

REFERENCE WETLANDS

Karen Newlon and Cat McIntyre
Montana Natural Heritage Program
Helena, MT

REFERENCE CONCEPT

- Indicators are evaluated against some expectation of condition
- Expectations act as a *reference* for comparison
- Reference represents a range of wetland conditions can be correlated with a known set of stressors
- Highest values within this range – *Reference Standard*
- Provides standard of comparison for describing the highest level of potential or expected wetland condition

REFERENCE *STANDARD* CONCEPT

- Minimally disturbed – condition in the absence of significant human disturbance
- Least disturbed condition – condition given the best available condition of the landscape
- Best attainable condition – equivalent to least disturbed condition if best management practices are implemented

REFERENCE *STANDARD* CONCEPT

- **Minimally disturbed – condition in the absence of significant human disturbance**
- Least disturbed condition – condition given the best available condition of the landscape
- Best attainable condition – equivalent to least disturbed condition if best management practices are implemented

REFERENCE *STANDARD* CONCEPT

- Defining reference standard provides context for interpreting wetland condition
- Expectations for reference standard are represented by a range of indicator scores
- This range of values represents the natural variability within a wetland system
- Once described, different indicators within that range can be used to classify wetland condition

WETLAND CONDITION

Reference
standard

Gradient of Ecological Condition

Severely
impacted

Minimal
disturbance

Gradient of human disturbance

Severe
disturbance

Reference Standard Wetland -an example from the Prairie Pothole Region

Impacted Wetland -an example from the Prairie Pothole Region

REFERENCE WETLAND NETWORKS

- Establish a baseline for defining characteristic levels of condition
- Represent a range of condition for monitoring and assessing trends
- Establish range and variability of wetland attributes
- Develop indices of ecological integrity

