I. INTRODUCTION

Part 2 contains the species of Scaphopoda and Gastropoda from the Tertiary and later deposits of the Island of Taiwan. As in the case of Part 1, the specimens treated in this report are preserved in the Institute of Geology and Palaeontology, Tôhoku Imperial University, Sendai; these are derived from several localities of the Raised Coral Reef (Holocene deposits), the Ryûkyû²⁾ Limestone (Pleistocene), the Byôritu Beds (Pliocene) and the Kaizan Beds (Miocene), and comprises the collection of Mr. S. ANDÔ of the Nippon Petroleum Company, Mr. S. HANZAWA of our Institute, and those of Messrs. Y. ICHIKAWA, T. MAKIYAMA and J. TORII, geologists of the Government General of Taiwan.

There are 14 species of Scaphopoda and 291 species of Gastropoda, altogether 305 species of mollusca³⁾ represented in the collection, among which 60 species are considered to be new to science. The numerical terms of each shell-beds are given below:

1) SITIHEI = SHICHIHEI.

2) Geographical names in this paper are spelt in "Nippon siki" (Japanese system).

3) The species of Scaphopoda and Gastropoda described by Dr. YOKOYAMA in his report on the Mollusca from the Oil-Field of the Island of Taiwan (Imp. Geol. Surv. Jap., Rep. No. 101, 1928) are: *Ringicula foveolata* YOKOYAMA, *R. globulifera* YOKOYAMA, *Terebra lischkeana* DUNKER, *T. naumanni* YOKOYAMA, *T. subvariegata* YOKOYAMA, *T. formosana* YOKOYAMA, *T. sp.*, *Conus sinensis* SOWERBY var., *C. kikaiensis* PILSBRY, *C. comatosaeformis* YOKOYAMA, *C. oinouyei* YOKOYAMA, *Pleurotoma oxytropis* SOWERBY, *P. carinata* GRAY var. *woodwardi* MARTIN, *Drillia pseudoprincipalis* YOKOYAMA, *Surcula javana* (LINNÉ), *Mangilia perparva* YOKOYAMA, *Oliva mustellina* LAMARCK, *Olivella spretoides* YOKOYAMA, *Mitra isabella* SWAINSON, *M. sphaerulata* MARTYN, *M. gembacana* MARTIN, *Fasciolaria iizukai* YOKOYAMA, *Hemifusus ternatanus* (GMELIN), *Siphonalia kellettoides* YOKOYAMA, *Eburna* sp., *Nassa (Niøtha) gemmularia* (LAMARCK), *N. (Hima) verbeekii* MARTIN, *N.*

A. Raised Coral Reef

1) Total number of forms distinguished	33. ¹⁾
2) Number of forms specifically determined	33.
3) Number of forms hitherto found only recent	11.
4) Number of forms hitherto found recent as well as fossil ...	22.
5) Number of forms "extinct" or "not known as living"	0.

B. Ryūkyū Limestone

1) Total number of forms distinguished	9.
2) Number of forms specifically determined	8.
3) Number of forms specifically indetermined	1.
4) Number of forms hitherto found only recent	0.
5) Number of forms hitherto found recent as well as fossil	8.
6) Number of forms "extinct" or "not known as living"	0.

C. Byōritu Beds

1) Total number of forms distinguished	274. ²⁾
2) Number of forms specifically determined	246.
3) Number of forms specifically indetermined	28.
4) Number of forms hitherto found only recent	71.
5) Number of forms hitherto found recent as well as fossil	89.
6) Number of forms "extinct" or "not known as living"	86.
7) Percentage of "extinct" to the total species (except indetermined forms)	ca. 35.

D. Kaizan Beds

This complex yielded only two species namely: *Tonna melanostoma* (JAY) and *Cypraea* sp.; although very scanty in number, it is certainly Miocene in age according to Mr. HANZAWA from his study of foraminifera remains.

(*Zeuxis*) *canaliculata* (LAMARCK), *Murex ternispina* LAMARCK, *Ocinebra* sp., *Rapana bezoar* LINNÉ var. *thomasiiana* CROSSE, *Triton* (*Simpulum*) *costatus* (BORN), *Distorsio cancellinus* (ROISSY), *Gyrineum sclelestum* YOKOYAMA, *Cassis japonica* REeve, *C. gracilenta* YOKOYAMA, *Dolium olearium* BRUGUIÈRE, D. sp., *Pyrula taiwanica* YOKOYAMA, *Cypraea carneola* LINNÉ, *C. cinctoides* YOKOYAMA, C. sp., *Strombus* sp., *Rostellaria* (*Rimella*) *spinifera* MARTIN var. *formosana* YOKOYAMA, *R. sp.*, *Cerithium satoi* YOKOYAMA, *C. sp.*, *Potamides* (*Tymanotomus*) *fluvialis* POTIEZ et MICHELLIN, *P. (Batillaria) murayamai* YOKOYAMA, *P. muritus* YOKOYAMA, *Cerithiopsis* (?) *shikoenensis* YOKOYAMA, *Vermetus* sp., *Turritella terebra* LINNÉ, *T. bacillum* KIENER, *T. filiola* YOKOYAMA, *T. sp.* *Melania scabroides* YOKOYAMA, *M. subramidumensis* YOKOYAMA, *M. saigoi* YOKOYAMA, *M. glabelliuscula* YOKOYAMA, *M. grossula* YOKOYAMA, *Solarium perspectivum* LINNÉ, *Polinices sagamiensis* PILSBRY, *Natica colliei* RECLUZ N. sp., *Sigaretus undulatus* LISCHKE, *Turbo marmoratus* LINNÉ var. *laevis* YOKOYAMA, *T. (Senectus) argyrostomus* LINNÉ var. *margaritacea* LINNÉ, *Gibbula* (?) *taiwanica* YOKOYAMA, *Scutus unguis* (LINNÉ), *Dentalium octagonum* LAMARCK, *D. vernei* HANLEY, *D. subrectum* JEFFREYS, D. sp., *D. sp.*, *Cadulus gordoni* YOKOYAMA.

Of the 81 species of Mollusca above mentioned, the following forms are not found in our collection: *Reticularia foveolata* YOKOYAMA, *R. globulifera* YOKOYAMA, *Terebra naumannii* YOKOYAMA, *T. subvariegata*, YOKOYAMA, *T. formosana* YOKOYAMA, *Conus sinensis* SOWERBY, var., *Siphonalia kelletoides* YOKOYAMA, *Cassis glacilenta* YOKOYAMA, *Dolium olearium* BRUGUIÈRE, *Cypraea carneola* LINNÉ, *C. cinctoides* YOKOYAMA, *Potamides muritus* YOKOYAMA, *Melania scabroides* YOKOYAMA, *M. glabelliuscula* YOKOYAMA, *Sigaretus undulatus* LISCHKE *Turbo marmoratus* LINNÉ var. *laevis* YOKOYAMA, *Scutus unguis* (LINNÉ), *Cadulus gordoni* YOKOYAMA.

1) There are many minute shells intermingled in sand and foraminifera collected from Kontei; these will be enumerated at a later date.

2) There are also many minute shells intermingling in sands collected from various localities of the Byōritu Beds; these will be described in another opportunity.

II. A BRIEF NOTE ON THE BYÔRITU MOLLUSCAN FAUNA

The Molluscan fauna of the Byôritu Beds consists of 143 species of Pelecypoda,¹⁾ 13 species of Scaphopoda and 260 species of Gastropoda, 417 species in all, thus it may be regarded as the most fossiliferous deposits in Taiwan. The most prevalent types in the fauna are:

<i>Arca (Arca) inflata</i> REEVE	<i>Arca (Arca) tricenicosta</i> (NYST) ²⁾
<i>Arca (Barbatia) yokoyamai</i> NOMURA	<i>Arca (Trisidos) kiyonoi</i> MAKIYAMA
<i>Glycymeris formosana</i> (YOKOYAMA)	<i>Cucullaea granulosa</i> (JONAS)
<i>Ostrea denselamellosa</i> LISCHKE	<i>Pecten (Pecten) subsquamatus</i> NOMURA
<i>Pecten (Vola) naganumanus</i> YOKOYAMA	<i>Pecten (Amusium) pleuronectes</i> (LINNAEUS)
<i>Crassatellites loebbeckei</i> (KOBELT) ³⁾	<i>Venericardia crenulicostata</i> NOMURA
<i>Venericardia granulicostata</i> NOMURA	<i>Cardium (Trachycardium) burchardi</i> DUNKER
<i>Venus (Chione) tiara</i> DILLWYN	<i>Aloidis erythrodon</i> (LAMARCK)
<i>Aloidis taiwanensis</i> (NOMURA)	<i>Dentalium (Fissidentalium) byorituense</i> n. sp.
<i>Conus odengensis</i> MARTIN	<i>Conus djarianensis</i> MARTIN
<i>Conus aculeiformis</i> REEVE	<i>Turris (Turris) oxytropis</i> (SOWERBY)
<i>Turris (Turris) polytropa</i> (HEBLING)	<i>Turricula byorituensis</i> n. sp.
<i>Clavatula taiwanensis</i> n. sp.	<i>Clavus (Brachytoma) flavidulus</i> (LAMARCK)
<i>Clavus (Brachytoma) pseudoprincipalis</i> (YOKOYAMA)	<i>Mitra (Scabricola) sphaerulata</i> "MARTYN"
<i>Nassarius caelatus</i> (A. ADAMS)	<i>Nassarius gemmularius</i> (LAMARCK)
<i>Murex (Murex) tribulus</i> LINNAEUS	<i>Lataxiella tuliana</i> (MARTIN)
<i>Bursa (Gyrineum) subgranosa</i> (BECK)	<i>Strombus taiwanicus</i> n. sp.
<i>Turritella filiola</i> YOKOYAMA	<i>Lemintina javana</i> (MARTIN)
<i>Diala angustifera</i> n. sp.	<i>Architectonica perspectiva</i> (LINNAEUS)
<i>Architectonica maxima</i> (PHILIPPI)	<i>Polinices (Polinices) columnalis</i> (RECLUZ)

Together with the above mentioned species, *Ostrea ariakensis* FUJITA, *Macrocallista pacifica* (DILLWYN), *Anomia lischkei* DAUTZENBERG and FISCHER,⁴⁾ *Tellina prototenuilirata* NOMURA, *Dentalium hexagonum* GOULD, *Clavus (Brachytoma) nodilirata* (SMITH), *Turris (Turris) tigrinaeformis* n. sp., *Olivella spretooides* YOKOYAMA, *Mitrella yabei* n. sp., *Natica rufa* BORN, *Natica vitellus* (LINNAEUS), and *Polinices didyma* (BOLTON) are not rare in certain places.

The general features of the fauna are similar to that of the Pliocene deposits of: the Simaziri Beds of Ryûkyû,⁵⁾ the Takanabe Group of Hyûga, the Kakegawa Series of Tosa and Tôtomi, the Naganuma Beds of Sagami and the Umegase Series of Kadusa as already stated in the Introduction to Part 1; farther it is also related to that of the Neogene of Java, Timor, Seran, the Philippines and India. Hence the fauna may be roughly regarded as representing most probably the lower Pliocene, and to a certain extent of its upper part. It is here noticed, that if we adopt the Malayan standard established by K. MARTIN and others, the lower part of the Beds will be taken as upper Miocene, that is to say Pontian.

Geographically considered, the elements of the fauna recent as well as fossil can be divided into the following three groups:

- 1) Taiwan elements. Species hitherto found only in Taiwan, South China as well as ranging north and south of it.
- 2) Nippon elements. Species hitherto found only in Kyûsyû (except small islands lying south of Ôsumi), Sikoku and Honsyû and farther north.

1) See part 1 of this Science Report, 1933.

2) *Arca tricenicosta* NYST = *A. philippiana* DUNKER.

3) The writer is inclined to believe that this species is a synonym of *C. nanus* (ADAMS and REEVE).

4) This species is considered to be a mere variation of *A. cytaeum* GRAY.

5) The Molluscan fauna of the Simaziri Beds is now in preparation.

3) Malay-Philippine elements. Species hitherto found only in the Malay Archipelago, Philippines, Indian Ocean and Pacific Islands.

Excluding the Taiwan elements the Byōritu fauna consists of 41 species of the Nippon elements and 39 species of the Malay-Philippine ones. The Nippon elements and their main localities are:

1. <i>Area (Barbatia) yokoyamai</i> NOMURA	Honsyū (fossil).
2. <i>Pecten (Pecten) squamatus</i> (GMELIN)	Honsyū and Kyūsyū.
3. <i>Pecten (Vola) laqueatus</i> SOWERBY	Hokkaidō to Kyūsyū.
4. <i>Pecten (Vola) naganumanus</i> YOKOYAMA ¹⁾	Honsyū and Hokkaidō (fossil).
5. <i>Pecten (Amusium) japonicus</i> (GMELIN)	Honsyū and Kyūsyū.
6. <i>Pododesmus (Monia) radiatus</i> (SOWERBY)	Honsyū and Kyūsyū.
7. <i>Brechites giganteus</i> (SOWERBY)	Honsyū and Kyūsyū.
8. <i>Myodora proxima</i> SMITH	Honsyū and Kyūsyū.
9. <i>Crassatellites loebeckei</i> (KOBELT)	Honsyū.
10. <i>Lucina civica</i> (YOKOYAMA) ²⁾	Honsyū.
11. <i>Thyasira nipponica</i> YABE and NOMURA	Karahuto, Hokkaidō and Honsyū (fossil).
12. <i>Alveinus ojianus</i> YOKOYAMA	Honsyū (fossil).
13. <i>Cardium (Trachycardium) burchardi</i> DUNKER	Honsyū and Kyūsyū.
14. "Cardium (Cerastoderma?)" <i>toneanum</i> (YOKOYAMA)	Honsyū.
15. <i>Venus (Chione) creniferooides</i> (NOMURA)	Honsyū and Kyūsyū.
16. <i>Lioconcha gordoni</i> (YOKOYAMA)	Honsyū (fossil).
17. <i>Paphia (Paphia) amabilis</i> (PHILIPPI)	Honsyū and Kyūsyū.
18. <i>Paphia (Paphia) euglypta</i> (PHILIPPI)	Honsyū and Kyūsyū.
19. <i>Tellina nitidula</i> DUNKER ³⁾	Honsyū and Kyūsyū.
20. <i>Dentalium (Antalis) pretiosum</i> SOWERBY	Honsyū.
21. <i>Leucotina dianae</i> (A. ADAMS)	Honsyū.
22. <i>Cyliphna sibaensis</i> YAMAKAWA	Honsyū (fossil).
23. <i>Cyliphna musashiensis</i> TOKUNAGA	Honsyū (fossil).
24. <i>Retusa minima</i> YAMAKAWA	Honsyū (fossil).
25. <i>Retusa cucurbitiana</i> YOKOYAMA	Honsyū (fossil).
26. <i>Terebra torquata</i> ADAMS and REEVE	Honsyū and Kyūsyū.
27. <i>Clavus (Clavus?) braunsi</i> (YOKOYAMA)	Honsyū (fossil).
28. <i>Clavus (Brachytoma) pseudoprincipalis</i> (YOKOYAMA)	Honsyū (fossil).
29. <i>Cyathara hiradoensis</i> (MAKIYAMA)	Kyūsyū.
30. <i>Lienardia (Etrema) gainesi</i> (PILSBRY)	Honsyū.
31. <i>Lienardia (Etrema) fortilarata</i> (SMITH)	Honsyū and Kyūsyū.
32. <i>Olivella spretoides</i> YOKOYAMA	Honsyū (fossil).
33. <i>Fusinus nodosoplicatus</i> (DUNKER)	Honsyū and Kyūsyū.
34. <i>Siphonalia spadicea</i> (REEVE)	Honsyū.
35. <i>Siphonalia stearnsi</i> PILSBRY	Honsyū.
36. <i>Siphonalia cassidariaeformis</i> (REEVE)	Hokkaidō to Kyūsyū.
37. <i>Nassarius (Hinia) festivus</i> (POWYS)	Honsyū and Kyūsyū.
38. <i>Pyrene (Mitrella) niveomarginata</i> (SMITH)	Honsyū and Kyūsyū.
39. <i>Phalium (Semicassis) japonicum</i> (REEVE) ⁴⁾	Honsyū to Kyūsyū.
40. <i>Tegula (Chlorostoma) pfeifferi</i> (PHILIPPI)	Hokkaidō to Kyūsyū.
41. <i>Odostomia (Odostomia) limpida</i> DALL and BARTSCH	Honsyū to Kyūsyū.

1) This species was once reported by DICKERSON from the Vigo Group of the Philippines.

2) Formerly known as *Corbis civica*; *Dentilucina (Bellucina) hedleyi* PRASHAD in the Lamellibranchiata of the Siboga Expedition is a similar species.

3) PRASHED reported it recently from the Indo-Pacific Islands.

4) Also found from the Neogene deposits of the Malay Islands.

The Malay-Philippine elements (including a few Australian elements) and their main localities are:

1. *Arca (Arca) sedanensis* MARTIN Java (fossil).
2. *Pecten (Pecten) pseudolima* SOWERBY The Philippines.
3. *Pecten (Aequipecten) nux* REEVE Marquesas Island.
4. *Pecten (Vola) javanus* MARTIN Java (fossil).
5. *Cardium (Laevicardium) biradiatum* BRUGUIÈRE The Philippines.
6. *Cardium (Trachycardium) unicolor* SOWERBY The Philippines.
7. *Cardium (Fragum) alfuricum* (FISCHER) Timor (fossil).
8. *Cardium (Acanthocardia) exasperatum* SOWERBY New Holland.
9. *Pitar pallescens* (SOWERBY) Anna.
10. *Tellina semitorta* SOWERBY Australia.
11. *Macoma birmanica* (PHILIPPI) Birma.
12. *Dentalium (Rhabdus) philippinarum* SOWERBY The Philippines.
13. *Dentalium (Episiphon) subrectum* JEFFREYS The Philippines.
14. *Ringicula caron* HINDS Strait of Malacca.
15. *Conus odengensis* MARTIN Java (fossil).
16. *Conus djarianensis* MARTIN Java (fossil).
17. *Conus ngavianus* MARTIN Java (fossil).
18. *Conus ornatissimus* MARTIN Java (fossil).
19. *Clavatula serana* FISCHER Seran (fossil).
20. *Astenostoma epitonica* (FISCHER) Seran (fossil).
21. *Clavus (Clavus?) tjibaliungensis* (MARTIN) Java (fossil).
22. *Clavus (Brachytoma) nodiliratus* (SMITH) The Philippines.
23. *Mangelia pyramis* (HINDS) Straits of Macassar.
24. *Vexillum (Pusia) gembacanum* (MARTIN) Java (fossil).
25. *Hemifusus patinacea* (REEVE) Australia.
26. *Latrunculus canaliculatus* (SCHUMACHER) Indian Ocean.
27. *Pollia obliquicostata* (REEVE) The Philippines.
28. *Nassarius (Aelectriion) canaliculatus* (LAMARCK) The Philippines.
29. *Murex (Murex) rarispina* LAMARCK Indian Ocean.
30. *Lataxiella luliana* (MARTIN) Java (fossil).
31. *Cypraea cincta* MARTIN Java (fossil).
32. *Triphora (Viriola) corrugata* (HINDS) New Guinea.
33. *Heliacus asperus* (HINDS) Straits of Macassar.
34. *Hipponyx danieli* CROSSE New Caledonia.
35. *Umbonium vestarium* (LINNAEUS) The Philippines.
36. *Ethalia pulchella* (A. ADAMS) The Philippines.
37. *Monilea lentiginosa* A. ADAMS The Philippines.
38. *Fissuridea crucifera* (PILSBRY) Natal.
39. *Lemintina javana* (MARTIN) Java (fossil).

It is quite interesting to find that the two elements are nearly equal in number, hence natural to say that during the deposition of the Byōritu Beds, the temperature of the marine water around the Island of Taiwan was almost the same as at the present time; if cooler at all, it was very slightly so, and not as distinct as once expressed by Dr. YOKOYAMA.¹⁾ This is

1) Dr. YOKOYAMA stated in his "Mollusca from the Oil-Field of the Island of Taiwan" (Imp. Geol. Surv. Rep. No. 101, 1928, p. 17): "The strong Japanese affinity shown by the fauna of the Upper Byōritu can only be explained by assuming that the seas around Taiwan during the deposition of the said beds had been more temperate than at present. And this is quite in accordance with the conclusion arrived at by me by studying the Pliocene Mollusca of Japan. Repeatedly I said in my papers previously published that the Pliocene molluscan fauna of our country represents that of a somewhat cooler sea than that of the present. And this cooler character, I may say, is more deeply, and therefore more clearly, impressed on the Taiwan fossil than on those of Japan Proper."

perhaps also the case with the temperature of the Pliocene marine water along the Pacific coast¹⁾ of Central Japan.

The writer wishes to express his warmest thanks to Prof. H. YABE, who not only entrusted him with the rich material for study but also made possible the publication of this article; acknowledgements are also due to the following gentlemen: Messrs. S. ANDÔ, S. HANZAWA, Y. ICHIKAWA, J. TORII, T. MAKIYAMA and T. SUGIYAMA: lastly to Messrs. K. HATAI and S. ITÔ, to whom the present writer is much obliged for their faithful assistance during the preparation of the work.

III. LIST OF THE SPECIES

Species	Horizon ²⁾³⁾			Range in Time

22 <i>Atys</i> sp. indet.		X		

1) The present writer considers the Lower Musasino Formation of Kosiba to have been deposited in deep water, at the depth of 100 m. ±.

2) The fossils found in the ejecta of the mud-volcanoes at Konsuihei near Kyōsitu, Takao-syū were treated, in my previous papers, but are not represented in the collection upon which this report is based. In regard to the molluscan remains of this unknown horizon, the reader is referred to the following note written by Mr. K. TAN, of the Institute of Geology, Taihoku Imperial University, Taiwan:

"On the Fossil Mollusca ejected from the Mud-Volcanoes near Kyōsitu, Takao Prefecture" (Taiwan Tigaku Kizi, Vol. 3, No. 3, March 18, 1932, pp. 34-36).

3) No Gastropoda and Scaphopoda remains are found in our collection from the Karisan Beds of Eocene age.

IV. LOCALITIES AND THEIR FAUNA

(A) Raised Coral Reef

1. Kaikō, Kōsyun-gun, Takao-syū (高雄州恒春郡海口): coll. Mr. S. HANZAWA.

Trochus calcaratus SOUVERBIE.

Trochus incrassatus LAMARCK.

2. Kontei, Kōsyun-syō, Kōsyun-gun, ditto (同 恒春郡恒春庄懇丁): coll. Messrs. S. HANZAWA and T. MAKIYAMA.

Cypraea arabica LINNAEUS.

Nerita plicata LINNAEUS.

Cypraea caput-serpentis LINNAEUS.

Trochus incrassatus LAMARCK.

Cypraea caurica LINNAEUS.

Trochus niloticus LINNAEUS.

Cypraea talpa LINNAEUS.

3. Sisitō, Kōsyun-syō, Kōsyun-gun, ditto (同 恒春郡恒春庄獅子頭): coll. Mr. S. HANZAWA.

Batillaria zonalis (BRUGUIÈRE).

Oliva ispidula (LINNAEUS).

Cerithidea cingulata (GMELIN).

Oliva mustellina LAMARCK.

Cerithium kochi PHILIPPI.

Phalium areolum (LINNAEUS).

Cerithium sinense (GMELIN).

Polinices columnaris (RECHUZ).

Clavus suturalis (GRAY).

Polinices mamilla (LINNAEUS).

Conus coronatus GMELIN.

Pustularia cicercula (LINNAEUS).

Gourmya corollia (KIENER).

Telescopium telescopium (LINNAEUS).

Mitra filaris (LINNAEUS).

Terebralia caledonica (JOUSSAUME).

Monilea lenticinosa A. ADAMS.

Terebralia sulcata (BORN).

Nassarius eaelatus (A. ADAMS).

Turbo argyrostomus LINNAEUS.

Nerita planospira ANTON.

Turbo regenfussi DESHAYES.

Nerita undata LINNAEUS.

Turritella terebra (LINNAEUS).

(B) Ryūkyū Limestone

1. Hanpeizan, Okayama-gun, Takao-syū (高雄州岡山郡半屏山): coll. Messrs. S. HANZAWA and S. ANDŌ.

Dentalium vernediei SOWERBY.

Architectonica maxima (PHILIPPI).

Dentalium sp. indet.

Conus flavidus LAMARCK.

Cypraea felina GMELIN.
Cypraea onyx LINNAEUS.

Cypraea testudinaria LINNAEUS.
Turbo ticaonicus REEVE.

2. Kotobuki-yama, Takao-si, ditto (同 高雄市壽山) : coll. Mr. K. YAMAMOTO.

Cypraea mappa LINNAEUS.

(C) Byōritu Beds

1. Bōsiho, Siko-syō, Byōritu-gun, Sintiku-syū (新竹州苗栗郡四湖庄茅子埔). Station 7 (S. of Bōsiho) : coll. Mr. S. HANZAWA.

Dentalium byorituense n. sp.
Dentalium pretiosum SOWERBY.
Clavus hanzawai n. sp.
"Cyclostrema" sp.
Diala angustifera n. sp.
Hipponyx danieli CROSSE.
Lienardia fortilarata (SMITH).
Liotia sp. indet.
Mangelia bosioensis n. sp.
Mangelia sp. indet.
Mitra sphaerulata "MARTYN".
Nassarius caelatus (A. ADAMS).

Nassarius gemmulatus (LAMARCK).
Oliva mustellina LAMARCK.
Olivella spretoides YOKOYAMA.
Polinices columnalis (RECLUZ).
Pyrene niveomarginata (SMITH).
Ringicula arctata GOULD.
Turbanilla bosioensis n. sp.
Turricula byorituensis n. sp.
Turris oxytropis (SOWERBY).
Turritella filiola YOKOYAMA.
Turritella sp. indet.
Umboonium moniliferum (LAMARCK).

- Station 13 (Bōsiho) : coll. Mr. S. ANDŌ.

Dentalium hexagonum GOULD.
Bursa subgranosa (BECK).
Clavatula taiwanensis n. sp.
Clavus flavidulus (LAMARCK).
Clavus nodilirata (SMITH).
Clavus pseudohumilis n. sp.
Clavus pseudoprincipalis (YOKOYAMA).
Conus comatosaeformis YOKOYAMA.
Coraliophila pilosbyi n. sp.
Diala angustifera n. sp.
Heliaetus asperus (HINDS).
Lienardia fortilarata (SMITH).
Liotia hanzawai n. sp.
Nassarius caelatus (A. ADAMS).

Nassarius gemmulatus (LAMARCK).
Phalium areolum (LINNAEUS).
Polinices didyma (BOLTON).
Pyrene yabei n. sp.
Strombus taiwanicus n. sp.
Terebra dussumieri KIENER.
Terebra evoluta DESHAYES.
Turricula byorituensis n. sp.
Turris oxytropis (SOWERBY).
Turris polytropa (HELBING).
Turritella filiola YOKOYAMA.
Typhis duplicatus SOWERBY.
Umboonium vestarium (LINNAEUS).

2. Dainankwa, Tūsyō-syō, Byōritu-gun, ditto (同 苗栗郡通霄庄大楠窩).

- Station 5 (500 m. SW. of Dainankwa) : coll. Mr. S. HANZAWA.

Dentalium hexagonum GOULD.
Bursa subgranosa (BECK).

Hemifusus coloseus (LAMARCK).
Siphonia stearnsi PILSBRY.

3. Goko, Dōra-syō, Byōritu-gun, ditto (同 苗栗郡銅羅庄五湖) : coll. Mr. S. HANZAWA.

Dentalium philippinarum SOWERBY.
Bursa subgranosa (BECK).
Heliaetus dorsuosus (HINDS).
Hemifusus pastinacea (REEVE)?
Latiaxis yabei n. sp.
Lemintina javana (MARTIN).
Nassarius caelatus (A. ADAMS).

Nassarius gemmulatus (LAMARCK).
Natica solida BLAINVILLE.
Tibia fusus (LINNAEUS).
Turcica elisa (GOULD).
Turricula byorituensis n. sp.
Turris oxytropis (SOWERBY).
Vexillum gembacanum (MARTIN).

4. Hakusyatōn, Kōryū-syō, Tikunan-gun, ditto (同 竹南郡後龍庄白沙屯): coll. Messrs. S. HANZAWA and S. ANDŌ.

<i>Architectonica maxima</i> (PHILIPPI).	<i>Nassarius gemmulatus</i> (LAMARCK).
<i>Fusinus nodosoplicatus</i> (DUNKER).	<i>Natica zebra</i> LAMARCK.
<i>Lemintina javana</i> (MARTIN).	<i>Phalium japonicum</i> (REEVE).
<i>Mitra sphaerulata</i> "MARTYN".	<i>Strombus taiwanicus</i> n. sp.

Station 1 (300 m. E. of Hakusyatōn): coll. Mr. S. HANZAWA.

<i>Dentalium hexagonum</i> GOULD.	<i>Nassarius caelatus</i> (A. ADAMS).
<i>Bursa subgranosa</i> (BECK).	<i>Nassarius gemmulatus</i> (LAMARCK).
<i>Cerithium kochi</i> PHILIPPI.	<i>Terebra orthocostulata</i> n. sp.

V. DESCRIPTION OF THE SPECIES

Class **Scaphopoda**Order **Solenoconcha**Family **Dentaliidae**Genus **Dentalium** LINNAEUS, 1758Subgenus **Dentalium** s. s.**Dentalium (Dentalium) hexagonum** GOULD, 1859

Dentalium (Dentalium) hexagonum. PILSBRY and SHARP in TRYON, Man. Conch., 1 Ser., Vol. 17, p. 18, Pl. 2, figs. 20, 21, 23, 24, 1897-8.

Dentalium octagonum. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 68, 1928 (in part).

Several six sided, rarely seven sided specimens. Interspaces between ribs wide, more or less concave bottomed and ornamented by unequal threads except for apical or narrower part. The Formosan fossil agrees well with *D. sexcostatum* SOWERBY in essential characters, which is a variety of the present species.

D. hexagonum and *D. octangulatum* DONOVAN are perhaps conspecific, but here I treat them provisionaly as distinct, until more precise studies are accomplished.

Type locality: China; Recent.

