ACKNOWLEDGEMENTS

This work would not have been possible without the generous and continued support of the U.S. Environmental Protection Agency Region 5 (Sue Elston, Catherine Garra, Lula Spruill) and was funded under Wetland Program Development Grant CD975762-01. Special thanks are extended to Jennifer Martin and April Morrison of Ohio EPA for fiscal support in arranging for the printing of this manuscript. We are grateful for the support offered by the Ohio Department of Natural Resources, Division of Natural Areas and Preserves, and the Ohio State University and Kent State University Herbaria for generous assistance with their collections and for allowing use of their meeting spaces. Acknowledgements are made to Gerould Wilhelm, Kim Hermann, and Robert Lichvar for their assistance in the establishment of the methodology, and to Nancy Slack, Diane Lucas, and Donn Horchler for reviewing the moss database, and to our outside reviewers John Baird, Siobhan Fennessy and Rick Gardner.

CONTRIBUTORS AND REVIEWERS

Authors:

Barbara K. Andreas teaches botany at Kent State University, Kent, Ohio. Her areas of expertise are the ecology of Ohio's peatlands and the identification and distribution of Ohio's vascular plants and bryophytes. She received her Ph.D. from Kent State University. Additional post-doctoral studies were done at the University of Michigan Biological Station. She is the author of *Vascular Flora of the Glaciated Allegheny Plateau Region of Ohio*, and co-authored the *Floristic Index for Establishing Assessment Standards: A Case Study for Northern Ohio*, which is a regional floristic quality assessment index. She also wrote *A Catalog and Atlas of the Mosses of Ohio*.

John J. Mack is a wetland ecologist and botanist with the Ohio Environmental Protection Agency. He received a B.S. in Interdisciplinary Studies from Miami University in Oxford, Ohio, an M.S. in Environmental Science from Indiana University, Bloomington, Indiana, a Juris Doctor from Cleveland State University, Cleveland, Ohio, and an M.S. in Evolution, Ecology, and Organismal Biology from The Ohio State University, Columbus, Ohio. His work at Ohio EPA includes developing and applying biological indicators to assess wetland condition including the development of a Vegetation Index of Biotic Integrity for Ohio wetlands. He also has done research on the history of the Prairie Peninsula in Ohio and the floristics and ecology of Ohio prairie and savannah. His most recent paper is *An Ordination and Classification of Wetlands in the Till and Lake Plains and Allegheny Plateau*.

James S. McCormac is a botanist with the Ohio Department of Natural Resources, Division of Natural Areas and Preserves. His work there involves protection of Ohio's highest quality natural areas, statewide surveys of significant habitats and rare species, and ecological assessments of rare plant communities. He attended the Ohio State University, Columbus, Ohio. He was a founder of the Ohio Rare Plant Advisory Committee, a 16 member panel of Midwestern botanists that convenes biennially to refine changes to the Rare Native Ohio Plants Status List, the legal list of imperiled Ohio flora published by the Division of Natural Areas and Preserves. Research interests include plant migration and phytogeography, and the effects of fire and substrate disturbance on rare plant communities. He has published seven scientific papers on these subjects.

Reviewers:

Richard Gardner is a botanist and ecologist with the Ohio Chapter of The Nature Conservancy and the Ohio Department of Natural Resources, Division of Natural Areas and Preserves. He received a B.S. in Botany from Miami University in Oxford, Ohio. He has been studying Ohio's flora for over 10 years. His work involves monitoring eco-management on preserves, inventorying rare vascular plants species and sampling plant communities. Research interests include floristics, Ohio flora, wetland ecology, and xeric limestone prairies.

John Baird is an environmental specialist with the Ohio Department of Transportation. He received a B.S. in Biology from the University of Cincinnati where he is an adjunct instructor teaching Tri-State Native Plants. He has worked as a botanist for the Ohio Department of Natural Resources, Division of Natural Areas and Preserves.

M. Siobhan Fennessy is associate professor of Biology at Kenyon College where she teaches and

advises students, and conducts research on freshwater wetland ecosystems, their plant communities and the development of biological indicators of wetland condition. She received her undergraduate degree in Botany in 1986, and a Ph.D. in Environmental Biology from The Ohio State University in 1991. Dr. Fennessy previously served on the faculty of the Geography Department of University College London and held a joint appointment at the Station Biologique du la Tour du Valat (located in southern France) where she conducted research on the human impacts to Mediterranean wetlands. She worked for 5 years with the Ohio EPA where she helped establish wetland water quality standards and Ohio's bioassessment program.

INTRODUCTION

Plant communities are often described in general terms like “outstanding” or “marginal” or by using lists of species or a few indicator species. A community might be considered high quality by one investigator while a different investigator might categorize it as average or poor. Opinion is often determined by the degree of familiarity with flora or the level of experience with habitats on a statewide basis. The Floristic Quality Assessment Index (FQAI) is designed to reduce subjectivity and create an objective standard of quality that can be used by anyone with adequate botanical skills.

The FQAI was first devised by Swink and Wilhelm (1979) for evaluating plant communities in the Chicago region and later refined by Wilhelm and Ladd (1988) and Wilhelm and Masters (1995). The FQAI concept has been extended to many other states and regions including Michigan (Herman et al. 1997, 2001), Missouri (Ladd 1993), Ontario (Oldham et al. 1995), northern Ohio (Andreas and Lichvar 1995), Illinois (Taft et al. 1997), Wisconsin (Nichols 1998; Wisconsin Floristic Quality Assessment 2002), and North Dakota (North Dakota Floristic Quality Assessment Panel 2001). The present system for the state of Ohio is an expansion of the list developed by Andreas and Lichvar (1995) for northern Ohio.

The FQAI is a variation on a long tradition of richness and diversity indices in ecology. Species richness, the number of species in a community, is one of the oldest and simplest concepts of diversity (Krebs 1999). For example, in Figure 1, community A can be considered more diverse than community B since it has more species for the same level of sampling effort. However, if community A has 10 equally abundant species, while community B has one species which comprises 95% of the individuals and 9 species which comprise 5% of the individuals, which community is more “diverse?” To answer this question, Simpson (1949) proposed a measure of diversity which includes two concepts, richness and evenness:

$$D = \sum (p_i)^2 \quad \text{Eqn. 1}$$

where D = Simpson’s Index, p_i = proportion of species i in the community, which is the probability of picking two organisms at random that are different species. Simpson’s original equation has been modified by many investigators to

$$1 - D = 1 - \sum (p_i)^2 \quad \text{Eqn. 2}$$

which has a range of 0 (low diversity) to nearly 1 (high diversity). The concepts of evenness and richness are graphically illustrated in Figure 2, where community A is more diverse than community B since it has the same number of species but more even relative abundances, and community C is more diverse than community B since it has more species even though it has the same pattern of relative abundances.

The Shannon-Weiner index is probably the best

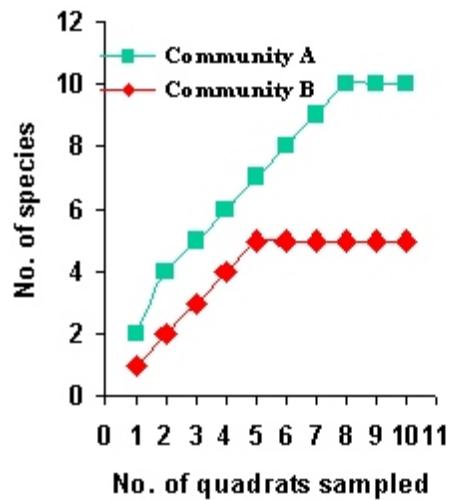

Figure 1. Hypothetical communities showing differences in diversity and species-area curves. For the same level of sampling effort, Community A is more diverse than Community B.

$$H' = \sum (p_i)(\log_e p_i) \quad \text{Eqn. 3}$$

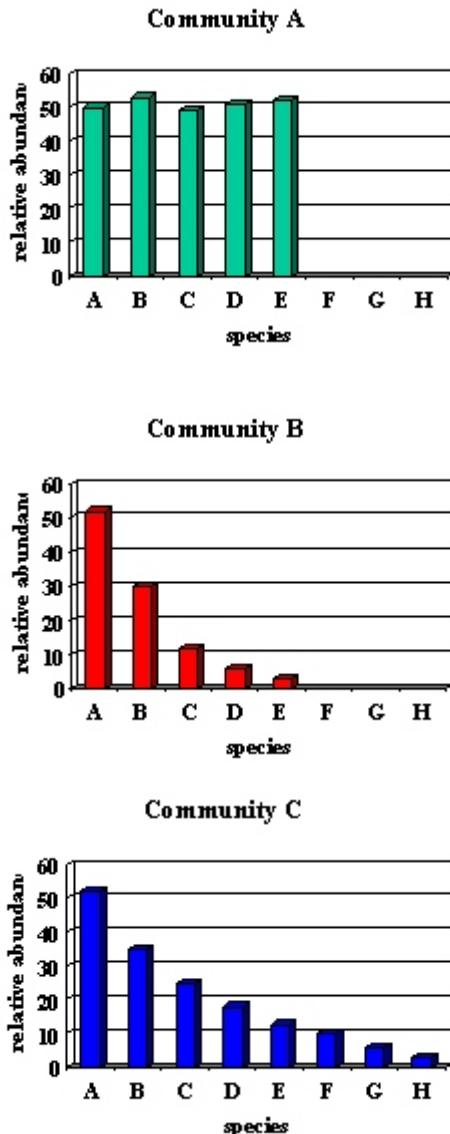

Figure 2. Hypothetical communities illustrating species richness and species evenness, two important concepts in diversity. Community A is more diverse than Community B since it has the same number of species but more even relative abundances. Community C is more diverse than Community B since its has more species even though it has the same pattern of relative abundances. Adapted from Krebs (1999).

known of the diversity indices. In its original formulation (Krebs 1999), it was calculated as follows:

where H' = index of species diversity (information content of sample), and p_i = proportion of the total sample of the species i . H' can vary from 0 (community with only one species) to much larger numbers, but in practice does not seem to exceed 5 for most biological communities (Krebs 1999). Some investigators modify the original Shannon-Weiner equation to change the index units from information content of the sample to numbers of species, or

$$N_1 = e^{H'} \quad \text{Eqn. 4}$$

where N_1 = number of equally common species that would produce the same diversity as H' , and $e = 2.718$ (base of the natural logarithm).

Simpson's Index and the Shannon-Weiner Index remain commonly used tools for making comparisons among communities of similar organisms. The need to make relative comparisons is one of paramount importance in environmental and natural resource management. For example, a principal goal of the Clean Water Act is to maintain and restore the physical, chemical and biological integrity of the waters of the United States (33 U.S.C. §1251(a)). Biological integrity has been defined as "...the capability of supporting and maintaining a balanced integrated, adaptive community of organisms having a species composition, diversity, and functional organization comparable to that of natural habitat of the region" (Karr and Dudley 1981). This national goal requires tools for determining whether an aquatic resource is in need of restoration or whether restoration has been successful. Similarly, given limited budgets, both governmental and nongovernmental natural resource organizations that acquire property need to be able to prioritize which natural areas should be purchased in order to make acquisition decisions.

One of the problems with many diversity measures is the equal weighting each species receives

regardless of its tolerance to disturbance or its fidelity to a specific habitat. This can limit their usefulness in making the kinds of natural resource management decisions that are often needed. For example, using the and Shannon-Weiner or Simpson's Index, a highly disturbed community with 10 evenly distributed common or adventive species will potentially receive the same score as an intact community with 10 evenly distributed rare species. The principal concept underlying the FQAI is that the quality of a natural community can be objectively evaluated by examining the degree of ecological conservatism (or fidelity) of the plants species in that community.

The FQAI is more directly a variation on the simplest of ordination techniques, weighted averaging (Gauch 1982). In weighted averaging, species abundance is multiplied by a weighting factor and then averaged. The basic calculation is

$$S_j = \sum A_{ij} W_i / \sum A_{ij} \quad \text{Eqn. 5}$$

where S_j = the weighted average ordination score, A_{ij} = the abundance of species i in sample j , and W_i = the ecological weighting factor for species i . While the math is simple, the main challenge in using weighted averaging as an ordination technique is having adequate ecological insight to develop useful weighting factors (Gauch 1982). An early use of this technique was by Curtis and McIntosh (1951) who developed weighting factor for whether a species was typical of pioneer to climax forest communities in southern Wisconsin. Thus, the original calculation of the FQAI can be conceptualized as the weighted averaging of species richness, with the weighting factor called the coefficient of conservatism (C of C). If the FQAI weighting factors are used in conjunction with species abundances, the FQAI becomes a “weighted averaging” technique (Gauch 1982).

The assigning of the C of C is a decision that has subjective elements since it is made by a person or group of persons intimately familiar with the flora of a geographic region based on their knowledge of the narrowness or breadth of a plant's ecological

tolerances. But, once this decision is made, the index is both objective and consistent. In effect, a floristic index "front-loads" any subjectivity during the development of the system itself: users of the index are required to apply it objectively and consistently. Any inherent biases in assigning a particular C of C to particular plants occur uniformly and the relative comparison of site A to site B to site C is not affected.

METHODOLOGY AND APPLICATION

METHODOLOGY

A floristic quality index is developed by assigning a numeric score from 0 to 10 (the C of C) to each plant species growing in a specified geographical region (Wilhelm and Ladd 1988; Swink and Wilhelm 1979, 1994; Andreas and Lichvar 1995). The C of C is an ordinal weighting factor of the degree of conservatism (or fidelity) displayed by that species in relation to all other species of the region (Wilhelm and Ladd 1988; Wilhelm and Masters 1995; Andreas and Lichvar 1995) (Table 1). Although discussed in more detail below, it

Table 1. Summary of coefficients of conservatism used in the FQAI for vascular plants.

C of C	Description
0	Plants with a wide range of ecological tolerances. Often these are opportunistic invaders of natural areas (e.g. <i>Phragmites australis</i> , <i>Phalaris arundinacea</i>) or native taxa that are typically part of a ruderal community (e.g. <i>Polygonum pensylvanicum</i> , <i>Ambrosia artemisiifolia</i>)
1-2	Widespread taxa that are not typical of (or only marginally typical of) a particular community like <i>Solidago canadensis</i> or <i>Impatiens capensis</i>
3-5	Plants with an intermediate range of ecological tolerances that typify a stable phase of some native community, but persist under some disturbance (<i>Asclepias incarnata</i> , <i>Ulmus rubra</i> , <i>Spartina pectinata</i>)
6-8	Plants with a narrow range of ecological tolerances that typify a stable or near "climax" community (e.g. <i>Goodyera pubescens</i> , <i>Veronicastrum virginicum</i> , <i>Cephalanthus occidentalis</i>)
9-10	Plants with a narrow range of ecological tolerances that exhibit relatively high degrees of fidelity to a narrow range of habitat requirements (e.g. <i>Potamogeton robbinsii</i> , <i>Cypripedium candidum</i>)

must be stressed at the outset the C of C's in this index were *not* assigned based on the rarity of

particular species. In this regard the Ohio FQAI may differ from indexes developed elsewhere where rare, endangered or threatened species were given high coefficients regardless of their fidelity habitat requirements.

Similarly, it must be stressed that the Ohio FQAI was developed to "work" within a geographic region, i.e. the political boundaries of the State of Ohio. To the extent that ecological regions located within Ohio are shared by other states, the C of C's should be reflective of the fidelity of that species throughout the geographical extent of the shared region. For example, Ohio shares large areas of the Eastern Corn Belt Plains with Indiana, the glaciated and unglaciated Allegheny Plateau with Pennsylvania, and the unglaciated Allegheny Plateau and Interior Plateau with Kentucky (Woods et al. 1999).

Each C of C is an expression of the taxon's autecology as it relates to its fidelity to narrow or broad habitat requirements with respect to all other taxa in the flora. Assignment of a numerical value was based on the authors' collective extensive field experience in Ohio, information on herbarium labels primarily in herbaria at Kent State University (KE) and The Ohio State University (OS), and information obtained from local and regional manuals such as Voss (1972, 1985, 1996), Deam (1940) Furlow (1991), Fisher (1988), Braun (1961, 1967), Cooperrider (1995), Swink and Wilhelm (1994), USDA, NRCS (2002) and the *Flora of North America* volumes available as of December 2003.

