GUIDE TO THE GENERA OF LIANAS AND CLIMBING PLANTS IN THE NEOTROPICS

CYCLANTHACEAE

By Pedro Acevedo-Rodríguez (Aug 2020)

Thoracocarpus bissectus, photo by P. Acevedo

A neotropical family of 12 genera and about 225 species of terrestrial, epiphytic or epilithic herbs or less often root-climbing vines. A total of 48 species in 5 genera are reported as vines; distributed from south-central Mexico south to SE Brazil, and Cuba; most diverse in moist lowland forests, and cloud forest of the Andean range up to 3000 m elevation.

Diagnostics: Root-climbing vines, usually a few m long, but up to 15 m in *Thoracocarpus*. Stems, cylindrical, slender; leaves alternate with parallel venation, commonly bifid at apex, long-petioled.

General Characters

 STEMS. Stems cylindrical, subwoody; commonly 3-5 m long, but some species (e.g., *Thoracocarpus bissectus* (Vell.) Harling) reaching 10 or more m in length, and commonly a few cm in diam., bark smooth. Cross section with typical monocot configuration of scattered, discrete bicollateral vascular bundles (fig. 1d).

- 2. EXUDATES. Clear, watery or mucilaginous exudates.
- 3. CLIMBING MECHANISMS. Long *adventitious roots* at the nodes below the leaf insertion (fig. 1c).
- 4. LEAVES. Large, alternate, spiral in vines, coriaceous with parallel veins (fig. 1a), the blade commonly bifid on distal half, or plicate; petioles elongated, woody, adaxially flattened in lianas, sheathed at base.
- 5. INFLORESCENCE. A solitary, peduncled spadix, axillary, subtended by 2 to several clustered or loosely arranged bracts (spathes).
- 6. FLOWERS. Unisexual, actinomorphic or zygomorphic, in the lianas spirally arranged with 1 pistillate flower surrounded by 4 staminate flowers; staminate flowers without perianth, with numerous stamens; pistillate flowers with 4 tepals, 4 long staminodes opposite to the tepals; ovary inferior, partly inferior to superior, of 4 connate carpels, unilocular; ovules numerous per locule, with parietal placentation, the stigmas 4, stocky, short, sometimes basally connate into a short style.
- 7. FRUIT. A coherent berry within the spadix.

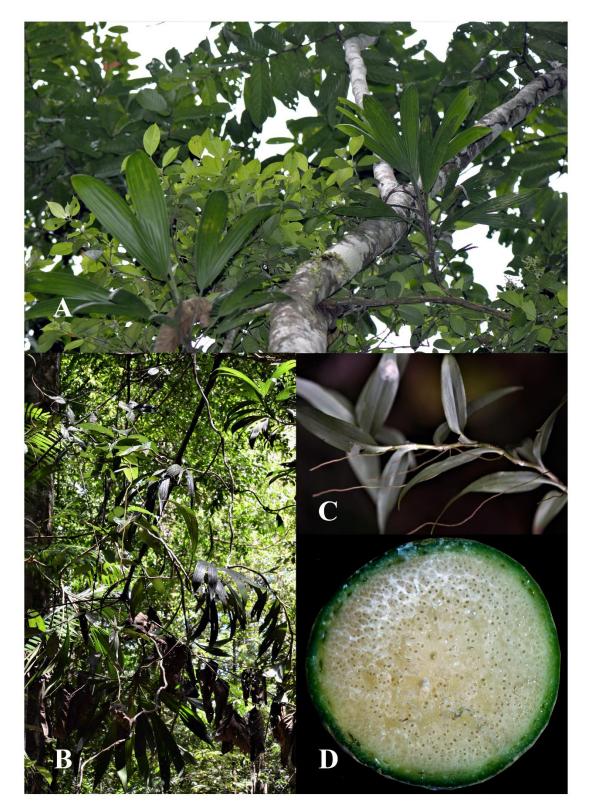

Figure 1. A. *Thoracocarpus bissectus*, root-climbing liana > 15 m long, with short sympodial branches (16085). **B**. High climbing liana with sympodial branches. **C**. Branch with juvenile leaves and adventitious roots. **D**. Stem cross section with atactostele. Photos by P. Acevedo.