Fossil occurrence: Byōritu Beds.—300 m. E. of Hakusyatōn: station 1; Reg. No. 37436. 700 m. E. of Hakusyatōn: station 3; Reg. No. 54425. 1000 m. NW. of Rinsuikwa: station 5; Reg. No. 52431. 500 m. SW. of Dainankwa: station 5; Reg. No. 37443. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 52426. Wangwa: station 6; Reg. No. 52399. Bōsiho: station 13; Reg. No. 52397. 1450 m. W. of Hokkō: station 14; Reg. No. 52429. 500 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 52400. Wangwa: station 15; Reg. No. 52572. 510 m. SE. of Zyō-tūsyōwan: station 15; Reg. No. 52396. 700 m. NE. of Nanseizan: station 19; Reg. No. 52398. 1000 m. E. of Hakusyatōn: station 20; Reg. No. 52430. Wangwa: station 28; Reg. No. 52569. 900 m. NW. of Keiyukwa: station 33; Reg. No. 52428. Wangwa: station 37; Reg. No. 52568. 500 m. E. of Sankwakō: station 41; Reg. No. 52432. 300 m. S. of Sankwakō: station 44; Reg. No. 52427. Keiyukwa: station 50; Reg. No. 52395. The upper course of Sairyōkyō; Reg. No. 52595.

Living: Northern Honshū to Kyūshū. Japan Sea, China, Singapore.

Geologic distribution: Post-Pleistocene, Pleistocene and Pliocene of Honshū; Pliocene of Ryūkyū.

Dentalium (Dentalium) species indet. (1)

A single, somewhat fractured specimen; 18 mm. long.

Shell small, tapering rather rapidly towards apex; test comparatively thick and solid; 10 ribs near apex, prominent, separated by wide, more or less concave-bottomed intervals provided with secondary and tertiary riblets; riblets grow rather rapidly, soon become subequal to main ribs. Aperture apparently simple.

Fossil occurrence: Byōritu Beds.—Wangwa: station 24; Reg. No. 52435.

Dentalium (Dentalium) species indet. (2)

A small fragment, about 18 mm. long, with 18 subequal ribs separated by wider inter-spaces; resembles *D. buccinulum* GOULD of our seas, but apparently more cylindrical.

Fossil occurrence: Byōritu Beds.—900 m. SE. of Naikotō: station 66; Reg. No. 52434.

Subgenus Antalis H. and A. ADAMS, 1854**Dentalium (Antalis) pretiosum SOWERBY, 1860**

Dentalium pretiosum. SOWERBY, Thes. Conch., Vol. 3, p. 95, Pl. 225, fig. 57, 1860: SOWERBY in REEVE, Conch. Icon., Vol. 18, Pl. 7, fig. 54, 1872: PILSBRY and SHARP in TRYON, Man. Conch., 1 Ser., Vol. 17, p. 54, Pl. 13, figs. 1-8, 1897-8: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 15, No. 456, 1931.

?*Dentalium nipponicum*. YOKOYAMA, Jour. Coll. Sci. Tōkyō Imp. Univ., Vol. 44, Art. 1, p. 119, Pl. 6, fig. 7, 1922.

Several fragmental specimens. Although none of these smooth, moderately arcuate, rather thin-shelled specimens retain the anal end, they agree well with the named one in dimensions, curvature, and surface features, and are perhaps identical with its so-called southern types which is said to have more persistent axial riblets upon the apical portion than the northern type of North America.

Type locality: Pacific coast of N. America; Recent.

Fossil occurrence: Byōritu Beds.—950 m. SW. of Taikwa: station 10; Reg. No. 52449. 510 m. SE. of Zyō-tūsyōwan: station 15; Reg. No. 52447. 700 m. NE. of Nanseizan: station 19; Reg. No. 52446. 1000 m. E. of Hakusyatōn: station 25; Reg. No. 52445. 300 m. E. of Sankwakō: station 39; Reg. No. 52448. On road S. of Bōsiho; Reg. No. 52444. Western side of Syōgun-yama; Reg. No. 37554. The upper course of Sairyōkyō; Reg. No. 52567.

Living: Sitka, Alaska to Lower California, and also in Central Honshū, Japan. Japan Sea.

Geologic distribution: Pleistocene of Central Honshū.

Subgenus Fissidentalium FISCHER, 1885**Dentalium (Fissidentalium) vernedei SOWERBY, 1860**

Dentalium vernedei. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 68, Pl. 6, fig. 6, 1928.

Several excellently preserved specimens. A part of *D. vernedei* mentioned by Dr. YOKOYAMA from the Tertiary deposits of Taiwan, is perhaps identical with the next species, which is more common. Several measure (in mm.):

	1	2	3
Length	140	105	99
Diameter of aperture .	13	11	11

Type locality: China; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 24; Reg. No. 52369. Wangwa: station 33; Reg. No. 52368. 300 m. E. of Sankwakō: station 44; Reg. No. 52371. Sikō; Reg. Nos. 49406, 52576.

Ryūkyū Limestone.—Hanpeizan; Reg. No. 52370.

Living: Western Honshū and Taiwan. China.

Geologic distribution: Known only from the Pliocene of Taiwan.

Dentalium (Fissidentalium) byorituense n. sp.

Pl. VI (I), Figs. 1a, 1b, 1c.

Shell resembling *D. vernedei* in some respects, rather large, slender, elongated and slightly curved; test thick and solid. About 7–9 narrow, prominent riblets apically, number immediately increasing by intercalation of subequal secondary and tertiary ones to about 40 in middle portion; weaken towards aperture where they are almost indistinct in aged specimens. Interspaces between riblets primarily much wider than riblets, but finally becoming quite reverse. Incremental lines rather fine, almost indistinct, and scarcely visible under lens. Constrictions or annular rings present, especially frequent near apertural portion. Aperture circular in cross-section; anal orifice small, pear-shaped with a short pipe or tubular appendage projecting outwardly; notch triangular, rather shallow, continuous to a short fissure above it, and situated on convex side of shell.

Approximate dimensions (in mm.):

	1	2
Length	90.0	95.0
Diameter of aperture	8.0	8.5

Numerous specimens are found in the collection, but they are mostly imperfectly preserved. The thickness of the test is seemingly somewhat variable.

Compared with *D. vernedei*, this shell is more slender, a little more slowly enlarging, and has a much shallower anal slit; further, riblets and incremental lines also differ in detail between the two.

Dentalium subrectum MARTIN¹⁾ (not JEFFREYS) from the Neogene of Java is, nearly identical in form and sculpture, and perhaps conspecific with the present fossil, but I hesitate to do this identification definitely, because the apical characters of MARTIN's type specimens are totally unknown. *D. yokoyamai* MAKIYAMA²⁾ (= *D. complexum* of YOKOYAMA, not of DALL) is perhaps also a related species.

Fossil occurrence: Byōritu Beds.—1000 m. E. of Hakusyatōn: station 4; Reg. No. 52389. Wangwa: station 8; Reg. No. 52376. 1100 m. SW. of Taikwa: station 11; Reg. No. 52383. Wangwa: station 14; Reg. No. 52379. 600 m. SE. of Zyō-tūsyōwan: station 17; Reg. No. 52388. Wangwa: station 19; Reg. No. 52570. 1000 m. E. of Hakusyatōn: station 20; Reg. No. 52453. 700 m. SW. of Kōkwan: station 23; Reg. No. 52390. Wangwa: station 24; Reg. No. 52378. Wangwa: station 25; Reg. No. 52574. Wangwa: station 32; Reg. No. 52575. 900 m. NW. of Keiyukwa: station 33; Reg. No. 52380. Wangwa: station 33; Reg. Dentalium (Fissidentalium) hungerfordi PILSBRY and SHARP, 1898

Dentalium (Fissidentalium) hungerfordi. PILSBRY and SHARP in TRYON, Man. Conch., 1 Ser., Vol. 17, p. 84, Pl. 6, fig. 83, 1897-8: FUJITA, The Venus, Vol. 1, No. 2, p. 64; Vol. 1, No. 3, Pl. 3, fig. 6, 1929: YOKOYAMA, Cat. Mar. Fresh-W. a. Land Shells, Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 15, No. 458, 1931.

The specimens are easily distinguished from the other allied forms by their characteristically compressed shell with elliptical cross-section of apertural portion. The shell enlarges rather rapidly and nearly straight.

Approximate dimensions of a specimen are: Length, 70 mm.; diameter of aperture, 12 mm.

Type locality: China; Recent.

Fossil occurrence: Byōritu Beds.—1000 m. E. of Hakusyatōn: station 4; Reg. No. 52373. Wangwa: station 9; Reg. No. 52374. Wangwa: station 19; Reg. Nos. 52571, 52573. 7000 m. SE. of Hakusyatōn: station 27; Reg. No. 52372. 1200 m. E. of Zyō-tūsyōwan: station 36; Reg. No. 52375.

Living: Central and Western Honshū. China.

Dentalium (Fissidentalium ?) species indet.

A large fragment resembling *D. verneidei*, but the riblets are more numerous and increase in number by division.

Fossil occurrence: Ryūkyū Limestone.—Hanpeizan; Reg. No. 37596.

Subgenus Laevidentalium COSSMANN, 1888

Dentalium (Laevidentalium ?) species indet. (1)

A nearly straight and rather thin-shelled *Dentalium*, tapering moderately towards apex; surface entirely smooth except for distinct growth lines. It somewhat resembles *D. coruscum* PILSBRY¹⁾ from the Japanese waters, but is indeterminable.

Fossil occurrence: Byōritu Beds.—700 m. E. of Hakusyatōn: station 3; Reg. No. 52566. Wangwa: station 13; Reg. No. 52442. 1000 m. E. of Hakusyatōn: station 25; Reg. No. 52441.

Dentalium (Laevidentalium ?) species indet. (2)

Resembling superficially the preceding one, but tapering more gradually; shell is more solid.

Fossil occurrence: Byōritu Beds.—1520 m. E. of Sinpo: station 68; Reg. No. 52443.

1) PILSBRY: Proc. Acad. Nat. Sci. Phila., p. 117, Pl. 5, figs. 42, 43, 1905.

Subgenus **Rhabdus** PILSBRY and SHARP, 1898**Dentalium (Rhabdus) philippinarum** SOWERBY, 1860

Pl. VI (I), Fig. 2.

Dentalium philippinarum. SOWERBY, Thes. Conch., Vol. 3, p. 98, Pl. 225, fig. 54, 1860: SOWERBY in REEVE, Conch. Icon., Vol. 18, Pl. 3, fig. 18, 1872: PILSBRY and SHARP in TRYON, Man. Conch., 1 Ser., Vol. 17, p. 116, Pl. 20, figs. 31, 32, 1897-8.

Several rather ill-preserved specimens. Elongate, narrow, smooth and thin-shelled with irregularly spaced ring-like swellings and intermediate impressed lines. The longitudinal striae, which are said to be distinct in the recent specimens from the Philippines, are rather indistinct in the Formosan fossils, perhaps due to being water-worn. *D. gonatodes* MARTIN¹⁾ is a similar species.

Type locality: The Philippines; Recent.

Fossil occurrence: Byōritu Beds.—E. of Goko: station 8; Reg. No. 37442. 500 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 52437. Wangwa: station 6; Reg. No. 52439. 1100 m. SW. of Taikwa: station 11; Reg. No. 52440. Wangwa: station 15; Reg. Nos. 52560, 52565. Wangwa: station 16; Reg. No. 52562. Wangwa: station 18; Reg. No. 52561. 1000 m. E. of Haku-syatōn: station 25; Reg. No. 52438.

Living: The Philippines.

Subgenus **Episiphon** PILSBRY and SHARP, 1898**Dentalium (Episiphon) subrectum** JEFFREYS 1882

Dentalium (Episiphon) subrectum. PILSBRY and SHARP in TRYON, Man. Conch., 1 Ser., Vol. 17, p. 119, Pl. 18, fig. 5, 1897-8 (not of MARTIN).

Several ill-preserved specimens; the longest, 4 mm. in length.

Shell very small, slightly curved, quite smooth and tapering slowly towards apex; test rather thin; cross-sections at both ends circular.

Dr. YOKOYAMA's *D. subrectum* from the Byōritu Beds of Taiwan,²⁾ needs confirmation; his figure being insufficient for specific identification of this small shell.

Type locality: The Philippines; Recent.

Fossil occurrence: Byōritu Beds.—500 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 52433. Wangwa: station 18; Reg. No. 52564. Wangwa: station 19; Reg. No. 52563. Wangwa: station 24; Reg. No. 52596. 550 m. E. of Sankwakō: station 43; Reg. No. 52454.

Living: The Philippines.

1) MARTIN: Tiefb. auf Java, p. 192, Pl. 10, fig. 194, 1887.

2) YOKOYAMA: Imp. Geol. Surv. Jap., Rep. No. 101, p. 69, Pl. 4, fig. 11, 1928.

Family Siphonodentaliidae

Genus **Cadulus** PHILIPPI, 1844

Cadulus wangwaensis, n. sp.

Pl. VI (I), Fig. 3.

Shell small, slender, slightly curved; test rather thick, solid; cross-section circular; surface quite smooth, polished; no distinct incremental lines; tapering towards apex, and slightly constricted at aperture; anal orifice simple.

Two specimens; the figured one, 8.5 mm. in length, 1.3 mm. in apertural diameter, and about 0.6 mm. in anal one.

This neat shell resembles *C. gordoni* YOKOYAMA, a species first found in the Neogene deposits of the Kwantô region, but it differs from that species in being less contracted anteriorly.

Fossil occurrence: Byôritu Beds.—500 m. SE. of Zyô-tûsyôwan: station 14; Reg. No. 52460. Wangwa: station 18; Reg. No. 52450.

Cadulus species indet.

Similar to the preceding in general respects, but more slowly tapering towards apex, constriction at aperture slightly more marked. It may perhaps be nearly identical with *C. gordoni* reported by Dr. YOKOYAMA from the Byôritu Beds of Taiwan; but an accurate naming requires better specimens.

A fragmental specimen; length, 2 mm.

Fossil occurrence: Byôritu Beds.—1100 m. SW. of Taikwa: station 11; Reg. No. 52436.

Class **Gastropoda**

Order **Opistobranchiata**

Family **Acteonidae**

Genus **Acteon** MONTFORT, 1810

Acteon sieboldii (REEVE), 1842

Pl. VI (I), Fig. 5.

Tornatella sieboldii. REEVE, Conch. Icon., Vol. 15, Pl. 3, fig. 11, 1865.

Actaeon sieboldii. PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 15, p. 148, Pl. 19, figs. 18, 19, 1893: PILSBRY, Cat. Mar. Moll. Jap., p. 7, 1895.

One specimen, 7.4 mm. in height and 4 mm. in diameter. Transverse grooves in body-whorl numerous as described by REEVE, but rather unequal; possibly a varietal form.

Type locality: Japan; Recent.

Fossil occurrence: Byôritu Beds.—700 m. NE. of Nanseizan: station 19; Reg. No. 53871.

Living: Japan (exact locality unknown).

Genus **Leucotina** A. ADAMS, 1860**Leucotina dianae** (A. ADAMS), 1854

Leucotina dianae. PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 15, p. 167, Pl. 18, figs. 68, 69, 88, 89, 1893: PILSBRY, Cat. Mar. Moll. Jap., p. 7, 1895: YOKOYAMA, Jour. Fac. Sci. Imp. Univ. Tôkyô, Sec. 2, Vol. 2, Pt. 4, p. 171, Pl. 47, fig. 1, 1927: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 52, 1931.

Tornatella dianae. REEVE, Conch. Icon., Vol. 15, Pl. 4, fig. 19, 1865: LISCHKE, Jap. Meeres-Conch., Vol. 2, p. 171, 1871: LISCHKE, ibid., Vol. 3, p. 76, 1874.

One imperfect specimen; 6.5 mm. in diameter. The genus perhaps belongs to the Pyramidellidae as considered by some authors.

Type locality: Japan; Recent.

Fossil occurrence: Byôritu Beds.—Kozantyô: station 24; Reg. No. 53868.

Living: Central Honsyû and Inland Sea.

Geologic distribution: Pliocene of Honsyû.

Family **Retusidae**Genus **Retusa** BROWN, 1827**Retusa minima** YAMAKAWA, 1912

Retusa minima. YAMAKAWA, Jour. Geol. Soc. Tôkyô, Vol. 18, p. 47, Pl. 11, figs. 21–24, 1912: YOKOYAMA, Jour. Coll. Sci. Imp. Univ. Tôkyô, Vol. 39, Art. 6, p. 26, Pl. 1, fig. 1, 1920: NOMURA and ZINBÔ, Sci. Rep. Tôhoku Imp. Univ. Ser. 2 (Geol.), Vol. 16, No. 2, p. 129, 1934.

One specimen; nearly equal to the type in size.

Type locality: Japan; Pleistocene.

Fossil occurrence: Byôritu Beds.—Wangwa; station 37; Reg. No. 53874.

Geologic distribution: Post-Pleistocene; Pleistocene and Pliocene of Honsyû; Pleistocene of Kikai-zima.

Living: Japan. China(?).

Retusa cucurbitiana YOKOYAMA, 1927

Retusa cucurbitiana. YOKOYAMA, Jour. Fac. Sci. Imp. Univ. Tôkyô, Sec. 2, Vol. 1, Pt. 10, p. 449, Pl. 51, fig. 4, 1927.

Two specimens. Resembles *R. minima* YAMAKAWA in shape, but excavation of upper half of shell much stronger.

Type locality: Japan; Pleistocene.

Fossil occurrence: Byôritu Beds.—Wangwa: station 17; Reg. No. 53876. Wangwa: station 37; Reg. No. 53875.

Geologic distribution: Pleistocene of Honsyû.

Subgenus **Pyrunculus** PILSBRY, 1894

Retusa (Pyrunculus) pyriformis (A. ADAMS) 1855

Pl. VI (I), Fig. 7.

Retusa (Pyrunculus) pyriformis. PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 15, p. 229, Pl. 33, fig. 68, 1893.
Bulla (Atys) pyriformis. ADAMS in SOWERBY, Thes. Conch., Vol. 2, p. 589, Pl. 125, fig. 128, 1855.

One small pyriform shell, 3.2 mm. in height and 2.4 mm. in diameter; spire sunken. Surface smooth due to abrasion.

Type locality: China; Recent.

Fossil occurrence: Byōritu Beds.—Nanseizan: station 11; Reg. No. 53877.

Living: China Sea.

Genus **Acteocina** GRAY, 1847

Acteocina fusiformis (A. ADAMS), 1855

Pl. VI (I), Fig. 6.

Bulla fusiformis. ADAMS in SOWERBY, Thes. Conch., Vol. 2, p. 570, Pl. 121, fig. 37, 1855.

Tornatina fusiformis. DUNKER, Ind. Moll. Mar. Jap., p. 165, 1882; PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 15, p. 194, Pl. 22, fig. 27, 1893; PILSBRY, Cat. Mar. Moll. Jap., p. 7, 1895.

Several specimens; agree best with the named species than any other figured ones from Japan and China. One measures 3.8 mm. in height, and 1.5 mm. in diameter.

Type locality: China; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 18; Reg. No. 53880.

Living: Japan. China Sea. Pacific Islands. Gulf of Suez. N. Australia.

Genus **Volvula** A. ADAMS, 1850

(= ? **Rhizorus** MONTFORT, 1810)

Volvula acuminata (BRUGUIÈRE), 1792

Volvula acuminata. YOKOYAMA, Jour. Coll. Sci. Tôkyô Imp. Univ., Vol. 39, Art. 6, p. 26, Pl. 1, fig. 2, 1920.

Volvula acuta. TOKUNAGA, Jour. Coll. Sci. Tôkyô Imp. Univ., Vol. 21, Art. 2, p. 32, Pl. 2, fig. 13, 1906.

Volvulella acuminata tokunagai. MAKIYAMA, Mem. Coll. Sci. Kyôto Imp. Univ., Ser. B, Vol. 3, No. 1, Art. 1, p. 141, 1927.

One specimen, about 4 mm. in height, and 1.4 mm. in diameter. The difference between the Japanese and European forms seems to be very slight, and are here taken to be conspecific.

Type locality: Europe; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 14; Reg. No. 53872.

Living: Japan(?). Persian Gulf. Suez. Atlantic, from Norway to Mediterranean Sea.

Geologic distribution: Pleistocene and Pliocene of Honshû; Pliocene of Europe.

Family Atyidae

Genus **Atys** MONTFORT, 1810**Atys** species indet.

A single mould, resembling *A. cylindrica* from the Indo-Pacific region in form; but the obscured sculpture prevents an accurate determination. Height, 27.5 mm.; diameter, 15.5 mm.

Fossil occurrence: Byōritu Beds.—Wangwa: station 14; Reg. No. 53869.

Genus **Cylichna** LOVÈN, 1846**Cylichna sibaensis** YAMAKAWA, 1911

Cylichna sibaensis. YAMAKAWA, Jour. Geol. Soc. Tôkyô, Vol. 18, p. 48, Pl. 11, figs. 25–29, 1911: YOKOYAMA, Jour. Coll. Sci. Tôkyô Imp. Univ., Vol. 39, Art. 6, p. 28, Pl. 1, fig. 6, 1920.

A single well preserved specimen; agrees very well with the type figures.

Type locality: Japan; Pleistocene.

Fossil occurrence: Byōritu Beds.—Wangwa: station 14; Reg. No. 53873.

Geologic distribution: Post-Pleistocene, Pleistocene and Pliocene of Honsyû.

Cylichna koryusyoensis, n. sp.

Pl. VI (I), Figs. 4a, 4b.

Shell small, elongate, cylindrical, slightly contracted in middle. Test thin. Surface transversely finely striated; striae more distant towards apex, crossed by incremental lines, finner than striae. Apex sunken, surrounded by acute margin. Aperture very narrow and linear, slightly curved; base rounded; columella twisted with a rather distinct, oblique fold bounded behind by a narrow groove.

One specimen, 6 mm. in height and 2.2 mm. in diameter.

This species resembles *C. braunsi* YOKOYAMA¹⁾ from the Lower Musasino Formation of Naganuma near Tôkyô, but is distinguished in the shell having a more distinct columellar fold. It is also closely related to *C. pulvisculus* EHRENBERG²⁾ from the Red Sea, but the two differ in ornamentation; EHRENBERG's species is said to be striated only at both ends of the shell. It is also similar to *C. strigella* A. ADAMS³⁾ (not of LOVÈN) from the Philippines and Australia except for lacking "undulating transverse striae".

Fossil occurrence: Byōritu Beds.—Wangwa: station 23; Reg. No. 53878.

Cylichna musashiensis TOKUNAGA, 1906

Cylichna musashiensis. TOKUNAGA, Jour. Coll. Sci. Tôkyô Imp. Univ., Vol. 21, Art. 2, p. 32, Pl. 2, fig. 12, 1906: YOKOYAMA, Jour. Coll. Sci. Tôkyô Imp. Univ., Vol. 39, Art. 6, p. 27, Pl. 1, fig. 4, 1920; and also in his later papers.

1) YOKOYAMA: Jour. Coll. Sci. Imp. Univ. Tôkyô, Vol. 39, Art. 6, p. 28, Pl. 1, fig. 5, 1920.

2) PILSBRY in TRYON: Man. Conch., 1 Ser., Vol. 15, p. 311, Pl. 27, fig. 95, 1893.

3) PILSBRY in TRYON: ibid., p. 314, Pl. 48, fig. 14, 1893.

One small specimen agreeing with the named species; height, 6 mm., diameter, 2.4 mm. It resembles very much the Australian *C. arachis* QUOY and GAIMARD, and perhaps will be proved to be identical by future study.

Type locality: Japan; Pleistocene.

Fossil occurrence: Byōritu Beds.—Wangwa: station 40; Reg. No. 53879.

Living: Central Honshū, and perhaps it is distributed southwards in Japan.

Geologic distribution: Pleistocene and Pliocene of Honshū: Pleistocene of Kikai-zima (?).

Cylichna species indet.

A small, ovate cylindric species, having its surface quite smooth; resembles somewhat *C. mongii* AUDOUIN¹⁾ from the Red Sea.

Fossil occurrence: Byōritu Beds.—Wangwa: station 18; Reg. No. 53882.

Family Hydatinidae

Genus **Hydatina** SCHUMACHER, 1817

Hydatina physis (LINNAEUS), 1758

Pl. VI (I), Figs. 8a, 8b.

Hydatina physis. SOWERBY in REEVE, Conch. Icon., Vol. 16, Pl. 1, fig. 2, 1869. LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 114, 1869: DUNKER, Ind. Moll. Mar. Jap., p. 162, 1882: PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 15, p. 387, Pl. 45, figs. 14-17, 1893: PILSBRY, Cat. Mar. Moll. Jap., p. 10, 1895: SUGITANI, Cat. Luchu Shells, p. 35, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 83, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 55, No. 1904, 1931. *Bulla physis*. ADAMS in SOWERBY, Thes. Conch., Vol. 2, p. 565, Pl. 120, figs. 9-11, 1855.

One rather small specimen. The Formosan fossil has the whorl more or less angular at the upper part, but this is usual among the living Japanese specimens.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—Sikō; Reg. No. 48982.

Living: Central Honshū to Taiwan. Widely distributed in the Indo-Pacific regions. West Indies (?).

Family Ringiculidae

Genus **Ringicula** DESHAYES, 1838

Ringicula arctata GOULD, 1859

Pl. VI (I), Fig. 9.

Ringicula arctata. GOULD, Proc. Bost. Soc. Nat. Hist., Vol. 7, p. 325, 1859: GOULD, Otia Conch., p. 122, 1862: LISCHKE, Jap. Meeres-Conch., Vol. 2, p. 78, Pl. 5, figs. 15, 16, 1871: LISCHKE, ibid., Vol. 3, p. 59,

1) PILSBRY in TRYON: Man. Conch., 1 Ser., Vol. 15, p. 311, Pl. 27, fig. 96, 1893.

1874: PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 15, p. 403, Pl. 47, figs. 74, 79, 1893: PILSBRY, Cat. Mar. Moll. Jap., p. 10, 1895: TOKUNAGA, Jour. Coll. Sci. Tôkyô Imp. Univ., Vol. 21, Art. 2, p. 32, Pl. 2, fig. 11, 1906.

Ringicula musashinoensis. YOKOYAMA, Jour. Coll. Sci. Tôkyô Imp. Univ., Vol. 39, Art. 6, p. 30, Pl. 1, figs. 3, 8, 1920: YOKOYAMA, ibid., Vol. 44, Art. 1, p. 30, Pl. 1, figs. 16, 17, 1922 and his later papers: MAKIYAMA, Mem. Coll. Sci. Kyôto Imp. Univ., Ser. B, Vol. 3, No. 1, Art. 1, p. 142, 1927: NOMURA, Sci. Rep. Tôhoku Imp. Univ. Ser. 2 (Geol.), Vol. 15, No. 2, p. 128, No. 455, 1932.

An examination of several Formosan fossil specimens of *Ringicula* showed that *R. musashinoensis* YOKOYAMA is certainly a synonym of *R. arctata* GOULD; the shell varies considerably in form and sculpture. The type of *R. musashinoensis* from the Lower Musasino Formation is a form with a less thickened outer lip, and less heavier callous on the inner lip.

Type locality: China; Recent.

Fossil occurrence: Byôritu Beds.—700 m. E. of Hakusyatô: station 3; Reg. No. 53853. 600 m. E. of Rinsuikwa: station 4; Reg. No. 53852. 500 m. SE. of Zyô-tûsyôwan: station 14; Reg. No. 53855. Wangwa: station 18; Reg. No. 53848. 1000 m. E. of Hakusyatô: station 25 Reg. No. 53850. 900 m. NW. of Keiyukwa: station 33; Reg. No. 53854. 550 m. E. of Sankwakô: station 43; Reg. No. 53856. Tyû-tûsyôwan: station 48; Reg. No. 53851. 1550 m. E. of Sinpo: station 69; Reg. No. 53847: S. of Bôsiho; Reg. No. 37421.

Living: Northern Honshû to Kyûshû. Hongkong, China. North Australia.

Geologic distribution: Post-Pleistocene, Pleistocene and Pliocene of Honshû.

Ringicula caron HINDS, 1844

Pl. VI (I), Fig. 10.

Ringicula caron. TRYON, Man. Conch., 1 Ser., Vol. 15, p. 407, Pl. 47, figs. 63, 64, 1893: ?TESCH, Paläont. von Timor, Vol. 8, p. 79, Pl. 16, fig. 222, 1920: FISCHER, Paläont. von Timor, Vol. 15, p. 107, Pl. 215, fig. 93, 1927: NOMURA and ZINBÔ, Sci. Rep. Tôhoku Imp. Univ. Ser. 2 (Geol.), Vol. 16, No. 2, p. 130, 1934.

Shell ovate, acuminate, striated, shining; whorls rounded, the last with subtransverse, rounded distant striae; spire exserted; aperture subabbreviated, the lip corrugated (HINDS after TRYON).

Several well preserved specimens. The elevated spire and minutely corrugated outer lip are the characteristic features of this species.

Type locality: Strait of Malacca; Recent.

Fossil occurrence: Byôritu Beds.—400 m. SE. of Zyô-tûsyôwan: station 13; Reg. No. 53845. Wangwa: station 14; Reg. Nos. 53841, 53843. 1000 m. E. of Hakusyatô: station 25; Reg. No. 53844. Wangwa: station 40; Reg. No. 53846. 500 m. E. of Sankwakô: station 41; Reg. No. 53842.

Living: Strait of Malacca. Australia. Torres Strait. Gwadar.

Geologic distribution: Pleistocene of Kikai-zima; Pliocene of Timor(?) and Seran.

Order Ctenobranchiata

Family Terebridae

Genus **Terebra** BRUGUIÈRE, 1789

Terebra evoluta DESHAYES, 1859

Pl. VI (I), Fig. 26.

Terebra evoluta. REEVE, Conch. Icon., Vol. 12, fig. 55, 1860: PILSBRY, Cat. Mar. Moll. Jap., p. 11, 1895: HIRASE, Terebridae Jap. Emp., p. 16, Pl. 2, figs. 11, 12; Pl. 4, figs. 42-44, 57, 1917: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 52, No. 1796, 1931: YAGURA, Cat. Moll. Hyôgo-ken, p. 48, No. 631, 1932: KURODA, Cat. Moll., Hukui-ken, p. 191, No. 203, 1933. *Terebra dussumieri*. TRYON (pars), Man. Conch., Vol. 7, p. 17, Pl. 3, fig. 47, 1855 (not of KIENER).

This species is characterized by its rather large and slender shell with about 18, subvertical axial ribs which are separated by wider interspaces; subsutural groove rather broad, distinct and with oblique, elongate nodes at shoulder; no spirals.

Several specimens; most of the larger ones are unfortunately ill-preserved.

Type locality: The Far East; Recent.