The C of C's for vascular plants were assigned as follows:

- Plants with a wide range of ecological tolerances, and non-native taxa, were assigned a rank of 0. These species are often opportunistic invaders of natural areas, due to natural or human disturbances and frequently create extensive monocultures, e.g. common reed (*Phragmites australis*) and reed canary grass (*Phalaris arundinacea*). In addition, a

ranking of 0 was assigned to those native taxa that are typically part of a ruderal community, such as Pennsylvania smartweed (*Polygonum pensylvanicum*) or common ragweed (*Ambrosia artemisiifolia*).

- Rankings of 1 and 2 were applied to taxa that are widespread and not typical of (or only marginally typical of) a particular community, e.g. *Solidago canadensis* and *Impatiens capensis*.
- Plants with an intermediate range of ecological tolerances were assigned average coefficients (3, 4, or 5). These taxa may be found in a stable phase of some native community, but persist under some disturbance. Examples include swamp milkweed (*Asclepias incarnata*) C of C = 4, slippery elm (*Ulmus rubra*) C of C = 3, and prairie cord grass (*Spartina pectinata*) C of C = 5.
- Rankings of 6 to 8 are applied to those plants that typify stable or near "climax" conditions. Examples include downy rattlesnake-plantain (*Goodyera pubescens*) C of C = 6, Culver's root (*Veronicastrum virginicum*) C of C = 7, and buttonbush (*Cephalanthus occidentalis*) C of C = 6.
- Plants with a narrow range of ecological tolerances were assigned high coefficients. Rankings of 9 and 10 were reserved for those

Figure 3. *Hymenoxys acaulis* (Lakeside Daisy) with Coefficient of Conservatism of 10. Grows in full sun on limestone pavement on Marblehead Peninsula, Ottawa Co., Ohio (Credit: Ohio DNR-DNAP).

Figure 4. *Trifolium stoloniferum* (Running Buffalo Clover) with a Coefficient of Conservatism of 5. Grows in open woods, forest clearings, and often in modified ecosystems (Credit: Ohio DNR-DNAP).

plants that exhibit relatively high degrees of fidelity to a narrow range of habitat requirements. Examples include Robin's pondweed (*Potamogeton robbinsii*) C of C = 10 and white lady's slipper (*Cypripedium candidum*) C of C = 9.

There are several other issues related to assigning coefficients. First, plants listed as threatened or endangered under the federal Endangered Species Act, or as threatened, endangered, or extirpated on the Ohio rare plant list (ODNR, DNAP 2002) are "rare" and frequently receive a high coefficient ranking, but there are exceptions. These plants may be rare for a number of reasons not related to the narrowness or breadth of their ecological tolerances.

For example, lakeside daisy (*Hymenoxys acaulis*) is federally endangered and only occurs in full sun on limestone pavement on Marblehead Peninsula, Ottawa County, Ohio (Figure 3). It has a ranking of 10 because of its very narrow habitat preferences. Conversely, running buffalo-clover (*Trifolium stoloniferum*) is federally endangered but occurs in open woods, forest clearings, and often in modified ecosystems (Figure 4). It receives an intermediate ranking of 5 even though it is endangered. Balsam poplar (*Populus balsamifera*) is listed as state endangered (Figure 5). It receives a relatively low ranking of 3. It is rare because it is at the edge of

Figure 5. *Populus balsamifera* (Balsam poplar). Coefficient of Conservatism of 3. At the edge of its range in Ohio but does not have specific habitat preferences (Credit: Ohio DNR-DNAP).

its range, but it does not have very specific habitat preferences.

Second, the coefficient of conservatism is independent of commonness. A plant may be widely distributed in Ohio, but predictably found in a limited number of habitats. For example, water willow (*Justicia americana*) is a common plant but it grows almost exclusively on gravel bars of mainstem rivers in Ohio (Figure 7). It receives a ranking of 9. Similarly, beechdrops (*Epifagus virginiana*) is common in beech-maple forests, but it only grows as a root parasite on beech trees (Figure 8). It receives a ranking of 10 because of its very narrow habitat.

Once the C of C's have been assigned, there are several formulas for calculating a floristic index. The formula most commonly used is,

$$I = \sum (CC_i) / \sqrt{N_{\text{native}}} \quad \text{Eqn. 6}$$

where I = the FQAI score, CC_i = the coefficient of conservatism of plant species i , and N_{native} = the total number of native species occurring in the community being evaluated.¹ Note that Equation 6 excludes non-native plants from the calculation of the index. Equation 6 is the original FQAI equation as formulated by Swink and Wilhelm (1979) and is the formulation used throughout this paper unless otherwise indicated.

The FQAI score calculated by Equation 6 has proven to be an excellent predictor of wetland degradation and intactness (Fennessy et al. 1998a and 1998b; Lopez and Fennessy 2002; Mack et al. 2000; Mack 2001). For example, the FQAI score correlates significantly with a semi-qualitative human disturbance gradient (Figure 11) and mean FQAI scores for wetlands decline as the width of natural buffers around the wetland are reduced (Figure 12).

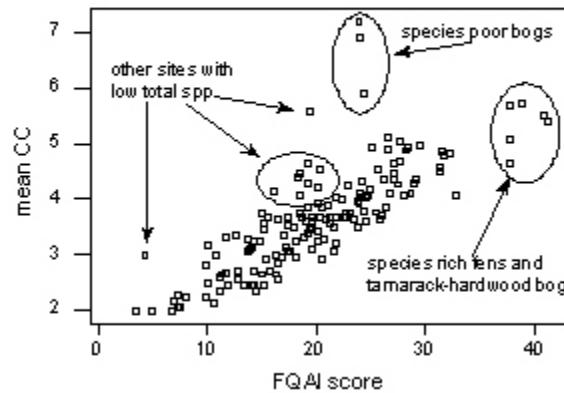

Figure 6. Comparison of mean C of C score (Equation 8) with FQAI score (Equation 6) for 156 Ohio wetlands sampled using a plot-based method.

Several variations on Equation 6 are possible. For example, N can be modified to include all species

¹ The FQAI scores should be consistently reported only to tenths (0.0). Since the C of C's are whole numbers, the rules of significant figures dictate that scores should be written as 00.0.

Figure 8. *Epifagus virginiana* (beech-drops). Coefficient of Conservatism of 10. This plant is parasitic on the roots of American beech trees (*Fagus grandifolia*). Credit: Jim Stasz - USDA Plants Database.

at a site, instead of just native species as in Equation 7:

$$I' = \sum (CC_i)/\sqrt{N_{all\ species}} \quad Eqn. 7$$

where I' = the modified FQAI score, CC_i = the coefficient of conservatism of plant species i , and $N_{all\ species}$ = the total number of species both native and non-native (Fennessy et al. 1998a, 1998b; Lopez and Fennessy 2002).

The basic equation can be simplified by calculating the mean of the ordinal C of C ranks, or

$$I'' = \sum CC_i/N_{all\ species} \quad Eqn. 8$$

where I'' = the modified FQAI score, CC_i = the

coefficient of conservatism of plant species i , and $N_{all\ species}$ = the total number of species both native and non-native (Rooney and Rogers 2002).

According to Rooney and Rogers (2002), Equation 8 is less sensitive to increases in species richness and sampling effort than Equations 6 and 7. An analysis of plot-based data from 156 Ohio wetlands indicates that high quality, species poor wetlands have higher scores using Equation 8 (mean C of C) than Equation 6 (FQAI score) when compared to species rich communities (Figure 6). For most wetland communities, the relative ranking is the same using either equation (Figure 6).

The coefficients of conservatism can be used as categorical variables. For example, an investigator may be interested in the relative abundance of plants with either high or low sensitivities to disturbance. Comprehensive, regionally calibrated lists of vascular plant species tolerances are generally lacking due to the number of species in the flora, the individualistic responses of plants to different types of disturbance, and the lack of experimental studies. Given this problem, the coefficients of conservatism provide a useful surrogate for experimentally derived species tolerances. To the extent a species has a narrow or broad range of natural ecological tolerances, this tolerance (or sensitivity) as ranked by the C of C's is a useful tool for evaluating its ability to tolerate

Figure 7. *Justicia americana* (water-willow). Coefficient of Conservatism of 9. Growing on a gravel bar in Big Darby Creek, Ohio. Credit: M. Lee - Ohio Department of Natural Resources, Division of Natural Areas and Preservers.

human disturbance. For example, the relative areal cover of plants with low C of C's can be summed to measure the dominance of "tolerant" species (Figure 12), as follows:

$$I''' = \sum (\%CC_{ij}) \quad \text{Eqn. 9}$$

where I''' = the sum of the relative cover of plants with one or more C of C scores, and $\%CC_{ij}$ = the relative cover of plant species i with C of C j (Mack et al. 2000; Mack 2001).

Finally, the C of C's can be used as the weighting factors in weighted average ordination as discussed above (Equation 5).

Selection of which equation to use will depend on the purpose of the investigation and preferences of the investigator. It is recommended that if an alternate equation is used (other than Equation 6) that Equation 6 also be calculated and reported for maximum comparability between studies.

APPLICATION

As with any tool, proper and appropriate use is of paramount importance. Once a species list is obtained, with or without abundance information, it is computationally simple to calculate any of the FQAI values discussed above. This simplicity of calculation is balanced by a need to be sensitive to several critical issues for using an FQAI system: sampling method, sampling effort, and plant community classification.

Sampling method and Sampling Effort

Selection of sampling method and standardization of sampling effort are important issues in any comparative study in vegetation ecology (Mueller-Dombois and Ellenberg 1974). The FQAI score is sensitive to sampling method and effort and care should be taken in comparing FQAI scores based on data from different methods or levels of effort.

For example, a detailed floristic inventory and a quantitative plant community characterization were undertaken at Daughmer Savannah, a 16 ha remnant consisting of oak savannah, mesic prairie, wet prairie, sedge meadow, and prairie pothole marsh (see photograph on cover) located in the formerly extensive Sandusky Plains Prairie complex in north central Ohio (Mack 2002). The oldest bur oak trees at Daughmer Savannah are at least 250 years old (Cho 1989).

The flora at Daughmer Savannah was qualitatively assessed in 1997 and 1998 by multiple site visits throughout the growing season in all of the different habitats of the site. Additionally in 1999, the plant communities at Daughmer Savannah were quantitatively characterized by establishing five 20m x 50m (0.1ha) plots in the different plant communities using the methods described in Peet et al. (1998). All species within the plots were identified to the lowest taxonomic level possible and percent cover was estimated.

The FQAI scores for the 5 plots ranged from 22.8 to 27.9 (plot 1 = mesic prairie, plot 2 = savannah with bluejoint swales, plot 3 = wet-mesic to mesic

prairie, plot 4 = savannah, plot 5 = wet prairie to sedge meadow). Aggregating the species lists from all five plots resulted in an FQAI score of 33.3 which was nearly 6 points higher than the score of the highest scoring single plot. In comparison, the result of a one year, spring-summer-fall, "qualitative" inventory was a score of 32.5. The FQAI score of a two year, spring-summer-fall qualitative inventory was 35.6, and aggregating the species lists from the all five plots and qualitative inventories resulted in a composite score of 38.4 (Figure 9).

It is well known that sample method and effort can affect the results of a vegetation survey (Mueller-Dombois and Ellenberg 1974). Sample method and effort can also affect the results of the FQAI. This raises several issues about its proper use:

- Caution should be used in comparing FQAI scores from different investigators or different studies unless it is determined that equivalent levels of floristic survey effort were used, especially for qualitative inventories.
- Compositing (pooling) species lists or quantitative data from different plant community types will almost always increase the overall score. FQAI scores from surveys of single plant communities will not generally be able to "compete" with scores based on lists from multiple different community types. Compositing of scores should generally be avoided unless the study expressly makes note of it. Where compositing is done, scores from the individual communities should also be reported.
- Calculating an FQAI score from a quantitative survey with a predetermined level of sampling effort provides the greatest assurance that the level of effort used is consistent and that relative comparisons of the scores can be made between studies and investigators, although scores based on complete floristic inventories made with similar effort by experienced botanists will also be comparable.

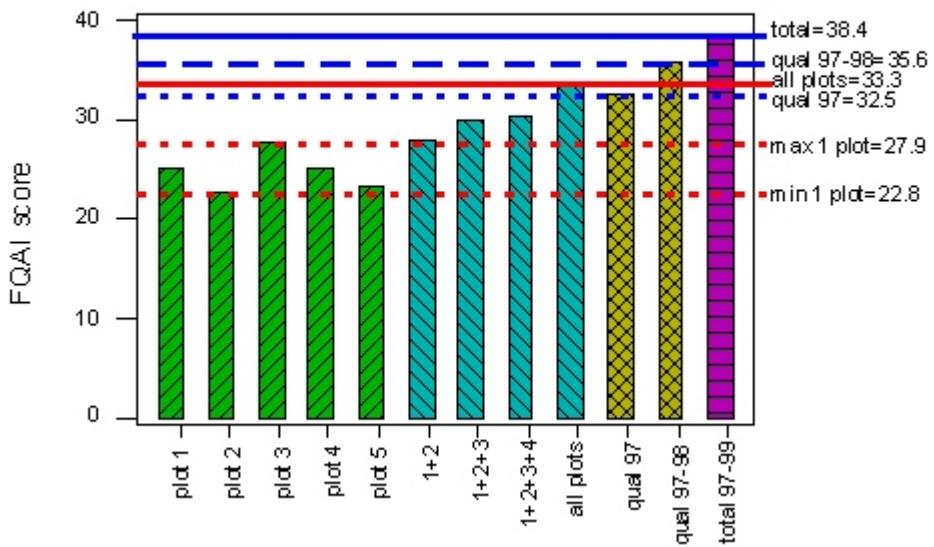

Figure 9. Comparison of Floristic Quality Assessment Index scores from Daughmer Oak Savannah, Crawford Co., Ohio. Plot 1, 2, 3, etc. (green with left slant) refer to 0.1ha (20x50) sample plots established in different dominant plant communities at Daughmer Savannah: plot 1 = mesic prairie, plot 2 = oak savannah with shaded bluejoint swales, plot 3 = wet to mesic prairie, plot 4 = oak savannah, plot 5 = prairie sedge meadow. Teal with right slant bars refer to FQAI scores from summations of species lists from individual plots, e.g. plot 1 plus plot 2, plot 1 plus plot 2 plus plot 3, etc. "Qual" refers to qualitative floristic inventories performed in 1997 and 1998 (gold bars with cross-hatching). "Total 97-99" (purple bar) refers to composite FQAI score from species lists from sample plots and qualitative floristic inventory.

Plant community effects

Coefficients of conservatism were assigned based on the narrowness or breadth of a particular plant species habitat preferences and ecological tolerances. It follows from this that an intact plant community with a naturally high proportion of habitat specialists will score higher than an equally intact plant community that is naturally dominated by more generalist species. In this situation, the difference in scores is not due to differences in floristic integrity but from differences in plant community types. Scores using Equation 6 for different wetland plant communities including sphagnum bogs, fens, sedge meadows, marshes, shrub swamps, and swamp forests show significant differences based on community type (Figure 10).

The data included in Figure 10 are from communities that are considered very good to excellent examples of that community type. For example mean FQAI score for marshes are significantly lower than mean scores for bog or fens. This makes sense because marshes contain

relatively few habitat specialists; many of the plants in marsh communities will grow in other types of wetland habitats, whereas fens and bogs have many habitat specialists. If the goal is to identify high quality marsh habitats for acquisition or protection, the FQAI score from a particular marsh should be compared to other marsh scores, not to scores from a fen or bog. Systems like the FQAI are sometimes criticized as being biased towards bogs and fens. This is not so much a bias but an improper use of the system because of an insensitivity to inherent differences in plant communities.

Rooney and Rogers (2002) reached a similar conclusion after calculating a modified floristic quality index score for various types of Wisconsin upland and wetland plant communities. For example, scores from upland sand barren communities were lower on average than scores from northern upland forests for reasons not associated with the quality of the flora of sand barren communities. They conclude that such inter-community comparison is meaningless for conservation purposes.