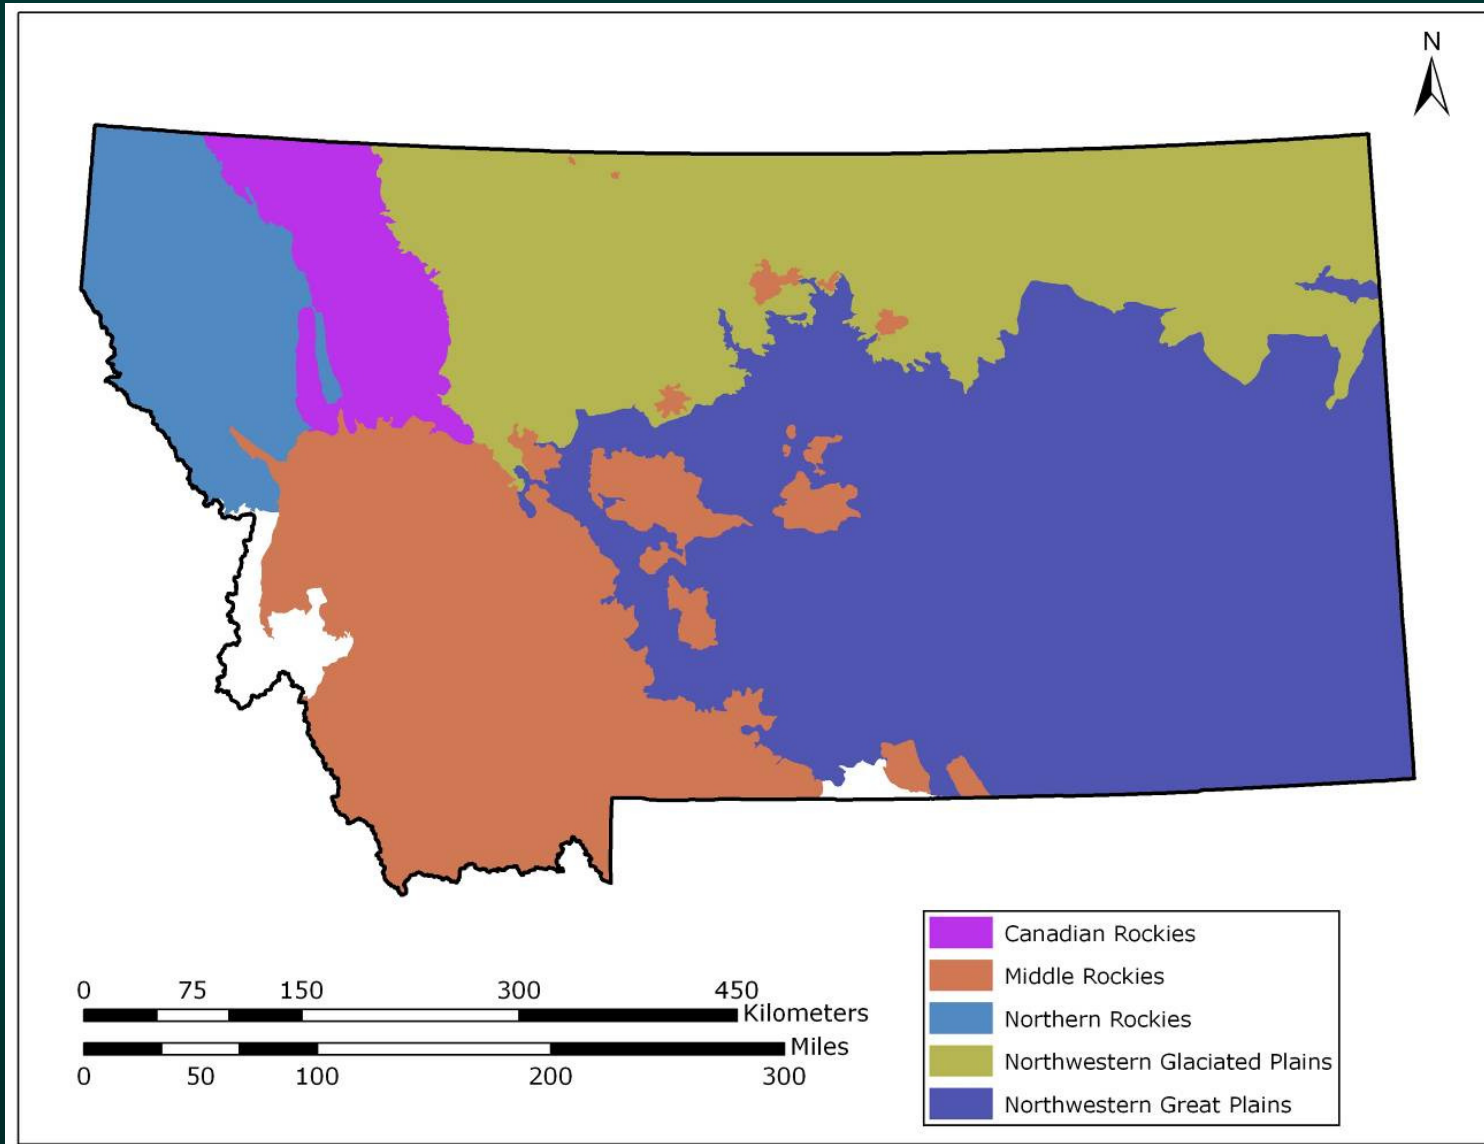

MONTANA'S REFERENCE WETLAND NETWORK

- Provide a collection of sites that represent a gradient of condition
- Provides examples of reference standard for multiple wetland systems
- Identifies the variability in wetland attributes
- Identifies human-induced disturbances impacting wetland condition

STUDY AREA

Northwestern Glaciated Plains Ecoregion

- Great Plains Prairie Pothole
- Western Great Plains Saline Depression
- Western Great Plains Closed Depression
- Western Great Plains Open Freshwater Depression

Northwestern Great Plains Ecoregion

- Western North American Emergent Marsh
- Western Great Plains Closed Depression
- Western Great Plains Open Freshwater Depression

Middle Rockies, Northern Rockies, & Canadian Rockies Ecoregions

- Western North American Emergent Marsh
- Rocky Mountain Subalpine-Montane Fen
- Rocky Mountain Alpine-Montane Wet Meadow