Fossil occurrence: Byôritu Beds.—700 m. E. of Hakusyatô: station 3; Reg. No. 52465. Wangwa: station 6; Reg. No. 52461. Nanseizan: station 11; Reg. No. 52464. Bôsiho: station 13; Reg. No. 52462. 510 m. SE. of Zyô-tûsyôwan: station 15; Reg. No. 52463. 700 m. NE. of Nanseizan: station 19; Reg. No. 53499. 1000 m. E. of Hakusyatô: station 25; Reg. No. 52466.

Living: Western Honshû and Kyûshû. Japan Sea. China.

Geologic distribution: Pliocene of Central Honshû.

Terebra dussumieri KIENER, 1835-57

Pl. VI (I), Fig. 27.

Terebra dussumieri. KIENER, Spec. Coq. viv., p. 31, Pl. 8, fig. 17, 1835-1857: REEVE, Conch. Icon., Vol. 12, Pl. 2, fig. 7, 1860: LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 62, 1869 (pars): TRYON, Man. Conch., 1 Ser., Vol. 7, p. 16, Pl. 3, figs. 46-48, 1885: PILSBRY, Cat. Mar. Moll. Jap., p. 11, 1895: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 52, No. 1798, 1931.

Terebra lischkeana. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 24, Pl. 1, fig. 9, 1928 (not of DUNKER).

Several fine specimens; the largest one ca. 55 mm. in height, and 13 mm. in diameter.

The shell resembles the preceding one in general aspects, but is invariably broader, and has a greater number of axial ribs. The subsutural groove is less distinctly bounded, and hence the ribs are subcontinuous from suture to suture.

Type locality: China; Recent.

Fossil occurrence: Byôritu Beds.—1100 m. E. of Rinsuikwa: station 3; Reg. No. 52469. Bôsiho: station 13; Reg. No. 52470. Wangwa: station 14; Reg. No. 52468. 550 m. SE. of Zyô-tûsyôwan: station 16; Reg. No. 52474. 700 m. NE. of Nanseizan: station 19; Reg. No. 52472. 550 m. SE. of Naikotô: station 28; Reg. No. 52467. Wangwa: station 32; Reg. No. 52473. Wangwa: station 35; Reg. No. 52471. Wangwa: station 40; Reg. No. 52475.

Living: Central Honshū to Taiwan. Tyōsen. China.

Terebra t-makiyamai n. sp.

Pl. VI (I), Figs. 16a, 16b, 17a, 17b.

Shell rather small, subulate, consisting of 13–14 whorls; apical two embryonal, smooth and globular; the rest slightly convex with a distinct constriction or groove which defines subsutural band at about two-thirds of height of whorl. Surface longitudinally ribbed; ribs nearly straight or slightly oblique to right, about 20 on body-whorl, somewhat roof-like, discontinuous, interrupted by a subsutural groove. Interspaces between ribs wider, rather shallow and concave. Entire surface covered by fine growth lines and occasionally with a few obsolete revolving ones on the lower whorls. Body-whorl about 1/3 shell-height; periphery rounded; base somewhat concave with obsolete axial ribs at upper half. Aperture subrhombic, oblique, columella straight above, oblique below; canal short and recurved.

Dimensions (in mm.):

	1	2	3
Height	26.0	28.0	21.0
Diameter	6.2	6.2	5.5

T. longiscata DESHAYES¹⁾ from the Philippines is somewhat similar in form and sculpture yet not quite identical in details.

The specific name is given in honor of Mr. T. MAKIYAMA, a geologist of the Government General of Taiwan, in recognition of his contribution on the geology of the Island.

Fossil occurrence: Byōritu Beds.—Hakusyatōn: station 1; Reg. No. 52492. 1000 m. NW. of Rinsuikwa: station 5; Reg. No. 52490. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 52496. 1450 m. W. of Hokkō: station 14; Reg. No. 52491. 1000 m. E. of Hakusyatōn: station 20; Reg. No. 52495. 900 m. NW. of Keiyukwa: station 33; Reg. No. 52494. Wangwa: station 37; Reg. No. 52493. 1520 m. E. of Sinpo: station 68; Reg. No. 52497. Between Kōsui and Zyuna; Reg. No. 37427.

Terebra reticostaeformis, n. sp.

Pl. VI (I), Figs. 18a, 18b, 19a, 19b.

Shell resembling *T. reticostata* YOKOYAMA in sculpture, rather small, subulate. Whorls 13–15; apical two (or one and a half) embryonal, smooth, globular; the rest slightly convex with a distinct constriction at about two-thirds of height of whorl. Longitudinally ribbed; ribs rounded, about 15 on a whorl, nearly vertical, intervened by a subsutural incised groove; interspaces rather shallow, concave, nearly equal to ribs in breadth on upper part of spire, broadening gradually towards lower, and two times as broad on ultimate whorl; ribs on last whorl frequently almost obsolete at rounded periphery; incremental lines rather distinct and occasionally with a few, obsolete spiral lines in interspaces. Columella straight above, oblique to left below; canal short and recurved with a truncate base; aperture slightly oblique, ovate in outline.

1) TRYON: Man. Conch., 1 Ser., Vol. 7, p. 18, Pl. 4, fig. 58, 1885.

Dimensions (in mm.):

	1	2
Length	21.5	23.0
Diameter	5.0	5.0

This is more slender than *T. reticostata* YOKOYAMA¹⁾ from the Pliocene of Naganuma, near Tôkyô, and has fewer and more vertical ribs than *T. t-makiyamai*, mentioned above.

Fossil occurrence: Byôritu Beds.—900 m. NW. of Rinsuikwa: station 6; Reg. No. 52498. Wangwa: station 24; Reg. No. 52499. Wangwa: station 33; Reg. No. 52500.

***Terebra orthocostulata* n. sp.**

Pl. VI (I), Figs. 20a, 20b, 21a, 21b.

Similar in sculpture to *T. awajiensis* PILSBRY,²⁾ a recent species of Japan proper, but differs from that species in being invariably smaller and more narrowly subulate in form with whorls more flattened. Its body-whorl is relatively shorter and base more abruptly narrowed than in *T. nitida* HINDS.³⁾

Subsutural bands varied in development at different parts of this shell; subsutural band occurring on whorls, represented by punctate grooves in interspaces on those of middle part and those in upper part; defined by a continuous groove which traverses the ribs on whorls in lower part.

Dimensions (in mm.):

	1	2
Length	31.0	21.0
Diameter	6.0	5.0

Fossil occurrence: Byôritu Beds.—700 m. E. of Hakusyatón: station 3; Reg. No. 53103. 500 m. SE. of Zyb-tûsyôwan: station 14; Reg. No. 53103. Wangwa: station 14; Reg. No. 53106. Kozantyô: station 24; Reg. No. 53105. Wangwa: station 24; Reg. No. 53107. Wangwa: station 32; Reg. No. 53104. 700 m. SE. of Sankwakô: station 46; Reg. No. 53108. 300 m. E. of Hakusyatón: Reg. No. 37567. Between Kôsui and Zyuna; Reg. No. 53101.

***Terebra cumingii* DESHAYES, 1857**

Pl. VI (I), Figs. 13, 14, 15.

Terebra cumingii. REEVE, Conch. Icon., Vol. 12, Pl. 8, fig. 29, 1860: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 28, Pl. 8, fig. 49, 1885: MARTIN, Foss. von Java, Vol. 1, p. 9, Pl. 1, fig. 4, 1906: FISCHER, Paläont. von Timor, Vol. 15, p. 87, Pl. 214, figs. 63-64, 1927.

Shell subulate; many-whorled, apical three embryonal, smooth and rather high, situated slightly oblique to succeeding ones. Supra- and subsutural band distinct, granular; the former generally about two times larger than the latter. Surface sculptured by 2 or 3 revolving cords,

1) YOKOYAMA: Jour. Coll. Sci. Imp. Univ. Tôkyô, Vol. 39, Art. 6, p. 32, Pl. 1, fig. 1, 1920.

2) PILSBRY: Proc. Acad. Nat. Sci. Philad., p. 4, Pl. 4, figs. 3a, b, 1904.

3) TRYON: Man. Conch., 1 Ser., Vol. 7, p. 35, Pl. 10, figs. 93, 96, 1885.

coarsely latticed by intersection of longitudinal riblets. Most perfect specimen 57 mm. in height, and 10 mm. in diameter.

Type locality: China; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 6; Reg. No. 52477. Wangwa: station 14; Reg. No. 52478. 1000 m. E. of Hakusyatōn: station 25; Reg. No. 52476.

Living: China Sea.

Geologic distribution: Pliocene of Java, Timor, Seran and India.

Terebra torquata ADAMS and REEVE, 1850

Pl. VI (I), Fig. 25.

Terebra torquata. REEVE, Conch. Icon., Vol. 12, Pl. 15, fig. 69, 1860: LISCHKE, Jap. Meeres-Conch., Vol. 3, p. 39, 1874: SMITH, Proc. Zool. Soc., p. 184, 1879: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 20, Pl. 15, fig. 78, 1885: PILSBRY, Cat. Mar. Moll. Jap., p. 18, 1895: HIRASE, Terebridae Jap. Emp., p. 11, Pl. 3, figs. 30–32, 1917: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 51, No. 1789, 1931: YAGURA, Cat. Moll. Hyōgo-ken, p. 48, No. 625, 1932.

Resembles the preceding one in general aspects, but distinguished by its subequal subsutural bands and finer lattice-sculpture on entire surface. Most perfect specimen 32.5 mm. in height, and 6 mm. in diameter.

T. naumani figured by Dr. YOKOYAMA from the Byōritu Beds of Taiwan is not perfectly identical with its type figured in 1920 from the Pliocene Beds of Naganuma near Tōkyō; the Formosan shell looks more like a varietal form of *T. torquata*.

Type locality: Japan; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 6; Reg. No. 52483. 800 m. NE. of Hakusyatōn: station 12; Reg. No. 52482. Wangwa: station 14; Reg. No. 52480. Wangwa: station 38; Reg. No. 52484. Keiyukwa: station 52; Reg. No. 52479. 300 m. E. of Hakusyatōn; Reg. No. 37556. Sikō; Reg. No. 52481. Between Kōsui and Zyuna; Reg. No. 37411.

Living: Western Honshū and Kyūshū.

Terebra triseriata GRAY, 1834

Pl. VI (I), Figs. 11, 12.

Terebra triseriata. REEVE, Conch. Icon., Vol. 12, Pl. 18, fig. 52, 1860: DUNKER, Ind. Moll. Mar. Jap., p. 72, Pl. 5, figs. 19, 20, 1882: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 30, Pl. 9, fig. 56, 1885: WATSON, Chall. Gastr., Vol. 15, p. 379, 1886: PILSBRY, Cat. Mar. Moll. Jap., p. 18, 1895: HIRASE, Terebridae Jap. Emp., p. 18, Pl. 5, figs. 61, 62, 1917: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 52, No. 1799, 1931: NOMURA and ZINBŌ, Sci. Rep. Tōhoku Imp. Univ. Ser. 2 (Geol.), Vol. 16, No. 2, p. 131, No. 95, 1934.

Markedly slender shell having numerous whorls (about 40); decidedly much narrower and more elongated than the preceding two species, although nearly similar in surface sculpture.

T. triseriata of YOKOYAMA¹⁾ from the Pliocene of Tōtōmi is certainly distinct from the normal type of *T. triseriata*; and perhaps requires another specific name.

1) YOKOYAMA: Jour. Fac. Sci. Imp. Univ. Tōkyō, Sec. 2, Vol. 1, Pt. 9, p. 326, Pl. 38, fig. 1, 1926.

Approximate dimensions of the specimens are (in mm.):

	1	2
Height	71.0	91.0
Diameter	7.5	8.0

Type locality: The Philippines; Recent.

Fossil occurrence: Byōritu Beds.—Sikō; Reg. No. 49413.

Living: Central and Western Honshū. The Philippines.

Geologic distribution: Pleistocene of Kikai-zima.

Terebra prototextilis, n. sp.

Pl. VI (I), Figs. 24a, 24b.

Shell small, subulate. Whorls about 15, or more in number, apical ones broken off; nearly flat, longitudinally ribbed and spirally grooved; ribs 18–20 on a whorl, rounded, almost vertical, slightly arcuate, extending from suture to suture, separated by wider interspaces; transverse grooves impressed only in interspaces, very distinct, 4 on a whorl, uppermost one slightly stronger than others; subsutural band well defined. Body-whorl with 6 transverse grooves above rounded periphery; uppermost one transversing ribs. Base convex, obsoletely ribbed above, distinctly trisulcate below, uppermost sulcus largest. Outer lip and canal fractured.

Approximate dimensions: Length, ca. 25 mm., diameter, 5.1 mm.

Resembling in some respects *T. textilis* HINDS,¹⁾ a recent species of Japan and the Philippines, but appears to be specifically distinct. It has more flattened whorls, more vertical ribs with a different subsutural band.

T. hizenensis PILSBRY²⁾ is also related to the Formosan fossil, but is distinguishable by different surface ornamentation.

Fossil occurrence: Byōritu Beds.—Wangwa: station 15; Reg. No. 52487.

Terebra pereoa, n. sp.

Pl. VI (I), Figs. 22a, 22b, 23a, 23b.

Shell small, subulate. Whorls about 18, somewhat concave, separated by well impressed sutures. Protoconch consisting of 3 whorls, smooth and elongate-conic; succeeding few ones ornamented with granular infra- and supra-sutural bands, former being larger; rest or older whorls provided with another smaller revolving row of grains, which gradually become larger and nearly equal in size with those of supra-sutural cord in penultimate whorl. Body-whorl with four revolving rows of grains which are alternately large and small; grains connected by oblique longitudinal riblets (or coarse threads), and more or less elongated, especially on infra-sutural band. Periphery angulate; base concave, roughly sculptured by incremental lines. Aperture oblique, more or less quadratic in outline; canal short and recurved with a distinct fold behind.

1) TRYON: Man. Conch., 1 Ser., Vol. 7, p. 20, Pl. 5, figs. 75, 76, 1885.

2) PILSBRY: Proc. Acad. Nat. Sci. Phila., p. 4, Pl. 1, figs. 2, 2a, 1904.

Two specimens; their dimensions are (in mm.):

	1	2
Height	18.5	16.5
Diameter	5.0	3.5

The smaller one is relatively more granulated than the larger, but this slight difference is taken as mere variation.

In sculpture, this shell resembles *T. eoa* MAKIYAMA¹⁾ from the Pliocene of Tōtōmi, but is decidedly narrower. *T. bathyraphe* SMITH is perhaps also a similar species.

Fossil occurrence: Byōritu Beds.—700 m. E. of Hakusyatōn: station 3; Reg. No. 52485.

***Terebra melanacme* SMITH, 1875**

Terebra melanacme. HIRASE, Terebridae Jap. Emp., p. 6, Pl. 2, figs. 15, 16, 1917.

A single specimen; it agrees with an immature individual of the named species. Height, ca. 5 mm.

Type locality: Japan; Recent.

Fossil occurrence: Byōritu Beds.—900 m. NW. of Rinsuikwa: station 6; Reg. No. 52486.

Living: Central Honshū to Ryūkyū.

Geologic distribution: Pleistocene of Central Honshū.

***Terebra* species indet.**

A fragment of *Terebra* resembling somewhat *T. subvariegata* YOKOYAMA,²⁾ however, the ribs are quite reverse in direction.

Fossil occurrence: Byōritu Beds.—Hakusyatōn: station 1; Reg. No. 52488.

Family Conidae

Genus *Conus* LINNAEUS, 1758

***Conus odengensis* MARTIN, 1906**

Pl. VII (II), Figs. 8a, 8b, 9a, 9b.

Conus odengensis. MARTIN, Foss. von Java, Vol. 1, p.19, Pl. 3, figs. 39–44, 1906.

Conus oinouyei. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 30, Pl. 1, fig. 16, 1928.

Several well preserved specimens. The Formosan fossils are rather small, but identical with figures 39 and 39a of MARTIN. *C. oinouyei* YOKOYAMA cited above is perhaps an immature form of MARTIN's species in the essential characters being quite similar.

Some specimens from 400 m. SE. of Zyō-tūsyōwan measure (in mm.):

	1	2	3	4	5	6	7	8	9	10
Height	47.0	45.0	44.0	42.5	40.0	36.5	36.0	35.0	33.0	31.5
Diameter	26.0	23.0	23.0	23.5	23.0	20.0	20.0	18.0	17.0	16.5
Length of aperture.	41.0	38.0	38.0	38.0	35.0	31.0	32.0	30.0	28.5	27.0

1) MAKIYAMA: Mem. Coll. Sci. Kyōto Imp. Univ., Ser. B, Vol. 3, No. 1, Art. 1, p. 88, Pl. 4, fig. 13, 1927.

2) YOKOYAMA: Imp. Geol. Surv. Jap., Rep. No. 101, p. 28, Pl. 1, fig. 4, 1928.

Type locality: Java; Pliocene.

Fossil occurrence: Byôritu Beds.—1000 m. E. of Hakusyatô: station 4; Reg. No. 52412. 300 m. E. of Zyô-tûsyôwan: station 4; Reg. No. 37381. 400 m. N. of Kozantyô: station 5; Reg. No. 52408. 1200 m. N. of Hakusyatô: station 6; Reg. No. 52405. 400 m. SE. of Zyô-tûsyôwan: station 13; Reg. Nos. 52403, 52407. 500 m. SE. of Zyô-tûsyôwan: station 14; Reg. No. 52404. Wangwa: station 20; Reg. Geologic distribution: Pliocene of Ryûkyû(?); Pliocene of Sumatra; Pliocene and Miocene of Java.

Conus djarianensis MARTIN, 1906

Pl. VII (II), Figs. 13a, 13b, 14a, 14b.

Conus djarianensis. MARTIN, Foss. von Java, p. 20, Pl. 3, figs. 45–50, 1906.

This resembles the preceding one in some respects, but is quite distinct. The body-whorl of this species has a straighter outline and is slightly more acutely angled at the shoulder; the basal grooves are coarser and fewer, being restricted to a smaller area. The shell never grows as large as that species. The Formosan specimens show considerable variation in regard to the height of the spire; however, the young forms, as a rule, have a longer spire than the adult.

Some specimens from 400 SE. of Zyô-tûsyôwan measure (in mm.):

	1	2	3	4	5	6	7	8	9	10
Height	42.5	36.2	30.0	26.0	23.0	22.0	19.0	18.0	16.0	13.5
Diameter	21.5	20.0	15.5	13.0	12.0	11.0	9.5	9.0	8.0	6.5
Length of aperture.	35.0	31.5	25.0	20.0	19.0	18.0	15.0	14.0	12.0	10.0

Type locality: Java; Miocene.

Fossil occurrence: Byôritu Beds.—300 m. E. of Zyô-tûsyôwan: station 4; Reg. No. 37352. 400 m. SE. of Zyô-tûsyôwan: station 13; Reg. No. 52414. 500 m. SE. of Zyô-tûsyôwan: station 14; Reg. No. 52422. Wangwa: station 14; Reg. No. 52416. Wangwa: station 21; Reg. No. 52420. Wangwa: station 23; Reg. No. 52415. Wangwa: station 24; Reg. No. 52417. 1000 m. E. of Hakusyatô: station 25; Reg. No. 52421. E. of Sinpo: station 69; Reg. No. 52424. Sikô; Reg. No. 48990.

Geologic distribution: Miocene of Java.

Conus ngavianus MARTIN, 1906

Pl. VII (II), Figs. 11, 12.

Conus ngavianus. MARTIN, Foss. von Java, Vol. 1, p. 23, Pl. 4, figs. 57–61, 1906; TESCH, Paläont. von Timor, Vol. 5, p. 21, Pl. 124, fig. 24, 1915.

Only two specimens; their dimensions (in mm.) are:

	1	2
Height	45.0	35.0
Diameter	21.0	16.0
Length of aperture	40.0	30.0

Medium in size; outlines straight, rather elongate, very broadly and acutely shouldered; test moderate in thickness. Spire low and concave-conical with pointed apex. Body-whorl straight in lateral view, provided with narrow and distant spiral grooves which are rather indistinct on upper two-thirds of whorl. Aperture very narrow, obliquely straight and parallel.

Type locality: Java; Pliocene.

Fossil occurrence: Byōritu Beds.—Wangwa: station 24; Reg. No. 52402.

Geologic distribution: Pliocene of Java, Timor, and Sumatra; Miocene of Java.

Conus flavidus LAMARCK, 1810

Conus flavidus. REEVE, Conch. Icon., Vol. 1, Pl. 28, fig. 207, 1843: TRYON, Man. Conch. 1 Ser., Vol. 6, p. 44, Pl. 13, figs. 48–50, 1884: SUGITANI, Cat. Luchu Shells, p. 30, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 76, No. 891, 1928.

One specimen; height, about 35 mm.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Ryūkyū Limestone.—Hanpeizan; Reg. No. 52406.

Living: Kyūsyū and Ryūkyū. Indian Ocean. Red Sea. E. coast of Africa.

Geologic distribution: Post-Pleistocene of Central Honshyū; Pleistocene of the Philippines; Post-Pliocene of Celebes.

Conus vexillum GMELIN, 1792

Conus vexillum. REEVE, Conch. Icon., Vol. 1, Pl. 1, fig. 3, 1843: TRYON, Man. Conch. Icon., 1 Ser., Vol. 6, p. 39, Pl. 11, figs. 12a–14, 1884: SUGITANI, Cat. Luchu Shells, p. 30, 1926: KURODA, Cat. Shell-bearing Moll., Amami-Ōshima, p. 70, No. 882, 1928.

One ill-preserved specimen; approximate dimensions, height, 67 mm., diameter, 35 mm. A large *Conus* with short spire; body-whorl almost straight in lateral view and smooth except for a few basal threads and alternating grooves. Secondary calcification makes specific identity somewhat doubtful.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 13; Reg. No. 52401.

Living: Kyūsyū and Ryūkyū. The Philippines. Java. Indian Ocean. E. coast of Africa. New Caledonia. Samoan Isles.

Conus yabei, n. sp.

Pl. VII (II), Figs. 5a, 5b, 6a, 6b.

Shell medium in size, narrow and rather elongated, height slightly exceeding $2\frac{1}{2}$ times diameter. Spire rather high, considerably concave in lateral view with apex acute. Whorls 15, apical 2 embryonal, smooth and globular, succeeding ones angulated at lower two-thirds, finely plicated, or crenulated especially marked by on surface below angle, lower or most aged whorls flat or sometimes slightly concave in middle. No spiral lines. Body-whorl almost straight in lateral profile, peripheral angle acute, smooth, except for a few unequal basal threads which are coarser towards lower. Incremental lines fine and not prominent. Aperture very narrow, sides parallel; inner lip slightly oblique at base.

The specimens measure (in mm.):

	1	2
Height	43.0	ca. 43.0
Diameter	16.0	17.0
Length of aperture	33.0	34.0

Two specimens, which faintly retain their original coloration. *C. bayani* JOUSSEAUME¹⁾ and *C. ngavianus* MARTIN²⁾ are somewhat related to this new species but the present shell has a longer spire.

Fossil occurrence: Byōritu Beds.—400 m. SE. of Zyō-tūsyōwan: station 13; Reg. No. 52367.

Conus coronatus GMELIN, 1792

Pl. VII (II), Fig. 15.

Conus d'orbignyi (ANDOUIN), 1831

Pl. VII (II), Fig. 1.

Conus d'orbignyi. REEVE, Conch. Icon., Vol. 1, Pl. 4, fig. 17, 1843: KÜSTER u. WEINKAUFF in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 4, Pt. 2, p. 258, Pl. 43, fig. 1, 1875: KIENER, Spec. Coq. viv., p. 33, Pl. 13, fig. 3, 1835-1857: SOWERBY, Thes. Conch., Vol. 3, p. 12, Pl. 16, fig. 368, 1866: DUNKER, Ind Moll. Mar. Jap., p. 93, 1882: TRYON, Man. Conch., 1 Ser., Vol. 6, p. 75, Pl. 23, figs. 95, 96, 1884: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 48, No. 1639, 1931.
?Conus comatosa. PILSBRY, Proc. Acad. Nat. Sci. Phila., p. 6, Pl. 1, fig. 9, 1904 (=C. dormitor PILSBRY).
Conus insculptus. TESCH, Paläont. von Timor, Vol. 5, p. 19, Pl. 73, figs. 13, 14, 1915. (not of KIENER).

Several well preserved specimens; largest one 60 mm. in height, and 20 mm. in diameter. Quite identical with the Chinese specimen figured by KIENER in the work above cited. *C. comatosa* PILSBRY slightly differs from the present species in sculpture of the spire. According to TRYON, *C. planicostulatus* SOWERBY and *C. gemmulatus* SOWERBY are synonyms.

Type locality: China; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 40; Reg. No. 52364. Sikô; Reg. Nos. 48976, 52365.

Living: Western Honshû. China. The Philippines.

Geologic distribution: Pleistocene of Kikai-zima(?); Pliocene of Timor.

Conus pseudosulcatus, n. sp.

Pl. VII (II), Figs. 3a, 3b.

Conus sulcatus var. MARTIN, Foss. von Java, Vol. 1, p. 12, Pl. 1, figs. 11, 12, 1906.

Shell of medium size, elongate-conic; test moderate in thickness. Spire conical, rather high, slightly concave in lateral outline, with pointed apex. Whorls about 12, apical 2 embryonal, smooth and globular; succeeding 2 also globular; others regularly increasing, and slightly shouldered; angle of shoulder somewhat projecting immediately above suture, surface above it concave and furnished with 4-6, subequal revolving threads, interspaces wider and provided with a few unequal spiral threads. Angle indistinctly granulate on upper whorls and broadly undulate on lower, forming distant, elongate nodules on periphery. Suture impressed, and also undulate. Body-whorl below peripheral angle nearly straight or slightly convex in side view, ornamented with about 20 subequal revolving cords which are beautifully punctate in aged specimens; entire surface covered by numerous, fine growth lines which are marked best in grooves of body-whorls. Aperture narrow, slightly wider in lower part truncated at base. Height, 50 mm.; diameter, 23 mm.

This species closely resembles *C. sulcatus* HAWASS living in Chinese waters but is distinguished by grooves on body-whorl being wider than cords

C. ornatissimus MARTIN mentioned below is also related to the present species, but that species is somewhat narrower and has more numerous spiral grooves and cords (more than 30) on body-whorl.

C. sulcatus of TESCH¹⁾ is a varietal or at least subspecifically different from the present new species; the two differ slightly in form.

Fossil occurrence: Byōritu Beds.—700 m. NE. of Nanseizan: station 19; Reg. No. 52335. Wangwa: station 24; Reg. No. 52336. Wangwa: station 34; Reg. No. 52334.

Geologic distribution: Pliocene of Java.

Conus ornatissimus MARTIN, 1906

Pl. VII (II), Figs. 4a, 4b.

Conus ornatissimus. MARTIN, Foss. von Java, Vol. 1, p. 12, Pl. 1, figs. 8–10, 1906: TESCH, Paläont. von Timor, p. 16, Pl. 73, figs. 3–6, 1915: DICKERSON, Rev. Philip. Paleont., Pl. 2, fig. 11, 1922: FISCHER, Paläont. von Timor, Vol. 15, p. 104, Pl. 214, fig. 87, 1927.

Several well preserved specimens; figured one 38 mm. in height, and 16 mm. in diameter.

The Formosan specimens agree perfectly with the typical examples of the species, which are excellently illustrated by MARTIN and by TESCH in the works cited above, though invariably smaller. *C. mucronatus* REEVE from the Philippines is perhaps the nearest recent ally of this species.

Type locality: Java; Miocene.

Fossil occurrence: Byōritu Beds.—400 m. N. of Kozantyō: station 5; Reg. No. 52340. 700 m. NE. of Nanseizan: station 19; Reg. No. 52342. Wangwa: station 24; Reg. No. 52339. Wangwa: station 33; Reg. No. 52343.

Geologic distribution: Pliocene of Timor and Seran; Pliocene(?) and Miocene of Java and the Philippines.

Conus aculeiformis REEVE, 1844

Pl. VII (II), Figs. 10a, 10b.

Conus aculeiformis. REEVE, Conch. Icon., Vol. 1, Pl. 44, fig. 240, 1844: TRYON, Man. Conch., 1 Ser., Vol. 6, p. 75, Pl. 23, figs. 90–94, 1884.

Conus insculptus. MARTIN, Foss. von Java, Vol. 1, p. 14, Pl. 1, fig. 18, 1906 (not of TESCH).

Conus longurionis. MARTIN, ibid., p. 16, Pl. 2, figs. 20–22, 1906.

Conus vimineus. MARTIN, ibid., p. 16, Pl. 2, figs. 24–25, 1906.

Conus kikaiensis. PILSBRY, Proc. Acad. Nat. Sci. Phila., p. 6, Pl. 1, fig. 8, 1904: YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 29, Pl. 1, fig. 7, 1928: NOMURA and ZINEŌ, Sci. Rep. Tōhoku Imp. Univ. Ser. 2, Vol. 16, No. 2, p. 131, No. 98, 1934.

Conus comatosa. YOKOYAMA, Jour. Fac. Imp. Univ. Tōkyō, Sec. 2, Vol. 2, Pt. 7, p. 338, Pl. 66, fig. 2, 1928 (not of PILSBRY).

Several well preserved specimens; largest one, 43 mm. in height, and 14 mm. in diameter.

Shell narrow and long; spire high and conical. Angle of whorl almost smooth projecting slightly above suture, surface above it flat, sloping and with a few spiral cords. Body-whorl

1) TESCH: Paläont. von Timor, Vol. 5, p. 16, Pl. 73, fig. 12, 1915.

below peripheral angle nearly straight in outline with many spiral grooves, often weaker on upper part, stronger and closer towards base, in this way merging apparently into *C. comatosaformis* YOKOYAMA, mentioned below. Entire surface covered by numerous fine growth lines, especially marked in grooves.

In form and sculpture, this species is related to *C. sondaianus* MARTIN and *C. palabuanensis* MARTIN both from the Pliocene of Java; it is also hardly distinguishable from *C. australis* LAMARCK, and if it proves to be identical with LAMARCK's species, the specific name *australis* should be used.

Type locality: The Philippines; Recent.

Fossil occurrence: Byôritu Beds.—E. of Rinsuikwa: station 2; Reg. No. 52358. 700 m. E. of Hakusyatón: station 3; Reg. No. 52354. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 52351. No. 52580. Between Kôsui and Zyuna; Reg. No. 37336.

Living: China. The Philippines. Indian Ocean. Australia.

Geologic distribution: Pleistocene of Kikai-zima; Pliocene of Kyûsyû; Pliocene and Miocene of Java; Pliocene of Sumatra, Timor and Seran.