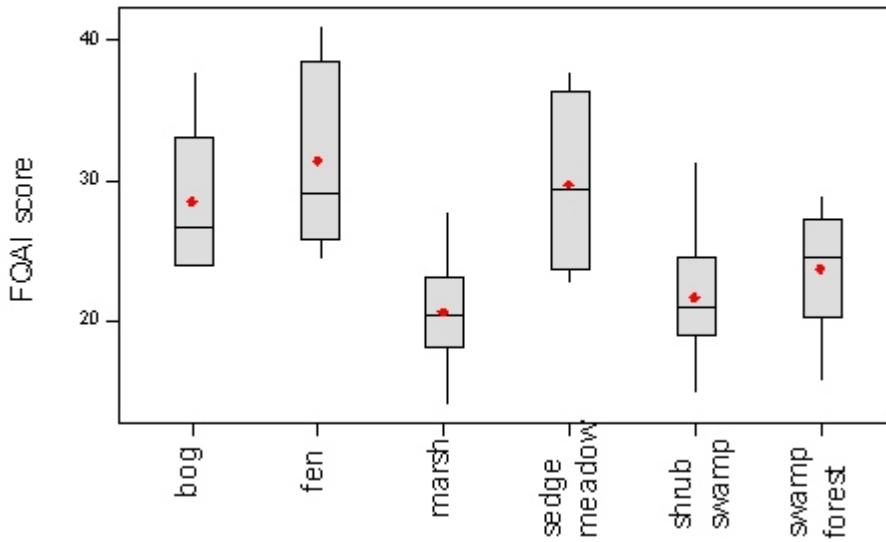

Figure 10. Box and whisker plots comparing mean FQAI scores for different plant community types. "Sedge meadow" includes sedge dominated wetlands that are not "fens" (deep soil prairie sedge meadows, Oak Openings sand prairies. Mean = red dot, median = horizontal bar in box, bottom and top of box 25th and 75th quartiles, respectively, whiskers = values outside 25th to 75th quartiles. Mean FQAI scores are significantly different ($df = 156, F = 12.29, p < 0.001$). Bog (28.4) = Fen (31.4) = Sedge meadow (29.8) > Marsh (20.6) = Shrub swamp (21.6) = Swamp forest (23.6) after Tukey's multiple comparison test ($p < 0.05$).

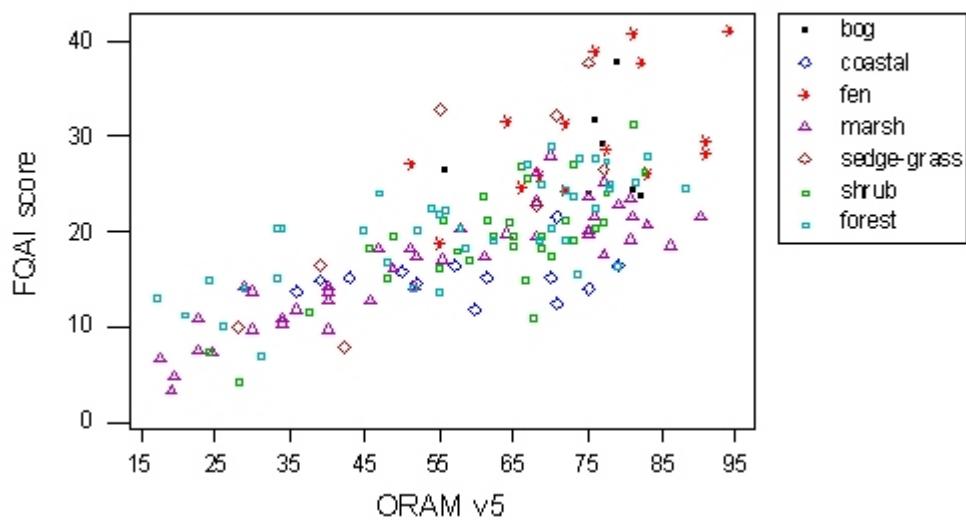

Figure 11. FQAI score versus Ohio Rapid Assessment Method v. 5.0 score used as a human disturbance gradient, 0 = high disturbance, 100 = low disturbance ($df = 156, F = 170.7, R^2 = 52.1\%, p < 0.001$).

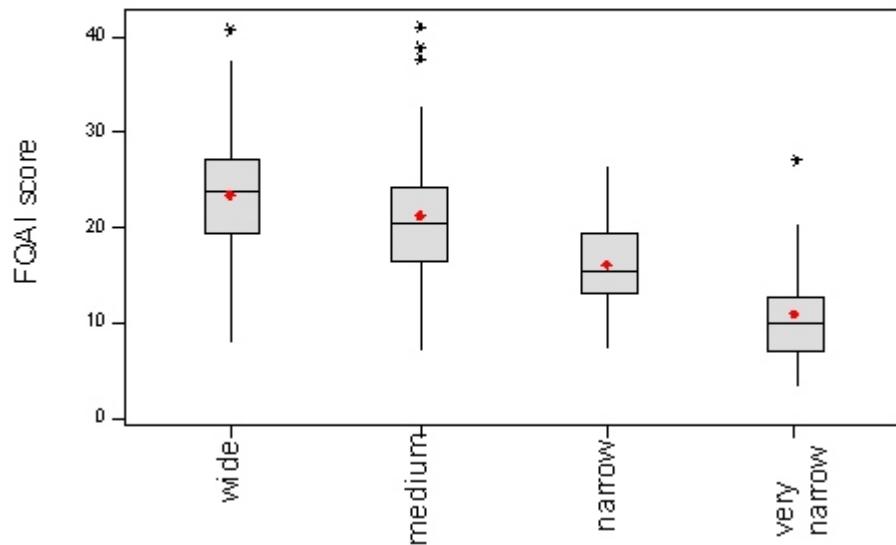

Figure 12. Box and whisker plots comparing mean FQAI scores for different average buffer width classes: wide = >50m, medium = 25-5m, narrow = 10-25m, very narrow = <10m. Mean = red dot, median = horizontal bar in box, bottom and top of box 25th and 75th quartiles, respectively, whiskers = values outside 25th to 75th quartiles. Mean FQAI scores are significantly different (df = 156, F = 22.9, p <0.001). Wide (23.5) = Medium (21.2) > narrow (16.1) > very narrow (10.8) after Tukey's multiple comparison test (p <0.05).

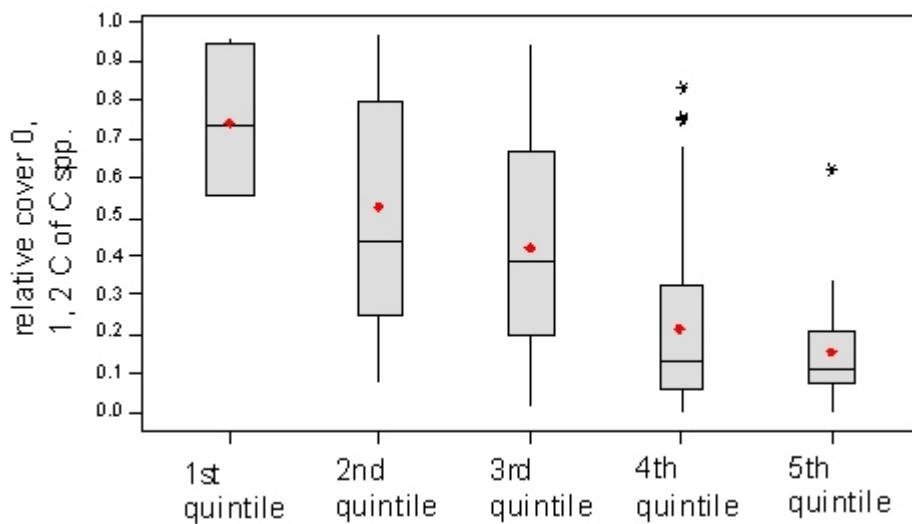

Figure 13. Box and whisker plots comparing relative cover of tolerant plant species (C of C's 0, 1, 2) for ORAM score quintiles (1 = 0-19.9, 2 = 20-39.9, 3 = 40-59.9, 4 = 60-79.9, 5 = 80-100). Mean = red dot, median = horizontal bar in box, bottom and top of box 25th and 75th quartiles, respectively, whiskers = values outside 25th to 75th quartiles. Mean FQAI scores are significantly different (df = 156, F = 15.2, p <0.001). Quintile 1 (74%) = Quintile 2 (52%) > Quintile 3 (42%) > Quintile 4 (21%) = Quintile 5 (16%) after Tukey's multiple comparison test (p <0.05).

Representative scores from different types of Ohio plant communities are provided in the next section. Scores derived from quantitative sampling of Ohio wetlands are provided in Table 2.

Example Calculations

Once a species list has been obtained for a site through quantitative sampling or qualitative floristic surveys, a FQAI score can be calculated relatively easily using a spreadsheet or statistical program. Relatively simple programs have also been developed to calculate the FQAI from quantitative data or qualitative surveys.²

Example calculations for data from a high quality leatherleaf bog are provided (Table 3). The first step is to assign each species on the list the appropriate C of C. Next, the C of C's are then summed. Third, a FQAI "N" must then be calculated: this is the number of native species excluding native species that can only be identified to genus. From these three basic steps, all of the various basic FQAI variant equations can be calculated (Table 3). Relative abundance is the sum of abundance values for a species divided by the summed abundance values of all species. Once relative abundances are calculated, they can be summed by C of C category or multiplied by the C of C's to obtain a weighted relative abundance. From these values, the weighted average ordination score or relative abundance of species by C of C class can be calculated (Table 3).

Example scores from selected natural areas in Ohio

The most common application of the FQAI will

² Hermann et al. (2001) state that a Windows™-based program is available for inventory and transect assessments from The Conservation Research Institute, 375 W. First St., Elmhurst, ILL 60126, 630-559-2018.

likely be the assessment of the floristic quality of various types of Ohio plant communities. With the cautions and recommendations discussed above in mind, example scores from selected communities are listed below. In many instances these communities are generally regarded as being some of the most intact and least disturbed examples in Ohio. All of these sites have been the focus of numerous botanical surveys, and complete species lists were available for each based on multi-visit and/or multi-year floristic inventories. Scores from wetlands sampled using single visit quantitative vegetation surveys are summarized in Table 2. Equation 6 was used to calculate the FQAI score.

EMERGENT MARSH

Calamus Swamp – FQAI = 37.0, n=126, where “n” means number of species occurring at a site. Calamus Swamp is an approximately 7.3 ha (18 acre) glacial kettle lake located in Pickaway County. The core of the wetland is lushly vegetated with a diversity of native species, and the perimeter is ringed with a narrow fringe of swamp forest. Even though no state-listed species are known to occur here, there are many species with coefficients between 4 and 7.

North Pond State Nature Preserve – FQAI = 28.7, n=38. This approximately 16.2 ha (40 acre) marsh is the best remaining wetland on the Lake Erie islands, but floristic composition varies depending on lake water levels. A few species of state-listed wetland plants occur here, but most are mid-range coefficient species. Scores from a sample plot focusing on the emergent areas and a plot focusing on the shrubbier margins yielded FQAI scores of 16.4 (n = 21) and 19.6 (n = 42), respectively. A combined score of both plots was 21.6 (n = 49).

PRAIRIE AND SAVANNAH

Caledonia (Claridon) Prairie – FQAI = 43.4, n=144. This 4.8 ha (12 acre) prairie remnant in Marion County is a linear strip between railroad

Table 2. Representative FQAI scores using a quantitative, plot-based sampling method. Data from Ohio EPA wetland data sets 1999-2002. Scores were calculated using Equation 6. “SNP” means a state nature preserve. Note how scores differ for sites where complete floristic inventories were available (Calamus Swamp, Daughmer Savannah, Gallagher Fen, Irwin Prairie, Wilson Swamp) discussed in the text.

type	name and location	score
High quality mixed emergent marsh	Marsh Wetlands SNP, Portage Co.	19.6
High quality mixed emergent marsh in former glacial kettle	Calamus Swamp, Pickaway Co.	21.0
High quality mixed emergent marsh	Eagle Creek SNP, Portage Co.	23.0
Good quality mixed emergent marsh	Rickenbacker, Franklin Co.	14.4
Very disturbed mixed emergent marsh	Palmer Rd., Fairfield Co.	6.6
High quality buttonbush swamp	Slate Run Metropark, Pickaway Co.	20.4
High quality buttonbush swamp	Gahanna Woods SNP, Franklin Co.	26.2
High quality buttonbush swamp	Wilson Swamp, St. Marys R. Oxbow, Mercer Co.	21.0
High quality mature swamp forest	Bradley Woods Metropark, Cuyahoga Co.	25.1
High quality mature swamp forest	Pawnee Rd., Medina Co.	28.9
High quality mature swamp forest	Crall Woods, Medina Co.	27.3
High quality vernal pool	Big Woods Park, Miami Co.	19.2
High quality vernal pool	Pallister Woods SNP, Ashtabula Co.	27.6
Degraded vernal pool	Graham Rd., Licking Co.	11.4
High quality prairie sedge meadow	Daughmer Savannah, Crawford Co.	22.7
High quality Oak Openings sand prairie	Irwin Prairie SNP, Lucas Co.	32.1
High quality Oak Openings sand prairie	Kitty Todd, Patton Tract, Lucas Co.	37.8
High quality calcareous fen with marl flats	Gallagher Fen, Clark Co.	40.9
High quality calcareous fen with marl flats	Prairie Rd. Fen, Clark Co.	38.8
High quality fen sedge meadow with prairie-fringed orchid	Cemetery Rd., Killbuck Swamp, Wayne Co.	25.7
High quality calcareous fen	Mantua Bog SNP, Portage Co.	41.1
High quality tamarack-hardwood bog	Oyer Tamarack Bog, Williams Co.	37.7
Large, very high quality leatherleaf bog	Singer Lake Bog, Summit Co.	23.8
Small, high quality kettle bog	Eagle Creek SNP, Portage Co.	24.3

Table 3. Example FQAI calculations using species and abundance data from a high quality leatherleaf bog at Singer Lake Bog, Summit County, Ohio. Species and abundance data collected from a 0.1ha plot (20x50m) and does not represent a complete floristic inventory of this site. Note that the C of C for *Sphagnum* could be included in the calculation if it had been identified to species (See Appendix B).

species	relative cover (A)	C of C (W)	A * W
<i>Calla palustris</i>	0.002	10	0.02
<i>Carex canescens</i>	0.0001	7	0.0007
<i>Carex oligosperma</i>	0.005	10	0.05
<i>Cephalanthus occidentalis</i>	0.011	6	0.066
<i>Chamaedaphne calyculata</i>	0.449	9	4.041
<i>Decodon verticillatus</i>	0.048	6	0.288
<i>Eriophorum virginicum</i>	0.007	10	0.07
<i>Nuphar advena</i>	0.020	4	0.08
<i>Polygonum amphibium</i>	0.005	4	0.02
<i>Sphagnum</i> sp.	0.449	*	---
<i>Toxicodendron vernix</i>	0.001	7	0.007
<i>Vaccinium corymbosum</i>	0.001	6	0.006
Sum of relative cover (excluding <i>Sphagnum</i> sp.)		0.5491	
Sum of A*W		4.6507	
Sum C of C		79	
FQAI N		11	
FQAI score (Eqn. 6)		23.8	
Average C of C		7.2	
relative cover sensitive species (6-10)		0.524	
Weighted average ordination score		8.875	

tracks and a county road, but is surprisingly intact. It is one of the best remaining relicts of the formerly expansive Sandusky Plains wet prairie that blanketed parts of Marion, Wyandot, and Crawford counties. There are a number of state-listed rare species here, and many plants with high coefficients.

Daughmer Savannah - FQAI = 38.4, n=147. This is a 14 ha (35 acre) prairie and savannah remnant in Crawford County. Although prairie forb richness has been suppressed by sheep grazing, it is likely the best deep-soil savannah, mesic prairie, wet prairie, and prairie sedge meadow remnant in Ohio. The score is based on a combined species list from all habitats from surveys performed over 4 years.

FEN

Cedar Bog State Memorial – FQAI vascular plants = 74.0, n=128; FQAI mosses = 45.4, n=105. The vascular plant score is the highest score of any area the authors are aware of in Ohio. Cedar Bog is a calcareous fen that is unique in that northern white cedar (*Thuja occidentalis*) is a dominant component of woody communities. There are expanses of open fen meadow that harbor many state-listed rarities, and many species with coefficients of 8 or greater. Species of natives used to develop this score occurred in the open meadows or interspersed shrub zones.