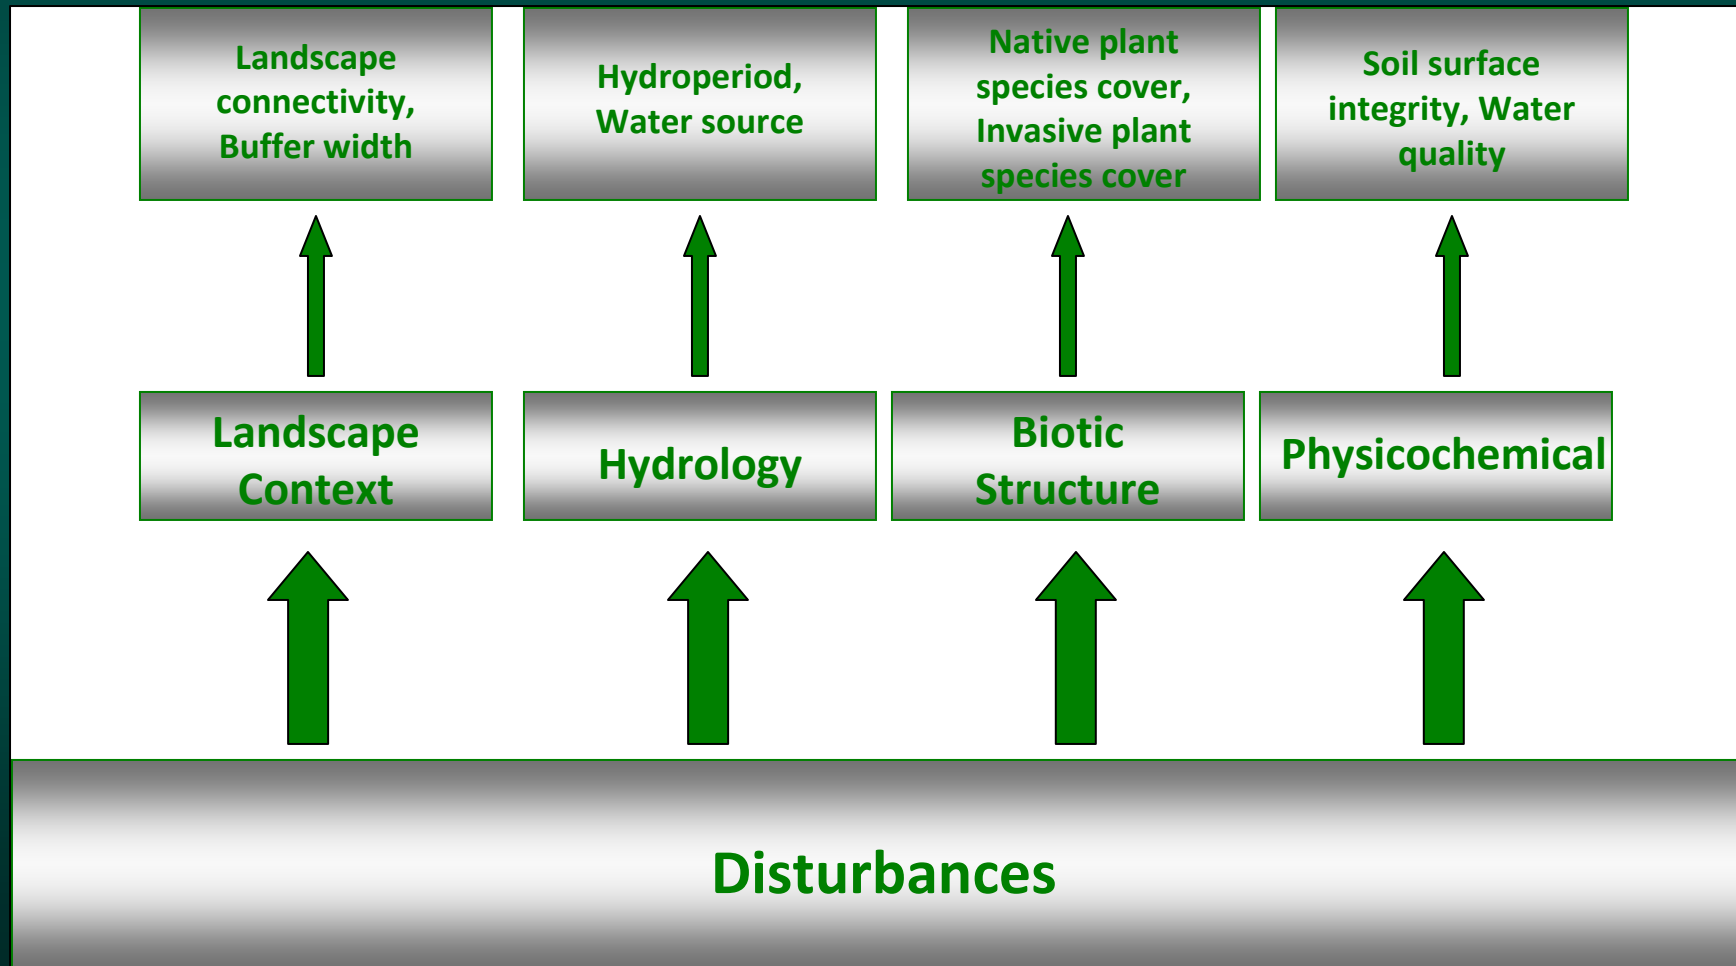

METHODS

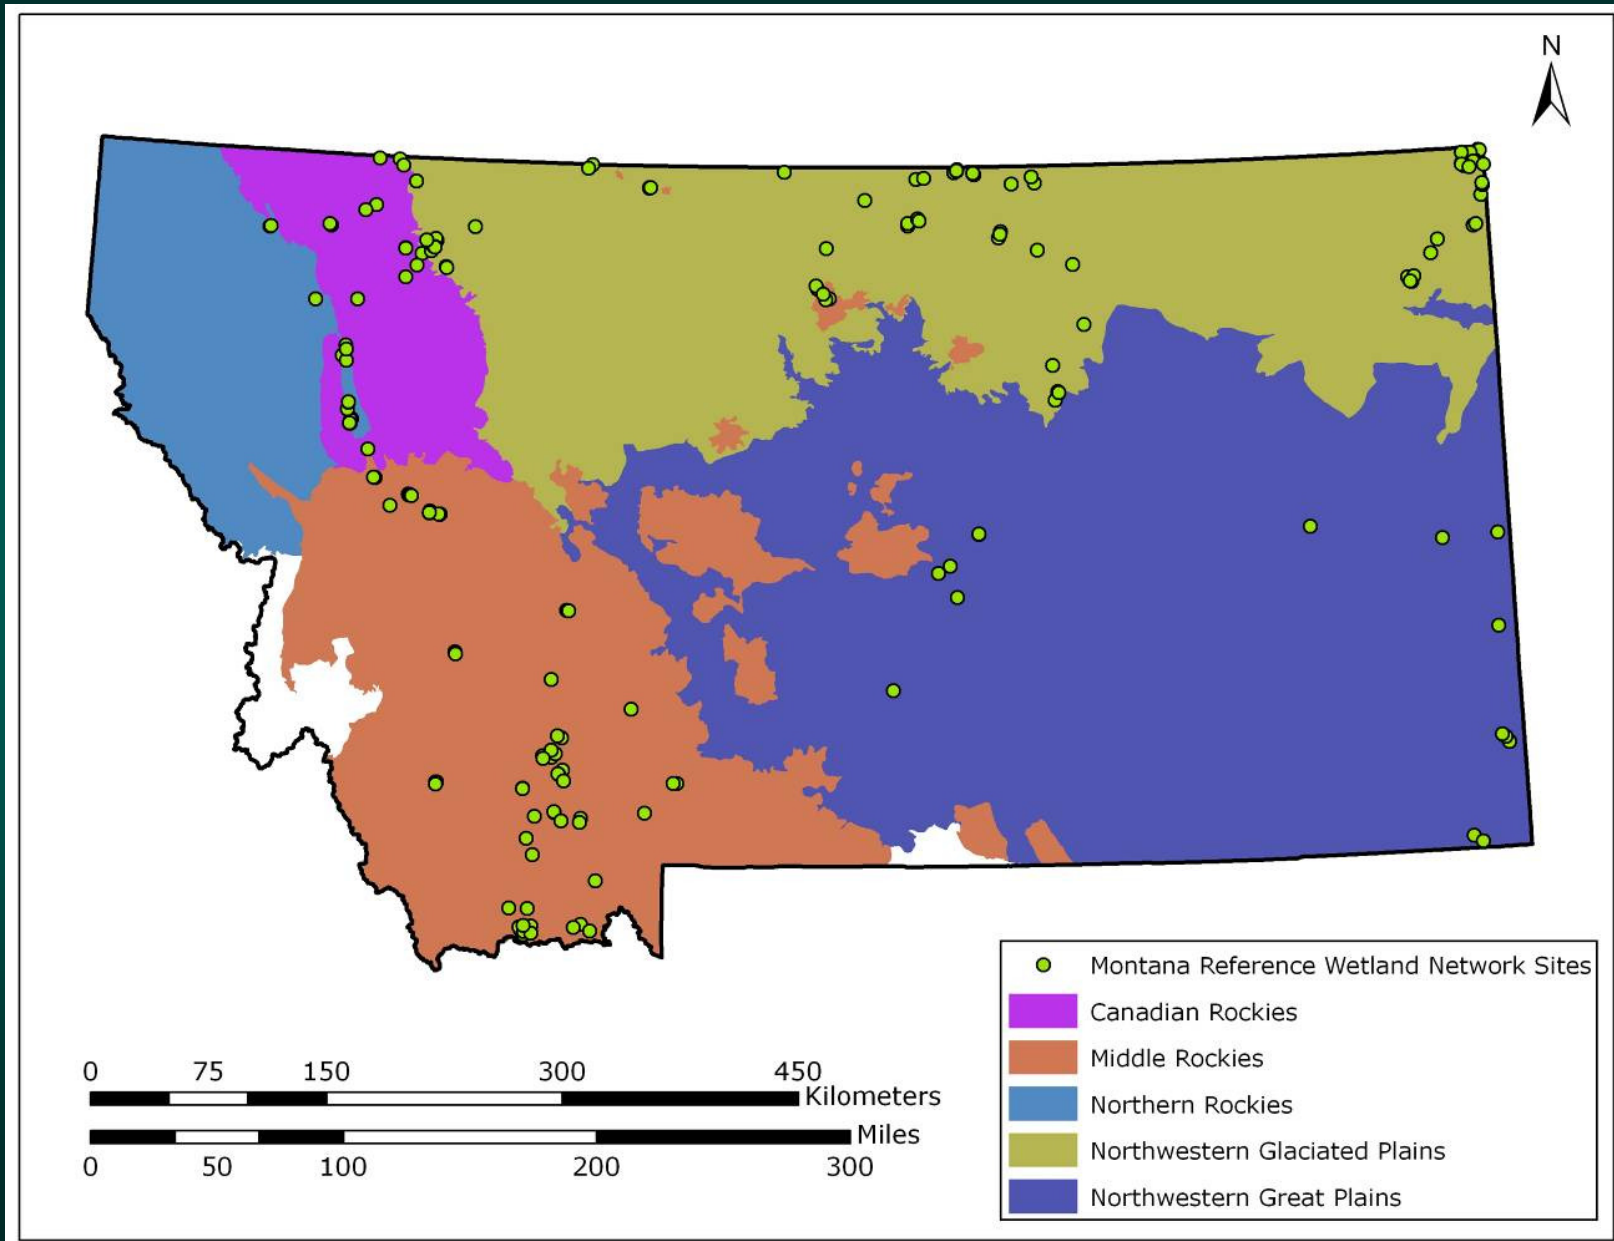

- Selected sites based on wetlands described in the literature and input from other ecologists
- Classified each wetland by:
 - ecological system
 - Cowardin system, class, and water regime
 - hydrogeomorphic features

METHODS

Level 2 - Rapid assessment

RESULTS

RESULTS

Wetland Condition Score Categories

- at or near expected reference standard (scores = 90-100)
- least impacted (scores = 80-89)
- moderately impacted (scores = 70-79)
- severely impacted (scores < 70)

Results – Great Plains Wetlands

Results – Montane Wetlands

RESULTS

Northwestern Glaciated Plains and Northwestern Great Plains Wetlands

Most Common Stressors

- livestock grazing
- roads
- buffer condition
- landscape connectivity
- altered hydrology

RESULTS

Middle Rockies, Canadian Rockies, and Northern Rockies Wetlands

Most Common Stressors

- livestock grazing
- altered hydrology
- roads

WETLAND REFERENCE NETWORK

Uses and Applications

- Allow for rapid comparison of wetland condition both within and across wetland systems
- Can diagnose potential causes of wetland degradation
- Provide examples of multiple wetland systems in varying levels of condition across Montana
- Highlights areas to focus and prioritize conservation, acquisition, and restoration efforts
- Characterize examples of reference standard
- Validate and calibrate our wetland assessment methods

WETLAND REFERENCE NETWORK

Future Work

- Continue adding to network
- Refine disturbance gradient
- Collect more Level 3 data
- Develop regional networks