Conus comatosaformis YOKOYAMA, 1928

Conus comatosaformis. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 29, Pl. 1, fig. 10, 1928.

Several rather well preserved specimens; one of them 44 mm. in height, and 14.5 mm. in diameter.

As stated in the preceding description, this species may prove to be a varietal form, or at least only a subspecies of *C. aculeiformis* by future study; the spiral grooves on the body-whorl seem to be considerably variable in their number and strength.

Type locality: Taiwan; Pliocene.

Fossil occurrence: Byôritu Beds.—1000 m. NW. of Rinsuikwa: station 5; Reg. No. 52345. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 52347. Bôsiho: station 13; Reg. No. 52344. 1450 m. W. of Hokkô: station 14; Reg. No. 52346. Keiyukwa: station 52; Reg. No. 52348.

Conus bonus n. sp.

Pl. VII (II), Figs. 7a, 7b.

Shell medium in size, elongate conic; test rather thin. Spire short, outline nearly straight, or slightly concave, acutely pointed at top of spire. Whorls about 12, apical ones smooth,

globular, embryonal; rest more or less concave with peripheral angle projecting above suture; angles on upper (about 5 whorls) whorls minutely beaded or crenulated, those on lower ones almost smooth. Spirally striate; striae rather unequal, 4-5 between suture and angle, crossed by fine oblique growth lines. Body-whorl almost straight in lateral outline, acutely angulated at periphery; densely and spirally grooved, or ridged throughout, grooves stronger on lower one-third than upper two-thirds; aperture narrow, obliquely straight, sides parallel.

Three beautifully preserved specimens; one figured, 42.5 mm. in height, 20.5 mm. in diameter, and 36.5 mm. in length of aperture.

In form, this shell resembles the recent Japanese species *C. sieboldi* REEVE,¹⁾ but it certainly differs from that species in the surface sculpture. The Formosan fossil has spirals which are finner, more numerous and cover the entire surface, while *C. sieboldi* is said to have only a few distant grooves on the basal part of the body-whorl.

C. sieboldianus MAKIYAMA²⁾ is a smaller shell with a more elongated spire, and has a slightly different ornamentation.

Fossil occurrence: Byōritu Beds.—Wangwa: station 24; Reg. No. 52393. Wangwa: station 33; Reg. No. 52581.

Conus significatus, n. sp.

Pl. VII (II), Figs. 2a, 2b.

Shell medium in size, obconical: test moderately thick. Spire very low; apex acute, decidedly concave in general outline. Whorls 12, apical ones embryonal, smooth and globular; post-embryonal ones shouldered and spirally striated; angle of shoulder minutely granulated on earlier whorls, more or less undulate on later ones; striae 4-5 in number, crossed by rather distinct, oblique, growth lines, making surface appear more or less granular. Body-whorl large, outline straight, peripheral angle acute; spirally grooved throughout; grooves about 45, rather unequal, wider on lower part than on upper. Outer lip fractured; aperture apparently narrow, straight, parallel sided as in *C. sieboldi*.

One specimen; 47 mm. in height, 22 mm. in diameter, and 42 mm. in the length of aperture.

Compared with the preceding species, this shell has a spire less elevated and more concave in outline; revolving grooves and ridges are more extensively marked upon its body-whorl. *C. decollatus* MARTIN from the Neogene of Java somewhat resembles the Formosan fossil, but differs in its much smaller shell with a different sculpture.

Fossil occurrence: Byōritu Beds.—Wangwa: station 24; Reg. No. 52394.

Conus species indet.

A small, imperfect mould of *Conus* resembling somewhat *C. hardi* MARTIN of the Javan Tertiary.

Fossil occurrence: Kaizan Beds(?)—Dakaho; Reg. No. 28142.

1) REEVE: Conch., Icon., Vol. 1, supp. Pl. 1, fig. 269, 1844.

2) MAKIYAMA: Mem. Coll. Sci. Kyōto Imp. Univ. Ser. B, Vol. 3, No. 1, Art. 1, p. 92, Pl. 4, figs. 16, 17, 1927.

Family **Turridae**Genus **Turris** (BOLTEN) RÖDING, 1798Subgenus **Turris**, s. s.**Turris (Turris) oxytropis** (SOWERBY), 1833

Numerous well preserved specimens. The following oriental forms are considered to be specifically identical with this as there is no good ground for separation; "*Pleurotoma*" *nobilis* HINDS, "*Pleurotoma*" *albicarinata* SOWERBY, "*Pleurotoma*" *leucotropis* ADAMS and REEVE, and "*Pleurotoma*" *gendinganensis* MARTIN.

Type locality: Panamic region, Pacific coast; Recent.

Living: Central and Western Honsyû. China.

Turris (Turris) tigrinaeformis, n. sp.

Pl. VII (II), Figs. 32a, 32b.

More or less similar in general respects to *T. tigrina* (LAMARCK) from the tropic seas of Asia, but on comparison side by side, the two are specifically distinguishable in the following respects: the Formosan specimens are a trifle broader, have a slightly shorter and recurved canal.

Several specimens; largest one 45 mm. in height; figured one lacking outer lip, 30 mm. in height, and 13 mm. in diameter.

1) DUNKER: Moll. Jap., p. 3, Pl. 1, fig. 3, 1861.

Fossil occurrence: Byôritu Beds.—300 m. E. of Zyô-tûsyôwan: station 4; Reg. No. 37321. 400 m. SE. of Zyô-tûsyôwan: station 13; Reg. No. 51472. Wangwa: station 14; Reg. No. 51473. Subgenus **Gemmula** WEINKAUFF, 1876

Turris (Gemmula) granosa (HEBLING), 1779

Turris (Gemmula) granosa. MAKIYAMA, Mem. Coll. Sci. Kyôto Imp. Univ., Ser. B, Vol. 3, No. 1, Art. 1, p. 95, 1927; NOMURA and ZINBÔ, Sci. Rep. Tôhoku Imp. Univ. Ser. 2 (Geol.), Vol. 16, No. 2, p. 132, No. 104, 1934.

Pleurotoma carinata var. *woodwardi*. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 32, pl. 1, fig. 17, 1928.

Pleurotoma asukana. YOKOYAMA, Jour. Fac. Sci. Imp. Univ. Tôkyô, Sec. 2, Vol. 2, Pt. 7, p. 340, Pl. 66, fig. 10, 1928 (not 1926).

Several well preserved specimens, both adult and young; a specimen from Sikô, ca. 11 mm. in diameter, and 47 mm. in height, the largest. Precise accounts of this species are found in the work of Dr. MAKIYAMA cited above.

Type locality of *T. granosa*; Indian Ocean. That of *T. carinata woodwardi*; Pliocene of Java.

Fossil occurrence: Byôritu Beds.—1000 m. NW. of Rinsuikwa: station 5; Reg. No. 52451. Wangwa: station 14; Reg. No. 51503. Wangwa: station 33; Reg. No. 51497. 300 m. E. of Sankwakô: station 39; Reg. No. 51502. 1550 m. E. of Sinpo: station 69; Reg. No. 51501. W. of Sikô: Reg. No. 48998. Western side of Syôgun-yama; Reg. No. 37343.

Living: Central Honsyû to Kyûsyû. Indian Ocean. Persian Gulf.

Geologic distribution: Pleistocene of Kikai-zima; Pliocene of Honsyû, Sikoku and Kyûsyû; Pliocene of Java, Sumatra, Timor and Seran; Miocene of Java, Borneo and the Philippines.

Genus **Turricula** SCHUMACHER, 1817

Turricula byorituensis n. sp.

Pl. VI (I), Figs. 28a, 28b, 29a, 29b.

Surcula javana. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 33, Pl. 1, fig. 12, 1928 (not of LINNAEUS).

Shell resembling *T. javana* (L.) the genotype, in general form and sculpture, medium in size, and longly fusiform, with 12 carinated whorls. Spire rather high, slightly shorter than aperture including canal, apical angle about 35°; uppermost two whorls embryonal, smooth and globular, the first standing somewhat side-way to second; rest strongly carinated; carina situated much nearer to lower suture than to upper, with about 18, more or less oblique tubercles on each whorl; concave above, vertically receding below carina. Suture impressed, well defined by sub- and supra-sutural revolving cords, latter found only in lower whorls of large specimen. Entire surface closely sculptured by unequal spiral threads and curved growth lines, especially marked on concave surface. Body-whorl convex below carina, rounded periphery, and narrowed

base; ornamented with many unequal spiral threads, upper ones strongly granulated. Aperture nearly rhombic in form, angulated behind and rather abruptly contracted in front; canal long, somewhat curved; inner lip smooth with thin and narrow callous deposit; outer lip thin, very sharp, produced forwards, smooth within, with a deep and wide sinus at about the center of concave surface.

Measurements (in mm.)	Specimens from Sikô, the type locality.				Those from 700 m. East of Hakusyatô.						
	1	2	3	4	5	6	7	8	9	10	11
Height	41.0	39.0	39.0	37.0	40.0	35.0	34.0	33.0	33.0	33.0	31.5
Diameter	14.5	14.5	13.0	13.0	13.5	12.5	12.0	11.5	11.0	10.5	10.5
Height/Diameter	2.8+	2.7—	3	2.9—	3—	2.8	2.8+	2.9—	3	3.1+	3

This species is similar to *T. javana* (L.)¹⁾ from Java, China and Japan, in form and sculpture, but the latter is larger, possessing broader whorls, and a proportionally shorter spire.

Fossil occurrence: Byôritu Beds.—Hakusyatô: station 1; Reg. No. 52137. 700 m. E. of Hakusyatô: station 3; Reg. No. 52116. Wangwa: station 5; Reg. No. 52124. Wangwa: station 6; Reg. No. 52117. 900 m. Turricula wangwana, n. sp.

Pl. VI (I), Figs. 37a, 37b.

Shell medium in size, longly fusiform, spire shorter than aperture and canal. Apical whorls lost and later 8 whorls preserved; whorls convex though slightly concave at about upper

1) *Turricula javana* (L.) = *T. nodifera* (LAMARCK).

one-third; longitudinally ribbed and spirally striated. Ribs very strong, rounded and slightly oblique to left, about 10 on each whorl, separated by somewhat wider interspaces. Ribs much narrower than their intervals and vanish towards rounded periphery. Spirals very unequal and numerous, 5 on convex surface of penultimate whorl, rather prominent; entirely devoid on concave portion below suture. Aperture elongated; canal long, widely open and very slightly recurved; inner lip smooth with uniform callosity except at very base. Outer lip unfortunately fractured, possibly thin; sinus apparently deep, wide and situated at concave portion of shell as indicated by flexuous growth lines.

The strong axial ribs, long aperture and canal are the most characteristic features of this species. No allied forms recent or fossil have been reported from the orient, except for "*Pleurotoma (Surcula) rembangensis* MARTIN¹⁾ from the Pliocene of Java.

A single specimen. Length, 35 mm., diameter, 11 mm.

Fossil occurrence: Byōritu Beds.—Wangwa: station 24; Reg. No. 52221.

Turridula sobrina (YOKOYAMA), 1923

Turridula (Surcula) sobrina. MAKIYAMA, Mem. Coll. Sci. Kyōto Imp. Univ., Ser. B, Vol. 3, No. 1, Art. 1, p. 100, 1927.

Drillia sobrina. YOKOYAMA, Jour. Coll. Sci. Tōkyō Imp. Univ., Vol. 45, Art. 2, p. 5, Pl. 1, fig. 1, 1923; YOKOYAMA, Jour. Fac. Sci. Imp. Univ. Tōkyō, Sec. 2, Vol. 1, Pt. 9, p. 331, 1926.

Two imperfect specimens; specific identification somewhat questionable.

Type locality: Tōtōmi, Japan; Pliocene.

Fossil occurrence: Byōritu Beds.—Wangwa: station 24; Reg. No. 53423.

Geologic distribution: Pliocene of Tōtōmi, Central Honshū.

Genus **Clavatula** LAMARCK, 1801

Clavatula taiwanensis, n. sp.

Pl. VI (I), Figs. 59a, 59b.

Shell resembling *C. consimilis* (SMITH) in general aspect; rather small, ovately fusiform, turreted, spire acute; apical angle about 30°. Whorls 10½ in number, regularly increasing, broader than high, separated by well defined marginated sutures. Protoconch globular, rather high, smooth, consisting of 1½ whorls; others concave above, shouldered at middle, vertical or at least slightly concave below. Body-whorl nearly equal to spire in length, evenly rounded at periphery, and somewhat contracted at base. Surface ornamentation consists of longitudinal plicae and spiral lirae. Plicae flexuous, about 17 on shoulder of last whorl, branching to 25 on periphery; nodulous at lower suture, and more prominently double beaded at angle. 2–3 revolving series of smaller nodules on surface beneath shoulder; body-whorl ornamented by a number of series of small nodules except at base where only revolving ridges are present. Lirae connecting the nodules rather unequal, 2–3 in number on surface below angle, and 3 or often more above it, and 1 on sutural band. About 10 lirae on body-whorl, separated

1) MARTIN: Foss. von Java, Vol. 1, p. 292, Pl. 43, fig. 701, 1906.

by somewhat wider interspaces, occasionally with an interstitial thread. Upper 4 whorls extending to protoconch smaller and entirely devoid of spirals except for the subsutural band and beaded shoulder. Aperture equal to about one-third entire shell-length, rather narrow and passing gradually into a short and slightly recurved canal below. Columella more or less flexuous, turned to left below; callous of inner lip narrow, smooth and moderately thick, being almost free from remaining part of base; outer lip thin, evenly curved, with distant transverse lirae within, leaving narrow smooth marginal area; sinus shallow and wide, placed at angle of shoulder.

Numerous well preserved specimens; the following are the measurements (in mm.) of the type specimens collected by Mr. S. ANDÔ from 1450 m. W. of Hokkô, Obokô, Sintiku-syû; station 14.

	1	2	3	4
Height	17.0	16.0	15.0	13.0
Diameter	5.5	5.0	5.0	4.5
Height/Diameter ...	3.1	3.2	3.0	2.9-

Clavatula taiwanensis greatly resembles *Clavatula consimilis* (SMITH)¹⁾ from Japan and China, but differs in having a more granular sculpture, and by its double beaded angle of shoulder. *Clavatula patruelis* (SMITH),²⁾ *Clavatula dainichiensis* (YOKOYAMA),³⁾ *Clavatula kakegawensis* MAKIYAMA⁴⁾ are also somewhat related to it, but invariably much longer in body-whorl. The Malayan fossil ally of the present species is perhaps "*Pleurotoma (Drillia) djocdjocartae* MARTIN,"⁵⁾ but the two may be distinguished by different ornamentation; MARTIN's species has a relatively larger body-whorl and a much finer sculpture on the surface.

Several Japanese Neogene forms of *Clavatula*, *C. dainichiensis muraokensis*, *C. dainichiensis ninomiyana*, *C. dainichiensis nisiyatensis*, and *C. dainichiensis makiyamai* were named by Mr. Y. OTUKA of the Earthquake Research Institute, Tôkyô Imperial University, in 1930⁶⁾; unfortunately, these have been neither figured nor described, I can not bring the present new species into comparison with them.

Fossil occurrence: Byôritu Beds.—300 m. E. of Zyô-tûsyôwan: station 4; Reg. No. 51596. Wangwa: station 5; Reg. No. 52060. 1000 m. NW. of Rinsuikwa: station 5; Reg. No. 52111. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 52112. 1100 m. NW. of Hakusyatô: station 9; Reg. No. 52113. Bôsiho: station 13; Reg. No. 52114. 1450 m. W. of Hokkô: station 14; Reg. No. 51597. Clavatula serana FISCHER, 1927

Pl. VI (I), Figs. 58a, 58b.

Clavatula djocedjocartae var. *serana*. FISCHER, Paläont. von Timor, Vol. 15, p. 98, Pl. 214, fig. 77, 1927.

Several specimens; one measured: diameter, 7 mm., height, ca. 20 mm.

Shell small and fusiform in outline, whorls somewhat turreted. Surface ornamented with a spiral series of granules, fine flexuous longitudinal threads, and a prominent, somewhat nodulous subsutural cord. The Formosan specimens agree in all respects with *C. djocedjocartae serana* from Timor, although the embryonal whorls, which are said to be characteristic in this species, are unfortunately broken.

This is not "*Drillia*" *serana* FISCHER, 1927.

Type locality: Seran; Pliocene.

Fossil occurrence: Byôritu Beds.—700 m. E. of Hakusyatô: station 3; Reg. No. 52115. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 53551. Wangwa: station 15; Reg. No. 52975. Wangwa: station 28; Reg. No. 52977. Keiyukwa: station 50; Reg. No. 52976. 940 m. NW. of Keiyukwa: station 55; Reg. No. 53550.

Geologic distribution: Pliocene of Timor; Miocene of Java(?).

Genus Astenostoma HARRIS and BURROWS, 1891**Astenostoma epitonica (FISCHER), 1927**

Pl. VI (I), Fig. 44.

Oligotoma epitonica. FISCHER, Paläont. von Timor, Vol. 15, p. 98, Pl. 214, fig. 78, 1927.

Several specimens; one figured, 12 mm. in height, and 4.5 mm. broad, it is the largest in the collection.

Type locality: Seran; Pliocene.

Fossil occurrence: Byôritu Beds.—Wangwa: station 6; Reg. No. 52250. 1000 m. E. of Hakusyatô: station 25; Reg. No. 52249. Wangwa: station 33; Reg. No. 52251. 500 m. E. of Sankwakô: station 41; Reg. No. 52980. 1550 m. E. of Sinpo: station 69; Reg. No. 51599.

Geologic distribution: Pliocene of Seran.

Astenostoma perepitonica, n. sp.

Pl. VI (I), Figs. 43a, 43b.

Shell resembling *A. epitonica* mentioned above but smaller and relatively broader, has suture more indistinct, and two subequal keels on each whorl. Two oblique folds on inner lip more or less obsolete.

Approximate dimensions: Height, 9.5 mm.; diameter 4.5 mm.

Fossil occurrence: Byôritu Beds.—1100 m. NE. of Hakusyatô: station 9; Reg. No. 52252.

Astenostoma vertebrata (SMITH), 1875

Pl. VI (I), Figs. 35a, 35b.

Astenostoma vertebrata. KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 72, No. 921, 1928: NOMURA, Sci. Report Tōhoku Imp. Univ., Ser. 2 (Geol.), Vol. 15, No. 2, p. 119, No. 379, 1932.

Pleurotoma vertebrata. SMITH, Proc. Zool. Soc., p. 186, Pl. 19, figs. 6, 6a, 1879: TRYON, Man. Conch., 1 Ser., Vol. 6, p. 170, Pl. 3, figs. 29, 29a, 1884: PILSBRY, Cat. Mar. Moll. Jap., p. 15, 1895.

One well preserved specimen. It agrees well with fig. 6a given by SMITH in the work cited above.

Dr. YOKOYAMA's "*Pleurotoma*" *vertebrata*¹⁾ from the Upper Musasino Formation of Kadusa is quite distinct from the present species; the Musasino shell can be identified with *Suavodrillia declivis* (MARTIN) from Northern Japan as pointed out by Mr. T. KURODA.

Type locality: Persian Gulf.

Fossil occurrence: Byōritu Beds.—600 m. SE. of Zyō-tūsyōwan: station 17; Reg. No. 53406.

Living: Western Honshū to Southern Kyūshū. Persian Gulf.

Geologic distribution: Post-Pleistocene, Pleistocene and Pliocene of Honshū.

Genus **Clavus** MONTFORT, 1810Subgenus **Clavus** s. s.**Clavus (Clavus?) tjibaliungensis (MARTIN), 1906**

Pl. VI (I), Fig. 40.

Pleurotoma (Surcula) tjibaliungensis. MARTIN, Foss. von Java, Vol. 1, p. 32, Pl. 5, fig. 78, 1906: TESCH, Paläont. von Timor, Vol. 5, p. 30, Pl. 78, fig. 61, 1915.

?*Drillia serana*. FISCHER, Paläont. von Timor, Vol. 15, p. 95, Pl. 214, fig. 76, 1927.

Several well preserved specimens. The Formosan fossils are identical with MARTIN's species in form; but have fine revolving impressed lines lacking in the type. This character, according to TESCH, is not sufficient to separate them into two distinct species. A specimen from Kozantyō measures 25 mm. in length, and 9 mm. in diameter.

Type locality: Java; Pliocene.

Fossil occurrence: Byōritu Beds.—Kozantyō: station 24; Reg. No. 51595. Western side of Syōgun-yama; Reg. No. 37324.

Geologic distribution: Pliocene of Java, Timor and Seran(?).

Clavus (Clavus?) braunsi (YOKOYAMA), 1920

Pleurotoma (Drillia) braunsi. YOKOYAMA, Jour. Coll. Sci. Imp. Univ. Tōkyō, Vol. 39, Art. 6, p. 40, Pl. 1, fig. 25, 1920.

1) YOKOYAMA: Jour. Coll. Sci. Imp. Univ. Tōkyō, Vol. 44, Art. 1, p. 37, Pl. 1, fig. 26, 1922.

One specimen. Shell small, strongly ribbed, polished, no spirals. Base remarkably contracted, canal comparatively long. The specimen is quite similar to YOKOYAMA's species, and is tentatively referred to that species, although it is slightly smaller.

Type locality: Kosiba, Central Honsyû; Pliocene.

Fossil occurrence: Byôritu Beds.—1000 m. E. of Hakusyatô: station 25; Reg. No. 52220.

Geologic distribution: Pliocene of Honsyû and Sikoku.

Clavus (Clavus?) rinsuikawaensis, n. sp.

Pl. VI (I), Figs. 45a, 45b.

Shell slender, rather small; test moderately solid, spire high. Whorls $10\frac{1}{2}$, convex, regularly increasing, ornamented throughout with 9, oblique, axially elongate ribs and fine, obscure spiral lirae excepting apical $1\frac{1}{2}$ whorls which are globular and smooth; whorls separated by well impressed sutures; interspaces between ribs much wider than ribs, concave at base. Body-whorl almost equal to half shell-height, well rounded at periphery where ribs are almost obsolete. Aperture elongate, longly ovate; outer lip thickened externally at a short distance from sharp edge, smooth internally; inner lip narrow, smooth and distinctly bounded from its outer margin; columella nearly vertical; canal somewhat fractured, but apparently short, wide and almost straight; sinus rather shallow, situated slightly apart from suture. Height, 17.5 mm.; diameter, 6.5 mm.

In form, this shell somewhat resembles *Inquisitor? eoa* MAKIYAMA¹⁾ from the Pliocene of Tôtômi, but is distinguished by its narrower and sharper axial ribs, and much broader interspaces. It has more ribs than "*Drillia*" *longispirata*,²⁾ as the latter is said to have only six ribs according to SMITH.

Fossil occurrence: Byôritu Beds.—900 m. NW. of Rinsuikwa: station 6; Reg. No. 52253.

Subgenus **Cymatosyrinx** DALL, 1889

Clavus (Cymatosyrinx) pseudohumilis n. sp.

Pl. VI (I), Figs. 46a, 46b, 46c, 47, 48.

Shell resembling living "*Drillia*" *humulis* SMITH in general aspect, rather small, ovately fusiform, spire conical. Whorls 9, apical two smooth and globular; somewhat depressed on upper third of later especially of last whorl; last whorl nearly equal to length of spire, or slightly longer. Suture well defined. Surface covered by prominent axial ribs extending from lower to upper sutures; ribs nearly vertical upon upper whorls and oblique upon lower ones, separated by interspaces as wide as ribs. On last whorl, ribs become subobsolete toward outer lip and base. Periphery well rounded, transversely striated on base. Aperture nearly oval in outline, with a deep and wide sinus situated at concave area above angle; outer lip thin, sharp and produced, evenly arcuated, smooth within; inner lip smooth, columella straight; canal very short and widely open, not sufficiently separated from aperture.

1) MAKIYAMA: Mem. Coll. Sci. Kyôto Imp. Univ., Ser. B, Vol. 3, No. 1, Art. 1, p. 103, Pl. 5, figs. 1, 2, 1927.

2) SMITH: Proc. Zool. Soc., p. 190, Pl. 19, fig. 14, 1879.

Dimensions: Height, 15 mm., length, 6 mm., length of aperture, 6 mm.

This species shows considerable variation both in form and sculpture.

Variety, a: shell a little more slender, and the ribs more numerous (about 16) than in the type.

Variety, b: shell also more slender than in the type, and the ribs obsolete, especially on the last whorl.

At first sight I took them to be quite distinct from the type, but I am now convinced that they merely range within the variation of a species, linked by many intermediate form. In general young specimens, have base rather abruptly narrowed.

Fossil occurrence: Byōritu Beds.—700 m. E. of Hakusyatō: station 3; Reg. No. 52230. Wangwa: station 6; Reg. Nos. 52226, 52235. Wangwa: station 8; Reg. No. 52239. Wangwa: station 11; Reg. No. 52232. Bōsiho: station 13; Reg. No. 52225. 500 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 52229. Wangwa: station 17; Reg. No. 52228. 700 m. SE. of Kōkwan: station 23; Reg. No. 52233. 700 m. E. of Naikotō: station 31; Reg. No. 52236. Wangwa: station 35; Reg. No. 52234. 1200 m. E. of Zyō-tūsyōwan: station 36; Reg. No. 52238. Wangwa: station 37; Reg. No. 52231. Keiyukwa: station 55; Reg. No. 52237. 900 m. SE. of Naikotō: station 66; Reg. No. 52227. 1550 m. E. of Sinpo: station 69; Reg. Nos. 52240, 52224.

Clavus (*Cymatosyrinx*) hanzawai, n. sp.

Pl. VI (I), Figs. 57a, 57b.

Two specimens from different localities.

Shell small, elongate ovate, spire nearly equal to body-whorl in length. Whorls 7, apical two (at least one and a half) embryonal, apparently smooth and globular; rest markedly concave above middle, and convex below, with rather broad and distinct subsutural elevation; coarsely, somewhat obliquely plicated; plicae rounded, separated by interspaces of nearly same breadth, about 8 on last whorl, and obsoleted toward periphery as well as outer lip. No visible spirals. Suture well defined. Aperture narrow; outer lip thin and smooth within, with an apparently small sinus at concave area above angle; inner lip smooth; canal very short and straight. Height, 8 mm.; diameter, 3 mm.

This species is quite characteristic in its small and polished shell with only a few rather strong plications; no allied forms have hitherto been reported from Japan and Eastern Asia.

Fossil occurrence: Byōritu Beds.—Wangwa: station 18; Reg. No. 52244. S. of Bōsiho; Reg. No. 37387.

Subgenus *Brachytoma* SWAINSON, 1840

Clavus (*Brachytoma*) flavidulus (LAMARCK), 1822

Pl. VI (I), Fig. 33.

Clavus (Clathrodrillia) flavidulus. GRANT and GALE, Mem. San Diego Soc. Nat. Hist., Vol. 1, p. 579, Pl. 26, fig. 4, 1931: YAGURA, Cat. Moll. Hyōgo-ken, p. 47, No. 602, 1932.

Clathrodrillia flavidula. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus., Imp. Geol. Surv. Jap., p. 49, No. 1697, 1931.

Drillia flavidula. TRYON, Man. Conch., 1 Ser., Vol. 6, p. 177, Pl. 10, figs. 56,? 57, 1884: PILSBRY, Cat. Mar. Moll. Jap., p. 16, 1895: FISCHER, Paläont. von Timor, Vol. 15, p. 95, 1927: LISCHKE, Jap. Meeres-Conch., Vol. 2, p. 25, 1871: LISCHKE, ibid., Vol. 3, p. 24, 1874.

Pleurotomia flavidula. KIENER, Spec. Coq. viv., p. 30, Pl. 6, fig. 2; Pl. 18, fig. 2, 1839-40: WEINKAUFF u. KOBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 4, Pt. 1, p. 45, Pl. 10, figs. 1-5, 1887: MARTIN, Foss. von Java, Vol. 1, p. 41, Pl. 6, figs. 102-104; Pl. 7, fig. 105, 1906: TESCH, Paläont. von Timor, Vol. 5, p. 30, Pl. 78, fig. 62, 1915.

Pleurotomia pseudoprincipalis. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 32, Pl. 1, fig. 15, 1928 (not 1920).

Numerous well preserved specimens; mostly small in size except for a few; largest specimen figured, collected from Sikô, 65 mm. in height, and 16.5 mm. in diameter.

C. flavidulus resembles *C. jeffreysii* (SMITH) which is better known as "*Drillia*" *pseudoprincipalis* PILSBRY,¹⁾ but it is proportionally longer, and differs in details of sculpture. "*Drillia*" *pseudoprincipalis* figured by Dr. YOKOYAMA from the Byôritu Beds of Taiwan in 1928 is certainly an immature individual of the present species, as the distinct subsutural cord on each whorl, characteristic of the typical *pseudoprincipalis*, is wanting in that figure. What DICKERSON figured as "*Turris*" *flavidula* from the Vigo Miocene of the Philippines²⁾ seems to represent another species; it is more related to *C. pseudoprincipalis*.

Type locality: Oriental Sea.

Fossil occurrence: Byôritu Beds.—700 m. E. of Hakusyatô: station 3; Reg. No. 52187. Wangwa: station 5; Reg. No. 52180. Between Kôsui and Zyuna: station 6; Reg. No. 37331. Wangwa: station 6; Reg. No. 52163. E. of Goko: station 8; Reg. No. 37342. Wangwa: station 11; Reg. No. 52179. Bôsiho: station 13; Reg. No. 52188. 1450 m. W. of Hokkô: station 14; Reg. No. 52162. 550 m. SE. of Zyô-tûsyôwan: station 14; Reg. No. 52186. Wangwa: station 14; Reg. No. 52185. 510 m. SE. of Zyô-tûsyôwan: station 15; Reg. No. 52164. Wangwa: station 15; Reg. No. 52161. 550 m. Wangwa: station 19; Reg. No. 52165. 700 m. NE. of Nanseizan: station 19; Reg. No. 52160. 1000 m. E. of Hakusyatô: station 20; Reg. No. 52184. Wangwa: station 23; Reg. No. 52182. Wangwa: station 28; Reg. No. 52181. 700 m. E. of Naikotô: station 31; Reg. No. 52174. Wangwa: station 33; Reg. No. 52183. Wangwa: station 35; Reg. No. 52173. 1200 m. E. of Zyô-tûsyôwan: station 36; Reg. No. 52172. Wangwa: station 39; Reg. No. 52171. 550 m. E. of Sankwakô: station 43; Reg. No. 52178. Keiyukwa: station 50; Reg. No. 52177. 940 m. NW. of Keiyukwa: station 55; Reg. No. 52176. 1520 m. E. of Sinpo: station 68; Reg. No. 52175. 1550 m. E. of Sinpo: station 69; Reg. No. 52169. 300 m. E. of Hakusyatô; Reg. No. 37506. Sikô; Reg. Nos. 49401, 48986. Western side of Syôgun-yama; Reg. No. 37511.