Springfield (Gallagher) Fen – FQAI vascular plants = 62.7, n=159; FQAI mosses = 25.3, n=28. Springfield fen is comprised of two rich calcareous fen meadows totaling about 2.8 ha (7 acres). A quantitative, multi-year vegetation survey was performed using 403 quadrats (quadrats = 1 m²).

RED CEDAR BARRENS

Lynx Prairie – FQAI mosses = 20.0, n=32. Lynx Prairie, as described by Osterbrook and Snider (1985) is a 21.4 ha (53 acre) tract comprised of open red cedar (*Juniperus communis*) barrens and

limestone outcrops surrounded by oak-maple forests.

LIMESTONE CLIFF FACE

Clifton Gorge State Nature Preserve – FQAI = 37.1, n=28 (only species growing directly on cliff faces or at the edge of the cliff top). This preserve is part of a deep gorge cut through limestone bedrock by the Little Miami River, and one of its defining characteristics are the large, sheer cliff faces, many of which are very undisturbed and support a good diversity of rock-dwelling plants. Many rare species are found here.

SANDSTONE CLIFF FACE

Conkle's Hollow State Nature Preserve – FQAI = 32.2, n=20 (Only plants that grow on the cliff faces, along the precipices, or in the shaded sandy basal alcoves). This preserve is a relatively narrow box canyon carved through sandstone, featuring sheer undisturbed cliff faces. There are a few species of state-listed rare plants on the cliffs, including some obligate rock-face species like Sullivantia (*Sullivantia sullivantia*) and round-leaved catchfly (*Silene rotundifolia*).

TWIG-RUSH SEDGE MEADOW

Irwin Prairie State Nature Preserve – FQAI = 45.9, n=89. This habitat is very rare in Ohio, and the only remaining large expanses are in and around this preserve. The meadow studied here is about 20 ha (50 acres), and contains numerous state-listed rarities, including several species confined to the Oak Openings. There are a number of wet prairie species as well.

ALVARS

North Shore Alvar – FQAI = 20.6, n=27. Located along the shoreline of Kelley's Island, this is probably the most intact, unmolested alvar remaining in the state. While not very diverse botanically, there are several rare species that occur here.

Lakeside Daisy State Nature Preserve – FQAI = 33.2, n=55. This 7.7 ha (19 acre) site is essentially an alvar, although it has been modified by past quarrying activities. It is mostly open limestone pavement, with scattered ephemeral wetland pools. The flagship species is the federally threatened Lakeside Daisy (*Hymenoxys herbacea*) which is present in great numbers. There are nearly a dozen other state-listed rarities as well.

LAKE ERIE BEACH

Headlands Dunes State Nature Preserve – FQAI = 32.9, n=23. This is the most intact, undisturbed beach along the Ohio portion of Lake Erie. Very little recent disturbance has taken place, and the beach grass community is probably typical of what used to be found on other Lake Erie beaches. Several rare species are present including several that are beach-obligates, such as American beach grass (*Ammophila breviligulata*), beach pea (*Lathyrus maritimus*), and seaside spurge (*Euphorbia polygonifolia*).

SWAMP FOREST

Goll Woods State Nature Preserve – FQAI = 46.7, n=103. Goll Woods represents the only significant remaining tract of woods in the former Great Black Swamp region, and is well known for the old-growth timber that is present. The preserve is 130 ha (321 acres), but only species occurring within the mature woodlands were used to compile this score. There are a few state-listed species present, such as Three-birds orchid (*Triphora trianthophora*) and rock elm (*Ulmus thomasii*).

St. Marys River oxbow wetlands – FQAI = 32.9, n=39. The St. Marys River floodplain supports some of the best remaining riparian woodlands in western Ohio, an approximately 50-acre tract of wet, regularly inundated woods interspersed with flooded oxbows. This area is almost free of weedy species, and is known for harboring some of the most localized rarities in Ohio, such as catchfly grass (*Leersia lenticularis*), cuspidate dodder

(*Cuscuta cuspidata*), and lake cress (*Armoracia lacustris*).

MIXED MESOPHYTIC FOREST

Fowler Woods State Nature Preserve – FQAI = 64.9, n=272. Located in Richland County, Fowler Woods is one of the best remaining woodlands of its type. Containing about 40 ha (100 acres) of mature woodland, a diversity of habitats are encompassed within the forest, which resulted in the high score, as the woodland was treated as a unit and a complete species list was compiled. There are very few rare species, but many high coefficient plants. Most of the woodland is beech-sugar maple, with maple-ash inclusions, and two large buttonbush swamps. As comparison, the FQAI score from a single 0.1 ha sample plot located in a pumpkin ash swamp with Fowler Woods was 25.5 (n = 44).

OAK-HICKORY WOODLAND

Shawnee State Forest – FQAI = 36.1, n=67. This is the largest state forest at over 24,000 ha (60,000 acres), but the sample unit is only 4 ha (10 acres). However, it is an area that was burned in 1998, which reinvigorated the herbaceous understory. It is also in an area known for supporting rare flora of southern distribution, and there are several state-listed rare species present. Dominant trees are chestnut oak (*Quercus prinus*), with scattered shagbark hickory (*Carya ovata*), and a few blackjack oak (*Quercus marilandica*). Sixty-seven native species were recorded.

TEAYS RIVER LACUSTRINE WET MEADOW

Glade Wetland Preserve – vascular plant FQAI = 30.4, n=277; moss FQAI = 14.4, n=13. Possibly the only remaining example of this habitat type in the state, Glade Wetland is a 118 ha (292 acre) expanse of open, mostly wet fields that are in the process of being restored via fire management and restoration of original hydrology. It is located on thick, lacustrine silt deposits associated with the prehistoric Teays River. Several rarities are found here, including

the only known Ohio population of Wolf's spikerush (*Eleocharis wolfii*). As management progresses, it is expected that upland species will decrease, and additional high coefficient wetland plants will colonize the site.

BOG

Triangle Lake Bog – FQAI = 38.5, n=44. This 25 ha (61 acre) site includes one of the most pristine kettle lake bogs remaining in Ohio. For purposes of compiling the list of species used to develop the score, only the open areas of bog mat and shrub zone inclusions were examined. There are a number of very rare bog obligates, including two-scapled bladderwort (*Utricularia geminiscapa*), as well as other bog species like pitcher-plant (*Sarracenia purpurea*) and round-leaved sundew (*Drosera rotundifolia*).

EXPLANATION OF APPENDICES

EXPLANATION OF APPENDIX A: OHIO VASCULAR PLANT DATABASE

The arrangement of the vascular plant database is alphabetical by genus and species with the authority and family name provided. Nomenclature and circumscription essentially follow Gleason and Cronquist (1991). Differences in nomenclature or circumscription from Gleason and Cronquist (1991) are noted by underlining the species name in Appendix A and by providing a synonym in Appendix C.

Coefficients of conservatism for native vascular plants were normally distributed although the distribution was slightly skewed to towards higher C of C's (Figure 14). With the recent review and updating of the flora of Ohio as represented by the *Seventh Catalog of the Vascular Plants of Ohio* (Cooperrider et al. 2001), the taxa listed in the Ohio Vascular Plant Database were compared to the taxa listed in the Cooperrider et al. (2001) (Table 4). Overall, there are relatively few differences between the Ohio Plant Database in Appendix A and Cooperrider et al. (2001). The main difference is that Appendix A only lists varieties and subspecies separately where differences in habitat preferences resulted in different C of C's for the variety or subspecies. Other differences include different opinions as to whether a particular species is native or non-native to Ohio; elevating a variety or subspecies to specific rank or vice versa; or whether a species is legitimately included in Ohio's flora.

Only native species were given C of C ranks between 0 and 10. Native species are those taxa presumed to be present in the region prior to European settlement. The native status of a taxon was determined from reviewing Fernald (1950), Braun (1961, 1967), Voss (1972, 1985, and 1996), Cooperrider (1985), Furlow (1991), Gleason and Cronquist (1991), Cooperrider et al (2001),

USDA, NRCS (2002) the *Flora of North America* volumes listed in the reference section, and journal articles.

Non-native taxa have been assigned the value of 0. They are excluded from the calculation of the FQAI in Equation 6 and are preceded with an asterisk in the coefficient of conservatism column. Additionally, the scientific name of non-native taxa is printed in BOLD TYPE. Examples of common non-native plants include chicory (*Cichorium intybus*) and queen Anne's lace (*Daucus carota*).

When both native and non-native populations of a species (or native and non-native varieties) are known in Ohio, or where a species or variety is native in one part of Ohio but adventive elsewhere (e.g. *Campsis radicans*), several approaches were used in Appendix A. A few plants in the Ohio plant database are listed twice, once in normal typeface and once in CAPS, and information is provided in the footnotes as to the status of native and non-native populations (e.g. *Najas marina*, *Phlox subulata*, *Pinus strobus*).

Table 4. Summary table of Appendix A and Appendix E comparing results to numbers from the 7th catalog (Cooperrider et al. 2001).

	Appendix A	7 th Catalog
native species and infraspecific taxa	1794	1904
native hybrids	1	115
naturalized non-native taxa including infraspecific taxa	550	527
non-native taxa (in Appendix E not in Appendix A)	298	428
TOTALS	2643	2974

When there are both native and non-native varieties of the same species, these may also be listed in the database twice, with the native variety in normal typeface and the non-native variety in CAPS (e.g. *Descurainia pinnata*, *Fragaria vesca*, *Symporicarpus albus*).

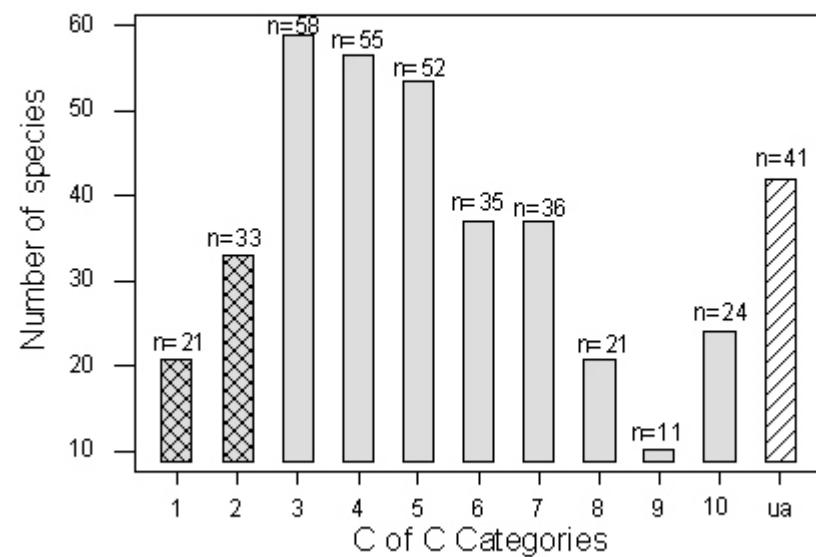

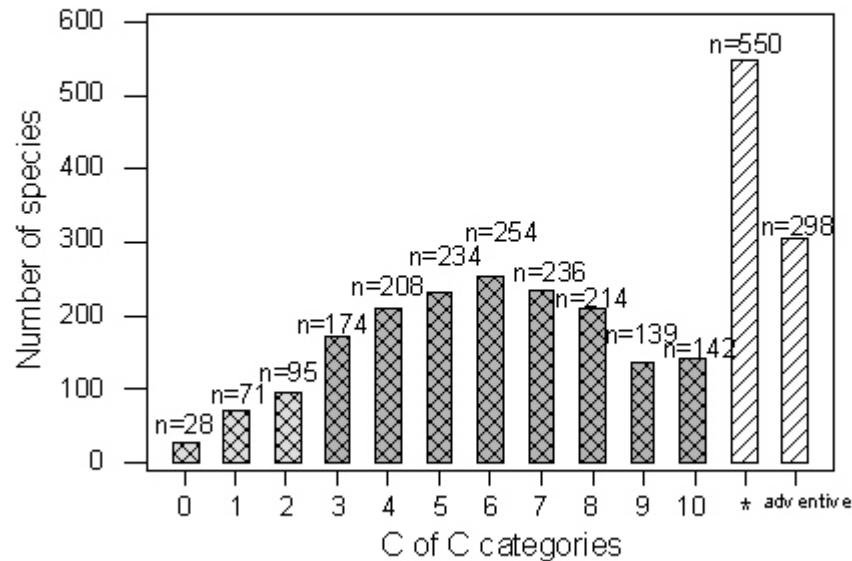

Figure 15. Histogram of coefficients of conservatism categories and number of unassigned C of C's in the Ohio Moss Database in Appendix B.

Finally, the issue of nativity in only one part of the state was often addressed in a footnote for that species (e.g. *Achillea millefolium*, *Aralia spinosa*, *Artemesia campestris*, *Campsis radicans*, *Cardamine palustris*, *Desmanthus illinoensis*, *Filipendula rubra*, *Gymnocladus dioicus*, *Humulus lupulus*, *Hydrangea arborescens*, *Physalis longifolia*, *Polygonum lapathafolium*, *Veronica peregrina*, *Thuja occidentalis*).

Each taxon is preceded with a 6-letter acronym. This generally represents the first three letters of the genus followed by the first three letters of the specific epithet. The exceptions are where duplicate names would occur and a nonintuitive generic acronym was created (e.g. CX for *Carex*). Where varieties or subspecies are listed separately, a 7th letter was added to distinguish the variety or subspecies.

A common name is provided for each plant. Common names were generally selected from Gleason and Cronquist (1991), Voss (1972, 1985, and 1996), or Cooperrider et al (2001) or are innovations of the authors.

Additional information is provided for each taxon. In the column labeled “group,” the taxonomic class to which the taxon belongs is listed: SVP = seedless vascular plant, MONO = monocotyledon, DI = dicotyledon, and GYMN = gymnosperm. Life history information is provided with AN = annual, PE = perennial, BI = biennial and W=woody. Physiognomic categories (tree, small tree, shrub, vine, forb, grass, sedge, fern) are provided in the column labeled “form.” Information for all of the preceding categories was obtained primarily from Gleason and Cronquist (1991).

Wetland categories (Reed 1988, 1997) are provided for each native taxon. For taxa not provided with a wetland indicator status in Reed (1988), the status provided by Reed (1997) was used (if one was listed) or a determination was made based on the authors' familiarity with the plant and the indicator status was listed in brackets. The wetland categories are UPL (upland), FACU (facultative upland), FAC (facultative), FACW (facultative wetland) and OBL (obligate wetland). The several facultative

categories may also have a + or - modifier (e.g. FACW+). See Reed (1988, 1997) for definitions of these categories.

EXPLANATION OF APPENDIX B: OHIO MOSS DATABASE

The arrangement of the moss database is alphabetical by genus and species with the family name provided. Nomenclature and circumscription essentially follow Anderson, Crum and Buck (1990) and Anderson (1990). Appendix B includes 387 of the 400 Ohio moss taxa (385 species and 15 varieties) listed in Snider and Andreas (1996). All Ohio mosses are considered to be native (Snider and Andreas, 1996). Unless a variety has a distinct habitat, varieties are listed together and have the same coefficients of conservatism. A rare intergeneric hybrid, *Pleuriditrichum marylandicum* Andrews & Hermann (a putative hybrid between *Pleuridium subulatum* (Hedw.) Rabenh. and *Ditrichum pallidum* (Hedw.) Hampe), known from a site in Jackson County, is not included in the moss database.

The assignment of a numerical value for the coefficient of conservatism is based on the same principles used in the vascular plant database: 1) the author's (Andreas) extensive field experience in Ohio, 2) descriptions of habitat preferences in local and regional manuals, and 3) a survey of information on herbarium labels primarily in herbaria at the University of Cincinnati (UC), Kent State University (KE), and The Ohio State University (OS). The moss values are intended to be used in conjunction with vascular plants when mosses are included in the floristic list of a natural area, although separate indices could also be calculated for the vascular and nonvascular flora of an area. The distribution of moss C of C's is summarized in Figure 15.

Species often associated with human disturbance, such as *Bryum argenteum* Hedw., *Ceratodon purpureus* (Hedw.) Brid. var. *purpureus* and *Funaria hygrometrica* Hedw., and are found on a variety of substrates, receive numerical values of

“1.” Several Ohio taxa, such as *Bryum algovicum* Sendtn. ex C. Müll. var. *algovicum*, *Desmatodon plinthobius* Sull. & Lesq. in Sull., *Grimmia plagiopodia* Hedw., *G. pulvinata* (Hedw.) Sm. var. *pulvinata*, and *Jaffueliobryum wrightii* (Sull. in Gray) Thér., are presently known to grow only on man-made structures such as cement walls, tombstones and bridges. Although rare in distribution, these taxa are also considered plants of disturbed areas and are assigned coefficient of conservatism values of 1.