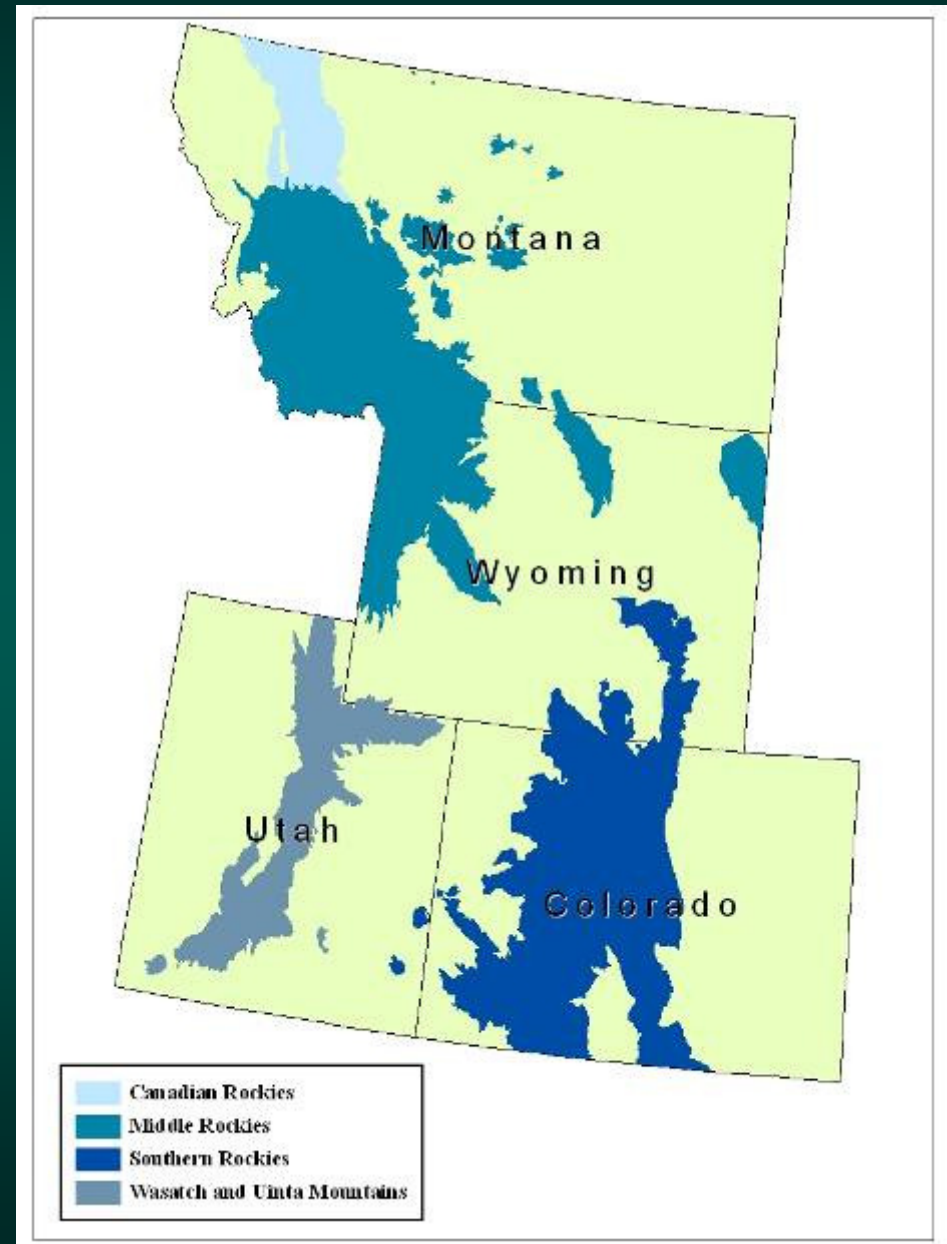

Rocky Mountain Regional Monitoring and Assessment Project (REMAP)

Project Partners:

- Montana
- Colorado
- Wyoming
- Funded through EPA ORD

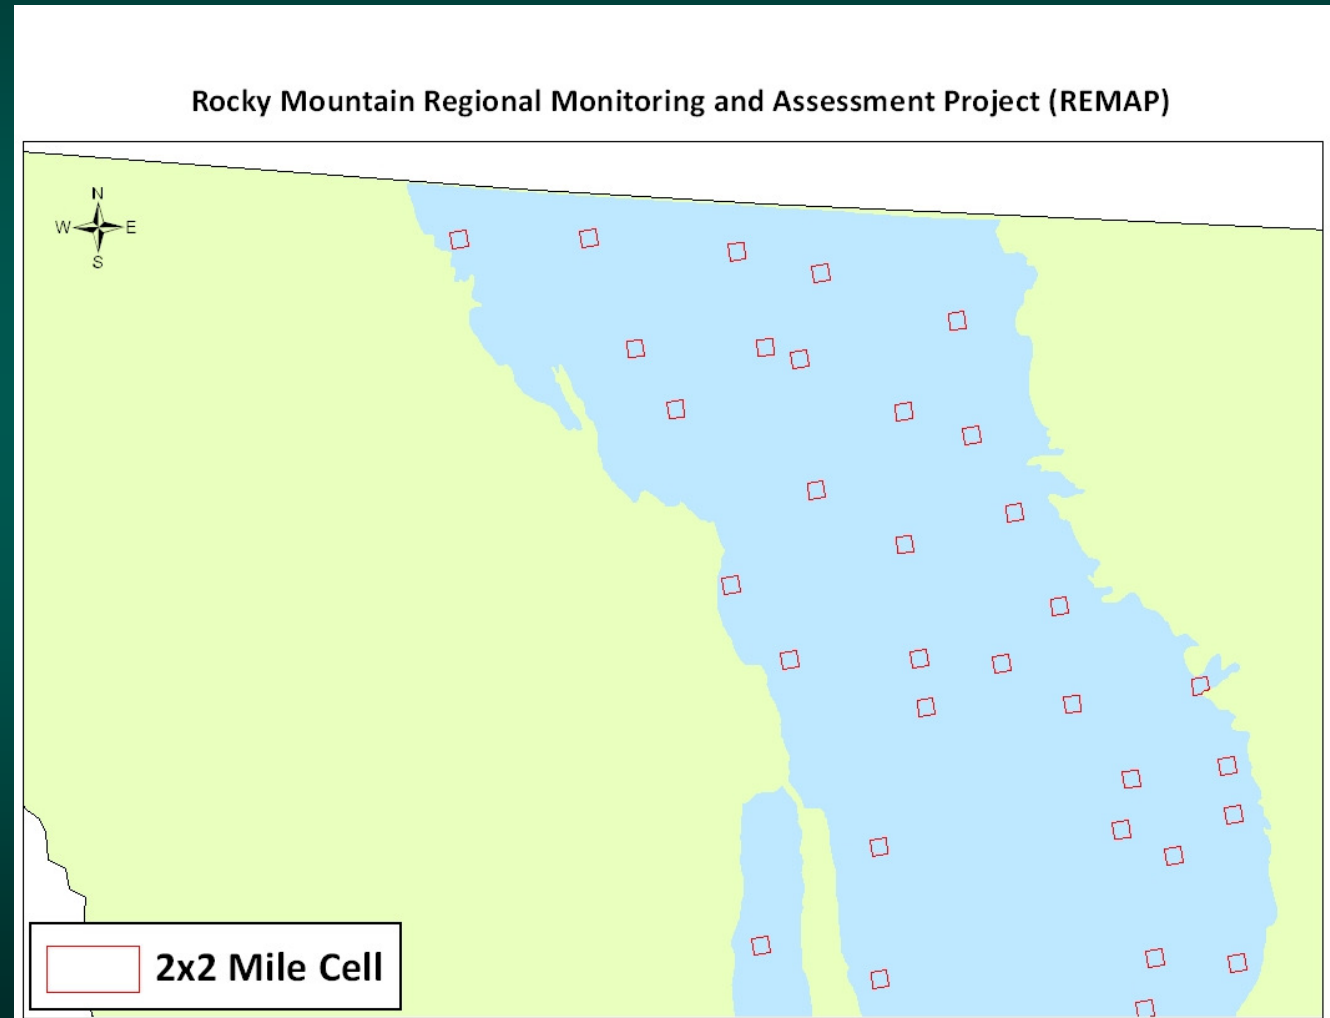

Project Objectives:

1. Develop a regional set of reference standard wetlands:
 - ~ wet meadows
 - ~ marshes
 - ~ fens
 - ~ riparian shrublands
2. Quantify the range of natural variability within reference standard wetlands
3. Develop a regionally standardized Level 1, 2, 3 protocol

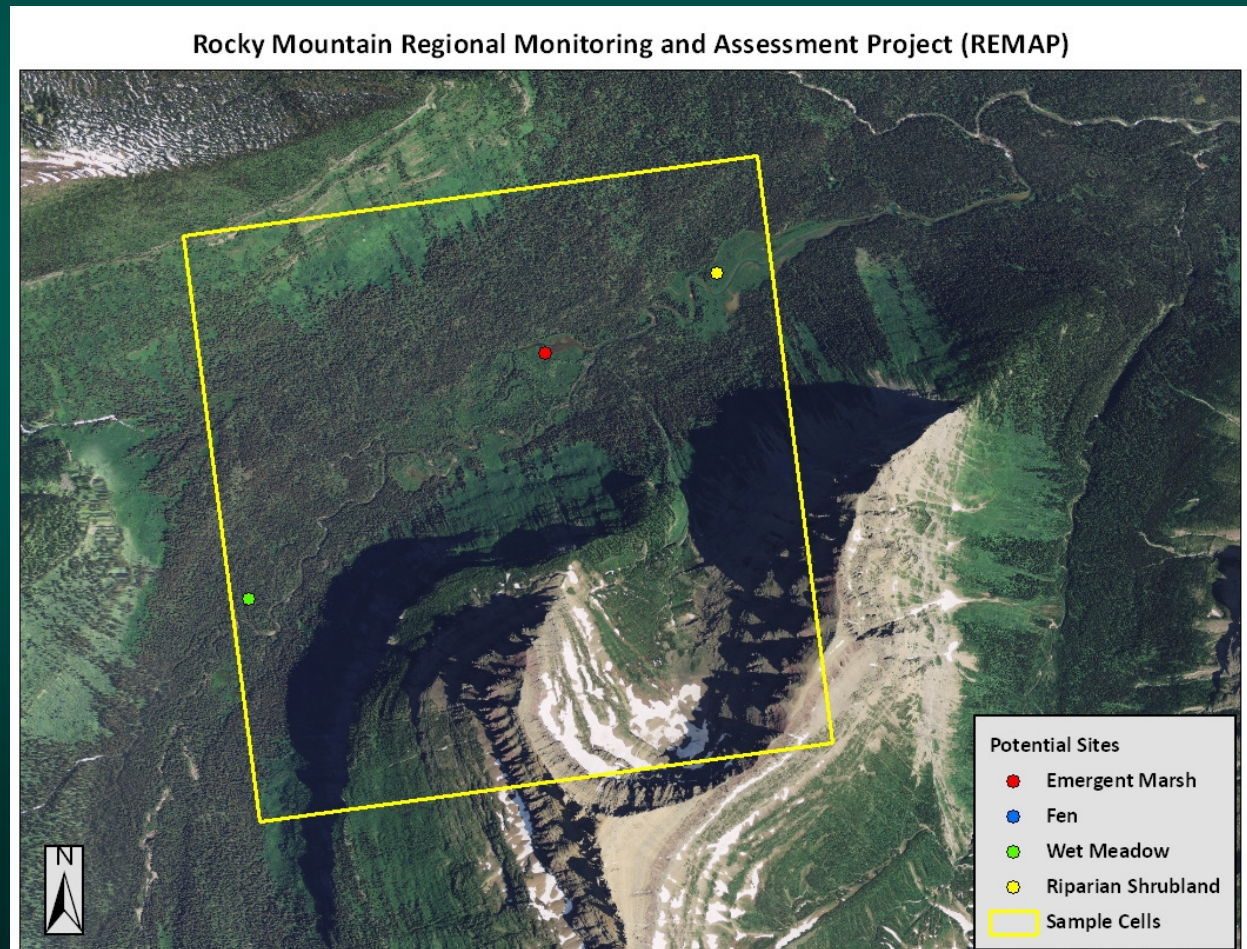

SITE SELECTION

- Selected 50 2x2 mile grid cells within each Level 3 Ecoregion
- Used a landscape integrity model to guide us towards high integrity areas
- Low integrity landscape excluded from the sample frame

Site Selection

- Within the high integrity landscape of each 2x2 m cell, laid down a grid of points 100 meters apart
- Points ordered by GRTS in a spatially balanced random sequence
- Identified all potential wetlands through photo-interpretation and NWI
- Selected the first ordered point from each wetland ecological system

Field Criteria for Minimally Disturbed Sites

Distance from Roads:

- >200 m 4x4, dirt road
- >300 m local, city road
- >500 m highways

Hydrologic modifications:

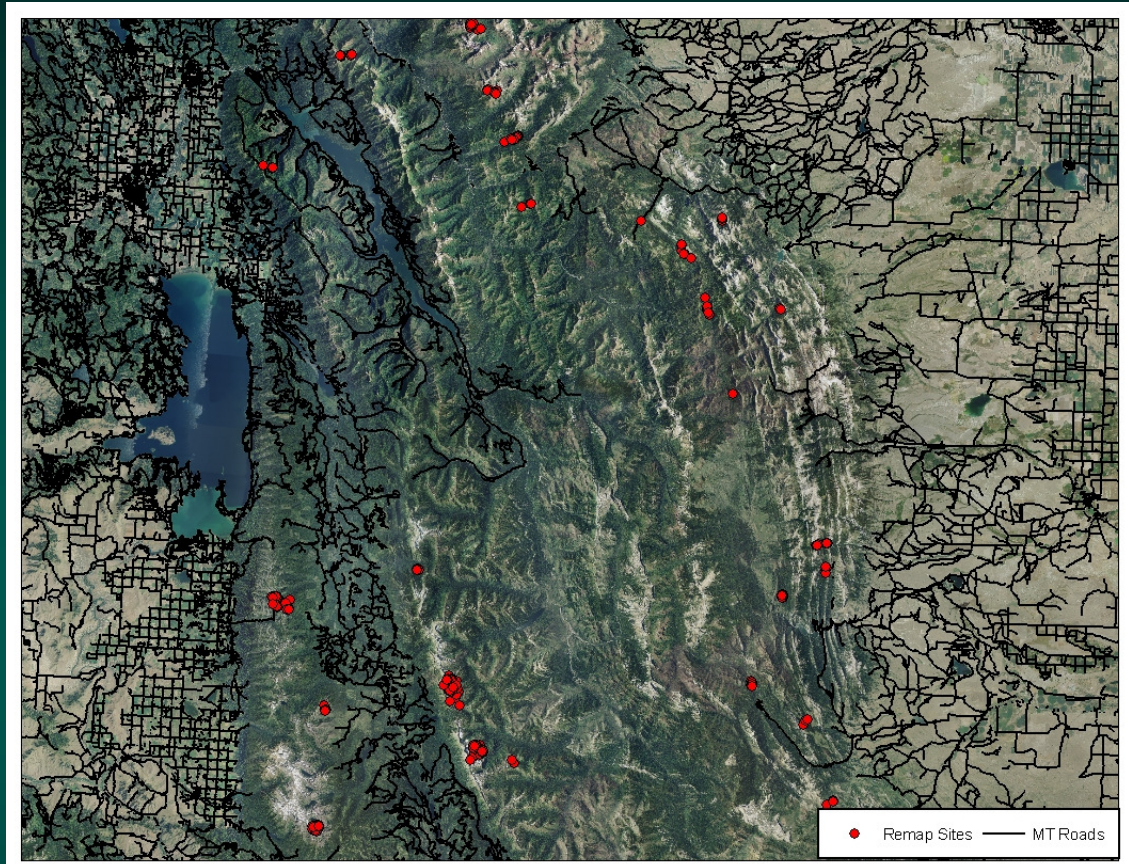

- >200 m canals, ditches
- >200 m wells, impoundments
- >1,000 m upstream reservoirs

Land Cover:

- >300 m low density residential
- >500 m crop agriculture/ hay pastures
- >2,000 m high density residential/ timber harvest

Land Use:

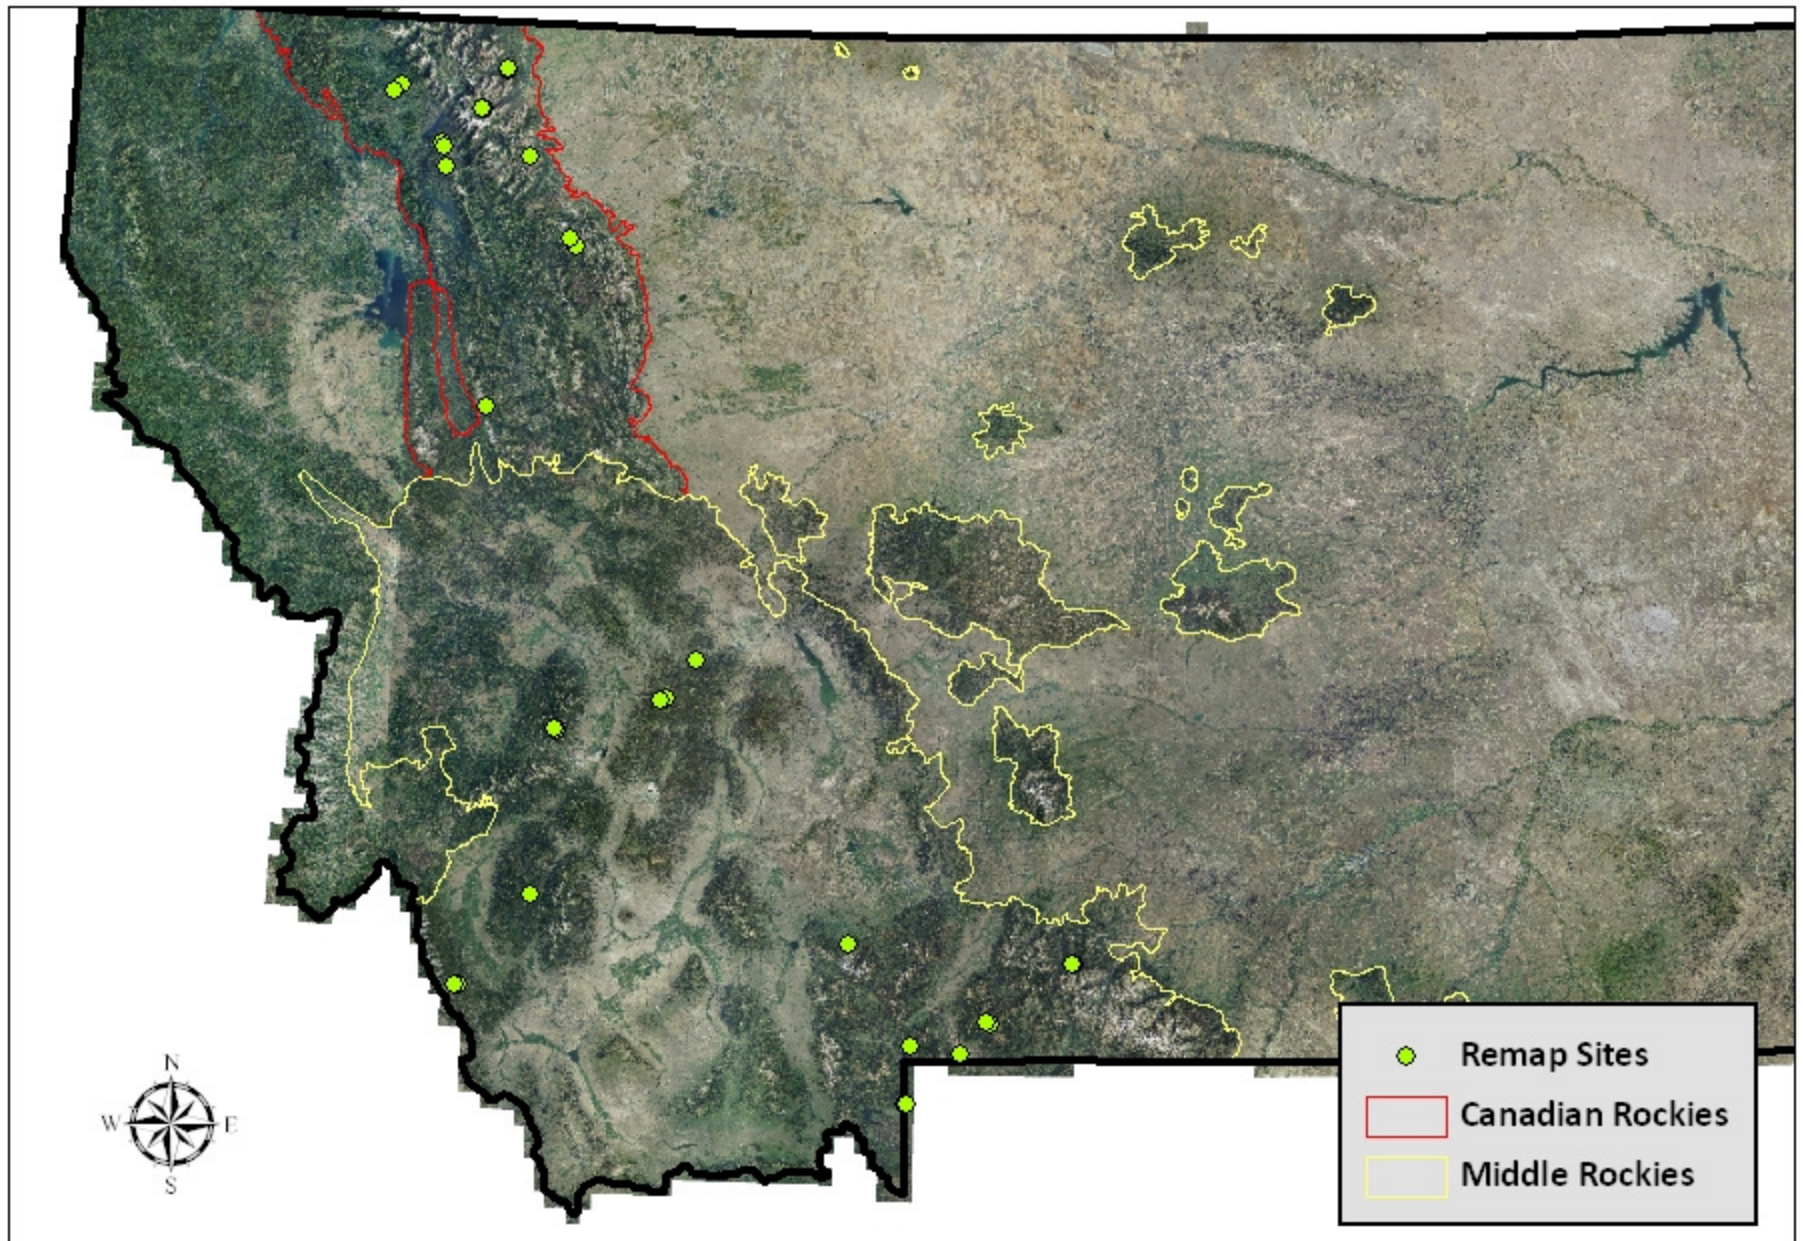

- >200 m evidence of livestock grazing
- >500 m abandoned mines/ tailing piles
- >1,000 m active gravel pit, open pit, strip mining

AA ESTABLISHMENT CRITERIA

- **Assess 1 Ecological System**
- **Ecological system has to be at least 0.1 ha**
- **Wetlands had to be at least 20 m wide**
- **AA has to have less than 10% standing water and upland inclusions**

Rocky Mountain Regional Monitoring and Assessment Project (REMAP)

Lessons So Far.....

With so many rules a preliminary field season is a must!

Rocky Mountain Subalpine-Montane Fens

Wet Meadow vs. Marsh

- Have similar vegetation
- Can have similar soils
- Main difference is water duration