Living: Central Honshû to Taiwan. China. Singapore. Indian Ocean. Red Sea.

Geologic distribution: Pliocene of Kyûsyû, Post-Pliocene of Celebes; Pliocene of Java, Timor and Seran.

1) PILSBRY: Cat. Mar. Moll. Jap., p. 17, Pl. 2, figs. 9, 10, 1895.

2) DICKERSON: Rev. Philippine Paleont., Pl. 5, fig. 9, 1922.

Clavus (Brachytoma) nodiliratus (SMITH), 1875

Pl. VI (I), Fig. 39.

Pleurotoma (Drillia) nodilirata. TESCH, Paläont. von Timor, Vol. 5, p. 31, Pl. 78, fig. 64, 1915.

Several rather well preserved specimens. In surface sculpture, this shell is similar to *C. flavidulus* (LAMARCK) and *C. jeffreysii* (SMITH) from our seas, but has a less higher spire and proportionally longer aperture; the aperture and canal together is nearly equal to the spire in length, thus approaching certain species of *Turricula*.

"*Pleurotoma (Surcula) bantamensis* MARTIN¹⁾ is perhaps most related to the present species, though slightly different in sculpture.

Type locality: The Philippines; Recent.

Fossil occurrence: Byôritu Beds.—700 m. E. of Hakusyatōn: station 3; Reg. No. 52214. Bôsiho: station 13; Reg. No. 52210. 1450 m. W. of Hokkô: station 14; Reg. No. 52215. Wangwa: station 14; Reg. No. 52216. Wangwa: station 15; Reg. No. 52212. 700 m. NE. of Nanseizan: station 19; Reg. No. 52211. 1000 m. E. of Hakusyatōn: station 20; Reg. No. 52213. 300 m. E. of Sankwakô: station 39; Reg. No. 52208. 920 m. NW. of Keiyukwa: station 54; Reg. No. 52209.

Living: The Philippines.

Geologic distribution: Pliocene of Timor and Seran.

Clavus (Brachytoma) pernodiliratus, n. sp.

Pl. VI (I), Figs. 41a, 41b, 42a, 42b.

Shell resembling *C. nodiliratus* mentioned above; medium in size, fusiform; spire slightly shorter than aperture and canal. Whorls 10, apical two embryonal, smooth and globular, rest angular at upper one-third, surface somewhat concave above angle, convex below it; lower surface bears rounded, axial ribs separated by much narrower interspaces. Body-whorl with 10 ribs which are distinct on and near angle, and gradually become obsolete towards periphery. Entire surface reticulated by intersection of or microscopically granulated with rather fine, revolving and growth lines. Revolving lines larger and smaller in more or less regular alternation. Aperture longly oval, outer lip thickened, sinus profound, large, situated at concave area above angle; inner lip smooth; canal rather long, slightly recurved below.

This species is similar to *C. nodiliratus* (SMITH) in form, but certainly differs from that species by having a quite different surface sculpture. The vertical ribs and the microscopic reticular sculpture may be the most characteristic features of this species.

A few ill-preserved specimens. One of them height, ca. 20 mm.; diameter, 8 mm.

Fossil occurrence: Byôritu Beds.—Wangwa: station 6; Reg. No. 52218. 1520 m. E. of Sinpo: station 16; Reg. No. 52217. 900 m. NW. of Keiyukwa: station 33; Reg. No. 52219.

Clavus (Brachytoma) suturalis (GRAY), 1838

Pl. VI (I), Fig. 30.

Pleurotoma (Drillia) suturalis. MARTIN, Foss. von Java, Vol. 1, p. 39, Pl. 6, figs. 97, 98, 1906: TESCH, Paläont. von Timor, Vol. 5, p. 32, Pl. 78, fig. 65, 1915.

1) MARTIN: Foss. von Java, Vol. 1, p. 28, Pl. 5, figs. 72, 73, 1906.

One excellently preserved specimen. Height, 32 mm.; diameter, 11.5 mm.

Shell of medium size, rather stout, somewhat fusiform, with about 12 angular whorls; spire nearly equal or slightly shorter than aperture and canal; angle of each whorl with prominent, longitudinal rounded ribs, about 13 in number on body-whorl where ribs are somewhat weaker, vanishing on periphery; upper slope of whorl slightly concave, provided with a distinct subsutural thread, and making sutures well marked; surface also sculptured with rather coarse and irregular spiral lines or threads throughout. Aperture elongated, deep sinus above, short and wide canal below; outer lip thickened and produced, its inner surface smooth.

"*Pleurotoma*" *nodilirata* SMITH¹⁾ and "*Pleurotoma*" cf. *driliaeformis* MARTIN,²⁾ figured by TESCH are closely related to the present species; the specific distinction of those species is questionable.

It is here added, that a species figured by REEVE as "*Pleurotoma*" *suturalis* BRONN,³⁾ is quite distinct from GRAY's species, that species is said to be living in the European seas.

Type locality: Unknown; Recent.

Fossil occurrence: Raised Coral Reef.—S. of Sisitō; Reg. No. 37481.

Living: Unknown; somewhere in the tropic seas of Asia.

Geologic distribution: Pliocene(?) and Miocene of Java; Pliocene of Timor.

Clavus (Brachytoma) pseudoprincipalis (YOKOYAMA), 1920

Pl. VI (I), Fig. 38.

Pleurotoma (Drillia) pseudoprincipalis. YOKOYAMA, Jour. Coll. Sci. Imp. Univ. Tōkyō, Vol. 39, Art. 6, p. 37, Pl. 1, fig. 21, 1920.

Drillia pseudoprincipalis. YOKOYAMA, Jour. Coll. Sci. Imp. Univ. Tōkyō, Vol. 45, Art. 2, p. 5, 1923: YOKOYAMA, Jour. Fac. Sci. Imp. Univ. Tōkyō, Sec. 2, Vol. 1, Pt. 9, p. 330, 1926.

Inquisitor pseudoprincipalis. MAKIYAMA, Mem. Coll. Sci. Kyōto Imp. Univ., Ser. B. Vol. 3, No. 1, Art. 1, p. 104, 1927.

Several specimens. *C. pseudoprincipalis* was first established by Dr. YOKOYAMA on a specimen from the Lower Musasino Formation of Naganuma, as a species related to "*Drillia*" *principalis* PILSBRY (=*Clavus jeffreysii* SMITH), a living species of Japan; the same species occurs also in the Pliocene deposit in the vicinity of Kakegawa, province of Tōtōmi, as reported by Dr. YOKOYAMA, and Dr. MAKIYAMA.⁴⁾ The Formosan fossils now under consideration are of nearly the same type as those of Naganuma and Kakegawa, and are therefore confidently referred to that species, though the majority of the Formosan specimens, I confess, have somewhat narrower whorls than in the type; the difference may be regarded as variation.

The following are some of the measurements (in mm.):

	1	2	3	4	5	6	7	8	9	10
Height	31.0	30.0	28.0	26.5	26.0	25.0	25.0	24.0	20.5	20.0
Diameter	8.5	8.0	8.0	7.5	7.5	7.0	7.0	7.0	6.0	6.0

1) TESCH: Paläont. von Timor, Vol. 5, p. 81, Pl. 78, fig. 64, 1915.

2) TESCH: ibid., p. 30, Pl. 78, fig. 60, 1915.

3) REEVE: Conch. Icon., Vol. 1, Pl. 3, fig. 50, 1843.

4) An allied form, but not quite identical with the type, was once collected by Mr. KURODA, of the Kyōto Imperial University from the coast of Kii, Western Honshū according to Dr. MAKIYAMA.

Type locality: Sagami, Central Honshū; Pliocene.

Fossil occurrence: Byōritu Beds.—Hakusyatō: station 1; Reg. No. 52039. 700 m. E. of Hakusyatō: station 3; Reg. No. 52194. 400 m. N. of Kozantyō: station 5; Reg. No. 52057. 1000 m. Between Kōsui and Zyuna; Reg. No. 37305. Western side of Syōgun-yama; Reg. No. 37319. 300 m. E. of Zyō-tūsyōwan; Reg. No. 37306.

Geologic distribution: Pliocene of Honshū, Kyūshū, and Ryūkyū.

Clavus (Brachytoma) crassitestulatus, n. sp.

Pl. VI (I), Figs. 49a, 49b, 49c.

Shell small, ovately fusiform, of about 8, more or less shouldered whorls; spire conical in lateral outline, short, about equal in length to aperture and canal. Whorls with about 11, prominent, nearly straight, vertical rounded ribs, broader than their interspaces. On body-whorl, ribs obsolete below periphery, totally disappearing at base. Surface marked by many, distinct rather irregular revolving threads, about 4 above shoulder and 3 below it; latter on lower two whorls associated with a smaller one in each interspace. Periphery rounded; base rather abruptly narrowed towards canal with subequal revolving cords and slightly wider interspaces. Aperture narrow with large and distinct sinus situated at middle of sloping surface above shoulder; outer lip thin and sharp, smooth within, obsoletely crenate at edge corresponding to external sculpture; inner lip smooth with thin and narrowly spread callosity; columella slightly curved; canal short, nearly straight. Test rather heavy and solid.

One specimen lacking apical whorls; ca. 14 mm. in height, and 6.6 mm. in diameter.

No similar form has hitherto been described from Japan and eastern Asia both recent and fossil.

Fossil occurrence: Byōritu Beds.—400 m. SE. of Zyō-tūsyōwan: station 13; Reg. No. 53739.

Clavus (Brachytoma) turriculoides, n. sp.

Pl. VI (I), Figs. 34a, 34b.

One specimen lacking its apex.

Shell small, fusiform, with aperture and canal nearly equal to spire in length. Preserved whorls 5, convex, with 9 or 10, rather prominent, slightly oblique axial ribs and narrower inter-spaces; ribs on last whorl not extending below periphery. Entire surface covered with numerous, small, unequal concentric threads; threads finer on upper surface of whorls than on lower; flexuous growth lines not well marked, and scarcely visible under a lens. Periphery distinctly rounded, rather abruptly narrowed towards base. Outer lip fractured; columella and canal curved. Height, ca. 14 mm.; diameter, ca. 5.5 mm.

This species resembles "*Pleurotoma (Surcula) dijki* MARTIN¹⁾" from the Neogene of Java, but is mainly distinguishable from that species by its broader shell, with a trifle shorter canal and covered by more numerous spiral threads.

Fossil occurrence: Byōritu Beds.—1200 m. E. of Zyō-tūsyōwan: station 36; Reg. No. 53460.

Clavus (Brachytoma) species indet.

One rather small and slender *Clavus* resembling "*Pleurotoma*" *bataviana*²⁾ and "*Pleurotoma*" *tjemoroënsis*,³⁾ both described by MARTIN from the Pliocene of Java, but an accurate determination is impossible due to the greater part of the canal being fractured.

Fossil occurrence: Byōritu Beds.—1100 m. NE. of Hakusyatō: station 9; Reg. No. 52248.

Genus **Cythara** SCHUMACHER, 1817**Cythara hiradoensis** (MAKIYAMA), 1927

Cytherella hiradoensis. MAKIYAMA, Mem. Coll. Sci. Kyōto Imp. Univ., Ser. B, Vol. 3, No. 1, Art. 1, p. 110, Pl. 5, fig. 12, 1927.

Two specimens exactly agree in form and sculpture with the named species, though slightly smaller.

Type locality: Tōtōmi, Central Honshū; Pliocene.

Fossil occurrence: Byōritu Beds.—Wangwa: station 8; Reg. No. 52203. Wangwa: station 15; Reg. No. 52201.

Living: Hirado, Hizen, Kyūshū.

Geologic distribution: Pliocene of Central Honshū.

1) MARTIN: Tiefb. auf Java, p. 62, Pl. 4, fig. 62, 1887.

2) MARTIN: Foss. von Java, Vol. 1, p. 43, Pl. 8, fig. 108, 1906.

3) MARTIN: ibid., p. 205, Pl. 43, fig. 705, 1906.

Genus **Mangelia** RISSE, 1826

Subgenus **Mangelia** s. s.

Mangelia (Mangelia) perparva (YOKOYAMA), 1927

Mangilia perparva. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 33, Pl. 2, fig. 2, 1928.

Two well preserved specimens. This species is said to be related to "*Mangilia*" *parva* TOKUNAGA from the Pleistocene deposits in the environs of Tôkyô, by which the specific name "perparva" was introduced.

The generic name has hitherto been often erroneously spelled "*Mangilia*" by many authors.¹⁾

Type locality: Sikô, Taiwan; Pliocene.

Fossil occurrence: Byôritu Beds.—1450 m. W. of Hokkô: station 14; Reg. No. 52207. 700 m. NE. of Nanseizan: station 19; Reg. No. 52245. 300 m. E. of Zyô-tûsyôwan; Reg. No. 37330.

Geologic distribution: Known only from the Pliocene of Taiwan.

Mangelia (Mangelia) pyramis (HINDS), 1843

Pl. VI (I), Figs. 51a, 51b.

Pleurotoma pyramis. REEVE, Conch. Icon., Vol. 1, Pl. 18, fig. 147, 1843.

Two specimens, unfortunately lacking apical whorls and outer lips, but otherwise agreeing well with the following description given by REEVE:

"Shell elongately pyramidal, somewhat club-shaped anteriorly; white, angularly ribbed, six-sided, transversely very closely striated, ribs sharp, flowing one under the other; lip thickened, sinus broad and rather superficial; aperture small, canal very short".

Type locality: Straits of Maccassar; Recent.

Fossil occurrence: Byôritu Beds.—1000 m. NW. of Rinsuikwa: station 5; Reg. No. 52222. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 52223.

"Mangelia" bosioensis, n. sp.

Pl. VI (I), Figs. 55a, 55b.

Shell small, slender, turreted; test rather thin. Whorls about 8 in number, apical 2 nucleal, smooth and convex; the third whorl, angular, but smooth; remaining ones strongly angulated at middle by sharp revolving ridges with about 10 small ribs or nodes; ribs separated by interspaces of different width, but in general narrower than ribs; surface sloped, or more or less concave above angle, almost vertical below it. Suture well defined by fine supra-sutural and slightly larger sub-sutural threads. Body-whorl nearly half of shell-height, biangulate, upper angle larger; periphery angulated; base abruptly narrowed, ornamented by numerous, fine, but distinct spiral lirae. Aperture small, ovate; outer lip thin, arched forwardly, and smooth

1) GRANT and GALE: Mem. San Diego Soc. Nat. Hist., Vol. 1, p. 585, 1931.

within; sinus large and deep, situated nearer to carina than to suture; inner lip smooth; columella straight; canal short and slightly oblique. Height, 5.5 mm.; diameter, 2 mm.

Fossil occurrence: Byōritu Beds.—1000 m. E. of Hakusyatōn: station 25; Reg. No. 52242. S. of Bōsiho: station 7; Reg. No. 37385.

“Mangelia” species indet.

A fragmental specimen lacking its apex, about 2 mm. broad. Resembles the preceding one in general features, but its whorls less angulated, axial ribs fewer and more prominent, and periphery less angulated.

Fossil occurrence: Byōritu Beds.—S. of Bōsiho; Reg. No. 52243.

Genus **Lienardia** JOUSSEAUME, 1884

Subgenus **Lienardia** s. s.

Clathurella gainesi. YAGURA, Cat. Moll. Hyōgo-ken, p. 47, No. 612, 1932.

Lienardia gainesi. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 50, No. 1736, 1931; NOMURA, Sci. Rep. Tōhoku Imp. Univ., Ser. 2 (Geol.), Vol. 15, No. 2, p. 120, No. 386, 1932.

One well preserved specimen; height, 7.5 mm., diameter, a little less than 3 mm. The shell has 8 angular whorls which are coarsely latticed by revolving threads and longitudinal plicae except for a few apical ones which are smooth and globular. Outer lip considerably thickened to varix.

“*Mangilia*” *sawanensis* YOKOYAMA¹⁾ from the Pliocene of Sado is perhaps identical with the present species. This shell is apparently related to *Clathurella rava* (HINDS) from the Philippines which is the type of this genus.

Type locality: Kamakura, Japan; Recent.

Fossil occurrence: Byōritu Beds.—500 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 52246.

Living: Northern to Western Honshū; Japan Sea.

Geologic distribution: Post-Pleistocene of Central Honshū; Pliocene of the Island of Sado, Japan Sea.

Lienardia (Lienardia) hayasakai, n. sp.

Pl. VI (I), Figs. 52a, 52b.

Shell resembling *L. gainesi* (PILSBRY) mentioned above in general aspect, small in size, rather narrowly fusiform, with spire nearly half shell-height. Whorls 8, apical 2 embryonal, smooth, globular, rather high and more or less loosely coiled; rest angulated at about middle,

1) YOKOYAMA: Jour. Fac. Imp. Univ. Tōkyō, Sec. 2, Vol. 1, Pt. 8, p. 263, Pl. 32, fig. 6, 1926.

surface flat and somewhat sloping above angle, vertical or more or less convex below it; suture distinct, impressed, bounded by a supra-sutural thread upon penultimate whorl. Surface of each mature whorl ornamented with about 12 rather small, subequidistant, axial plicae, crossed by small revolving ridges or striae; 2 revolving striae on each whorl of spire (one at angle and other below it) and 3 on body-whorl above periphery forming rather indistinct nodes or beads at point of intersection with plicae; no nodes on the sloping surface above the angle. Entire surface ornamented by very fine, obscure revolving striae as well as growth lines visible under lens. Periphery rounded, and passing into rather abruptly narrowed base with numerous rather distinct spiral striae. Aperture elongate ovate; outer lip thickened behind to varix, obsoletely dentate within; sinus deep, round at top, situated at angle of whorls; inner lip smooth, with moderate callosity; columella straight, but slightly oblique to left at base; canal short, broad, nearly straight, rather well differentiated from aperture.

A single specimen. Height, 8 mm.; diameter, 3 mm.

Distinguished from *L. gainesi*, only by finer sculpture, otherwise almost similar. The specific name is given for Dr. I. HAYASAKA, Prof. of the Taihoku Imperial University, Taiwan.

Fossil occurrence: Byōritu Beds.—400 m. SE. of Zyō-tūsyōwan: station 18; Reg. No. 52366.

Lienardia (Lienardia ?) keiyukwana, n. sp.

Pl. VI (I), Figs. 54a, 54b.

Shell minute, ovate-fusiform; test rather thin. Whorls angulated, composed of 7 volutions, apical 3 embryonal, smooth and convex; rest sloping above, vertical below. Last whorl slightly longer than half shell-height, angulated at periphery and rather abruptly narrowed at base. Axially plicate and spirally striate; plicae 10 on last whorl, vertical, subequidistant, almost equal to interspaces in width, crossed by a series of beaded spirals on angle and below it. Suture rather distinct, provided with subsutural small lira. Aperture ovate, inner lip smooth, columella slightly oblique below; canal short, more or less twisted; outer lip somewhat fractured. Height, 4 mm.; diameter, 2 mm.

L. gainesi (PILSBRY), mentioned in this paper, is related to the present fossil in form and apparent sculpture, though different in details.

Fossil occurrence: Byōritu Beds.—Keiyukwa: station 52; Reg. No. 52247.

Subgenus *Etrema* HEDLEY, 1918

Lienardia (Etrema) fortilarata (SMITH), 1879

Etrema fortilarata. YOKOYAMA. Cat. Mar. Fresh-W. and Land Shells, Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 50, No. 1745, 1931.

Drillia fortilarata. SMITH, Proc. Zool. Soc., p. 195, Pl. 19, fig. 22, 1879: TRYON, Man. Conch., 1 Ser., Vol. 6, p. 207, Pl. 12, fig. 36, 1884: WEINKAUFF u. KOEBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 4, Pt. 3, p. 189, Pl. 38, fig. 10, 1887: PILSBRY, Cat. Mar. Moll. Jap., p. 16, 1895: YOKOYAMA, Jour. Fac. Sci. Imp. Univ. Tōkyō, Sec. 2, Vol. 1, Pt. 10, p. 410, Pl. 46, fig. 20, 1927.

Two specimens, both agree perfectly with the Musasino fossils as well as recent specimens collected from our seas. One of the specimens is about 8 mm. long and 2.5 mm. broad.

Type locality: Kyūsyū, Japan; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 8; Reg. No. 52243. Bōsiho: station 13; Reg. No. 54210. Wangwa: station 17; Reg. No. 52205. Wangwa: station 23; Reg. No. 52204. Bōsiho; Reg. No. 52241. 700 m. SW. of Kōkwan; station 23; Reg. No. 52255.

Living: Central Honsyū and Kyūsyū.

Geologic distribution: Pleistocene of Honsyū; Pliocene of Sikoku.

Lienardia (Etrema) sintikuensis, n. sp.

Pl. VI (I), Figs. 36a, 36b.

Shell small, slender, turreted, height slightly exceeding three times diameter, consisting of 11 whorls; apical 3 embryonal, rather smooth; the rest sub-angulated a little below middle, somewhat constricted above and below angle. Suture rather minutely channeled, well defined by one upper and one lower marginal thread; threads undulated, lower one larger. Each whorl ornamented by 10, small, vertical plicae separated by interspaces of nearly same breadth and crossed by unequal spiral series of beads; spirals 4 on whorls of spire, the second from lower suture largest and at angle. Body-whorl above periphery sculptured by alternating spirals, of which one at angle and one at periphery being larger than others. Base contracted with obsolete axial plicae and two kinds of spirals, the lowest 4 especially larger. Entire surface covered by numerous obscure growth lines, flexuous at angle. Aperture ovate, narrowed into a short and oblique canal; outer lip fractured, lirate within; inner lip smooth; columella rather straight, slightly oblique to left at lower. Sinus situated at angle of whorl, indicated by flexuous growth lines.

One specimen. Height, 13 mm., diameter, 4 mm. No allied forms are found among the hitherto described species both fossil and recent in Japan and eastern Asia.

Fossil occurrence: Byōritu Beds.—1100 m. E. of Hakusyatōn: station 3; Reg. No. 52254.

Genus **Daphnella** HINDS, 1844

Daphnella subzonataeformis, n. sp.

Pl. VI (I), Figs. 50a, 50b, 50c.

Shell resembling *Daphnella subzonata* SMITH in general aspect, rather small, elongate-ovate, consisting of 9 whorls; apical two globular, apparently smooth, upper-most being oblique to the second; the rest more or less angulated at two-thirds of length of whorl; sloping above, and convex below angle. Surface ornamented by longitudinal costae and spiral lirae; costae slightly oblique and rounded, separated by much wider interspaces, 12 on body-whorl, obsolete at base; lirae very unequal, distinct below, almost obsolete above angle, 20 on body-whorl; each interspace provided with a finner one; lirae fewer on upper whorls, about 8 on penultimate of which two are larger than the other. Aperture shorter than spire, broad; outer lip evenly arcuate, thickened by terminal costa, apparently smooth within; inner lip smooth; columella slightly oblique to left at lower; canal short, wide and slightly recurved; sinus small, but well marked, situated close to suture.

One specimen. Length, 16 mm., diameter, 6.5 mm.

This species is distinguishable from *Daphnella subzonata* SMITH¹⁾ mainly in being a trifle broader, and has fewer and more distinct costae; farther the whorls of the Formosan fossil are more or less angulated instead of well rounded as in SMITH's species.

Fossil occurrence: Byōritu Beds.—Sikō; Reg. No. 52202.

Family Cancellariidae

Genus *Cancellaria* LAMARCK, 1799

Subgenus *Cancellaria* s. s.

Cancellaria (Cancellaria) spengleriana DESHAYES, 1830

Cancellaria spengleriana. YOKOYAMA, Jour. Coll. Sci. Imp. Univ. Tōkyō, Vol. 39, Art. 6, p. 44, Pl. 2, figs. 2, 3, 1920.

One large fragmental specimen.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—500 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 53109.

Living: Widely distributed in Japan from North to South. China. The Philippines. Australia.

Geologic distribution: Post-Pleistocene, Pleistocene and Pliocene of Honshū. Pliocene of Sikoku.

Cancellaria (Cancellaria) reeveana CROSSE, 1863

Pl. VI (I), Fig. 62.

Cancellaria reeveana. DUNKER, Ind. Moll. Mar. Jap., p. 104, 1882: LISCHKE, Jap. Meeres-Conch., Vol. 2, p. 56, 1871: LOEBBECKE in MARTINI u. CHEMNITZ, Syst. Conch., Cab., Vol. 4, Pt. 4, p. 12, Pl. 2, figs. 1-9, 1887: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 46, No. 1586, 1931: YAGURA, Cat. Moll. Hyōgo-ken, p. 45, No. 586, 1932: KURODA, Cat. Moll., Hukui-ken, p. 190, No. 191, 1933: NOMURA and ZINBŌ, Sci. Rep. Tōhoku Imp. Univ., Ser. 2 (Geol.), Vol. 16, No. 2, p. 133, No. 109, 1934.

Cancellaria elegans. SOWERBY, Thes. Conch., Vol. 2, p. 446, Pl. 93, fig. 63; Pl. 94, fig. 104, 1855: REEVE, Conch. Icon., Vol. 10, Pl. 3, fig. 12a, b, 1856. (non DESHAYES).

Cancellaria asperella. TRYON, Man. Conch., 1 Ser., Vol. 7, p. 74, 1885 (pars) (non LAMARCK).

?*Cancellaria asperella* LAMARCK, var. *reeviana*. YOKOYAMA, Jour. Coll. Sci. Tōkyō Imp. Univ., Vol. 44, Art. 1, p. 46, Pl. 2, fig. 2, 1922.

Several well preserved specimens. This is a globose shell, which is beautifully cancellated. The form and the sculpture of this species are considerably variable. A specimen which has fewer longitudinal plicae, and with somewhat longer spire than that of the type is called *C. laticosta*. This varietal form is also found in our collection. *C. sinensis* REEVE, *C. subsinensis* KOBELT and *C. melanostoma* are considered to be synonyms.

1) SMITH: Proc. Zool. Soc., p. 197, Pl. 19, fig. 21, 1879.

Annexed are some of the measurements (in mm.):

	1	2	3	4	5
Height	36.0	34.4	34.0	24.2	22.4
Diameter	28.0	19.0	21.0	8.3	14.8

Type locality: Eastern Asia; Recent.

Fossil occurrence: Byōritu Beds.—1100 m. SW. of Taikwa: station 11; Reg. No. 53120. Wangwa: station 15; Reg. No. 53116. Wangwa: station 16; Reg. No. 53115. Wangw: station 33; Reg. No. 53121. Wangwa: station 39; Reg. No. 53118. 500 m. E. of Sankwakō: station 41; Reg. No. 53117. N. of Kityō; Reg. No. 53119.

Living: Central Honsyū to Kyūsyū. Japan Sea. The Philippines.

Geologic distribution: Post-Pleistocene, Pleistocene and Pliocene of Honsyū; Pleistocene of Kikai-zima; Miocene of Java.

Cancellaria (Cancellaria) macrospira ADAMS and REEVE, 1850

Pl. VI (I), Fig. 61.

Cancellaria macrospira. REEVE, Conch. Icon., Vol. 10, Pl. 11, figs. 50a, b, 1856: DUNKER, Ind. Moll. Mar. Jap., p. 104, 1882. TRYON, Man. Conch., 1 Ser., Vol. 7, p. 76, Pl. 4, fig. 67, 1885: LOBBECKE in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 4, Pt. 4, p. 56, Pl. 16, figs. 7, 8, 1887: PILSBRY, Cat. Mar. Moll. Jap., p. 22, 1895.

Two specimens. Shell small in size, with high spire. Whorls 7, apical two embryonal, smooth and globular; the rest convex and ornamented by longitudinal plicae and several unequal spiral threads making surface finely cancellated. Suture distinctly channeled. Columellar plaits 3, rather strong and oblique. The number of longitudinal plicae is considerably variable; in our smaller specimen the plicae are 23, but in the larger (figured) there are only 15.

Type locality: The Far East; Recent.

Fossil occurrence: Byōritu Beds.—1000 m. E. of Hakusyatō: station 4; Reg. No. 53114. 900 m. SE. of Naikotō: station 66; Reg. No. 53113.

Living: Japan. China. Borneo.

Subgenus **Trigonostoma** BLAINVILLE, 1827

Cancellaria (Trigonostoma) taiwanensis n. sp.

Pl. VI (I), Figs. 60a, 60b.

Shell small, nearly ovate in general outline, widely umbilicate; test thick and solid. Whorls, 7, the apical two embryonal, smooth and globular; the rest, moderately convex, excavately channelled along sutures. Surface sculptured with strong axial ribs and obsolete spiral threads; ribs 9 on last whorl, narrow, sharp on top, oblique and much narrower than concave interspaces; spirals rather distinct, irregular, stronger on ribs than in interspaces. Aperture ovate, nearly equal to spire in length; outer lip thickened by a terminal rib, transversely finely lirate within; columella straight, with three oblique folds, upper-most being largest and lower-most smallest. Height, 18.4 mm.; diameter, 12 mm.

No allied forms have been reported from the Oriental regions except *C. bicolor* HINDS¹⁾ which is nearly similar in form but not in sculpture.

Fossil occurrence: Byōritu Beds.—Sikô; Reg. No. 48985.

Family Olividae

Genus *Oliva* BRUGUIÈRE, 1789

Oliva mustellina LAMARCK, 1811

Oliva mustellina. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 34, Pl. 2, fig. 5, 1928.

Several well preserved specimens. The original zigzag color markings are fairly well preserved in some specimens.

Type locality: Eastern Sea.

Fossil occurrence: Byōritu Beds.—600 m. E. of Rinsuikwa: station 4; Reg. No. 53777. 900 m. NW. of Hokkô: station 6; Reg. No. 53769. Wangwa: station 11; Reg. No. 53768. 400 m. SE. of Zyô-tûsyôwan: station 13; Reg. No. 53767. 500 m. SE. of Zyô-tûsyôwan: station 14; Reg. No. 53766. Wangwa: station 24; Reg. No. 53776. Wangwa: station 26; Reg. No. 53778. On road, S. of Bôsiho; Reg. No. 37310. Sinsui; Reg. No. 37439.

Raised Coral Reef.—S. of Sisitô; Reg. No. 37478.

Living: Central Honshû to Taiwan. Japan Sea. China. Singapore.

Geologic distribution: Pliocene of Honshû, Sikoku and Kyûshû.