Taxa common to a variety of substrates and habitats receive values of 2 and 3. Examples include *Polytrichum commune* Hedw. and *Thuidium delicatulum* (Hedw.) Schimp. in B.S.G. Both species occur in a variety of habitats such as roadside banks, mature forests, and edges of wetlands.

There are some moss taxa that have low community affiliation but are specific to a natural substrate. These taxa receive values of 4-6. For example, *Anacamptodon splachnoides* (Fröl. ex Brid.) Brid. is found on bark in the crotch of hardwood tree trunks in a wide range of habitats.

Taxa affiliated with mature communities, and which are somewhat substrate-specific, receive values of 7-8. An example is *Dicranum fulvum* Hook., which typically grows on sandstone boulders in a variety of mature forest types.

Mosses growing in specific plant communities and on specific substrates receive values of 9-10. Examples of the latter would include *Bryoxiphium norvegicum* (Brid.) Mitt. and *Pohlia elongata* Hedw. var. *elongata* (both limited to moist sandstone cliffs in shaded ravines); *Anomodon viticulosus* (Hedw.) Hook. & Tayl. (limited to exposed limestone boulders in oak forests); and *Hamatocaulis vernicosus* (Mitt.) Hedenäs (limited to highly minerotrophic peatlands).

Some taxa are given the code “ua” (unassigned) in the coefficient of conservatism column. Plants given this assignment are from two situations. The first is taxa whose distribution for Ohio comes from literature sources (such as Crum and Anderson, 1981) but for which there are no known herbarium records. An example is *Cyrtomnium*

hymenophylloides (Hüb.) Nyh. ex T. Kop., reported in Crum and Anderson (1981) and whose Ohio distribution is unknown. The second group includes historical records reported in the literature (e.g. Geisy 1957), but these specimens have yet to be located or verified. An example is *Encalypta ciliata* Hedw., reported by Geisy (1957) as occurring in Ottawa County, but no herbarium specimen has been located. In both situations, until further field knowledge is gained, or herbarium records are located, a numerical value cannot be assigned.

In many manuals mosses are separated into either acrocarpous or pleurocarpous body forms. Acrocarps (A) produce a sporophyte at the end of the main stem and are therefore unbranched or sparsely branched and grow as tufts. Pleurocarps (P) produce sporophytes laterally and are usually prostrate and form mats.

The column “Life Cycles” refers to the condition of the gametophyte plant body. In most genera the leafy gametophyte (gametophore) is commonly perennial (P). In several genera such as *Pogonatum* and *Buxbaumia*, the gametophore is inconspicuous and ephemeral, and the protonema is persistent or perennial. Annuals are common in a few families (e.g. the Funariaceae), where the plant goes from spore to spore in one season. For these latter two situations the symbol A/E is used. Life cycle information was taken from Crum and Anderson (1981) and Ireland (1982).

EXPLANATION OF APPENDIX C: SELECTED SYNONYMS

For its completeness, identification keys, and availability to the general botanical community, Gleason and Cronquist (1991) is followed for nomenclature and circumscription. With the publication of more and more volumes of *The Flora of North America North of Mexico* (FNA) by the Flora of North American Editorial Committee, new treatments have been proposed. With a few exceptions, e.g. *Panicum* and *Dichanthelium*, the FNA treatment was used in

Appendix A with the name of a species in Gleason and Cronquist (1991) provided as a synonym in Appendix C. For example, the current treatment of FNA (Vol. 2) uses the scientific name *Huperzia lucidula* (FNA, Vol. 2) instead of *Lycopodium lucidulum*, which is listed in synonymy. Other common synonyms were also provided in Appendix C when it was felt there inclusion would aid the user.

EXPLANATION OF APPENDIX D: FOOTNOTES

Appendix D includes additional information regarding specific taxa. These footnotes are arranged in numeric order. Many footnotes refer to the inclusion of one taxon within another (for example *Bromus pubescens* Muhl. ex Willd. includes plants known by the rejected name *Bromus purgans* L.). Other footnotes list varieties included within a taxon (for example, *Campanula aparinaoides* Pursh includes both varieties: *C. aparinaoides* var. *aparinaoides* and *C. aparinaoides* var. *grandiflora* Holz). Other footnotes refer to situations where the plant is indigenous within part of its range, but may be escaped from cultivation elsewhere in the state (for example, *Campsis radicans*). Recent additions to Ohio's flora are also noted as problematic issues of nomenclature or circumscription. Occasionally the "nativeness" of a taxon is questioned, such as *Penstemon tubaeformis*. Often the information included in Appendix D reflects the thinking of the authors during the compilation of Appendix A.

EXPLANATION OF APPENDIX E: LIST OF OHIO ADVENTIVE TAXA

Non-native species which have become naturalized in Ohio's flora and can be encountered in natural habitats are included in Appendix A. To keep Appendix A uncluttered, infrequently observed non-native, adventive taxon were deleted from Appendix A. If the adventive taxa is known from less than 3 counties based on published distribution maps or is known from only one or two Ohio collections (for example, *Lycoris*

squamigera and *Spiraea japonica*) or from non-natural habitats like cemeteries, vicinities around greenhouses, landfills or gardens, it was removed from Appendix A and alphabetically listed in Appendix E. New additions to Ohio's non-native flora can be assigned an asterisk or a zero score depending on the equation used.

APPENDIX C
SELECTED SYNONYMS
OHIO VASCULAR PLANT DATABASE

Viola pallens (Banks ex DC.) Brainerd

Viola palmata L.

Viola papilionacea Pursh

Viola pedatifida G. Don

Viola sororia Willd. var. *missouriensis* (Greene) L.E. McKinney

Viola triloba Schwein

Wolffia papulifera C. Thompson

Wolffia punctata Griseb.

Wolffiella floridana (Donnell Smith) C.H. Thompson

Viola macloskeyi F.E. Lloyd

Viola palmata var. *palmata* L.

Viola sororia Willd.

Viola palmata var. *pedatifida* (G. Don) Cronquist

Viola missouriensis Greene

Viola palmata var. *palmata* L.

Wolffia brasiliensis Weddell

Wolffia brasiliensis Weddell

Wolffiella gladiata (Hegelm.) Hegelm.

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

FN NOTES

- 1 Ohio material generally considered to be separate spp. but often treated as var. of *A. virginica* L. or *A. rhomboidea* Raf.
- 2 incl. var. *violaceum* (Kirchn.) Jaeger
- 3 incl. var. *rubrum*, var. *trilobum* Torr. & A. Gray
- 4 incl. var. *saccharum*, var. *viride* (Schmidt) E. Murray (*A. nigrum* F. Michx.)
- 5 Cooperrider et al. (2001) distinguish native (var. *occidentalis* DC.) and nonnative varieties (var. *millefolium*)
- 6 incl. *A. octandra* Marshall
- 7 incl. var. *sargentii* Rehder
- 8 does not include *A. gattingeri* (Small) Small ex Britton
- 9 incl. var. *macrophylla* (Benth.) S. F. Blake, var. *parviflora* (Nutt.) Pennell, var. *tenuifolia*
- 10 does not incl. *A. tenuis* Sibth.
- 11 also known as *A. stolonifera* var. *major*; incl. Ohio plants treated by some authors as *A. alba* L.
- 12 incl. var. *scabra* (Willd.) Blomq. (*A. scabra* Willd.), var. *hyemalis* (Walter) B.S.P.
- 13 incl. var. *palustris* (Huds.) Farw.
- 14 the name *A. plantago-aquatica* has been used in many floras but native distribution of this sp. limited to Eurasia
- 15 incl. var. *burdickii* Hanes, var. *tricoccum*
- 16 ours var. *americana* Regel (*Alnus incana* subsp. *rugosa* (Du Roi) R.T. Clausen)
- 17 some authors treat this as *A. graecizans* L.
- 18 some authors treat this *A. tamariscinus* Nutt.
- 19 this species may be hybrid swarm of *A. laevis* Wiegand and *A. sanguinea* (Pursh) DC.
- 20 incl. var. *comosa* (L.) Fernald, *A. pitcherii* Torr. & A. Gray
- 21 Confused nomenclature. Incl. all varieties of *A. neglecta* Greene in Gleason and Cronquist (1991) and/or *A. neodioica* Greene in Fisher (1988)
- 22 Confused nomenclature. Incl. all varieties of *A. plantaginifolia* (L.) Richardson in Gleason and Cronquist (1991) and/or *A. parlinii* Fernald in Fisher (1988)
- 23 includes *A. perstellata* E.L. Braun
- 24 nonnative populations present in Ohio
- 25 incl. var. *coactilis* Fernald & J. F. Macbr.
- 26 see text p. 263 in Gleason & Cronquist (1991) regarding *A. prunifolia* (Marshall) Rehder (*Pyrus floribunda* (Lindl.) Spach, *Photinia floribunda* (Lindl.) K.R. Robertson & J.B. Phipps)
- 27 Cooperrider et al. (2001) also incl. nonnative var. *canadensis* (Michx.) Welsh in the flora of Ohio
- 28 incl. var. *gnaphalodes* (Nutt.) Torr. & A. Gray

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 29 there are historical records of native stands in Ohio; a few potential native stands of this species may remain in Ohio
- 30 incl. var. *reflexum* (E.P. Bicknell) B.L. Rob.
- 31 incl. subsp. *quadrivalens* D.E. Mey
- 32 incl. *A. junciformis* Rydb.
- 33 incl. *A. dodgei* Fernald
- 34 incl. var. *prostratus* (Kuntze) S.F. Blake
- 35 incl. *A. puniceus* var. *lucidulus* A. Gray
- 36 incl. var. *interior* (Weig.) Semp. & Chm. (*A. simplex* var. *interior*), var. *lanceolatus* (*A. simplex* var. *ramosissimus*), var. *simplex* (Willd.) A.G. Jones (*A. simplex* var. *simplex*)
- 37 incl. var. *lanceolatus* Porter (*A. cordifolius* var. *lanceolatus* Porter), var. *lowrieanus* (incl. *A. cordifolius* var. *laevigatus* Porter)
- 38 incl. *A. azureus* Lindl.
- 39 incl. var. *phlogifolius* (Muhl.) Nees, var. *patens*
- 40 incl. var. *pilosus*, var. *pringlei* (A. Gray) S. F. Blake (incl. var. *demotus* S. F. Blake)
- 41 does not include *Aster firmus* Nees (*A. puniceus* var. *firmus* (Nees) Torr. & A. Gray)
- 42 incl. var. *angustum* (Willd.) G. Lawson, var. *asplenoides* (Michx.) Farw.
- 43 incl. *A. subspicata* (Nutt.) Rydb.
- 44 incl. var. *flava*, var. *macrantha* (Pennell) Pennell
- 45 There has been considerable debate as to whether this species is native to Ohio. Cooperrider et al. (2001) treat as native to Ohio
- 46 incl. var. *crebra* Fernald
- 47 Recently found in southern Ohio in *Sphagnum* dominated wetland and new to flora of the state
- 48 Ohio specimens of *B. laevis* inseparable from *B. cernua*
- 49 only with difficulty distinguished from the European *B. tripartita* L.
- 50 Cooperrider et al. (2001) treat as native; but most specimens (OS) start ca 1950 (except one 1929 Camden Lake collection)
- 51 also known as *Schoenoplectus fluviatilis* (Torr.) M.T. Strong
- 52 incl. *B. obliquam* Muhl. ex Willd.
- 53 incl. var. *angustisegmentum* Pease & A.H. Moore
- 54 Saarela et al. (Systematic Botany 28(4):674-692) treat as distinct species and annotate specimen collected by B.K. Andreas from boggy woods in NE Ohio
- 55 incl. *B. napobrassica* (L.) Mill.
- 56 incl. plants known by the rejected name *Bromus purgans* L.
- 57 incl. var. *lacustris* Fernald

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 58 incl. subsp. *inexpansa* (A. Gray) Greene (*C. inexpansa* A. Gray)
- 59 incl. *C. pulchellus* R. Br. ex W.T. Aiton
- 60 incl. var. *aparinoides*, var. *grandiflora* Holz
- 61 indigenous to Ohio River habitats, but many nonnative escaped populations elsewhere in Ohio
- 62 often confused with *C. hirsuta*
- 63 incl. var. *arenicola* (Britton) O.E. Schulz
- 64 does not include nonnative var. *pratensis* (Eurasian Cuckoo Flower); ours var. *palustris* Wimm. & Grab.
- 65 may be difficult to distinguish from *C. gravida* if leaf sheaths damaged or not visible
- 66 easily confused with *C. festucacea*
- 67 does not incl. var. *rigida* (L. H. Bailey) Fernald (*Carex planispicata* Naczi), var. *turgida* Fernald (*C. grisea* Wahlenb.); note the FNA concept of this species differs from Braun (1967)
- 68 incl. *C. annexens* var. *annexens*, *C. annexens* var. *xanthocarpa* (E.P. Bicknell) Wiegand
- 69 for a long time incl. in *C. radiata* (Wahlenb.) Dewey, and this name frequently misapplied to *C. appalachica*
- 70 ours var. *substricta* Kuk.
- 71 often confused with *C. foena*
- 72 incl. *C. incompta* E.P. Bicknell
- 73 does not include *C. garberi* Fernald
- 74 can be confused with immature *C. cristatella*; can behave has facultative annual reaching reproductive stage from seed in one season
- 75 most common and widespread member of Section Laxiflorae and grows on diverse soil and environmental conditions
- 76 does not include *C. molesta* Schk. or *C. merritt-fernaldii* Mack.
- 77 ours subsp. *bromoides*
- 78 incl. subsp. *brunnescens* and subps. *sphaerostachya* (Tuck.) Kalela
- 79 FNA erroneously does not list for Ohio
- 80 incl. subsp. *canescens*, subsp. *disjuncta* (Fernald) Toivonen
- 81 formerly in Section Laxiflorae and moved to Section Careyana in FNA
- 82 ours var. *communis*
- 83 distinguished from typical variety by non-constricted achenes and ellipsoid perynginia
- 84 can hybridize with *C. gynandra*
- 85 mature specimens distinguished by widely spreading peryngina and globose spikes; confused with *C. bebbii* when immature
- 86 formerly called *C. abscondita* Mack. but this species is not in Ohio. Ohio material is *C. cumberlandensis*

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 87 FNA does not list for Ohio
- 88 ours subsp. *deweyana*
- 89 formerly in Section Laxiflorae and moved to Section Careyana in FNA
- 90 ours var. *digitalis*; formerly in Section Laxiflorae, moved to Section Careyana in FNA
- 91 ours subsp. *echinata*; incl. *C. cephalantha* (L. H. Bailey) Bicknell
- 92 in Ohio inhabits stream habitats; superficially similar to *C. stricta* but resembles and is more closely related to *C. aquatilis*
- 93 can often be confused with *C. albulotescens*
- 94 some authors incl. *C. garberi* Fernald in *C. aurea* Nutt.
- 95 true *C. flaccosperma* is known from states south Ohio where it can co-occur with *C. glaucodea*
- 96 incl. var. *haleana* (Olney) Porter; a very morphological variable species
- 97 incl. var. *hispidula* A. Gray
- 98 some authors treat as variety of *C. amphibola*
- 99 can hybridize with *C. crinita* var. *crinita*
- 100 often confused with *C. stricta*, and identified by inflated perynginia, acute scales, glabrous leaves and sheaths
- 101 infrequent and local; often grows with *C. albursina*, *C. jamesii*, *C. oligocarpa*
- 102 recently added to flora of Ohio in FNA and specimens often misidentified as *C. blanda*, *C. laxiflora* var. *serrulata*, and *C. albursina*; known from specimen from Lawrence Co. but Ohio distribution may be broader. *C. kraliana* appears to be a more conservative dry woods species
- 103 incl. var. *americana* Fernald
- 104 incl. var. *laxiculmis*, var. *copulata* (L.H. Bailey) Fernald; formerly in Section Laxiflorae and moved to Section Careyana in FNA
- 105 incl. var. *laxiflora*, var. *serrulata* F. J. Herm.; there is substantial phenotypic variation in the *C. laxiflora* complex
- 106 easily confused with *C. cephalophora* and may be overlooked
- 107 FNA erroneously does not list for Ohio
- 108 variable, abundant and sometimes weedy wetland species
- 109 does not incl. *Carex magellanica* subsp. *irrigua* (Wahlenb.) Hiitonen, Suom, Kasvio (*Carex limosa* var. *irrigua* Wahelnb.) which FNA erroneously lists for Ohio.
- 110 separating *C. meadii* from *C. tetanica* Schkuhr can be difficult; see discussion in FNA; some authors treat this as variety of *C. tetanica* Schkuhr
- 111 some authors incl. *C. merritt-fernaldii* Mack. in *C. brevior* (Dewey) Mack.
- 112 some authors incl. *C. molesta* Mack. ex Bright in *C. brevior* (Dewey) Mack.
- 113 incl. var. *enervis* Boott, var. *muhlenbergii*
- 114 formerly treated as *C. amphibola* Steud. or *C. amphibola* var. *rigida* (L.H. Bailey) Fern.

