facing upwards. Insert pipe 65 in the hole in the housing block $A$.
Place spring 66 in position in the diaphragm disk subassembly 67. Insert diaphragm disk subassembly 67 in housing block 64 so that the pipe 65 passes through the holes in the diaphragm disk subassembly 67.
Place amplifier diaphragm 68 on the diaphragm disk subassembly 67 (with the projection facing downwards), pipe 65 should be inserted in the hole of the amplifier diaphragm 68.
Place housing block B 69 in its correct position, so that the pipe 65 is inserted in the relevant hole in housing block $B$
69. Press housing block B 69 against housing block A 64.

## Note:

When these two components are pressed together housing block B 69 should be plane-parallel with housing block A 64.
If not, check why they are misaligned. Is pipe 65 in its correct position in the holes of housing block A 64 and housing block B 69 ?
Insert input diaphragm subassembly 70 in housing block $B$ 69. Install cover 71 in the right way round (threaded holes on the amplifier setting side), and screw the amplifier together. Tighten the four screws 63 uniformly.
d) Screw on the flapper lever 35 again.
e) Install the amplifier (see 7.1)
f) Perform a basic adjustment (see 5.1)

### 7.3 Replacing the amplifier diaphragm in the double acting positioner

Remove the dual amplifier 41 (see 7.1)

## Replace the input diaphragm

a) Remove screw 54.
b) Remove two screws 56 , the strip 55 and the flapper lever 35.
Fig. 35: Dual amplifier

c) Remove four screws 72 and the cover 71.
d) Remove and replace the input diaphragm subassembly 70.
e) Reassemble the input diaphragm in the reverse order.
d) Insert the new diaphragm assembly 77 in its correct position in housing block B 78.
Important note:
The pipe 79 passes through the first disk 80 and is inserted in a hole in the second disk 81.
If the two disks 80 and 81 are not absolutely flush when the diaphragm assembly is pressed together by hand, the pipe is not in its correct position in the hole. In this case disk 81 should be turned until the pipe is correctly inserted in the hole.
e) Install housing block A 74 in its correct position and screw on with the four screws 73 .
f) Measure the gap between the housing blocks 74 and 78 with the aid of a feeler gauge.
g) The spring washer 75 selected should have a wire diameter which corresponds to the gap measured as described in $f$ ), or which is no more than 0.1 mm smaller in diameter.
h) Remove the four screws $\mathbf{7 3}$ again and remove housing block A 74 .
Install the spring washer 75 selected, replace housing block A 74 in its correct position, and tighten the screws 73 firmly and uniformly. Align the spring washer so that it does not project over the edges of the housing blocks 74 and 78.
Reinstall the amplifier (see 7.1) and perform basic adjustment (see 5.2).

## Replace the diaphragm assembly

a) Remove four screws 73 and housing block A 74.
b) Remove spring washer 75 .
c) Through the holes $\mathbf{7 6}$, the diaphragm assembly 77 can be pressed out of the housing block B 78, for example by means of a small screwdriver. The diaphragm assembly is a self-contained component and should not be dismantled further.

Fig. 36: Dual amplifier dismantled

A

## 8 SAFETY REQUIREMENTS

### 8.1 Accident prevention

This device complies with the regulations for the prevention of accidents Power-Driven Work Aids (VBG 5) of October 1st, 1985.

### 8.2 Electrical safety

### 8.2.1 General requirements

When the housing is open, repair and maintenance operations must always be carried out by service personnel if any power sources are connected to the device.

### 8.2.2 Regulations for Connection

The device is to be used according to its purpose and is to be connected in compliance with its connection plan (see section 3). The locally effective national directives for electrical installations are to be observed, e.g. in the Federal Republic of Germany DIN VDE 0100 resp. DIN VDE 0800. The units may only be operated with safety extra-low voltage SELV or SELV-E.
The protective measures provided in the units can become ineffective if the unit is not used in accordance with the operation instructions.
The limitation of the circuit for fireproofing is to be customer guarded according to EN 61010-1, Appendix F (IEC 61010-1 resp.).

### 8.2.3 Explosion protection

For technical data concerning explosion protection please refer to product specification PSS EVE0103A.
Please observe the effective national rules and installation instructions concerning installations in hazardous locations, for instance in the Federal Republic of Germany these are ElexV and DIN VDE 0165.

## Attention!

Observe the corresponding national requirements for repairing explosion-protected devices.
Use only original spare parts when making repairs.
The following applies to the Federal Republic of Germany: Repairs on parts on which the explosion protection depends must either be done by the manufacturer or must be checked by an authorized expert and approved by his test mark or a certificate.

### 8.2.4 EMC and CE

For references pertaining to electro-magnetic compatibility EMC and regarding CE certification see product specifications PSS EVE0103 A.

Detail: Nozzles/ flappers system