Oliva ispidula (LINNAEUS), 1758

Pl. VII (II), Fig. 16.

Oliva ispidula. REEVE, Conch. Icon., Vol. 6, Pl. 17, fig. 34, 1850: WEINKAUFF in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 5, Pt. 1, p. 34, Pl. 4, figs. 1-4, 6-10, 15, 16, 18, 19, 1878: SOWERBY, Thes. Conch., Vol. 4, p. 21, Pl. 16, figs. 240-254, 1880: TRYON, Man. Conch., 1 Ser., Vol. 5, p. 86, Pl. 33, figs. 34-43, 29, 38, 1883: PILSBRY, Cat. Mar. Moll. Jap., p. 23, 1895: SUGITANI, Cat. Luchu Shells, p. 29, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 69, No. 857, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 47, No. 1909, 1931.

Several well preserved specimens, some of them retain their original color markings.

Like the preceding in general respects, but is invariably smaller, and has a higher spire. Height, 23 mm.; diameter, 9.7 mm.

Type locality: The Philippines; Recent.

Fossil occurrence: Raised Coral Reef.—S. of Sisitô; Reg. No. 37461.

Living: Southern Kyûshû and Ryûkyû. The Philippines. Fiji Island. Indian Ocean.

Geologic distribution: Pliocene of Java, Sumatra and Timor; Miocene of Java and Sumatra.

1) TRYON: Man. Conch., 1 Ser., Vol. 7, p. 79, Pl. 5, fig. 86; Pl. 6, figs. 89, 90, 1885.

Genus **Olivella** SWAINSON, 1840**Olivella spretoides** YOKOYAMA, 1922

Pl. VII (II), Fig. 18.

Olivella spretoides. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 35, Pl. 1, fig. 14, 1928.

Several well preserved specimens. The Formosan specimens in our possession are generally more globose than the types figured by Dr. YOKOYAMA, hence our shells may be regarded as variants, or distinct species.

Type locality: Central Honsyû, Japan; Pleistocene.

Fossil occurrence: Byôritu Beds.—Hakusyatô: station 1; Reg. No. 53774. 1000 m. NW. of Rinsuikwa: station 5; Reg. No. 53770. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 53780. Wangwa: station 8; Reg. No. 53773. 500 m. SE. of Zyô-tûsyôwan: station 14; Reg. No. 53785. 510 m. SE. of Zyô-tûsyôwan: station 15; Reg. No. 53786. Wangwa: station 18; Reg. No. 53881. 700 m. Living: Southern Kyûsyû and Ryûkyû.

Genus **Ancilla** LAMARCK, 1799**Ancilla rubiginosa** (SWAINSON), 1823

Ancilla rubiginosa. YOKOYAMA, Jour. Fac. Sci. Imp. Univ. Tôkyô, Vol. 1, Pt. 9, p. 334, Pl. 38, fig. 11, 1926: NOMURA and ZINBÔ, Sci. Rep. Tôhoku Imp. Univ., Ser. 2 (Geol.), Vol. 16, No. 2, p. 133, No. 110, 1934.

Three well preserved specimens. One measures: 33.3 mm. in height and 15 mm. in diameter. *A. mammilata* (HINDS), *A. albocallosa* (LISCHKE), *A. hinomotoensis* YOKOYAMA¹⁾ and *A. okawai* YOKOYAMA²⁾ may perhaps prove to be only varietal forms of the present species by future study, but now I shall leave this question open.

Type locality: Indian Ocean.

Fossil occurrence: Byōritu Beds.—Sikô; Reg. No. 48972.

Living: Central Honsyû to Ryûkyû. China. Malacca. Indian Ocean.

Geologic distribution: Pleistocene and Pliocene of Honsyû; Pleistocene of Kikai-zima; Pliocene of Sikoku and Kyûsyû.

Family Marginellidae

Genus *Persicula* SCHUMACHER, 1817

Subgenus *Persicula* s. s.

Persicula (Persicula) bernardii (LARGILLIER), 1845

Pl. VII (II), Fig. 19.

Marginella bernardii. REEVE, Conch. Icon., Vol. 15, Pl. 10, fig. 38, 1864: WEINKAUFF in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 5, Pt. 6, p. 45, Pl. 8, figs. 14, 15, 1879: TRYON, Man. Conch., 1 Ser., Vol. 5, p. 31, Pl. 9, fig. 76, 1883.

Several fine specimens. A well preserved specimen, 23 mm. in height and 13.5 mm. in diameter.

The shell is cylindrically oblong in outline with an immersed spire. The columella has six plications, of which the upper ones are nearly horizontal, the lower being oblique and stouter.

"*Marginella*" *tricincta* HINDS and "*Marginella*" *quinqueplicata* LAMARCK var. *minor* MARTIN are nearly similar in form with the present species, but the columellar folds of these shells are said to be five in number.

Type locality: China; Recent.

Fossil occurrence: Byōritu Beds.—400 m. SE. of Zyô-tûsyôwan: station 13; Reg. No. 53907. Wangwa: station 14; Reg. No. 53909. Wangwa: station 23; Reg. No. 53908. 300 m. E. of Sankwakô: station 39; Reg. No. 53906. Sikô; Reg. No. 49413. 300 m. E. of Hakusyatton; Reg. No. 37344.

Living: China Sea.

Family Volutidae

Genus *Voluta* LINNAEUS, 1758

Voluta sikoensis, n. sp.

Pl. VI (I), Figs. 5a, 5b.

Shell medium in size, oblong fusiform, rather solid, consisting of 5½ convex whorls, apical 1½ embryonic, large, smooth and globular. Surface of post-embryonic whorls sculptured

1) YOKOYAMA: Jour. Coll. Sci. Tôkyô Imp. Univ., Vol. 44, Art. 1, p. 48, Pl. 2, fig. 5, 1922.

2) YOKOYAMA: Jour. Coll. Sci. Tôkyô Imp. Univ., Vol. 45, Art. 2, p. 7, Pl. 1, figs. 4-7, 1923.

with fine transverse striae and longitudinal growth lines, the former obsolete in the middle part of body-whorl. Aperture two times longer than spire; outer lip a little thickened, smooth within. Columella with 7, distinct folds in the type specimen.

Two specimens from the same locality. The paratype specimen differs from the type by having a smaller number of columellar folds (4 instead 7), otherwise quite similar.

Holotype: Height, 57 mm., diameter, ca. 23 mm.

Paratype: Height, 54 mm., diameter, 22 mm.

This species is quite characteristic in surface ornamentation, and no allied recent as well as fossil forms have hitherto been found in Japan and tropic Asia.

Fossil occurrence: Byōritu Beds.—Sikō; Reg. No. 48979.

Genus *Fulgoraria* SCHUMACHER, 1817

Fulgoraria rupestris (GMELIN), 1791

Pl. VII (II), Fig. 40.

Fulgoraria rupestris. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 47, No. 1595, 1931: YAGURA, Cat. Moll. Hyōgo-ken, p. 45, No. 589, 1932.

Voluta rupestris. REEVE, Conch. Icon., Vol. 6, Pl. 6, fig. 14, 1849: LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 68, 1869: LISCHKE, ibid., Vol. 2, p. 59, 1871: TRYON, Man. Conch., 1 Ser., Vol. 4, p. 85, Pl. 24, figs. 41, 42, 1882: PILSBRY, Cat. Mar. Moll. Jap., p. 24, 1895.

Voluta fulminata. KÜSTER in MARTINI u. CHEMNITZ, Syst. Conch., Cab., Vol. 5, Pt. 6, p. 159, Pl. 22, figs. 5, 6, 1841: KIENER, Spec. Coq. viv., p. 46, No. 39, Pl. 42, fig. 1, 1835–1857: SOWERBY, Thes. Conch. Vol. 1, p. 209, No. 39, Pl. 50, figs. 51–53, 1847.

Voluta fulgura. DUNKER, Ind. Moll. Mar. Jap., p. 49, 1882.

Several specimens. Like *F. prevostiana* (CROSSE) in general respects, but the concentric grooves in the surface are more distinct and the whorls are more angular.

“*Voluta*” *hamilla* CROSSE and *Fulgoraria chinensis* SCHUMACHER are synonyms according to LISCHKE.

Type locality: The Far East; Recent.

Fossil occurrence: Byōritu Beds.—700 m. E. of Hakusyatōn: station 3; Reg. No. 53904. Wangwa: station 24; Reg. No. 53901. Wangwa: station 33; Reg. No. 53905. Wangwa: station 40; Reg. No. 53902.

Living: Kyūshū to Taiwan. Japan Sea. Tyōsen. China. Indian Ocean.

Geologic distribution: Pleistocene of Honshū.

Genus *Cymbium* (BOLTEN) RÖDING, 1798

Cymbium indicum (GMELIN), 1791

Cymbium indicum. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 46, No. 1591, 1931.

Melo indica. TRYON, Man. Conch., 1 Ser., Vol. 4, p. 80, Pl. 23, fig. 14, 1882.

A large, thin shelled specimen is represented by fragments. It may perhaps be the named species as is indicated by the preserved features.

Type locality: Indian Ocean.

Fossil occurrence: Byôritu Beds.—1000 m. E. of Hakusyatton: station 25; Reg. No. 53903.

Living: Taiwan. Indian Ocean.

Family Vasidae

Genus **Tudicla** (BOLTEN) RÖDING, 1798

Tudicla cumingii (JONAS), 1848

Pl. VII (II), Fig. 38.

Tudicla cumingii. TRYON, Man. Conch., 1 Ser., Vol. 3, p. 144, Pl. 58, figs. 407, 408, 1881.

Fusus cumingi. REEVE, Conch. Icon., Vol. 4, Pl. 17, fig. 67, 1848: KOBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 3, Pt. 3b, p. 193, Pl. 62, figs. 5, 6, 1881.

Fasciolaria iizukai. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 37, Pl. 2, fig. 3, 1928.

Three well preserved and one imperfect specimens. The Formosan fossils are invariably low spired, and hence quite agree with figure No. 408 given by TRYON as *Tudicla couderti* PETIT which according to him is identical with *T. cumingii*.

Fasciolaria iizukai YOKOYAMA, cited above appears to me to be an immature individual of *T. cumingii*. One of the specimens measures 60 mm. in height, and 25 mm. in diameter. The others are nearly equal in size. This is not "*Fusus cumingii*" CROSSE.

Type locality: China; Recent.

Fossil occurrence: Byôritu Beds.—Sikô; Reg. No. 48977.

Living: China seas.

Family Vexillidae

Genus **Mitra** LAMARCK, 1799

Subgenus **Scabricola** SWAINSON, 1840

Mitra (Scabricola) sphaerulata "MARTYN", 1784

Mitra sphaerulata. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 36, Pl. 2, fig. 4, 1928.

Several well preserved specimens, both large and small. The surface sculpture of the Formosan fossil resembles *M. scabricola* (LINNAEUS), but is much coarser. Below are some of the measurements (in mm.):

	1	2	3	4	5
Length	34.0	23.5	21.0	20.0	19.0
Diameter	12.5	8.4	8.4	8.0	7.0
Length of aperture ..	20.0	13.4	13.5	12.0	11.5

Type locality: The Philippines?; Recent.

Fossil occurrence: Byôritu Beds.—Hakusyatton: station 1; Reg. No. 53413. 1000 m. NW. of Rinsuikwa: station 5; Reg. No. 53511. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 53531.

1100 m. SW. of Taikwa: station (?) ; Reg. No. 53538. Wangwa: station 12; Reg. No. 53536. 400 m. SE. of Zyô-tûsyôwan: station 13; Reg. No. 53525. 1450 m. W. of Hokkô: station 14; Reg. No. 53530. Wangwa: station 14; Reg. No. 53526. 510 m. SE. of Zyô-tûsyôwan: station 15; Reg. No. 53532. 700 m. SW. of Kôkwan: station 23; Reg. No. 53529. Kozantyô: station 24; Reg. No. 53527. Wangwa: station 24; Reg. No. 53528. 1000 m. E. of Hakusyatô: station 25; Reg. No. 53533. 700 m. SE. of Hakusyatô: station 27; Reg. No. 53534. 500 m. E. of Sankwakô: station 41; Reg. No. 53540. 500 m. E. of Sankwakô: station 43; Reg. No. 53537. 300 m. S. of Sankwakô: station 44; Reg. No. 53539. Tyû-tûsyôwan: station 48; Reg. No. 53483. Hakusyatô; Reg. No. 53535. S. of Bôsiho; Reg. No. 37374.

Living: Southern Kyûsyû and Ryûkyû. The Philippines. Polynesia.

Geologic distribution: Pliocene of Java and Sumatra.

Mitra (Scabricola) yokoyamai, n. sp.

Pl. VII (II), Figs. 25a, 25b.

Mitra isabella. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 35, Pl. 2, fig. 1, 1928 (non SWAINSON).

Shell resembling *M. isabella* SWAINSON in general aspects, large, longly fusiform, narrowly umbilicate with long spire; whorls about 10 in number, slightly convex, separated by well impressed sutures. Surface latticed by crossing of numerous spiral cords and longitudinal threads. Spiral cords about 10 on penultimate whorl and 30 or more on body-whorl, rounded; interspaces nearly equal to cords in breadth; no interstitial smaller cords except on basal part of shell. Longitudinal threads numerous, rather fine and somewhat irregular in strength. Aperture narrow much longer than spire with truncate base. Columellar folds 5, distinct oblique, becoming weaker towards lower; outer lip thin and smooth within.

This species is strongly related to *M. isabella* SWAINSON which lives in the water adjacent to Japan and China, but it has a finer and greater number of spiral cords; further the interspaces between cords are much narrower than in that species.

Length, 61.5 mm.: diameter, 17 mm.: length of aperture, 32 mm. (from the figure of Dr. YOKOYAMA).

Fossil occurrence: Byôritu Beds.—Wangwa: station 33; Reg. No. 53514.

Subgenus *Cancilla* SWAINSON, 1840

Mitra (Cancilla) filaris (LINNAEUS), 1771

Pl. VII (II), Fig. 24.

Mitra (Cancilla) filaris. KURODA, Cat. Shell-bearing Moll., Amami-Ôshima, p. 54, No. 631, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Imp. Geol. Surv. Jap., p. 38, No. 1262, 1931.

Mitra filaris. KÜSTER in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 5, Pt. 2, p. 63, Pl. 12, figs. 5, 6, 1841: TRYON, Man. Conch., 1 Ser., Vol. 4, p. 138, Pl. 40, figs. 174–176, 180, 1882.

One specimen lacking its apical portion; diameter, 12 mm.

Shell fusiformly cylindric, umbilicate. Whorls almost flat, slightly shouldered at summit. Surface of each whorl ornamented by spiral ridges and longitudinal threads. Ridges sharp and

distinct, about 12 on body-whorl and 4 on penultimate; these are separated by wider interspaces provided with 3 or 4 irregular small spiral cords on lower whorls. Longitudinal threads fine and numerous, but very distinct, making by intersection of spirals, a series of small, granular, revolving bands. Aperture narrow, somewhat dilate in front; outer lip thin, slightly contracted at upper part, grooved within, and corresponding to external sculpture; columellar folds 5, oblique and distinct being weaker towards lower.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Raised Coral Reef.—S. of Sisitô; Reg. No. 37509.

Living: Southern Kyûsyû to Ryûkyû. The Philippines. Mauritius. Polynesia.

Geologic distribution: Post-Pliocene of Celebes.

Mitra (Cancilla) flammea QUOY, 1832

Pl. VII (II), Fig. 20.

Mitra (Cancilla) flammea. FISCHER, Paläont. von Timor, Vol. 15, p. 83, 1927.

Mitra flammea. KÜSTER in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 5, Pt. 2, p. 68, Pl. 12, figs. 16, 17, 1841; TRYON, Man. Conch., 1 Ser., Vol. 4, p. 140, Pl. 41, figs. 190–193, 195–197, 199, 200, 1882; MARTIN, Foss. von Java, Vol. 1, p. 76, Pl. 11, figs. 170, 171, 1906; TESCH, Paläont. von Timor, Vol. 5, p. 45, Pl. 79, fig. 96, 1915.

Mitra interlirata. REEVE, Conch. Icon., Vol. 2, Pl. 10, fig. 70, 1844.

Numerous fine specimens. The shell is longly fusiform in form, with spire shorter than aperture. Whorls about 9, slightly convex, beautifully sculptured with revolving cords and longitudinal threads. Interspaces wider than cords themselves, each of them being generally provided with a single thread on both penultimate and body-whorl. Columella straight, bearing 4, oblique and distinct folds.

Annexed are some of the measurements (in mm.):

	1	2	3	4	5
Height	39.5	39.0	29.0	25.8	25.6
Diameter	13.0	13.0	9.3	8.7	8.4
Length of aperture ..	24.5	23.0	17.0	16.0	15.3

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byôritu Beds.—1000 m. NW. of Rinsuikwa: station 5; Reg. No. 53516. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 53521. Nanseizan: station 11; Reg. No. 53518. Wangwa: station 24; Reg. No. 53515. Wangwa: station 35; Reg. No. 53524. Keiyukwa: station 50; Reg. No. 53520. Keiyukwa: station 52; Reg. No. 53517. 1200 m. SE. of Sankwakô: station 60; Reg. No. 53523. 900 m. SE. of Naikotô: station 66; Reg. No. 53519. Sikô; Reg. No. 48995. Sôkeisi; Reg. No. 53522.

Living: Southern Kyûsyû and Ryûkyû. The Philippines. Molucca. Polynesia. Sandwich Islands. Australia.

Geologic distribution: Pliocene of Java, Timor and Seran; Miocene of Java, Sumatra, Borneo and Nias.

Mitra (Cancilla?) astenostomoides, n. sp.

Pl. VII (II), Figs. 22a, 22b, 23a, 23b.

Two specimens.

Shell small, slender, spire exceeding body-whorl in length. Whorls $8\frac{1}{2}$, apical $2\frac{1}{2}$ embryonal, smooth and globular; the rest slightly convex, separated by well impressed sutures. Surface granular by intersection of transverse ridges and numerous, somewhat oblique axial threads. Ridges rather sharp on top, 4 on each whorl of spire and 12 (including basal ridges) on body-whorl, separated by grooves which are nearly equal to or slightly broader than ribs themselves. Grooves on lower whorls, often provided with an intercalating thread. Columellar folds 4, oblique and distinct. Outer lip fractured in both specimens. The larger specimen which is somewhat pathologic in growth measures 17 mm. in height, and 5 mm. in diameter.

This species is characterized by its small and elongate shell with a tolerably long spire and is somewhat related to a certain species of *Astenostoma* in form. No similar species has hitherto been recorded from Japan as well as other Oriental regions both recent and fossil.

Fossil occurrence: Byōritu Beds.—510 m. SE. of Zyō-tūsyōwan: station 15; Reg. No. 53557. 940 m. NE. of Keiyukwa: station 55; Reg. No. 53556.

Mitra (Cancilla) pruinosa REEVE, 1844

Pl. VII (II), Fig. 26.

Mitra pruinosa. REEVE, Conch. Icon., Vol. 2, Pl. 22, fig. 11, 1844: SOWERBY, Thes. Conch., Vol. 4, p. 11, Pl. 376, fig. 565, 1880: TRYON, Man. Conch., 1 Ser., Vol. 4, p. 142, Pl. 41, fig. 215, 1882.

REEVE described this species as: "Shell ovately fusiform, spire acuminate, decussately engraved with longitudinal and transverse impressed lines; columella four plaited."

The two specimens which were examined agree well with REEVE's type figure, although they are somewhat water-worn and lack their nuclear whorls. The columellar folds are five in the Formosan fossils; this is the only difference noticed between this and the type. One of the specimens measures ca. 22 mm. in height, and 7 mm. in diameter.

Type locality: Unknown; Recent.

Fossil occurrence: Byōritu Beds.—400 m. SE. of Zyō-tūsyōwan: station 13; Reg. No. 53555. 700 m. SW. of Kōkwan: station 23; Reg. No. 53554.

Living: No authorities give the habitat of this species.

Subgenus **Chrysame** H. and A. ADAMS, 1853**Mitra (Chrysame) rutila A. ADAMS, 1851**

Pl. VII (II), Fig. 21.

Mitra rutila. SOWERBY, Thes. Conch., Vol. 4, p. 19, No. 257, Pl. 353, fig. 221, 1881: TRYON, Man. Conch., 1 Ser., Vol. 4, p. 151, Pl. 44, fig. 299, 1882.

An imperfect specimen having only two lower whorls. It is 15 mm. broad, ca. 45 mm. high, and fusiform in shape with the whorls somewhat convex. The surface is sculptured by obsolete grooves, which are rather well marked on the basal part. The outer lip is thin and contracted in the middle. The inner lip has 4 oblique folds, of which the lowest is very weak and indistinct.

The specimen is not unlike an elongate variety of *M. scutulata* LAMARCK living in Southern Japan and farther south, but it is seemingly more elongated. In form, our fossil shell is almost similar to *M. rutila* A. ADAMS figured by SOWERBY, a living species from an unknown locality, and hence it is provisionally referred to that species.

Type locality: Unknown; Recent.

Fossil occurrence: Byōritu Beds.—Tyū-tūsyōwan: station 48; Reg. No. 53553.

Living: Unknown.

Mitra species indet.

A small, imperfect specimen, ovate in form. The surface with equal revolving cords (6 on the penultimate whorl) separated by interspaces which are generally narrower than the cords themselves. The entire surface is covered with fine incremental lines. The columella folds are 4 in number, oblique, and distinctly disposed. Diameter, about 4 mm.

Fossil occurrence: Byōritu Beds.—1200 m. SE. of Sankwakō: station 60; Reg. No. 53549.

Genus Vexillum (BOLTEN) RÖDING, 1798

Subgenus Pusia SWAINSON, 1840

Vexillum (Pusia) gembacanum (MARTIN), 1887

Mitra gembacana. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 37, Pl. 2, fig. 6, 1928.

This small neat shell which has already been mentioned by Dr. YOKOYAMA from the Byōritu Beds of Taiwan is represented in our collection by many well preserved specimens.

The whorls are invariably somewhat shouldered or gradate, but the form of the shell and the number of longitudinal plicae seem to be variable to some extent.

Type locality: Java; Pliocene.

Fossil occurrence: Byōritu Beds.—Wangwa: station 14; Reg. No. 53543. 550 m. SE. of Zyō-tūsyōwan: station 16; Reg. No. 53545. 600 m. SE. of Zyō-tūsyōwan: station 17; Reg. No. 53547. Wangwa: station 23; Reg. No. 53546. Wangwa: station 40; Reg. No. 53544. Tyū-tūsyōwan: station 47; Reg. No. 53548. 1000 m. E. of Zyō-tūsyōwan: station 59; Reg. No. 53542. Western side of Syōgun-yama; Reg. No. 37347. E. of Gokō; Reg. No. 37425. 3000 m. E. of Zyō-tūsyōwan; Reg. No. 37369.

Geologic distribution: Pliocene of Java and Timor; Miocene of Java.

Vexillum (Pusia) obeliscum (REEVE), 1844

Pl. VII (II), Fig. 27.

Vexillum (Costellaria) obeliscum. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 39, No. 1291, 1931; NOMURA and ZINBŌ, Sci. Rep. Tōhoku Imp. Univ. Ser. 2 (Geol.), Vol. 16, No. 2, p. 135, No. 116, 1934.

Mitra obeliscus. REEVE, Conch. Icon., Vol. 2, Pl. 15, fig. 107, 1844: MARTIN Foss. von Java, Vol. 1, p. 82, Pl. 12, figs. 182, 183, 1906: TESCH, Paläont. von Timor, Vol. 5, p. 49, Pl. 80, fig. 106, 1915.

Turricula oblicus. TRYON, Man. Conch., 1 Ser., Vol. 4, p. 179, Pl. 53, fig. 535, 1882: FISCHER, Paläont. von Timor, Vol. 15, p. 85, 1927.

Resembling the preceding in some respects, but is narrower in form, and has decidedly a greater number of longitudinal plicae; further the whorls are slightly more convex, having no distinct shoulder angle.

Type locality: The Philippines; Recent.

Fossil occurrence: Byōritu Beds.—700 m. SW. of Kôkwan: station 23; Reg. No. 53552.

Living: Western Honshû. The Philippines. Viti Islands. Indo-Pacific.

Geologic distribution: Pleistocene of Kikai-zima; Post-Pliocene of Celebes; Pliocene of Java, Sumatra and Timor; Miocene of Java.

Family **Fasciolariidae**

Genus **Fusinus** RAFINESQUE, 1815

Fusinus gracillimus (ADAMS and REEVE), 1850

Pl. IX (IV), Fig. 6.

Fusus gracillimum. REEVE, Conch. Icon., Vol. 4, Pl. 18, fig. 69, 1848: KOBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 3, Pt. 3b, p. 198, Pl. 64, fig. 1, 1881: TRYON, Man. Conch., 1 Ser., Vol. 3, p. 63, Pl. 38, fig. 159, 1881: PILSBRY, Cat. Mar. Moll. Jap., p. 27, 1895.

Two specimens, one nearly perfect and the other somewhat fragmental.

REEVE described this species as: "Shell very slender fusiform, spirally grooved and ridged throughout, whorls rounded, longitudinally plicately ribbed, ribs rather broad, keeled round the middle, fading toward the lip."

"*Fusus*" *gracillimus* figured by SOWERBY¹⁾ is apparently a distinct species. Height, 64 mm.; diameter, 13 mm.; length of canal, 31 mm.

Type locality: Eastern Sea.

Fossil occurrence: Byōritu Beds.—400 m. SE. of Zyô-tûsyôwan: station 13; Reg. No. 53577. Sikô; Reg. No. 48993.

Living: Japan. Eastern seas.

Fusinus nodosuplicatus (DUNKER), 1858-71

Pl. VIII (III), Fig. 9.

Fusus nodosuplicatus. YOKOYAMA, Jour. Fac. Sci. Imp. Univ. Tôkyô, Sec. 2, Vol. 1, Pt. 10, p. 412, Pl. 46, fig. 14, 1927.

Several specimens, some of them are fairly well preserved. A specimen collected from Wangwa measures 82.5 mm. in height, and 24 mm. in diameter.

1) SOWERBY: Thes. Conch., Vol. 4, p. 80, Pl. 411, fig. 62, 1880.

Whether this species is valid or only a variety of *F. tuberculatus* (LAMARCK) as suspected by TRYON,¹⁾ I am unable to decide at present. However, the specimens from the Byōritu Beds of Taiwan agree well with YOKOYAMA's figure as well as with the specimens collected from the Pleistocene deposits of Sinagawa in Tōkyō.

Type locality: Japan; Recent.

Fossil occurrence: Byōritu Beds.—1000 m. NW. of Rinsuikwa: station 5; Reg. No. 53559. 700 m. E. of Hakusyatōn: station 5; Reg. No. 53564. Wangwa: station 6; Reg. No. 53560. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 53411. 550 m. NW. of Rinsuikwa: station 7; Reg. No. 53561. 1900 m. NE. of Hakusyatōn: station 10; Reg. No. 53558. 1450 m. W. of Hokkō: station 14; Reg. No. 53562. Wangwa: station 16; Reg. No. 53567. 550 m. SE. of Zyō-tūsyōwan: station 16; Reg. No. 53576. Wangwa: station 17; Reg. No. 53572. Wangwa: station 19; Reg. No. 53575. 700 m. NE. of Nanseizan: station 19; Reg. No. 53568. Wangwa: station 22; Reg. No. 53566. 700 m. SW. of Kōkwan: station 23; Reg. No. 53571. Wangwa: station 24; Reg. No. 53563. Wangwa: station 32; Reg. No. 53574. 700 m. SE. of Sankwakō: station 46; Reg. No. 53570. 940 m. NW. of Keiyukwa: station 55; Reg. No. 53573. 1550 m. E. of Sinpo: station 69; Reg. No. 53569. Between Kōsui and Zyuna; Reg. No. 37134. 600 m. E. of Hakusyatōn; Reg. No. 37313.

Living: Central Honsyū to Ryūkyū.

Geologic distribution: Pleistocene of Central Honsyū.

Fusinus laticanaliculatus n. sp.

Pl. VIII (III), Figs. 3a, 3b.

?*Siphonalia kelletoides*. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 39, Pl. 2, fig. 10, 1928 (except fig. 11).

Shell rather large, elongate fusiform; aperture together with canal slightly shorter than 2 times of spire. Test rather thin. Whorls 8, the apical 2 embryonal, globular and smooth, the rest flattened, or more or less concave above, subangulate around middle, and nearly vertical below. Surface ornamented by axial plicae and spiral cords. Plicae about 12 on penultimate whorl, rounded, prominent on angulate middle part of whorls, separated by shallow interspaces which are generally wider than plicae themselves. Spiral cords distinct, about 5 on upper slope, and 3 on lower vertical surface (one on angle) of each whorl; the latter larger than the former and provided with one or two interstitial threads in their intervals. Body-whorl large, with almost obsolete plicae and numerous distinct irregular spiral cords, of which 5 subequal ones are situated on surface above angle. Aperture large, longly oval in form; outer lip fractured, but apparently thin; inner lip smooth with a thin and broadly spread callous. Canal considerably curved, rather short, very widely open.

Three specimens. The largest specimen, height, 121 mm.; diameter, 40.8 mm.; length of canal and aperture, 80 mm.

This species is characterized by its rather short and widely open canal and is somewhat related to a species of *Hemifusus*.

Dr. YOKOYAMA gives two types of figures for his new species of *Siphonalia kelletoides* from the Byōritu Beds of Taiwan. The present species is nearly identical with his fig. 10 in

1) TRYON: Man. Conch., 1 Ser., Vol. 3, p. 54, 1881.

sculpture, but unfortunately that specimen lacks its aperture and canal, and I can not bring the two into an accurate comparison.

Fossil occurrence: Byōritu Beds.—Wangwa: station 15; Reg. No. 53580. Sikō; Reg. No. 49404.

Fusinus colus (LINNAEUS), 1758

Fusinus colus. KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 53, No. 617, 1928.

Fusus colus. REEVE, Conch. Icon., Vol. 4, Pl. 3, fig. 11, 1847; KOBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 3, Pt. 3b, p. 146, Pl. 30, fig. 3; Pl. 47, fig. 1, 1881; TRYON, Man. Conch., 1 Ser., Vol. 3, p. 52, Pl. 32, figs. 89–92, 95, 1881; SUGITANI, Cat. Luchu Shells, p. 21, 1926.

A rather large, apparently slender specimen with sharp tubercles at the shoulder. The specimen is closely related to *F. colus*, a well known living species from our southern seas in general aspects. Unfortunately it is fragmental. This is not *Fusus colus* LAMARCK from the Eocene of Paris basin.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—Sikō; Reg. No. 53578.