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 115 formerly in Section Laxiflorae and moved to Section Careyana in FNA
- 116 formerly in Section Laxiflorae and moved to Section Careyana in FNA
- 117 very common along highways where road salt is applied
- 118 intermediate between *C. tribuloides* and *C. cristatella* but *C. projecta* flowers and fruits first
- 119 smaller and more slender than *C. comosa* with straight versus curved perigynia beak
- 120 for a long time known as *C. rosea* Schk. but this name misapplied to *C. radiata* (Wahlenb.) Small; *C. rosea* Schk. is now limited to what was formerly known as *C. convoluta* Mack.
- 121 records of *C. retroflexa* and *C. texensis* not always clearly distinguished and some references to *C. retroflexa* may refer to *C. texensis*
- 122 FNA erroneously does not list for Ohio
- 123 incl. var. *scoparia*
- 124 the name *C. foena* misapplied in recent literature
- 125 FNA erroneously does not list for Ohio
- 126 incl. var. *maxima* Chapm., var. *stipata*
- 127 FNA erroneously does not list for Ohio
- 128 may be most common wetland sedge in eastern N.A.; often confused with *C. haydenii* but distinguished by veined, flattend, ovoid perynginia with short scales
- 129 inhabits moister habitats than typical variety and has more southerly distribution in U.S.
- 130 differs from var. *echinodes* in sparsely papillose leaf sheaths, appressed peryngia, and peryngia beaks exceeding scales much less (0 to 0.8mm)
- 131 can be confused with *C. meadii*; see discussion in FNA; does not incl. *C. meadii* Dewey (*C. tetanica* var. *meadii* (Dewey) L.H. Bailey)
- 132 some authors consider Ohio within natural range of this species but it is unlikely that it is a species native to Ohio based on examination of Ohio material; FNA treats this spp. as introduced in Ohio.
- 133 incl. var. *tonsa*, var. *rugosperma* (Mack.) Crins; long known as *C. rugosperma* Mack. but name *C. tonsa* has priority
- 134 incl. var. *tribuloides* and var. *sangomonensis* Clokey (distinguished by wider perynginia)
- 135 often treated as part of *C. rostrata* but FNA considers quite different in leaf shape and anatomy
- 136 broad variable species complex
- 137 incl. subsp. *viridula*
- 138 hybrid of *C. hyalinolepis* X *C. pellita*
- 139 incl. subsp. *virginiana* (Marshall) Furlow
- 140 incl. var. *mollis* (Ashe) Sudw., var. *obcordata* (Muhl. & Willd.) Sarg.; incl. by some authors in *C. glabra* (Mill.) Sweet
- 141 incl. var. *giganteum* Farw., var. *thalictroides*. FNA treats these as separate species
- 142 incl. var. *pitcheri* Torr. & A. Gray

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 143 incl. var. *pumila* (Pursh) A. Gray
- 144 incl. var. *georgiana* (Small) Fernald & B. Schub.
- 145 incl. var. *pubescens* Raf.
- 146 incl. *C. longepedunculatum* Muhl. ex Britton
- 147 incl. by some authors in *C. vulgatum* L.
- 148 incl. var. *procumbens*, var. *shortii* Torr. & A. Gray
- 149 incl. var. *angustifolia* (Aiton) Rehder
- 150 incl. var. *elatior* T. A. Frick, var. *glabra*, var. *linifolia* N. Coleman
- 151 incl. *C. missouriense* Aellen (*C. album* var. *missouriense* (Aellen) Bass. & Cromp.)
- 152 incl. var. *bushianum* (Aellen) Cronquist, var. *zxchackei* (Murr.) Murr.
- 153 Ohio material not well studied and may not be native to flora but Ohio is considered within natural range by some authors; incl. *C. subglabrum* (S. Watson) A. Nelson
- 154 Ohio material not well studied and may not be native to flora but Ohio is considered within natural range by some authors
- 155 also known as *C. hybridum* var. *gigantospermum* (Aellen) Rouleau.
- 156 incl. var. *cisatlantica* S.F. Blake
- 157 incl. var. *canadensis* L.
- 158 incl. var. *arvense*, var. *horridum* Wimm. & Grab.
- 159 Cooperrider et al. (2001) incl. "some Ohio specimens previously identified as *C. hillii*" in *C. pumilum*
- 160 incl. var. *diffusa*
- 161 FNA erroneously does not list for Ohio
- 162 incl. var. *canadensis*, var. *pusilla* (Nutt.) Cronquist
- 163 some authors treat Ohio as within natural range of this spp. but Ohio collections at OSU herbarium from roadsides and OSU Campus. Earliest collections ca1930s
- 164 incl. var. *amomum*, var. *schuetzeana* (C. A. Meyer) Rickett (*C. obliqua* Raf.)
- 165 does not incl. *Cornus stricta* Lam. (*C. foemina* sensu Mill.) where there is one doubtful specimen of *C. stricta* from Wood Co.
- 166 incl. var. *brainerdii*, var. *scabrida* (Sarg.) Eggl., and *C. coleae* Sarg.
- 167 incl. var. *calpodendron*, var. *globosa* (Sarg.) E. J. Palmer, and var. *microcarpa* (Chapm.) E. J. Palmer
- 168 incl. var. *brownii* (Britton) Sarg., var. *meiophylla* (Sarg) E.J. Palmer, *C. margarettiae* var. *margarettiae*, and *C. sicca* var. *glabrifolia* (Sarg.) E.J. Palmer
- 169 incl. *C. haberi*, *C. hillii*, *C. holmsiana*, *C. pennsylvanica*, *C. pringlei*, *C. putnamiana*, *C. pedicellata*,
- 170 incl. *C. arborea*, *C. engelmannii*, *C. fontianesiana*, *C. hannibalensis*, *C. ohioensis*, *C. vallicola*
- 171 incl. *C. basilica*, *C. brumalis*, *C. gravis*, *C. iracunda*, *C. macrosperma*, *C. populnea*, *C. stolonifera*

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 172 incl. *C. biltmoreana*, *C. boyntonii*, *C. fortunata*, *C. horseyi*, *C. rubella*
- 173 incl. var. *mollis*, var. *sera* (Sarg.) Eggl. and *C. submollis* Sarg.
- 174 incl. *C. compacta*, *C. crawfordiana*, *C. disjuncta*, *C. formosa*, *C. franklinensis*, *C. gattingeri*, *C. guadensis*, *C. C. jesupii*, *C. leiophylla*, *C. mackenzii*, *C. milleri*, *C. porteri*, *C. rugosa*, and *C. virella*
- 175 incl. *C. indicens*, *C. peoriensis*, *C. suoriculata*
- 176 incl. vars. *succulenta*, *macrantha*, *michganensis*, *neofluviatilis*, *pertomentosa*
- 177 incl. var. *septentrionalis* (Mull) Arg.; there is some question whether this is a native spp. in Ohio
- 178 recently added to flora of Ohio
- 179 very similar to *Cuscuta pentagona* Engelm. Only collected in Adams Co. Deleted from flora by Cooperrider et al. (2001).
- 180 incl. *Cyperus rivularis* Kunth
- 181 FNA erroneously does not list for Ohio
- 182 ours var. *leptostachyus* Boeckeler
- 183 incl. var. *poiformis* (Pursh) Fernald
- 184 incl. subspp. *lupulinus*, *macilentus* (Fernald) Marcks
- 185 some authors treat *C. engelmanii* Steud. and *C. ferruginescens* Boeck as separate spp.
- 186 FNA erroneously does not list for Ohio
- 187 incl. *C. inflexus* Muhl.
- 188 incl. var. *laevigatus* Torr. & A. Gray
- 189 rare native populations present in Ohio. Many nonnative populations.
- 190 mostly nonnative pops. in dist. habitats
- 191 possibly nonnative in Ohio. Oldest OSU Herbarium collection ca1900. Cooperrider et al. (2001) and Gleason & Cronquist (1991) treat as native and these treatments are followed
- 192 incl. *Desmodium perplexum* Schubert
- 193 incl. *D. nuttallii* (Schindl.) B.G. Schub.
- 194 doe not incl. var. var. *obovata* Gleason (*D. obovata* (Gleason) Brandenburg)
- 195 incl. *Panicum bicknellii* and *P. calliphillum* (note FNA treats these spp. as probable hybrids) although often treated as separate spp.
- 196 treated by some authors as part of *P. ovale* Elliott (*Dichanthelium ovale* var. *addisonii* (Nash) Gould & C.A. Clarke)
- 197 treated by some authors as part of *P. dichotomum* L. (*D. dichotomum* (L.) Gould)
- 198 treated by some authors as part of *P. dichotomum* L. (*D. dichotomum* (L.) Gould)
- 199 incl. var. *scribnerianum* (Nash) Fernald

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 200 treated by some authors as part of *P. linearifolium* Scribn. (*D. linearifolium* (Scribn. ex Nash) Fernald)
- 201 recently added to flora where it was collected growing in natural habitat with other native spp.
- 202 incl. *Lycopodium complanatum* var. *flabelliforme* Fernald, *L. flabelliforme* (Fernald) Blanch, *L. digitatum* Dill. ex A. Braun
- 203 incl. *D. spinulosa* (O.F. Mull.) Watt, *D. austriaca* var. *spinulosa* (D. C. Eaton) Underw.
- 204 incl. var. *arundinaceum*
- 205 incl. var. *muricata* (*E. pungens* (Poir.) Rydb.), var. *microstachya* Wieg. (*E. wiegandii* (Fassett) MacNeil & Dore). Note that var. *microstachya* considered nonnative to Ohio by some authors
- 206 incl. *E. pustulosum* Sibth & Sm. (*E. vulgare* var. *pustulosum* (Sibth & Sm.) Coincy)
- 207 incl. *E. alba* (L.) Hassk.
- 208 ours var. *compressa*
- 209 incl. in *Eleocharis ovata* (Roth) Roem. & Schult. by some authors
- 210 incl. in *E. palustris* L. by some authors
- 211 *E. caribea* (Rott.) S.F. Blake considered by most authors to be misapplied
- 212 erroneously incl. in *E. ovata* (Roth) Roem. & Schult. by some authors
- 213 our variant of this extremely variable worldwide species is *E. smallii* Britton *sensu stricto*; does not incl. *E. erythropoda* Steud.
- 214 incl. var. *crassior* Fernald
- 215 does not incl. *E. elliptica* Kunth (*E. tenuis* var. *borealis* (Svenson) Gleason)
- 216 incl. var. *glabriflorus* (Vasey) Bush, var. *submuticus* Hook.
- 217 incl. var. *glabrifolia* Fernald
- 218 incl. var. *platyphyllum* (Daniels) Fernald, var. *canescens* A. W. Wood
- 219 ours var. *affine* (Engelm.) A.A. Eaton; also known as subsp. *affine* (Engelm.) Calder & Roy L. Taylor
- 220 incl. *Eragrostis megastachya* (Koeler) Link
- 221 incl. *Eragrostis poaeoides* P. Beauv. ex Roem. & Schult.
- 222 incl. var. *intermedia* Fernald
- 223 incl. var. *brauniae* Fernald, var. *pulchellus*
- 224 *E. septangulare* With. is a widely used but invalid name; the name used here treats N.A. and Eurasian material as conspecific; if N.A. material is segregated then the proper name is *E. pellucidum* Michx.
- 225 incl. var. *laciniatum* A. Gray
- 226 includes all named varieties of this species

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 227 incl. var. *ovatum* (Bigelow) Torr., var. *rotundifolium*
228 The USDA plants data base shows both native and introduced populations of this species
229 incl. var. *graminifolia* (*Solidago* g. var. g.), var. *nuttallii* (Greene) W. Stone (*Solidago* g. var. n. (Greene) Fernald)
230 treated by some authors as part of *E. gymnospermoides* Greene or *Solidago gymnospermoides* (Greene) Fernald
231 incl. var. *caroliniana* (Loudon) Fernald & Rehder (White Beech), var. *grandifolia* (red beech)
232 also known as *Lolium arundinaceum* (Schreb.) Darbysh. or *F. elatior* var. *arundinacea* (Schreb.) Wimm.
233 incl. *F. filiformis* Pourr., *F. tenuifolia* Sibth.
234 can occasionally escape from gardens
235 incl. var. *americana* L., var. *biltmoreana* (Beadle) J. Wright ex Fernald (*F. biltmoreana* Beadle)
236 inc. var. *subintegerrima* (M. Vahl) Fernald (Green Ash), var. *pennsylvanica* (Red Ash)
237 var. *campestris* (Small) Fernald
238 Cooperrider et al. (2001) treats as native to Ohio
239 incl. *G. spurium* L.
240 incl. *G. hypomalacum* Fernald
241 incl. var. *occidentalis* (A. Gray) Small
242 incl. var. *confertiflorum* Fernald
243 incl. var. *strictum* (Aiton) Fernald
244 incl. var. *shortii* (Durand) Gleason
245 incl. var. *serrulata* (Rydb.) Steyerl., var. *squarrosa*
246 incl. var. *americana* (A. Gray) Fernald & I.M. Johnst.
247 incl. *H. tetraptera* Ellis
248 incl. var. *parviflora* Nutt.
249 incl. var. *stenophyllus* Torr. & A. Gray
250 incl. var. *helianthoides*, var. *occidentalis* (T. R. Fisher) Steyerl.
251 sometimes treated as variety of single species *H. nobilis* var. *acuta* (Pursh) Steyerl.
252 sometimes treated as variety of single species *H. nobilis* var. *obtusa* (Pursh) Steyerl.
253 incl. var. *americana*, var. *hirsuticaulis* (Wheel.) Ros., Butt., Lak., var. *hispida* (Pursh) E. Wells
254 incl. var. *rugelii* (Shuttlew.) Rosend., Butters & Lakela
255 incl. *H. militaris* Cav.

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 256 incl. *H. palustris* L.
- 257 incl. *Hieraceum florentinum* All.
- 258 Coperrider et al. (2001) incl. "some Ohio specimens previously identified as *H. trailii* Greene or *H. greenei* A. Gray" in *H. venosum*
- 259 questions regarding nativeness in Ohio. Known collections are from sandy seawall on the Maumee River ca1979 and from Williams Co. on "sandy ground" ca1930s.
- 260 native varieties incl. var. *pubescens* E. Small, var. *lupuloides* E. Small; nonnative variety *H. lupulus* var. *lupulus* is sparingly collected
- 261 incl. var. *oblonga* Torr. & A. Gray
- 262 incl. var. *acutiflorum* (Elliott) S.F. Blake
- 263 incl. var. *multicaule* (Michx. ex Willd.) Fosberg
- 264 incl. *H. spathulatum* (Spach) Steud.
- 265 treated by some authors a part of *H. ascyron* L.
- 266 incl. var. *padifolia* (Willd.) Torr. & A. Gray ex S. Watson, var. *tenuifolia* (Torr.) S. Watson
- 267 FNA erroneously does not list for Ohio
- 268 incl. var. *smalliana* Fernald ex M.E. Edwards
- 269 confusing nomenclature with frequent name shifts; this treatment follows Gleason and Cronquist (1991) and includes all named varieties and subspecies of *J. alpinus*; *J. balticus* (Willd.) Trautvetter until further research clarifies this situation
- 270 ours var. *balticus* (Willd.) Trautvetter
- 271 *J. brachycephalus*, *J. canadensis*, *J. subcaudatus* have been treated as distinct spp., varieties of *J. canadensis*, or two polymorphic spp. (*J. canadensis*, *J. brachycephalus*)
- 272 *J. brachycephalus*, *J. canadensis*, *J. subcaudatus* have been treated as distinct spp., varieties of *J. canadensis*, or two polymorphic spp. (*J. canadensis*, *J. brachycephalus*)
- 273 incl. var. *decipiens* Buchenau, var. *pylaei* (Laharpe) Fernald, var. *solutus* Fernald & Wiegand
- 274 erroneously treated by some authors as part of *J. tenuis* var. *tenuis* Willd.
- 275 FNA merges *J. marginatus* Rostk. and *J. biflorus* Elliott into single variable *J. marginatus* complex
- 276 *J. brachycephalus*, *J. canadensis*, *J. subcaudatus* have been treated as distinct spp., varieties of *J. canadensis*, or two polymorphic spp. (*J. canadensis*, *J. brachycephalus*)
- 277 incl. var. *williamsii* Fernald
- 278 var. *depressa* Pursh (subsp. *depressa* (Pursh) Franco)
- 279 incl. var. *crebra* Fernald & Griscom
- 280 incl. var. *culta* Farw.
- 281 incl. var. *corymbulosa* Torr. & A. Gray
- 282 incl. var. *canadensis*, var. *latifolia* Kuntze, var. *longifolia* (Michx.) Farw., var. *ovata* Wieg.
- 283 incl. var. *floridana*, var. *villosa* (Jacq.) Cronq.