KEY TO THE GENERA

1. Leaves distichous, entire, acuminate at apex	Ludovia
1. Leaves spiral, commonly bifid	2
2. Pistillate flowers and berries free	Evodianthus
2. Pistillate flowers and berries connate	3
3. Spathes 3-5(8), diminishing in size acropetally; seeds smooth	Asplundia
3. Spathes 8-11, diminishing in size basipetally; seeds striate	. Thoracocarpus

GENERIC DESCRIPTIONS

ASPLUNDIA Harling, Acta Horti Berg. 17: 41. 1954, (nom. cons.).

Asplundia sp., photo by P. Acevedo

Terrestrial or epiphytic herbs or root-climbing vines, mostly 1-2 m long, but some species reaching up to 10 m in length. Stems cylindrical, commonly with short internodes. Branching monopodial, short, bearing several spiral, bifid leaves; petioles long, adaxially flattened. Spadix widely ellipsoid, subtended by 3-5 spathes that diminish in size acropetally; pistillate flowers actinomorphic or zygomorphic, pedicellate, partly connate, surrounded by 4 staminate flowers. Berries partly connate.

Distinctive features: Root-climbing vines with spiral bifid, plicate leaves; spadix widely ellipsoid.

Distribution: A neotropical genus of about 100 species,

46 of which are reported as root-climbing vines or lianas; Although the genus is distributed from

Mexico south to SE Brazil, climbing species are known only from Panama, south to Peru and east to the Guianas; common in wet or moist lowland forests.

EVODIANTHUS Oersted, Vidensk. Meddel. Dansk Naturhist. Foren. Kjøbenhavn 1857: 194. 1857.

E. funifer, photo by A.C. Araujo

Terrestrial or epiphytic herbs, or rootclimbing vines. Stems cylindrical, slender. Branches sympodial, short, bearing several spiral, bifid leaves; petioles long, adaxially flattened. Spadix subtended by a cluster of 3 spathes; staminate flowers actinomorphic, tepals in two whorls; pistillate flowers and berries free.

Distinctive features: Vegetatively similar to other genera of Cyclanthaceae but distinguish by the free pistillate flowers and berries on the spadix.

Distribution: A single species *E. funifer* (Poit.) Lindm. distributed from Nicaragua south to Bolivia, the Amazon basin to NE Brazil., in moist and wet, lowland forests.

LUDOVIA Brongniart, Ann. Sci. Nat. Bot. ser. 4, 15: 361. 1861, (nom. cons.).

Erect terrestrial herbs, epiphytes or root-climbing vines, mostly 1-4 m long. Stems cylindrical, smooth, with short internodes. Branching monopodial, short, bearing several

distichous leaves with simple blades; venation pinnateascending; petioles long, sheathed for most of their length. Spadix ellipsoid to fusiform, subtended by 3-5 caducous spathes on upper half of peduncle; staminate flowers nearly actinomorphic, the perianth 20-30, glanduliferous; pistillate flowers and berries entirely connate, the staminodes 4, very long, white.

Distinctive features: Root-climbing vines with simple, long, distichous leaves with long petioles, venation pinnate-ascending.

L. lancifolia Brongn., photo by K. Farrell

Distribution: A New World genus of 3 species, 2 of which

sometimes grow as vines; distributed from Nicaragua south to Peru and the Amazon Basin; in wet or moist, lowland forests.

THORACOCARPUS Harling, Acta Horti Berg. 18(1): 254. 1958.

T. bissectus, photo by P. Acevedo

Root-climbing vines or epiphytic vines, stems slender 15-30 m long. Stems cylindrical, smooth, commonly with short internodes. Branching monopodial, short, bearing several spiral, deeply bifid leaves; petioles long, adaxially flattened. Spadix cylindrical to ellipsoid, subtended by 8-11 spathes that diminish in size basipetally; staminate flowers actinomorphic, the perianth with 10-15 lobes, glanduliferous; pistillate flowers and fruits basally connate; ovary with 4 parietal placentae. Berries partly connate on the spadix.

Distinctive features: Root-climbing vine with long, slender stems and deeply bifid leaves; spadix subtended by 8-11 spathes.

Distribution: A monotypic neotropical genus; distributed from Costa Rica south to Bolivia and SE Brazil; in wet or moist, lowland forests.