Living: Southern Kyūsyū and Ryūkyū. Indian Ocean.

Genus **Latirus** MONTFORT, 1810

Subgenus **Persternia** MÖRCH, 1852

Latirus (Persternia) coreanicus (SMITH), 1879

Latirus (Persternia) coreanicus. NOMURA and ZINBÔ, Sci. Rep. Tôhoku Imp. Univ., Ser. 2 (Geol.), Vol. 16, No. 2, p. 135, No. 117, 1934.

Fusus coreanicus. SMITH, Proc. Zool. Soc., p. 204, Pl. 20, fig. 36, 1879; YOKOYAMA, Jour. Coll. Sci. Tôkyô Imp. Univ., Vol. 44, Art. 1, p. 52, Pl. 2, fig. 10, 1922.

One specimen lacking the aperture. It is a small shell with 7, rounded axial plicae, crossed by a few distinct revolving lines, and is perhaps referable to a varietal form of *L. coreanicus* by having fewer and more prominent ribs than the type.

Type locality: Tyōsen; Recent.

Fossil occurrence: Byōritu Beds.—1000 m. NW. of Rinsuikwa: station 5; Reg. No. 53579.

Living: South of Tyōsen and Ryūkyū. Ogasawara-zima.

Geologic distribution: Post-Pleistocene and Pliocene of Honsyū; Pleistocene of Kikai-zima.

Latirus (Persternia) species indet.

One rather ill-preserved, small specimen, 15 mm. in height. The shell is nearly similar in form and sculpture to *Peristerina ustulata* var. *luchuana* PILSBRY,¹⁾ but is much smaller, and has more distinct columellar folds. It may be a new species.

Fossil occurrence: Byōritu Beds.—1200 m. SE. of Sankwakō: station 60; Reg. No. 53832.

1) PILSBRY: Proc. Acad. Nat. Sci. Philad., pp. 179, 390, Pl. 19, fig. 18, 1901.

Latirus (?) minutisquamulosus (REEVE) 1848

Pl. VII (II), Fig. 35.

Fusus minutisquamulosus. REEVE, Conch. Icon., Vol. 4, Pl. 20, fig. 80, 1848: TRYON, Man. Conch., 1 Ser., Vol. 3, p. 65, Pl. 39, fig. 166, 1881.

REEVE first described this neat shell as: "Shell somewhat elongately fusiform, canal rather short, whorls rounded, longitudinally rudely plicated ribbed, spirally finely ridge, ridges minutely scaled throughout."

Several specimens. The characteristic minutely squamate nature of the surface is well exposed in the Formosan fossils.

The generic position is still in question; TRYON thought that it may belong *Coralliophila*.

Type locality: Unknown; Recent.

Fossil occurrence: Byōritu Beds.—900 m. NW. of Rinsuikwa: station 6; Reg. No. 53419. 600 m. SE. of Zyō-tūsyōwan: station 19; Reg. No. 53420. 1200 m. E. Zyō-tūsyōwan: station 36; Reg. No. 53417. 1500 m. E. of Zyō-tūsyōwan: station 49; Reg. No. 53418.

Living: Exact locality unknown.

Family **Busyconidae**Genus **Hemifusus** SWAINSON, 1840**Hemifusus colosseus (LAMARCK), 1822**

Hemifusus colosseus. TRYON, Man. Conch., 1 Ser., Vol. 3, p. 111, Pl. 44, fig. 232, 1881: SUGITANI, Cat. Luchu Shells, p. 24, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 58, No. 695, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 40, No. 1352, 1931.

Fusus colosseus. KIENER, Spec. Coq. viv., p. 50, Pl. 25, 1835-1857: REEVE, Conch. Icon., Vol. 4, Pl. 5, fig. 19, 1847.

Pyrula colossea. SOWERBY, Thes. Conch., Vol. 4, p. 102, Pl. 1, fig. 3, 1880: KOEBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 3, Pt. 3b, p. 40, Pl. 6, fig. 1, 1881:

Hemifusus ternatanus. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 38, Pl. 2, fig. 12, 1928 (not of GMELIN).

Several ill-preserved specimens, sufficient for specific determination. The tubercles or spines upon the shoulder of this species appear to be just an intermediate character between those of *H. ternatanus* and *H. tuba* of our seas.

Type locality: The Eastern sea.

Fossil occurrence: Byōritu Beds.—Wangwa: station 17; Reg. No. 53405. 1000 m. E. of Hakusyatōn: station 20; Reg. No. 53403. Wangwa: station 37; Reg. No. 53404. Keiyukwa: station 50; Reg. No. 53402. 500 m. SW. of Dainankwa: Reg. No. 37377.

Living: Kyūsyū and Taiwan. China. The Philippines. Indian Ocean.

Hemifusus protolacteus n. sp.

Pl. VII (II), Figs. 39a, 39b.

Three specimens.

Shell small, angulate fusiform. Whorls 6 or 7, apical 2 embryonal, rather large, smooth and globular. Post-embryonal whorls strongly angulate around middle; area above angle flat and somewhat sloping, nearly vertical or slightly receding below. Surface longitudinally plicate and spirally striate. Plicae about 8 on a whorl, rounded, distinctly tuberculate at shoulder, interspaces somewhat broader; plicae on body-whorl do not extend below surface of one-third from upper. 5 spiral threads on upper flattened surface, one on angle and 4 below it; interspaces wider than threads; body-whorl with many unequal threads separated by unequal interspaces, some nearly periodically larger. Outer lip broken; aperture angulate-ovate in outline; inner lip smooth with thin callosity. Canal partly fractured, but may have been straight and open.

Height, ca. 30 mm.; diameter, ca. 11.5 mm.

This shell is distinguished from *H. lacteus*, a species found living in the Philippines as well as Japan, by its smaller size, larger embryonal whorls, narrower outline and markedly fewer tubercles on the last whorl. There are no *Hemifusus*, whose immature shell is closely related to this new one.

Fossil occurrence: Byōritu Beds.—900 m. NW. of Keiyukwa: station 33; Reg. No. 53421. 900 m. SE. of Naikotō: station 66; Reg. No. 53422.

Hemifusus pastinaca (REEVE), 1848 ?

Pl. VII (II), Fig. 36.

Compare with

Hemifusus pastinaca. TRYON, Man. Conch., Vol. 3, p. 112, Pl. 44, fig. 234, 1881.

Fusus pastinaca. REEVE, Conch. Icon., Vol. 4, Pl. 16, fig. 64, 1848: KOBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 3, Pt. 3b, p. 137, Pl. 45, fig. 4, 1881.

Two imperfect specimens.

Whorls intact, 7 in better specimen, apical 2 embryonal, smooth and globular; the rest shouldered around middle, surface above shoulder flat and sloping, below it nearly vertical. Surface of post-embryonal whorls ornamented by longitudinal plicae as well as spiral cords; plicae about 13 on a whorl, rather low and weak, separated by interspaces nearly equal to plicae in breadth; cords about 9 on each whorl, 4 on upper sloping surface. Inner lip smooth with a thin callosity. Outer lip and larger part of canal fractured. Diameter, ca. 21 mm.

Type locality: Of "*Fusus*" *pastinaca*, Australia; Recent. This extension in distribution of the Australian species is of geographic significance.

Fossil occurrence: Byōritu Beds.—Wangwa: station 15; Reg. No. 53416. E. of Goko; Reg. No. 37384.

Living: *H. pastinaca* has been recorded only from Australia.

Family Buccinidae

Genus *Siphonalia* A. ADAMS, 1863

Siphonalia spadicea (REEVE), 1846

Pl. VII (II), Fig. 32.

Siphonalia spadicea. YOKOYAMA, Jour. Coll. Sci. Imp. Univ. Tokyo, Vol. 39, Art. 6, p. 53, Pl. 3, figs. 8-11, 1920.

Several fine specimens; they agree well with REEVE's type figure as well as the specimens collected from Japan proper. The largest specimen, 41 mm. in height, and 18 mm. in diameter.

Type locality: Japan; Recent.

Fossil occurrence: Byōritu Beds.—550 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 53590. Wangwa: station 24; Reg. No. 53589. 700 m. E. of Naikotō: station 31; Reg. No. 53589. Wangwa: station 33; Reg. No. 53588. Wangwa: station 35; Reg. No. 53592. 550 m. E. of Sankwakō: station 43; Reg. No. 53591. 700 m. SE. of Sankwakō: station 46; Reg. No. 53593. Sikō; Reg. No. 49414.

Living: Northern Honshū to Inland Sea. Japan Sea.

Geologic distribution: Pleistocene, Pliocene and Miocene(?) of Honshū.

Siphonalia stearnsii PILSBRY, 1895

Pl. VII (II), Fig. 33.

Siphonalia stearnsii. PILSBRY, Cat. Mar. Moll. Jap., p. 29, Pl. 2, figs. 1, 2, 1895: MAKIYAMA, Mem. Coll. Sci. Kyōto Imp. Univ., Ser. B, Vol. 3, No. 1, Art. 1, p. 119, 1927: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 40, No. 1346, 1931.

Several well preserved specimens; they agree quite well with PILSBRY's type figure. The largest, 40 mm. in height, and 21.5 mm. in diameter.

The specimens from the Pliocene bed of Naganuma, Sagami province once figured by Dr. YOKOYAMA¹⁾ do not quite agree with the type as well as the Formosan fossils, they may possibly be referred to a varietal form or a distinct species.

Type locality: Japan; Recent.

Fossil occurrence: Byōritu Beds.—500 m. SW. of Dainankwa: station 5; Reg. No. 37353. Wangwa: station 6; Reg. No. 53414. 1100 m. SW. of Taikwa: station 11; Reg. No. 53598. Wangwa: station 33; Reg. No. 53415. Wangwa: station 39; Reg. No. 53599. 1520 m. E. of Sinpo: station 68; Reg. No. 53600.

Living: Central Honshū to Sikoku.

Geologic distribution: Pleistocene, Pliocene and Miocene(?) of Honshū.

Siphonalia cassidariaeformis (REEVE), 1846

Pl. VII (II), Fig. 34.

Siphonalia cassidariaeformis. LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 38, Pl. 4, figs. 1-10, 1869: TRYON, Man. Conch., Vol. 3, p. 135, Pl. 55, figs. 364-369, 1881: PILSBRY, Cat. Mar. Moll. Jap., p. 29, 1895: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 40, Nos. 1349, 1349a, 1349b, 1931: YAGURA, Cat. Moll. Hyōgo-ken, p. 41, No. 521, 1932.

Buccinum cassidariaeforme. REEVE, Conech. Icon., Vol. 3, Pl. 2, fig. 11, 1846.

Neptunea (Siphonalia) cassidariaeformis. KOBELT in MARTINI u. CHEMNITZ, Syst. Conch., Cab., Vol. 3, Pt. 3b, p. 86, Pl. 23, figs. 2-5, 1881.

1) YOKOYAMA: Jour. Coll. Sci. Imp. Univ. Tōkyō, Vol. 39, Art. 6, p. 54, Pl. 3, figs. 3, 4, 1920.

Several specimens, some of them are exceedingly well preserved.

This is one of the most common living species in Japan. It is variable in form and coloration. The Formosan fossils agree with figs. 8 and 9 given by LISCHKE, though much smaller in size. The largest, 38 mm. in height, and 19.6 mm. in diameter.

Type locality: Japan; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 6; Reg. No. 53597. 1100 m. SW. of Taikwa: station 11; Reg. No. 53594. 550 m. SE. of Zyō-tūsyōwan: station 16; Reg. No. 53595. 600 m. SE. of Zyō-tūsyōwan: station 17; Reg. No. 53596.

Living: Hokkaidō to Kyūshū.

Geologic distribution: Post-Pleistocene, Pleistocene, Pliocene and Miocene of Honsyū; Pliocene of Sikoku.

Genus *Nassaria* LINK, 1807

Nassaria monospina, n. sp.

Pl. VII (II), Figs. 37a, 37b.

Shell small, somewhat rhombic-fusiform, consisting of $6\frac{1}{2}$, rather rapidly increasing whorls, earlier $1\frac{1}{2}$ whorls are protoconch; the rest bluntly angulate or almost convex; last whorl nearly two-thirds length of shell, tapering quite abruptly into base. Surface of each whorl ornamented by about 10 longitudinal ribs, narrower than their interspaces; crossing these there are a few elevated irregular revolving cords which are somewhat granular. Aperture ovate; outer lip thickened by terminal rib which bears a short spine at shoulder, transversely lirate within; inner lip moderately calloused with a few (about 3) obsolete oblique folds. Canal short, narrowly open and slightly oblique.

Height, 12 mm.; diameter, 7.2 mm.

This small neat shell resembles somewhat "*Hindsia*" *teschi* FISCHER¹⁾ from the Pliocene of Timor in form, but specifically differs from that species by its smaller shell with the short spire. The dentition or folds of the inner lip are seemingly more distinct and more in number in FISCHER's species. The form of the present species is somewhat related to a young individual of a certain *Murex*.

Several species of *Nassaria* were figured by TRYON in his Manual of Conchology, but none of them have spines at the shoulder of the terminal rib as the present species does. The genus *Nassaria* (= *Hindsia*) is sometimes referred to *Bursidae*.

Fossil occurrence: Byōritu Beds.—400 m. SE. of Zyō-tūsyōwan: station 13; Reg. No. 53459. Wangwa: station 33; Reg. No. 53482. 1520 m. E. of Sipno: station 68; Reg. No. 53498.

Genus *Latrunculus* GRAY, 1847

(= *Eburna*; ? *Babylonia*)

Latrunculus canaliculatus (SCHUMACHER), 1817

Pl. VIII (III), Fig. 8.

Eburna canaliculata. SOWERBY, Thes. Conch., Vol. 3, p. 69, Pl. 215, figs. 2, ?3, 1866.

Dispaceus canaliculatus. MARTIN, Foss. von Java, Vol. 1, p. 101, Pl. 11, figs. 224–227, 1906.

Eburna spirata. TRYON, Man. Conch., 1 Ser., Vol. 3, p. 212, 1881 (pars.).

1) FISCHER: Paläont. von Timor, Vol. 15, p. 64, Pl. 213, fig. 33, 1927.

One ill-preserved specimen. Although several allied recent forms have been reported from eastern tropic regions, the one described by SCHUMACHER under the above specific name answers our Formosan fossil.

Type locality: Indian Ocean.

Fossil occurrence: Byōritu Beds.—Sikō; Reg. No. 53583.

Living: The Philippines. Indian Ocean. Red Sea.

Geologic distribution: Pliocene of Java and Sumatra; Miocene of Java.

Latrunculus formosus (SOWERBY), 1866

Latrunculus formosae. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 41, No. 1372, 1931.

Eburna formosae. SOWERBY, Thes. Conch., Vol. 3, p. 72, Pl. 291, figs. 17, 18, 1866: KOEBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 3, Pt. 3, p. 11, Pl. 72, fig. 7, 1883.

Eburna formosa. TRYON, Man. Conch., 1 Ser., Vol. 3, p. 211, Pl. 82, fig. 475, 1881.

One fragmental specimen with narrowly canaliculated sutures.

Type locality: Taiwan; Recent.

Fossil occurrence: Byōritu Beds.—500 m. E. of Sankwakō: station 41; Reg. No. 53582.

Living: Taiwan.

Latrunculus lamarcki, n. sp.

Pl. VIII (III), Fig. 28.

Shell large, ovate in form, smooth, except for numerous, fine, growth lines. Whorls 9, convex, separated by impressed but not channeled sutures; spire conical, its apex acute; shoulder of each whorl roundedly angulate; Aperture ovate, somewhat widening below; columellar callous thick and heavy; outer lip regularly convex, but more or less flattened above. Umibilicus widely open, bounded behind by a broad and flexuously sculptured ridge; outer side of ridge, with a smooth cord running parallel to it.

Length, 67 mm.; diameter, ca. 42 mm.

The form of this species closely resembles that of *L. japonicus* (REEVE), but the umbilicus of the former is much wider than the latter; moreover the callous of the inner lip is heavier, and embryonal whorls are apparently smaller.

Latrunculus formosus (SOWERBY) is perhaps another similar species to the present fossil, but that shell has a much more distinctly angulate shoulder with narrowly channelled sutures.

Fossil occurrence: Byōritu Beds.—Wangwa: station 24; Reg. No. 53584. Sōkeisi; Reg. No. 53586. The upper course of Sairyōkyō; Reg. No. 53585.

Genus **Metula** H. and A. ADAMS, 1853

Metula mitrella (ADAMS and REEVE), 1850

Pl. VIII (III), Fig. 1.

Metula mitrella. TRYON, Man. Conch., 1 Ser., Vol. 3, p. 152, Pl. 72, fig. 239, 1881.

Two well preserved specimens. This is a rather small and somewhat cylindrical shell, its surface is very beautifully cancellated. The revolving and axial threads are nearly equal in size except one revolving thread close to the lower suture which is slightly larger than the others. The aperture is long and distinctly sinuate behind.

Metula hindsii figured by MARTIN,¹⁾ and by TESCH²⁾ are apparently closely allied to the Formosan fossil, though they are much smaller. The specimens measure:

- 1. Length, 32 mm.; diameter, 9 mm.
- 2. Length, 25 mm.; diameter, 8 mm.

Type locality: China; Recent.

Fossil occurrence: Byôritu Beds.—Sikô; Reg. No. 49416.

Living: China Sea, at the depth of 10 fathoms.

Genus **Cantharus** (BOLTEN) RÖDING, 1798

Cantharus wangwaensis, n. sp.

Pl. VIII (III), Figs. 18a, 18b.

Shell resembling *C. cecillei* (PHILIPPI) in general aspects, very stout, somewhat rhombic-subfusiform. Whorls about 6, subangulate, and rather rapidly increasing; body-whorl nearly two-thirds total shell-length, distinctly shouldered above, and gradually narrowing below. Surface ornamented by longitudinal plicae and spiral cords. Plicae prominent, about 10 on each whorl, but on body-whorl they do not extend below middle, and tend to become obsolete towards base; interspaces nearly equal to plicae themselves in breadth on whorls of spire, but vary on body-whorl. Spiral cords subequal, prominent, 5 on each whorl of spire, 13 on body-whorl, separated by nearly equal interspaces. Entire surface also sculptured by fine revolving threads as well as longitudinal growth lines. Aperture ovate; outer lip thickened by terminal plicae, transversely dentate within; inner lip smooth with a moderate callosity; canal short, widely open and slightly curved. Umbilicus small and shallow.

Height, 34 mm.; diameter, 21 mm.

This species is closely related to *C. cecillei* (PHILIPPI) of our seas, from which it is easily distinguished by its angulate shoulder. *Cantharus totomiensis* MAKIYAMA³⁾ may be the most related species, though specifically distinct in details.

A specimen quite similar to this fossil was once found living from our coast, though the exact locality is unknown.

Fossil occurrence: Byôritu Beds.—900 m. NW. of Rinsuikwa: station 6; Reg. No. 53408. 510 m. SE. of Zyô-tûsyôwan: station 15; Reg. No. 53407. Wangwa: station 19; Reg. No. 53581. Wangwa: station 23; Reg. No. 53410. 1200 m. SE. of Sankwakô: station 60; Reg. No. 53409.

Living: Japan.

1) MARTIN: Tiefb. von Java, p. 106, Pl. 8, fig. 143, 1887.

2) TESCH: Paläont. von Timor, Vol. 5, p. 53, Pl. 81, fig. 115, 1915.

3) MAKIYAMA: Mem. Coll. Sci. Kyôto Imp. Univ., Ser. B, Vol. 1, No. 1, Art. 1, p. 114, Pl. 5, figs. 21, 22, 1927.

Genus **Pollia** SOWERBY, 1834

Pollia obliquicostata (REEVE), 1846

Pl. VIII (III), Fig. 10.

Cantharus obliquicostatus. TRYON, Man. Conch., Vol. 3, p. 161, Pl. 74, figs. 277, 278, 1881.
Buccinum obliquicostatum. REEVE, Conch. Icon., Vol. 3, Pl. 12, figs. 91a, b., 1846.

Two specimens. The axial ribs in the Formosan fossils are rather slightly oblique, and are more marked on the spire than on the last whorl. The specimens measure:

1. Height, 11.2 mm.; diameter, 5.2 mm.
2. „ ca. 11.4 mm.; „ 5.5 mm.

Type locality: The Philippines; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 14; Reg. No. 53461.

Living: The Philippines.

Family **Nassariidae**

Genus **Nassarius** DUMÉRIL, 1806

Subgenus **Alectriion** MONTFORT, 1810

Nassarius (Alectriion) canaliculatus (LAMARCK), 1822

Nassarius canaliculata. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 41, Pl. 3, fig. 1, 1928.

Several excellently preserved specimens. The Formosan fossils differ from the living *N. canaliculatus* figured by REEVE, and by TRYON, in that the lower whorls invariably have no axial plicae and are evidently smooth. This difference may perhaps require a new name for the fossil specimens, but I treat it provisionally as variation. The largest specimen in our possession measure 30 mm. in height, and 16 mm. in diameter.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—Sikô; Reg. Nos. 48984, 52945.

Living: The Philippines. Indian Ocean.

Geologic distribution: Pliocene of Ryûkyû; Post-Pliocene of Celebes; Pliocene of Java, Timor and Seran; Miocene of Nias and the Philippines.

Nassarius (Alectriion) pictus (DUNKER), 1846

Pl. VIII (III), Fig. 32.

Nassarius pictus. SUGITANI, Cat. Luchu Shells, p. 25, 1926: KURODA, Cat. Shell-bearing Moll., Amami-Ôshima, p. 60, No. 734, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 42, No. 1421, 1931.

Nassa picta. REEVE, Conch. Icon., Vol. 8, Pl. 2, fig. 9, 1853.

One specimen lacking its apical whorls. Height, ca. 21 mm.; diameter, 12 mm.

This is an ovate, rather thick-shelled species and its surface is longitudinally closely ribbed upon the upper whorls. The suture is somewhat step-like with crenulations at the

shoulder. The base is spirally furrowed and striated. Several species were included here by TRYON.¹⁾ *N. balteatus* (LISCHKE) from our seas is a nearly similar species.

Type locality: The Philippines; Recent.

Fossil occurrence: Byōritu Beds.—Sikō; Reg. No. 52985.

Living: Southern Kyūsyū to Taiwan. The Philippines.

Geologic distribution: Post-Pliocene of Java.

Subgenus *Zeuxis* H. and A. ADAMS. 1853

Nassarius (*Zeuxis*) *caelatus* (A. ADAMS), 1851

Nassa caelata. REEVE, Conch. Icon., Vol. 8, Pl. 20, fig. 133, 1853.

Nassa (*Hima*) *verbeekii*. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 40, Pl. 2, figs. 9, 13, 1928.

Several thousand specimens. Compared with the recent specimens of *N. caelatus* collected from Japan, the Formosan fossil does not differ much, hence I prefer to retain ADAMS' name.

N. verbeekii (MARTIN),²⁾ *N. crenulatus* of DICKERSON³⁾ and *N. dispar* also of DICKERSON⁴⁾ are closely allied species; the distinction between the species is not always easy. However, I prefer to distinguish it from *N. siquijorensis* A. ADAMS.

Annexed are some of the measurements (in mm.) for the specimens collected by Mr. ANDŌ from 700 m. E. of Hakusyatōn.

	1	2	3	4	5	6	7
Height	22.5	21.0	20.0	19.0	18.5	15.0	14.0
Diameter	11.0	11.0	10.5	9.0	9.0	9.0	7.5

Type locality: The Philippines; Recent.

Fossil occurrence: Byōritu Beds.—Hakusyatōn: station 1; Reg. No. 52912. 700 m. E. of Hakusyatōn: station 3; Reg. No. 52911. 1000 m. NW. of Rinsuikwa: station 5; Reg. No. 52931. Raised Coral Reef.—S. of Sisitô; Reg. No. 37471.

Living: Central Honshû to Ryûkyû. Japan Sea. The Philippines.

Geologic distribution: Pliocene of Honshû, Sikoku and Ryûkyû. Neogene of Java(?) and the Philippines(?)

Subgenus *Niotha* H. and A. ADAMS, 1853

Nassarius (*Niotha*) *gemmaulatus* (LAMARCK), 1822

Nassa (*Niotha*) *gemmaulata*. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 40, Pl. 2, fig. 8, 1928.

Several thousand, beautifully preserved specimens.

The species is characterized by its large and globose shell with granular sculpture; it is canaliculated along the suture.

N. quadrasi figured by DICKERSON¹⁾ from the Vigo Miocene of the Philippines is seemingly nearly identical.

Annexed are some of the measurements (in mm.) for the specimens collected by S. ANDÔ from Wangwa, st. 1:

	1	2	3	4	5	6	7	8	9
Height	26.5	26.0	24.0	24.0	21.0	21.0	19.0	19.0	11.5
Diameter	14.0	15.0	13.5	12.0	11.0	12.0	11.5	11.0	6.0

Type locality: The Philippines; Recent.

Fossil occurrence: Byôritu Beds.—Hakusyatón: station 1; Reg. No. 52523. Wangwa: station 1; Reg. No. 52506. 700 m. E. of Hakusyatón: station 3; Reg. No. 52521. Wangwa: station 4; Reg. Between Kōsui and Zyuna; Reg. No. 37312. E. of Goko; Reg. No. 37328.

Living: Central Honshū to Taiwan. Japan Sea. The Philippines. Sunda Straits. Australia.

Geologic distribution: Pleistocene and Pliocene of Honshū; Pliocene of Java, Sumatra and Seran; ?Miocene of the Philippines.

Subgenus *Hinia* LEACH, 1848¹⁾

Nassarius (Hinia) eximius (H. and A. ADAMS), 1872

Pl. VIII (III), Fig. 33.

Nassa eximia. TRYON, Man. Conch., 1 Ser., Vol. 4, p. 48, Pl. 15, fig. 257, 1882.

Nassarius eximius. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 42, No. 1430, 1931.

Four specimens; the largest, ca. 8 mm. in height, and 3.5 mm. in diameter.

It is a small *Nassarius*, longitudinally closely ribbed and spirally striated. In sculpture, this shell resembles *N. dominulus* (TAP.-CAN.), a species very commonly found living in Japan,

1) KURODA: The Venus, Vol. 4, No. 4, p. 260, 1934.

but is smaller and narrower. *N. luteolus* (SMITH) and *N. plebeculus* (GOULD) from Southern Japan are perhaps also similar species.

Type locality: Pacific Islands; Recent.

Fossil occurrence: Byōritu Beds.—700 m. E. of Hakusyatōn: station 3; Reg. No. 52987. Wangwa: station 23; Reg. No. 52986.

Living: Ogasawara-zima. South Sea. Vita Island. New Hebrides.

Nassarius (Hinia) festivus (Powys), 1835

Nassarius festivus. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 42, No. 1426, 1931: NOMURA, Sci. Rep. Tōhoku Imp. Univ. Ser. 2 (Geol.), Vol. 15, No. 2, p. 115, No. 349, 1932: YAGURA, Cat. Moll. Hyōgo-ken, p. 43, 1932: KURODA, Cat. Moll. Hukui-ken, p. 43, No. 174, 1933.

Nassa festiva. REEVE, Conch. Icon., Vol. 8, Pl. 18, fig. 117, 1853: LISCHKE, Jap. Meeres-Conch., Vol. 2, p. 53, 1871: DUNKER, Index Mar. Moll. Jap., p. 37, 1882: TRYON, Man. Conch., 1 Ser., Vol. 4, p. 46, Pl. 14, figs. 239–241 (not 242), 1882: PILSBRY, Cat. Mar. Moll. Jap., p. 35, 1895.

Nassa lirata. DUNKER, Moll. Jap., p. 7, Pl. 1, fig. 20, 1861.

A single fractured specimen. “*Nassa*” *festiva* mentioned by Dr. YOKOYAMA¹⁾ from the Upper Musasino Formation of the Kwantō region is a quite distinct species judging from his figure; his species seems to represent *N. dominulus* (TAP.-CAN.), better known under the name of *N. acutidentatus* (SMITH).

REEVE gives the localities of *N. festivus* as Panama and St. Elena, but are doubted by TRYON; it is perhaps an Oriental species.

Type locality: Oriental Sea.

Fossil occurrence: Byōritu Beds.—The upper course of Sairyōkyō; Reg. No. 53725.

Living: Widely distributed in Japan from Hokkaidō to Kyūshū. Japan Sea. China.

Geologic distribution: Post-Pliocene, Pleistocene and Pliocene of Honshū; Pliocene of Sikoku.

Nassarius spp. (?) indet.

Several imperfect specimens of small *Nassarius* are found in the collection. I am not certain whether they belong to an adult species or are young individuals of a certain large species.

Fossil occurrence: Byōritu Beds.—Wangwa: station 8; Reg. No. 53891. Wangwa: station 18; Reg. No. 53890. 700 m. SW. of Kōkwan: station 23; Reg. No. 53893. Wangwa: station 37; Reg. No. 53889. Tyū-tūsyōwan: station 47; Reg. No. 53892.

Genus Cyllene GRAY, 1833

Cyllene pulchella ADAMS and REEVE, 1850

Pl. VIII (III), Fig. 4.

Cyllene pulchella. SOWERBY, Thes. Conch., Vol. 3, p. 79, No. 12, Pl. 217, figs. 24, 25, 1866: TRYON, Man. Conch., 1 Ser., Vol. 3, p. 224, Pl. 84, figs. 567–571, 1881.

1) YOKOYAMA: Jour. Coll. Sci. Tōkyō Imp. Univ., Vol. 39, Art. 6, p. 97, Pl. 3, fig. 6, 1920.

Two well preserved specimens nearly equal in size; 7.5 mm. in diameter, 15 mm. in height.

Shell small, ovately conical, spire much shorter than body-whorl; body-whorl slightly shouldered above, convex below. Upper half of shell surface finely latticed by intersection of both spiral and longitudinal threads, but is nearly smooth on surface below shoulder of body-whorl except for obsolete spiral grooves. Base rather distinctly spirally furrowed. Aperture narrow, inner side of outer lip crenulated.

According to TRYON, *C. grayi* REEVE, *C. glabrata* A. ADAMS and *C. guillainii* PETIT are synonyms; anyhow, they are hardly distinguishable from each other even by the excellent figures given by SOWERBY.

Type locality: Borneo; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 6; Reg. No. 53920.

Living: Japan. Borneo.

Cyllene lugubris ADAMS and REEVE, 1850

Pl. VIII (III), Fig. 3.