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 284 incl. var. *integrata* Gren. & Godr., var. *serriola*
- 285 some authors incl. *L. japonicus* Willd. in *L. maritimus*
- 286 some authors treat as part of *L. thymifolia* Michx.
- 287 some authors treat as part of *L. villosa* Elliott
- 288 for purposes of the Ohio FQAI a *L. minor* sensu lato is defined to incl. *L. turionifera* Landolt, *L. obscura* (Austin) Dobbs, *L. minuta* HBK., and *Lemna perpusilla* Torr. given the equivalent habitat preferences of these species and the difficulty in identifying them in the field and lab. This is contrary to the recent treatment in FNA and is a pragmatic not a
289 some authors incl. in *L. minor* (Cooperrider et al. 2001)
- 290 Cooperrider et al. (2001) treat as native to Ohio
- 291 incl. var. *fascicularis*, var. *acuminata* (Nash) Gleason
- 292 incl. var. *aspera*, var. *intermedia* (Lunell) Gaiser
- 293 treated as native by some authors
- 294 incl. var. *nieuwlandii* (Lunell) E.G. Voss
- 295 incl. var. *andinum* (Nutt.) Ker Gawl.
- 296 incl. var. *benzoin*, var. *pubescens* (E.J. Palmer & Steyermark.) Rehder
- 297 incl. var. *americana* (J. Forbes) Rehder
- 298 incl. var. *texanum* (Planch.) Fernald
- 299 also known as *Hemicarpha micrantha* var. *drummondii* (Nees) Freidl. or *H. micrantha* var. *aristulata* Coville
- 300 also known as *Hemicarpha micrantha* var. *micrantha* (Vahl) G.C. Tucker
- 301 incl. var. *croceum* (Fernald) Cronquist
- 302 incl. var. *simulans* Fernald
- 303 incl. var. *leptostachya* (A. DC.) Mack. & Bush, var. *spicata*
- 304 incl. var. *dasygyna* (Rehder) Gleason, var. *glaucescens* (Rydb.) Butters
- 305 incl. var. *flavescens* Gleason (incl. *L. flavidia* Cockerell)
- 306 incl. *L. villosa* var. *tonsa* Fernald, *L. caerulea* var. *villosa* (Michx.) Torr. & A. Gray
- 307 incl. var. *glabrescens* (Kuntze) Shinners
- 308 incl. var. *acuminata*, var. *caroliniae* S. Watson
- 309 incl. var. *mesochorea* F.J. Herm.
- 310 ours subsp. *multiflora*
- 311 incl. *L. chinense* Mill., *L. halimifolium* Mill.

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 312 new to flora of Ohio
- 313 incl. var. *interius* Fernald
- 314 incl. var. *agrestis* (Knafl) Wilmott
- 315 incl. var. *pensylvanica* (Willd.) C.V. Morton
- 316 incl. subsp. *sativa* L., subsp. *falcata* (L.) Arcang.
- 317 incl. var. *americanum* (Michx.) Beauverd, var. *latifolium* Barton
- 318 incl. var. *canadensis* (L.) Kuntze, incl. var. *glabratra* (Benth.) Fernald and *M. gentilis* L.
- 319 hybrid of *M. aquatica* L. x *M. spicata* L.
- 320 some authors treat as nonnative but within range of species. Collection from Hamilton Co.
- 321 incl. var. *villicaulis* (Pennell) E.J. Palmer & Steyermark
- 322 incl. *M. versicolor* (Pers.) Sims
- 323 some authors incl. in *M. stricta* Link ex Roem. & Schult.
- 324 Cooperider et al. (2001) treat as native to Ohio
- 325 incl. *M. exalbescens* Fernald, *M. spicatum* var. *squamosum* (Laest) Hartm.
- 326 ours subsp. *guadalupensis*
- 327 nonnative or adventive populations are found in disturbed or artificial habitats. Collections in alkaline habitats at Resthaven Wildlife Area.
- 328 definite questions regarding nativeness of this species to Ohio flora. See Wentz and Stuckey (1971), Stuckey (1985). Some authors treat as nonnative to Ohio but at least one recent collection at an undisturbed alkaline kettle lake in Williams Co.
- 329 incl. subsp. *tuberosa* (Paine) Wiersema & Hellq.; *N. tuberosa* Paine
- 330 incl. var. *biennis*, var. *canescens* Torr. & A. Gray, var. *nutans* (G.F. Atk. & Bartlett) Wieg.; does not incl. *O. oakesiana* (A. Gray) J.W. Robbins, *O. parviflora* L.
- 331 does not incl. *O. tetragona* Roth (*O. fruticosa* var. *ambigua* Nutt.)
- 332 some authors treat variety of *O. biennis* L. or *O. parviflora* L.
- 333 incl. var. *parviflora* (*O. biennis* var. *p.* (L.) Torr. & A. Gray; does not include *O. oakesiana* (A. Gray) J.W. Robbins
- 334 much like *O. fruticosa* L. and not always sharply distinct from it
- 335 incl. var. *hispidissimum* (Mack.) Cronquist
- 336 incl. var. *spectabilis* (Willd.) A. Gray
- 337 incl. *Oxalis montana* Raf.
- 338 incl. subsp. *capillare* (*P. capillare* var. *occidentale* Rydb.)
- 339 incl. *P. tuckermanii* Fernald

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 340 some authors treat as part of *P. inserta* (A. Kern.) Fritsch
- 341 incl. var. *glabrum* Vasey ex Scribn.
- 342 incl. *P. ciliatifolium* (Michx.) Vasey
- 343 incl. var. *glabriflora* Fernald
- 344 incl. *P. alluviorum* Pennell
- 345 does not incl. *P. calycosus* Small (*P. laevigatus* subsp. *calycosus* (Small) R.W. Benn.
- 346 may not be native in Ohio
- 347 incl. var. *crispa* (Benth.) W. Deame
- 348 ours var. *triflora* (Michx.) Reveal & C. R. Broome
- 349 incl. var. *purpurea* Michx.
- 350 very frequently found as an escaped garden cultivar and is often planted in cemeteries
- 351 some native populations present but more often is found as an escaped cultivar
- 352 recent genetic work (Saltonstall 2002) suggests that nonnative genotypes are the invasive genotype expanding in Ohio and native genotypes are declining. See Blossey (2003) for morphological differences between native and nonnative stands.
- 353 native variety is var. *subglabrata* (Mack. & Bush) Cronquist; does not incl. nonnative variety var. *longifolia*
- 354 incl. var. *grisea* Waterf. (*P. pruinosa* L.), var. *integrifolia* (Dunal) Waterf., var. *pubescens*
- 355 incl. var. *intermedius* (Rydb.) B. L. Rob
- 356 incl. var. *arenaria* Shimek, var. *virginiana*
- 357 Native populations present in Ohio, but often planted or escaped from cultivation
- 358 Relatively small number of native populations but more is often planted or escaped from cultivation
- 359 incl. var. *herbiola* (R. Br. ex W.T. Aiton) Luer
- 360 treated by some authors as part of *P. satuensis* Fernald & Weigand
- 361 incl. var. *reptans*, var. *villosum* E.L. Braun
- 362 incl. var. *aquilonia* Fernald & B.G. Schub.
- 363 incl. var. *latifolia* Torr. & A. Gray
- 364 incl. var. *ambigua* (Nutt.) A. W. Wood (*P. ambigua* Nutt.), var. *verticillata* (incl. var. *isocycla* Fernald, var. *sphenostachya* Penn.)
- 365 inc. var. *emersum* Michx. (formerly *P. coccineum*, var. *stipulaceum* N. Coleman (formerly *P. amphibium* L.))
- 366 incl. var. *pubescens* (Keller) Fernald
- 367 incl. var. *longisetum* (Bruyn) Steward

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 368 treated by some authors as native to Europe and naturalized in North American wetlands
- 369 does not incl. *P. setaceum* Baldwin (*P. hydropiperoides* var. *setaceum* (Baldwin) Gleason)
- 370 some populations may be introduced
- 371 incl. var. *eglandulosum* Myers, var. *pensylvanicum* L.
- 372 does not incl. *P. robustius* (Small) Fernald (*P. punctatum* var. *robustius* Small)
- 373 incl. var. *scandens*, var. *cristatum* (Engelm. & A. Gray) Gleason; nonnative var. *dumetorum* (L.) Gleason could be found in Ohio
- 374 treat by some authors as variety of *C. hydropiperoides* Michx.
- 375 incl. var. *michaixiana* Weath.
- 376 incl. var. *subcordata* Hyl.
- 377 incl. var. *deltaoides* (A. Henry) A. Henry, var. *occidentalis* Rydb.
- 378 some authors treat plants of this variety as cultivar "Italica"
- 379 incl. var. *nuttallii* (Cham. & Schleidl.) Fernald, var. *ramosus* (Peck) House
- 380 incl. var. *macellus* Fernald
- 381 incl. var. *foliosus*
- 382 incl. var. *maximus* Morong, var. *myriophyllus* J. W. Robbins
- 383 incl. var. *bupleuroides* (Fernald) Farw.
- 384 incl. subsp. *pusillus*, subsp. *tenuissimus* (Mertens & W.D.J. Koch) R.R. Haynes, *P. berchtoldii* Fieber
- 385 some authors treat as *P. inclinata* Vill.
- 386 incl. var. *lanceolata* (W. Bartram) Fernald
- 387 incl. var. *pumila* L. and var. *cuneata* (Raf.) L. H. Bailey (also knowns as *P. susquehanae* Willd. or *P. pumila* var. *susquehanae* (Willd.) H. Jaeger)
- 388 incl. var. *latiusculum* (Desv.) Underw. (Eastern Bracken) and var. *pseudocaudatum* (Clute) A. Heller (Tailed Bracken)
- 389 incl. var. *viridifolium* Fernald
- 390 perhaps better treated as *Orthilia secunda* (L.) House according to Gleason & Cronquist (1991)
- 391 incl. var. *dasyalyx* Rehder, var. *lancifolia* (Rehder) C. F. Reed, and *Malus glaucescens* Rehd.
- 392 incl. *Quercus ellipsoidalis* E. J. Hill
- 393 incl. *Q. montana* Willd.
- 394 incl. var. *ambigua* (A. Gray) Fernald, var. *borealis* (F. Michx.) Farw., *Q. borealis* var. *borealis* F. Michx., *Q. borealis* var. *maxima* (Marshall) Ashe
- 395 incl. vars. *caricetorum* (Greene) T. Duncan, var. *hispidus*, var. *nitidus* (Chapm.) T. Duncan
- 396 incl. var. *pleniflorus* Fernald

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 397 incl. var. *mollis* Fernald
- 398 incl. var. *glabrata* Gleason
- 399 incl. var. *latifolia* Engl.; also spelled *Rhus copallina*
- 400 Ohio material of *R. globularis* (Chapm.) Small is var. *recognita* Gale or *R. recognita* (Gale) Kral (Novon 9:205-219 (1999)); although FNA does not list *R. recognita* for Ohio and does map *R. globularis* var. *globularis* for Ohio this appears to be in error
- 401 incl. var. *glabrum* Fernald
- 402 incl. var. *hirtellum*, var. *calcicola* (Fernald) Fernald
- 403 incl. var. *fernaldiana* (Butters & Abbe) Stuckey, var. *hispida* (Desv.) Rydb.
- 404 does not incl. *R. micrantha* J.E. Smith
- 405 incl. by some authors in *R. eglanteria* L.
- 406 incl. var. *tomentosa* Torr. & A. Gray
- 407 some Ohio material has been identified as *R. orarius* Blanch and this species included here in *R. allegheniensis* Porter until future study clarifies problem
- 408 some Ohio material has been identified as *R. enslenii* Tratt. and this species included here
- 409 incl. var. *hispidus*, var. *obovalis* (Michx.) Fernald
- 410 some Ohio material has been identified as *R. argutus* Link. and *R. canadensis* L. and these spp. included here in *R. pensylvanicus* until future study clarifies this problem; also incl. here are *R. bushii* L.H. Bailey, *R. frondosus* Bigelow, *R. recurvans* Blanch.
- 411 incl. var. *fulgida*, var. *sullivantii* (Boynton & Beadle) Cronq., var. *umbrosa* (Boynton & Beadle) Cronq.
- 412 incl. var. *pulcherrima* Farw.
- 413 incl. native var. *laciniata*; does not incl. nonnative var. *hortensa* L.H. Bailey if found
- 414 incl. var. *calvescens* Fernald
- 415 incl. var. *fueginus* (Phil.) Dusen
- 416 some authors treat as nonnative to N.A. but FNA treats N.A. and Eurasian material as conspecific with worldwide distribution
- 417 ours subsp. *graminea*; does not incl. *S. platyphylla* (Engelm.) J.G. Sm.
- 418 incl. var. *obtusa* (Engelm. Wieg., var. *pubescens* (Muhl.) J.G. Sm.
- 419 incl. var. *alba* L., var. *calva* G. Mey, var. *vitellina* (L.) Stokes
- 420 incl. var. *latifolia* Andersson
- 421 incl. var. *angustata* (Pursh) Fernald
- 422 incl. all varieties and forms
- 423 does not incl. *Salix occidentalis* Walter (*S. humilis* var. *tristis* (Aiton) Griggs (*S. tristis* Aiton))

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 424 incl. *Salix glaucophylloides* Fernald
- 425 incl. var. *hypoglaaca* Fernald
- 426 incl. *S. subsericea* (Andersson) C.K. Schneid.
- 427 treated by some authors as *S. kali* var. *tenuifolia* Tausch
- 428 incl. var. *rotundifolia* (Greene) Fedde
- 429 incl. var. *grandis* Fernald
- 430 incl. var. *molle* (Raf.) Fernald
- 431 incl. var. *americana* Fernald
- 432 also spelled *S. scoparium* var. *littoralis*
- 433 ours var. *acutus*
- 434 recently added to flora of Ohio from Cedar Point Wildlife area
- 435 Cooperrider et al. (2001) incl. here Ohio material previously identified as *Scirpus americanus* Pers.
- 436 incl. var. *purshianus* and var. *williamsii* (Fernald) S.G. Smith; FNA erroneously does not map for Ohio
- 437 incl. var. *smithii*, var. *setosus* (Fernald) S.G. Smith; some authors treat this as part of *Schoenoplectus purshianus* (Fernald) M.T. Strong
- 438 incl. var. *creber* (Fernald) A. Love & D. Love, var. *validus*
- 439 incl. var. *pelius* Fernald, *S. rubricosus*
- 440 elevated to specific rank by FNA, some authors incl. in *S. atrovirens* Willd.
- 441 elevated to specific rank by FNA, some authors incl. in *S. cyperinus* (L.) Kunth; *S. atrocinctus* Fernald also has been split from *S. cyperinus* and could be found in Ohio
- 442 *Scirpus lineatus* Michx. erroneously applied to *S. pendulus*
- 443 incl. var. *pauciflora*, var. *caroliniana* (Willd.) A.W. Wood
- 444 incl. var. *elliptica*, var. *hirsuta* (Short & R. Peter) Fernald
- 445 incl. var. *calvifolia* Fernald, var. *nervosa*
- 446 var. *versicolor* (Nutt.) Fernald
- 447 incl. var. *leonardii* (Epling) Fernald (*S. leonardii* Epling), var. *parvula*
- 448 A few authors treat as native to Ohio. Cooperrider et al. (2001) treat as nonnative.
- 449 incl. *S. pratensis* (Raf.) Godr. & Gren.
- 450 incl. *S. cucubalis* Wibel and *S. latifolia* (Mill.) Britten & Rendle, not incl. *S. latifolia* Poir.
- 451 incl. var. *lucy-brauniae* Steyermark., var. *terebinthinaceum*; a cut-leaved form is also sometimes sometimes called var. *pinnatifidifidum*
- 452 incl. var. *crebrum* Fernald; FNA erroneously does not list for Ohio

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 453 incl. var. *leurophylla* S.F. Blake
- 454 FNA elevates to specific rank
- 455 FNA elevates to specific rank
- 456 incl. var. *villosum* Desv.
- 457 incl. *S. americanum* Mill., *S. ptychanthum* Dunal
- 458 some authors treat as part of *S. cornutum* Lam.
- 459 incl. var. *canadensis*, var. *rupestris* (Raf.) Porter, var. *scabra* Torr. & A. Gray (*S. altissima* L.)
- 460 incl. var. *leiophylla* Fernald
- 461 incl. var. *patula*
- 462 incl. var. *rigida*, var. *glabrata* E. L. Braun (*S. jacksonii* (Kuntze) Fernald)
- 463 incl. var. *aspera* (Aiton) Fernald, var. *rugosa*
- 464 incl. var. *speciosa*, var. *rigidiuscula* Torr. & A. Gray; does not incl. *S. erecta* Pursh (*S. speciosa* var. *erecta* (Pursh) MacMill.
- 465 incl. *S. purshii* Porter
- 466 incl. var. *arvensis*, var. *glabrescens* Gunther, Grab. and Wimm. (*S. uliginosus* M. Bieb.)
- 467 incl. *S. vulgare* Pers.
- 468 Ohio material is similar to less robust specimens of *S. emersum* and has long been referred to as *S. chlorocarpum* Rydb. which FNA recognizes as a form until definitive range wide studies performed
- 469 incl. var. *rosea* (Raf.) Fernald
- 470 incl. var. *gracilis* (Bigelow) Luer
- 471 incl. var. *erostellata* Catling
- 472 FNA erroneously does not list for Ohio
- 473 treated by some authors as a variety of *S. vaginiflorus* (Torr.) A.W. Wood (var. *ozarkansus* (Fernald) Shinners)
- 474 does not incl. *S. ozarkanus* Fernald
- 475 incl. all varieties except var. *hispida* (Pursh) Boivin (*S. hispida* Pursh)
- 476 incl. var. *pubera*, Michx., var. *sylvatica* (Beg.) Weath. (*S. corei* Shinners)
- 477 incl. var. *lanceolatus*, var. *roseus* (Michx.) Reveal
- 478 Cooperrider et al. (2001) treat as native to Ohio. The USDA Plant database treat as native and place Ohio within the species natural range. However, there are only 2 ca1930s records from Richland Co. at the OSU Herbarium that may not be correctly identified
- 479 ours subsp. *alpina* (Blytt) R.R. Haynes, Les, M. Kral

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 480 incl. *S. riparia* Kearney
- 481 note: doubtful (probably mis-labeled) collection of *S. americanus* Lam. from one Ohio county
- 482 disagreement exists as to correct citation; some authors attribute to (L.) Nuttall
- 483 incl. var. *canadense* (L.) Eaton, var. *occidentale* (A. Gray) E. M. McClint & Epling
- 484 incl. *T. polygamum* Muhl. ex Spreng.
- 485 incl. var. *angustifolium* J. M. Coulter & Rose
- 486 incl. var. *flavum* S. F. Blake, var. *trifoliatum*
- 487 incl. var. *pubescens* (G. Lawson) Fernald
- 488 incl. *T. neglecta* Spach
- 489 some authors treat as variety of *T. radicans* (L.) Kuntze
- 490 incl. var. *tubulosum* (Walter) Gleason; does not incl. var. *walteri* (J.G. Gmel) Cooperr (*T. walteri* (J.G. Gmel) Gleason)
- 491 incl. var. *virginicum* (L.) Raf.; does not incl. var. *fraseri* (Spach) Cooperr. (*T. fraseri* (Spach) Gleason)
- 492 some authors treat as part of *T. agrarium* L.
- 493 some authors treat as part of *T. procumbens* L.
- 494 incl. var. *glabrum* Lojac
- 495 *T. maritimum* is a long perpetuated mis-spelling
- 496 also known as *T. palustris*; differences in ending depending on arguments over etymology of generic name
- 497 incl. var. *schaffneri* Camp
- 498 some authors suggest this species is introduced from Eurasia on Atlantica coast and spread westward but FNA treats as *T. angustifolia* as a native taxa that has become aggressive and weedy with human disturbance
- 499 hybrid of *Typha angustifolia* x *Typha latifolia*
- 500 inc. var. *gracilis* (Aiton) C.L. Hitchc.
- 501 incl. *U. macrorhiza* Leconte
- 502 incl. *V. brittonii* Porter, *V. lamarckii* Camp
- 503 incl. *V. atrococcum* (A. Gray) A. Heller, *V. simulatum* Small
- 504 incl. *V. altomontanum* Ashe, *V. vacillans* Kalm
- 505 incl. *V. melancarpum* var. *neglecta* (Small) Deam, *V. caesium* Greene
- 506 incl. *V. austriaca* L., *V. teucrium* L.
- 507 does not incl. nonnative var. *xalapensis* (Kunth) H. St. John & F.A. Warren

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 508 incl. var. *glabrescens* Rehder
- 509 incl. *V. lantanoides* Michx.
- 510 incl. all varieties except *V. dentatum* var. *lucidum* Aiton (*V. recognitum* Fernald)
- 511 incl. var. *affine* (Bush) House, var. *rafinesquianum*
- 512 does not incl. *V. sativa* var. *nigra* L. (*V. angustifolia* L.)
- 513 incl. var. *palustriformis* A. Gray, *A. incognita* Brainerd
- 514 treated by some authors as part of *V. obliqua* Hill
- 515 incl. var. *pallens* (Banks ex DC.) C.L. Hitchc.
- 516 treated by some authors as part of *V. sororia* var. *soraria* Willd.
- 517 common phase in northeastern U.S. which passes into var. *pedatifida* (G. Don) Cronquist to west; incl. *V. triloba* Schwein (*V. palmata* var. *triloba* (Schwein) Ging.; does not incl. *V. palmata* L.)
- 518 western variety mainly of prairies; does not include *V. palmata* L.
- 519 incl. var. *pubescens* Aiton, var. *scabriuscula* Torr. & A. Gray
- 520 incl. by some authors in *V. bicolor* Pursh
- 521 incl. *V. fimbriatula* Sm. (*V. sagittata* var. *ovata* (Nutt.) Torr. & A. Gray)
- 522 incl. var. *soraria* and incl. *V. affinis* Leconte (a form with spurred petal bearded), *V. papilionacea* forma *beckwithiae* House, forma *priceana* (Pollard) Cooperr. (Confederate violet)
- 523 incl. var. *glaberrima* (DC.) R. M. Harper, var. *tripartita* Elliott
- 524 Ohio material referable to *V. hirsutula* although incl. in *V. villosa* by Gleason & Cronquist (1991) and treated as *V. hirsutula* Brainerd by Cooperrider et al. (2001)
- 525 incl. var. *aestivalis*, var. *bicolor* Deam (incl. var. *argentifolia* (Munson) Fernald)
- 526 incl. var. *baileyana* (Munson) Comeaux (*V. baileyana* Munson)
- 527 incl. *V. labruscana* L.H. Bailey
- 528 treated by some authors as part of *V. lineata* (L.) Sm.
- 529 incl. var. *glaucia* (Nutt.) Fernald
- 530 incl. *W. punctata* of FNA authors not *W. punctata* Griseb. (which is incl. in *W. brasiliensis* Weddell)
- 531 incl. *W. papulifera* C. Thompson and *W. punctata* Griseb.
- 532 incl. var. *canadense* (Mill.) Torr. & A. Gray, var. *glabratum* (DC.) Cronquist
- 533 incl. Ohio plants that have until recently been identified as *Xyris caroliniana* Walt.; ours var. *difformis*
- 534 incl. var. *glaucus* (Nutt.) Cronquist
- 535 recently added to flora of Ohio based on Clermont Co. collection in acidic Illinoian till plains flats wetland

APPENDIX D
FOOTNOTES
OHIO VASCULAR PLANT DATABASE

- 536 recently recognized by FNA (formerly incl. in *H. selago*) and confirmed from specimens collected in 1982 in Licking Co.
- 537 recently discovered in Jackson Co. in pin oak flats and nearby areas
- 538 incl. var. *fluitans* (Elliott) J. Wipff & S.D. Jones (*Paspalum fluitans* (Elliott) Kunth)
- 539 also spelled *S. alopecuroides* and *S. alopecuroides*
- 540 ours subsp. *calycina* (Engelm.) Bogin (*S. calycina* var. *calycina* Engelm.; *Lophotocarpus calycinus* (Engelm.) J.G. Sm.)
- 541 recently recognized species separated from *E. glabriflorus* (Vasey ex Dewey) Scribn. & Ball; distinguishable by very long awns and wide internodes between spikelets

<i>RIBES UVA-CRISPI</i>	L.	Grossulariaceae	GARDEN GOOSEBERRY
<i>ROSA GALICA</i>	L.	Rosaceae	FRENCH ROSE
<i>ROSA MAJALIS</i>	Herrm.	Rosaceae	CINNAMON ROSE
<i>ROSA NITIDA</i>	Willd.	Rosaceae	SHINING ROSE
<i>RUBUS DISCOLOR</i>	Weihe & Nees	Rosaceae	HIMALAYAN BLACKBERRY
<i>RUMEX CONGLOMERATUS</i>	Murray	Polygonaceae	CLUSTERED DOCK
<i>SALIX CINerea</i>	L.	Salicaceae	GRAY WILLOW
<i>SALVIA AZUREA</i>	Michx. ex Lam.	Lamiaceae	BLUE SAGE
<i>SALVIA COCCINEA</i>	Buc'hoz ex Etli.	Lamiaceae	CRIMSON SAGE
<i>SALVIA OFFICINALIS</i>	L.	Lamiaceae	GARDEN SAGE

APPENDIX E
OCCASIONAL ADVENTIVE VASCULAR PLANTS

SCIENTIFIC NAME	AUTHORITY	FAMILY	COMMON NAME
<i>SALVIA PRATENSIS</i>	L.	Lamiaceae	MEADOW SAGE
<i>SALVIA SPLENDENS</i>	Sellow ex Roem. & Schult.	Lamiaceae	SCARLET SAGE
<i>SALVIA X SUPERBA</i>	Stapf	Lamiaceae	SAGE
<i>SATUREJA HORTENSIS</i>	L.	Lamiaceae	SUMMER SAVORY
<i>SCABIOSA COLUMBARIA</i>	L.	Dipsacaceae	SCABIOUS
<i>SCANDIX PECTENS-VENERIS</i>	L.	Apiaceae	VENUS' COMB
<i>SCILLA NON-SCRIPTA</i>	(L.) Hoffmanns. & Link	Liliaceae	ENGLISH BLUEBELL
<i>SCHOENOPLECTUS SAXIMONTANUS</i>	(Fernald) J. Raynal	Cyperaceae	MOUNTAIN BULRUSH
<i>SEDUM SEXANGULARE</i>	L.	Crassulaceae	SIX-RANKED STONECROP
<i>SEDUM TELEPHIOIDES</i>	Michx.	Crassulaceae	AMERICAN ORPINE
<i>SENECIO SYLVATICUS</i>	L.	Asteraceae	WOODLAND GROUNDSEL
<i>SILENE CONICA</i>	L.	Caryophyllaceae	STRIATE CATCHFLY
<i>SOLANUM PHYSALIFOLIUM</i>	Rusby	Solanaceae	HAIRY NIGHTSHADE
<i>SOLANUM TRIFLORUM</i>	Nutt.	Solanaceae	CUT-LEAVED NIGHTSHADE
<i>SOLANUM TUBEROSUM</i>	L.	Solanaceae	POTATO
<i>SPIRAEA JAPONICA</i>	L. f.	Rosaceae	JAPANESE SPIRAEA
<i>SPOROBOLUS OZARKANUS</i>	Fern.	Poaceae	OZARK RUSH-GRASS
<i>STACHYS GERMANICA</i>	L.	Lamiaceae	DOWNY WOUNDWORT
<i>STELLARIA ALSINE</i>	Grimm	Caryophyllaceae	BOG STITCHWORT
<i>STELLARIA HOLOSTEA</i>	L.	Caryophyllaceae	EASTER-BELL
<i>STROPHOSTYLES LEIOSPERMA</i>	(T. & G.) Piper	Fabaceae	SMALL-FLOWERED WILD BEAN
<i>SUAEDA CALCEOLIFORMIS</i>	(Hook.) Moq.	Chenopodiaceae	PLAINS SEA-BLITE
<i>SYMPHORICARPOS OCCIDENTALIS</i>	Hook.	Caprifoliaceae	WOLFBERRY
<i>TAMARIX CHINENSIS</i>	Lour.	Tamaricaceae	CHINESE TAMARISK
<i>THLASPI ALLIACEUM</i>	L.	Brassicaceae	GARLIC PENNY-CRESS
<i>THYMELAEA PASSERINA</i>	(L.) Coss. & Germ.	Thymelaeaceae	THYMELAEA
<i>THYMUS SERPYLLUM</i>	L.	Lamiaceae	WILD THYME
<i>TRADESCANTIA BRACTEATA</i>	Small	Commelinaceae	LONG-BRACED SPIDERWORT

APPENDIX E
OCCASIONAL ADVENTIVE VASCULAR PLANTS

SCIENTIFIC NAME	AUTHORITY	FAMILY	COMMON NAME
<i>TRITICUM AESTIVUM</i>	L.	Poaceae	WHEAT
<i>TULIPA GESNERIANA</i>	L.	Liliaceae	TULIP
<i>VALERIANELLA RADIATA</i>	(L.) Dufr.	Valerianaceae	CORN-SALAD
<i>VERBASCUM PHLOMOIDES</i>	L.	Scrophulariaceae	CLASPING-LEAVED MULLEIN
<i>VERBASCUM VIRGATUM</i>	Stokes	Scrophulariaceae	TWIGGY MULLEIN
<i>VERBESINA VIRGINICA</i>	L.	Asteraceae	FROSTWEED
<i>VERONICA PEREGRINA L. var. XALAPENSIS</i>	(Kunth) H. St. John & F.A. Warren	Scrophulariaceae	HAIRY PURSLANE SPEEDWELL
<i>VICIA ANGUSTIFOLIA</i>	L.	Fabaceae	NARROW-LEAVED VETCH
<i>VICIA TETRASPERMA</i>	(L.) Schrebr.	Fabaceae	FOUR-SEEDED VETCH
<i>VINCA MAJOR</i>	L.	Apocynaceae	GREATER PERIWINKLE
<i>VITEX NEGUNDO</i>	L.	Verbenaceae	CUT-LEAVED CHASTE-TREE
<i>VULPIA BROMOIDES</i>	(L.) Gray	Poaceae	6-WEEKS BROME GRASS
<i>VULPIA MYUROS</i>	(L.) C.C. Gmel.	Poaceae	RAT-TAIL FESCUE
<i>WISTERIA FLORIBUNDA</i>	(Willd.) DC	Fabaceae	JAPANESE WISTERIA
<i>WISTERIA FRUTESCENS</i>	(L.) Poir.	Fabaceae	AMERICAN WISTERIA
<i>XANTHORHIZA SIMPLICISSIMA</i>	Marshall	Ranunculaceae	YELLOW-ROOT
<i>YUCCA FILAMENTOSA</i>	L.	Agavaceae	YUCCA
<i>ZEA MAYS</i>	L.	Poaceae	CORN