Cyllene lugubris. SOWERBY, Thes. Conch., Vol. 3, p. 78, No. 5, Pl. 217, figs. 7, 8, 9, 1866: TRYON, Man. Conch., 1 Ser., Vol. 3, p. 224, Pl. 84, figs. 561–563, 1881.

Many specimens. Similar in form with preceding except for coarser and more distinct longitudinal plicae. Spiral grooves on body-whorl more or less variable, quite distinct in some and obsolete in others.

TRYON unites this with *C. fuscata* A. ADAMS and *C. pallida* A. ADAMS; it is also apparently closely related to *C. oweni* GRAY.

Type locality: Sooloo Islands; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 6; Reg. No. 53919. Nanseizan: station 11; Reg. No. 53912. 400 m. SE. of Zyō-tūsyōwan: station 13; Reg. No. 53914. Wangwa: station 15; Reg. No. 53917. Wangwa: station 17; Reg. No. 53916. 1000 m. E. of Hakusyatōn: station 25; Reg. No. 53915. 500 m. E. of Sankwakō: station 41; Reg. No. 53918.

Living: Japan. Singapore. Malacca. Sooloo Islands. W. Africa (?).

Cyllene concinna SOLANDER, 1850

Cyllene concinna. SOWERBY, Thes. Conch., Vol. 3, p. 79, No. 14, Pl. 217, figs. 29, 30, 1866: TRYON, Man. Conch., 1 Ser., Vol. 3, p. 224, Pl. 84, fig. 572, 1881: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap.; p. 42, No. 1399, 1931.

One imperfect specimen, 6 mm. in diameter and about 10 mm. in height, if perfect.

This shell is smaller and narrower than the preceding two species, with the surface nearly smooth except for a few basal threads.

Type locality: Unknown. (Oriental Sea?).

Fossil occurrence: Byōritu Beds.—Wangwa: station 6; Reg. No. 53921.

Living: Yaku-sima, Southern Kyūshū.

Family Pyrenidae

Genus **Pyrene** (BOLTEN) RÖDING, 1798

Subgenus **Mitrella** RISSO, 1826

Pyrene (Mitrella) baculus (REEVE), 1859

Pl. VII (II), Fig. 30.

Columbella baculus. REEVE, Conch. Icon., Vol. 11, Pl. 25, fig. 157, 1859; TRYON, Man. Conch., 1 Ser., Vol. 5, p. 143, Pl. 52, fig. 74, 1883.

Astyris baculus. KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 62, No. 762, 1928.

Several specimens, though mostly small. The largest, 18.8 mm. in height, and 8 mm. in diameter.

Shell smooth, ovately fusiform, rather coarsely sulcate below angulate periphery. Whorls 9, flattened, apex acute, sutures subchanneled. Aperture narrow with a short and re-curved canal below. Outer lip thickened.

Type locality: China Sea.

Fossil occurrence: Byōritu Beds.—Wangwa: station 14; Reg. No. 53899. 700 m. NE. of Nanseizan: station 19; Reg. No. 53897. Wangwa: station 23; Reg. No. 53898. Wangwa: station 24; Reg. No. 53896. Sikō; Reg. No. 48973.

Living: China seas. Australia.

Pyrene (Mitrella) niveomarginata (SMITH), 1879

Pl. VII (II), Fig. 29.

Columbella (Atilia) niveomarginata. SMITH, Proc. Zool. Soc., p. 207, Pl. 20, fig. 41, 1879; PILSBRY, Cat. Mar. Moll. Jap., p. 38, 1895; YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 43, No. 1462, 1931.

Mitrella niveomarginata. YAGURA, Cat. Moll. Hyōgo-ken, p. 43, No. 559, 1932.

Columbella niveomarginata. TRYON, Man. Conch., 1 Ser., Vol. 5, p. 146, Pl. 52, fig. 91, 1883.

Three imperfect specimens resembling closely the named species in form.

Type locality: Japan; Recent.

Fossil occurrence: Byōritu Beds.—900 m. NW. of Rinsuikwa: station 6; Reg. No. 53900. 500 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 53928. On road S. of Bōsiho; Reg. No. 37550.

Living: Western Honsyū and Kyūshū.

Pyrene (Mitrella) yabei n. sp.

Pl. VII (II), Figs. 28a, 28b.

Shell small, subfusiform, whorls about 8, apical ones smooth and rounded, the rest slightly convex or nearly straight in lateral outline, separated by well defined, marginate sutures. Surface longitudinally plicate; plicae about 15 on each whorl and tend to become obsolete on body-whorl. Interspaces between plicae nearly equal to, or slightly wider than plicae them-

selves, quite smooth. Base suddenly narrowed by angulate periphery and spirally, rather coarsely striated at causal portion. Aperture narrow, rather angular and slightly sinuous above; inner lip smooth. Outer lip seemingly thick and dentate within according to the small preserved part. Height, 8.5 mm.: diameter, 3 mm.

This species appears to be related to "*Columbella (Atilia) lischkei* SMITH,¹⁾ a species found living in Japan and "*Columbella (Atilia) smithi* YOKOYAMA,²⁾ a Pleistocene fossil species from the Kwantō region, but it differs from both in details of form and sculpture.

Fossil occurrence: Byōritu Beds.—700 m. E. of Hakusyatōn: station 3; Reg. No. 53930. Wangwa: station 6; Reg. No. 48975. Wangwa: station 8; Reg. No. 53935. Bōsiho: station 13; Reg. No. 53931. 400 m. SE. of Zyō-tūsyōwan: station 13; Reg. No. 53937. Wangwa: station 14; Reg. No. 53939. Wangwa: station 15; Reg. No. 53933. Wangwa: station 17; Reg. No. 53934. Wangwa: station 18; Reg. No. 53932. Wangwa: station 19; Reg. No. 53936. Wangwa: station 24; Reg. No. 53942. 1000 m. E. of Hakusyatōn: station 25; Reg. No. 53938. Wangwa: station 40; Reg. No. 53940. 500 m. E. of Sankwakō: station 43; Reg. No. 53941. The upper course of Sairyōkyō; Reg. No. 53943. Western side of Syōgun-yama; Reg. No. 37373.

Genus **Anachis** H. and A. ADAMS, 1853

Subgenus **Zafra** A. ADAMS, 1860

Anachis (Zafra) species indet.

A small partly water-worn specimen, 2.7 mm. in height and 1.1 mm. in diameter. It resembles "*Columbella*" *pumilla* DUNKER³⁾ in form, but the longitudinal plicae are apparently more numerous.

Fossil occurrence: Byōritu Beds.—Wangwa: station 15; Reg. No. 53929.

Genus **Columbella** LAMARCK, 1799

Subgenus **Euplica** DALL, 1889

Columbella (Euplica) versicolor SOWERBY, 1832

Pl. VII (II), Fig. 31.

Columbella (Euplica) versicolor. KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 61, No. 749, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 43, No. 1443, 1931: YAGURA, Cat. Moll. Hyōgo-ken, p. 43, No. 548, 1932.

Euplica versicolor. SUGITANI, Cat. Luchu Shells, p. 26, 1926.

Columbella versicolor. SOWERBY, Thes. Conch., Vol. 1, p. 117, Pl. 73, figs. 41–46, 1847: REEVE, Conch. Icon., Vol. 11, Pl. 11, fig. 51, 1858: TRYON, Man. Conch., 1 Ser., Vol. 5, p. 110, Pl. 45, figs. 84–96, 1888.

Columbella scripta (= *versicolor* Sow.). PILSBRY, Cat. Mar. Moll. Jap., pp. 38, 169, 1895. (non *C. scripta* LINNAEUS).

This is a very common and one of the most abundant forms in the recent fauna along our coasts, ranging from Central Honshū to Taiwan, but its fossil occurrence in Taiwan is very

1) SMITH: Proc. Zool. Soc., p. 207, Pl. 20, fig. 42, 1879.

2) YOKOYAMA: Jour. Coll. Sci. Imp. Univ. Tōkyō, Vol. 44, Art. 1, p. 60, P. 2, fig. 24, 1922.

3) DUNKER: Moll. Jap., p. 6, Pl. 1, fig. 4, 1861.

scanty and is represented in the collection by only a single specimen. Dimensions: Height, 14.2 mm., diameter, 8.8 mm.

Type locality: The Philippines; Recent.

Fossil occurrence: Byōritu Beds.—Sikô; Reg. No. 48981.

Living: Central Honsyû to Ryûkyû. Japan Sea. The Philippines. New Guinea. Viti, Galpagos and Sandwich Islands.

Geologic distribution: Post-Pleistocene of Honsyû.

Family Muricidae

Genus **Murex** LINNAEUS, 1758

Subgenus **Murex** s. s.

Murex (Murex) tribulus LINNAEUS, 1758

Murex tribulus. TRYON, Man. Conch., 1 Ser., Vol. 2, p. 77, Pl. 9, figs. 107, 109, 1880.

Murex ternispina. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 42, Pl. 3, fig. 2, 1928.

Several well preserved immature specimens. The largest is about 55 mm. in height. *M. ternispina* LAMARCK and *M. verbeekii* MARTIN,¹⁾ are apparently identical.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—700 m. E. of Hakusyatô: station 3; Reg. No. 51137. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 51138. Wangwa: station 9; Reg. No. 51143. Wangwa: station 10; Reg. No. 51145. 500 m. SE. of Zyô-tûsyôwan: station 14; Reg. No. 51142. Wangwa: station 19; Reg. Nos. 51404, 51140. 1000 m. E. of Hakusyatô: station 20; Reg. No. 51139. Kozantyô: station 24; Reg. No. 51147. Wangwa: station 28; Reg. No. 51144. 300 m. E. of Sankwakô: station 39; Reg. No. 51146. Wangwa: station 40; Reg. No. 51154. 550 m. E. of Sankwakô: station 43; Reg. No. 51155. 1000 m. E. of Zyô-tûsyôwan: station 59; Reg. No. 51141. 1580 m. E. of Sinpo: station 69; Reg. No. 51153. 300 m. E. of Hakusyatô; Reg. No. 37523. Sikô; Reg. Nos. 49405, 51136.

Living: Central Honsyû to Ryûkyû. China. The Philippines. Indian Ocean.

Geologic distribution: Post-Pliocene of Celebes and Java; Miocene of Java.

Murex (Murex) rarispina LAMARCK, 1822

Pl. VIII (III), Fig. 7.

Murex rarispina. REEVE, Conch. Icon., Vol. 3, Pl. 21, fig. 86, 1845: KÜSTER u. KOBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 3, Pt. 2, p. 70, Pl. 25, fig. 4, 1878 (?Pl. 9, fig. 1): TRYON, Man. Conch., 1 Ser., Vol. 2, p. 79, Pl. 10, fig. 115; Pl. 11, fig. 119, 1880.

The shell resembles the preceding in general features, but the spines are decidedly fewer in number and shorter, the nodule between each varix is more prominent and the spire apparently a little more elevated.

1) MARTIN: Foss. von Java, Vol. 1, p. 123, Pl. 19, figs. 278-280, 1906.

This species is most closely related to *M. bantamensis* MARTIN¹⁾ from the Neogene deposits of Java; the two may perhaps prove to be identical by future study.

Type locality: Indian Ocean.

Fossil occurrence: Byōritu Beds.—700 m. E. of Hakusyatōn: station 3; Reg. No. 51151. Wangwa: station 14; Reg. No. 51150. Wangwa: station 23; Reg. No. 51149. Wangwa: station 24; Reg. No. 53895. Kozantyō: station 24; Reg. No. 51148. 1520 m. E. of Sinpo: station 68; Reg. No. 51152.

Living: Indian Ocean.

Subgenus **Chicoreus** MONTFORT, 1810

Murex (Chicoreus) sinensis REEVE, 1845

Pl. VIII (III), Fig. 11.

Chicoreus sinensis. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 44, No. 1491, 1931.

Murex sinensis. REEVE, Conch. Icon., Vol. 3, Pl. 6, fig. 25, 1845: LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 43, 1869: PILSBRY, Cat. Mar. Moll. Jap., p. 41, 1895.

Murex elongatus. TRYON, Man. Conch., 1 Ser., Vol. 2, p. 95, 1880 (pars.).

Several well preserved specimens. The largest, 45 mm. in height. Among several forms belonging to *Chicoreus* that have been reported from the tropic and subtropic regions of Asia, *C. brevifrons* (LAMARCK) from the Red Sea is most akin to the present species.

Type locality: China; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 14; Reg. No. 51156. 510 m. SE. of Zyō-tūsyōwan: station 15; Reg. No. 51159. Wangwa: station 40; Reg. No. 51157. Keiyukwa: station 50; Reg. No. 51158.

Living: Central Honshū to Ryūkyū. China.

Murex (?) species indet.

Two mould specimens. The preserved impression of a varix on each whorl resembles a certain form of *Muricidae*.

Fossil occurrence: Byōritu Beds.—Wangwa: station 1; Reg. No. 54205. 1000 m. E. of Hakusyatōn: station 4; Reg. No. 54206.

Genus **Rapana** SCHUMACHER, 1817

Rapana bezoar (LINNAEUS), 1767

Pl. VIII (III), Fig. 17.

Rapana bezoar. LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 51, 1869 (pars.); TRYON, Man. Conch., 1 Ser., Vol. 2, p. 202, 1880 (pars.); YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 46, No. 1562, 1931; YAGURA, Cat. Moll. Hyōgo-ken, p. 45, No. 579, 1932.

1) MARTIN: Foss. von Java, Vol. 1, p. 126, Pl. 19, figs. 290–291, 1906.

Purpura bezoar. KIENER, Spec. Coq. viv., p. 64, Pl. 17, fig. 49, 1835-1857.
Pyrula bezoar. REEVE, Conch. Icon., Vol. 4, Pl. 4, fig. 15 b only, 1847.

Several specimens. The largest, 49 mm. in height, and about 38 mm. in diameter.

It is closely related to *R. thomasiana* CROSSE, a common living and fossil species in Japan proper. However, the shell is generally smaller in size and possesses coarser transverse ridges and prominently developed foliations upon the last whorl.

What Dr. YOKOYAMA reports as small fragments of *R. thomasiana* from the Byōritu Beds of Taiwan may be this species.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 3; Reg. No. 53513. Wangwa: station 6; Reg. No. 52991. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 53484. 500 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 52993. 550 m. SE. of Zyō-tūsyōwan: station 16; Reg. No. 52990. Wangwa: station 17; Reg. No. 52994. Wangwa: station 22; Reg. No. 52995. Wangwa: station 23; Reg. No. 53504. Kōsui: station 61; Reg. No. 52992.

Living: Western Honshū, and Inland Sea to Kyūshū. Japan Sea. China. The Philippines. Indian Ocean.

Genus **Trophon** MONTFORT, 1810

Trophon? species indet.

An imperfect specimen lacking its canal and outer lip. Whorls 8, angulate at about two-thirds of height of whorl from lower suture, smooth except for almost obsolete spirals. Longitudinal plicae rather distinct, lamellar and nearly vertical, weaker on surface above angle than elsewhere. Canal apparently recurved. It is somewhat related to *Boreotrophon nipponicus* (YOKOYAMA)¹⁾ from the Pliocene of Kosiba, south of Yokohama, but is not accurately identical with that species.

Fossil occurrence: Byōritu Beds.—Wangwa: station 24; Reg. No. 54213.

Genus **Typhis** MONTFORT, 1810

Typhis duplicatus SOWERBY, 1870

Pl. VIII (III), Fig. 5.

Typhis duplicatus. SOWERBY in REEVE, Conch. Icon., Vol. 19, Pl. 2, figs. 8 a, b, 1874: SOWERBY, Thes. Conch., Vol. 4, app. Monog. *Typhis*, No. 15, figs. 29, 30, 1880.

Several fine specimens. The largest, 15 mm. in height, and 9.2 mm. in diameter. TRYON unites this species with *T. arcuatus* HINDS which is found both living and fossil in Japan; in fact the two are closely related.

Type locality: China Sea.

1) YOKOYAMA: Jour. Coll. Sci. Imp. Univ. Tōkyō, Vol. 39, Art. 6, p. 61, pl. 3, figs. 13, 14, 1920.

Fossil occurrence: Byōritu Beds.—Bōsiho: station 13; Reg. No. 53977. 500 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 53975. Wangwa: station 23; Reg. No. 53978. Wangwa: station 24; Reg. No. 53974. 1550 m. E. of Sinpo: station 68; Reg. No. 53976.

Living: China Sea.

Genus *Thais* (BOLTEN) RÖDING, 1798

***Thais luteostoma* (DILLWYN), 1817**

Pl. VIII (III), Fig. 34.

Thais luteostoma. SUGITANI, Cat. Luchu Shells, p. 27, 1926: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 45, No. 1529, 1931: NOMURA, Sci. Rep. Tōhoku Imp. Univ. Ser. 2 (Geol.), Vol. 15, No. 2, p. 118, No. 369, 1932: YAGURA, Cat. Moll. Hyōgo-ken, p. 45, No. 575, 1932.

Thais (Mancinella) luteostoma. KURODA, Cat. Moll. Hukui-ken, p. 188, No. 148, 1933.

Purpura luteostoma. REEVE, Conch. Icon., Vol. 3, Pl. 8, fig. 35, 1846: KÜSTER in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 3, Pt. 1, p. 107, Pl. 19, figs. 7, 8, 1858: DUNKER, Moll. Jap., p. 5, 1861: SCHRENCK, Reis. u. Forsch. Amur-Lande, p. 390, 1869: LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 54, 1869: LISCHKE, ibid., Vol. 2, p. 39, 1871: TRYON, Man. Conch., 1 Ser., Vol. 2, p. 166, Pl. 49, figs. 77, 78, 81, 1880: DUNKER, Ind. Moll. Mar. Jap., p. 39, 1882: PILSBRY, Cat. Mar. Moll. Jap., p. 44, 1895.

Numerous specimens, although from one locality. The tubercles on the shoulder vary greatly in their strength, some being sharper and more prominent than the others.

Type locality: China?; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 31; Reg. No. 53911.

Living: Widely distributed in Japan from North to South including Taiwan. Tyōsen. China. Indian Ocean.

Geologic distribution: Post-Pleistocene of Honshū; Pliocene of Java.

***Thais problematica* (BAKER), 1891¹⁾**

Pl. VIII (III), Fig. 35.

Thais tumulosa problematica. SUGITANI, Cat. Luchu Shells, p. 27, 1926: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 45, No. 1531, 1931: YAGURA, Cat. Moll. Hyōgo-ken, p. 45, No. 577, 1932.

Purpura alveolata. PILSBRY, Cat. Mar. Moll. Jap., p. 44, 1895 (pars.).

Purpura tumulosa. LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 54, Pl. 5, figs. 12–16, 1869: LISCHKE, ibid., Vol. 2, p. 39, 1871 (non REEVE).

A single small specimen, 22 mm. in height, and 13 mm. in diameter. The original blackish color is rather well preserved upon the rounded tubercles. This species may perhaps be rightly called *T. clavigera* (KÜSTER).

Type locality: Japan?; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 5; Reg. No. 53910.

Living: Northern Honshū to Ryūkyū.

1) PILSBRY: Proc. Acad. Nat. Sci. Philad., p. 388, 1901.

Genus **Lataxiена** JOUSSEAUME, 1883**Lataxiена luliana** (MARTIN), 1887

Pl. VIII (III), Fig. 27a, 27b.

Pollia luliana. MARTIN, Tiefb. auf Java, Vol. 3, p. 105, Pl. 6, fig. 106, 1887.*Tritonidea luliana*. TESCH, Foss. von Timor, Vol. 5, p. 55, Pl. 131, fig. 120, 1915.

Several well preserved specimens. The form and sculpture of the Formosan specimens are quite identical with the specimens from Timor figured by TESCH than the type given by MARTIN, although invariably slightly smaller in size. Annexed are some of the measurements (in mm.):

	1	2	3	4	5	6
Height	20.7	19.0	17.0	16.0	14.4	13.5
Diameter	10.0	9.5	8.4	8.3	8.5	7.0

Type locality: Java; Neogene.

Fossil occurrence: Byōritu Beds.—700 m. E. of Hakusyatōn: station 3; Reg. No. 53428. Wangwa: station 10; Reg. No. 53431. Nanseizan: station 11; Reg. No. 53440. 400 m. SE. of Zyō-tūsyōwan: station 13; Reg. No. 53436. 500 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 53427. Wangwa: station 14; Reg. No. 53432. 550 m. SE. of Zyō-tūsyōwan: station 16; Reg. No. 53441. 700 m. NE. of Nanseizan: station 19; Reg. No. 53446. Wangwa: station 19; Reg. No. 53442. 1000 m. E. of Hakusyatōn: station 20; Reg. No. 53447. Kozantyō: station 24; Reg. No. 53439. Wangwa: station 24; Reg. No. 53441. 1000 m. E. of Hakusyatōn: station 25; Reg. No. 53425. 700 m. SW. of Kōkwan: station 27; Reg. No. 53430. 550 m. S. of Naikotō: station 28; Reg. No. 53451. 900 m. NW of Keiyukwa: station 33; Reg. No. 53443. Wangwa: station 32; Reg. No. 53429. Wangwa: station 33; Reg. No. 53444. Wangwa: station 35; Reg. No. 53438. 1200 m. E. of Zyō-tūsyōwan: station 36; Reg. No. 53424. 300 m. E. of Sankwakō: station 39; Reg. No. 53445. 500 m. E. of Sankwakō: station 41; Reg. No. 53434. 550 m. E. of Sankwakō: station 43; Reg. No. 53437. 940 m. NW of Keiyukwa: station 55; Reg. No. 53433. 1200 m. SE. of Sankwakō: station 60; Reg. No. 53448. 900 m. SE. of Naikotō: station 66; Reg. No. 53450. 1520 m. E. of Sinpo: station 68; Reg. No. 53426. 1550 m. E. of Sinpo: station 69; Reg. No. 53435. 300 m. E. of Hakusyatōn; Reg. No. 37329. 300 m. E. of Zyō-tūsyōwan; Reg. No. 37378.

Geologic distribution: Pliocene of Timor; Miocene of Java and Sumatra.

Lataxiена fimbriata (HINDS), 1844

Pl. VIII (III), Fig. 12.

Trophon fimbriatus. TRYON, Man. Conch., 1 Ser., Vol. 2, p. 149, Pl. 33, fig. 355, 1880.*Lataxiена luculenta*. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 44, No. 1515, 1931.*Murex luculentus*. REEVE, Conch. Icon., Vol. 3, Pl. 28, fig. 127, 1845.*Trophon luculentus*. DUNKER, Ind. Moll. Mar. Jap., p. 9, Pl. 1, figs. 3, 4, 1882; PILSBRY, Cat. Mar. Moll. Jap., p. 40, 1895.

A single specimen whose shoulder varices are partly worn.

Shell ovate fusiform, apex acute. Whorls 9, apical 3 embryonal, smooth and convex; post-embryonal ones distinctly angulate around middle, surface above angle flat, vertical below.

Body-whorl about two-thirds of total shell-height and shallowly umbilicate in front. Surface longitudinally plicate and spirally ridged. Plicae about 10 on a whorl, narrow and rather indistinct, somewhat tuberculate at shoulder. Ridges few, rather irregular in strength, one on angle and one below it are prominent; 2 smaller ridges on sloping area above body-whorl angle, and 8 distinct ones on surface below it, and provided with smaller ones in each interval of upper ones. Entire surface rather coarsely fimbriated by longitudinal lamellar ridges especially marked on body-whorl. Aperture ovate; outer lip transversely dentate within; inner lip smooth. Canal short, recurved being widely open. Height, 29.5 mm.; diameter, 27.4 mm.

Type locality: Strait of Macassar; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 10; Reg. No. 53452.

Living: Sikoku and Taiwan. Straits of Macassar.

Family Coralliophilidae

Genus *Coralliophila* H. and A. ADAMS, 1853

Coralliophila pilsbryi, n. sp.

Pl. VIII (III), Figs. 13a, 13b.

Shell resembling *Coralliophila stearnsi* PILSBRY in general features, but somewhat smaller, body-whorl, relatively less broader, aperture proportionally narrower, spiral cords more nearly equal in size and sculptured in a somewhat different way. Height, 19 mm.; diameter, 11.8 mm.

Fossil occurrence: Byōritu Beds.—Bōsiho: station 13; Reg. No. 53453.

Genus *Latiaxis* SWAINSON, 1840

Latiaxis yabei, n. sp.

Pl. VIII (III), Figs. 30a, 30b, 31a, 31b.

Shell rather small, fusiform, umbilicate; spire longly conical in lateral view, and slightly longer than one-third of total shell-height. Whorls 8, the first 2 globular, forming a smooth embryonal conch, the third also globular, and sculptured with numerous, fine longitudinal threads only, the rest angular at about one-fourth of whorl-length from the lower suture; area above angle convexly sloping, below it receding. Surface sculptured by longitudinal plicae and spiral threads. Plicae about 10 on each whorl, rather low and weak, separated by shallow inter-spaces nearly equal to plicae themselves; plicae on lower two whorls rather obsolete and do not extend below middle part of body-whorl. Spiral threads subequal, minutely squamate with inter-spaces narrower, about 10 on upper sloping area and 3-4 on remaining part of penultimate whorl. Aperture angularly ovate; outer lip thin, lirate within; inner lip smooth; anterior canal moderate and recurved. Umbilicus rather shallow and narrow.

There are several specimens in the collection. The dimensions (in mm.) of two specimens are:

	1	2
Height	31.0	25.5
Diameter	21.6	18.7

This species somewhat resembles *R. idola* JONAS¹⁾ which said to be living in China, the Philippines and Australia, but our shell has invariably much narrower umbilicus than that species.

Fossil occurrence: Byōritu Beds.—Wangwa: station 24; Reg. No. 53456. 1200 m. E. of Zyō-tūsyōwan: station 36; Reg. No. 53454. 900 m. SE. of Naikotō: station 66; Reg. No. 53455. E. of Goko; Reg. Nos. 37383, 37370.

Family Bursidae

Genus **Bursa** (BOLTEN) RÖDING, 1798

Subgenus **Gyrineum** LINK, 1807

Bursa (Gyrineum) subgranosa (BECK), 1832-41

Ranella subgranosa. REEVE, Conch. Icon., Vol. 2, Pl. 1, fig. 1, 1844.

Ranella (Bursa) subgranosa. TESCH, Paläont. von Timor, Vol. 5, p. 70, Pl. 82, fig. 152, 1915: FISCHER, Paläont. von Timor, Vol. 15, p. 65, 1927: DICKERSON, Rev. Philippine Paleont., Pl. 4, figs. 13a, 13b, 1922. *Gyrineum scelestum*. YOKOYAMA, Imp. Geol. Surv., Rep. No. 101, p. 44, Pl. 3, figs. 5, 6, 1928.

Numerous well preserved specimens. The largest one about 60 mm. in height. This may perhaps be only a varietal form of *B. rana* (L.), a species found living from Western Honshū and farther southward in Japan. *G. scelestum* YOKOYAMA, above cited, is certainly identical with the present species; the canal of the former is not as long as suspected by Dr. YOKOYAMA.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—300 m. E. of Hakusyatōn: station 1; Reg. No. 37390. 700 m. E. of Hakusyatōn: station 3; Reg. Nos. 51164, 51189. 1000 m. E. of Hakusyatōn: station 4; Reg. SE. of Naikotô: station 66; Reg. No. 51183. 1500 m. E. of Sinpo: station 69; Reg. No. 51180.

Living: Western Honsyû and Kyûsyû. Tyôsen. China. The Philippines. Indian Ocean.

Geologic distribution: Post-Pliocene of New Guinea; Pliocene of Java, Timor and Seran; Miocene of Java and the Philippines.

Family Cymatiidae

Genus **Cymatium** (BOLTEN) RÖDING, 1798

Cymatium vespaeum (LAMARCK), 1822

Pl. VIII (III), Fig. 36.

Cymatium vespaeum. KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 36, No. 560, 1928.

Tritonium vespaeus. PILSBRY, Cat. Mar. Moll. Jap., p. 47, 1895.

Triton (Simpulum) vespaeus. TESCH, Paläont. von Timor, Vol. 5, p. 67, Pl. 82, fig. 147, 1915.

Triton vespaeus. REEVE, Conch. Icon., Vol. 2 Pl. 15, figs. 61a, b, 1844: TRYON, Man. Conch., 1 Ser., Vol. 3, p. 22, Pl. 12, figs. 94-100, 1881: KÜSTER u. KOBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 3, Pt. 2, p. 179, Pl. 52, fig. 3, 1878.

One small, somewhat imperfect specimen, 15 mm. in diameter, and about 30 mm. in height. According to TRYON, *C. thersites* (REEVE)¹⁾ is a typical full grown specimen of the present species.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byôritu Beds.—900 m. SE. of Naikotô: station 66; Reg. No. 51401.

Living: Ryûkyû. Polynesia. Indian Ocean. Australia. Sandwich Islands. West Indies(?).

Geologic distribution: Pliocene of Timor.

Cymatium sinense (REEVE), 1844

Pl. VIII (III), Fig. 22.

Cymatium (Monoplex) sinense. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 35, No. 1133, 1931.

Triton sinensis. REEVE, Conch. Icon., Vol. 2, Pl. 6, fig. 18, 1844: TRYON, Man. Conch., 1 Ser., Vol. 3, p. 20, Pl. 11, fig. 85, 1881: KÜSTER u. KOBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 3, Pt. 2, p. 215, Pl. 60, figs. 5, 6, 1878.

One specimen, it agrees closely in form and sculpture with the description given by REEVE, except for the canal which is, unfortunately, not perfectly preserved. Diameter, ca. 12 mm.

1) REEVE: Conch. Icon., Vol. 2, Pl. 13, fig. 48, 1844.

Type locality: China; Recent.

Fossil occurrence: Byōritu Beds.—400 m. SE. of Zyō-tūsyōwan: station 13; Reg. No. 51402.

Living: Western Honshū. China.

Cymatium parthenopeum (SALIS), 1773

Cymatium (Septa) parthenopeum. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 35, No. 1138, 1931.

Tritonium parthenopes. DUNKER, Ind. Moll. Mar. Jap., pp. 28, 256, 1882.

Triton (Simpulum) costatus. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 43, Pl. 3, fig. 9, 1928.

A small, perfect specimen. This species is widely distributed in the tropic and subtropic regions along both Pacific and Atlantic coasts. *C. olearium* (LINNAEUS)¹⁾ and *C. costatum* (BORN) are synonyms.

Type locality: Mediterranean Sea.

Fossil occurrence: Byōritu Beds.—Sōkeisi; Reg. No. 52997.

Living: Central Honshū to Ryūkyū. Japan Sea. Indo-Pacific. Mediterranean Sea. Atlantic.

Geologic distribution: Post-Pleistocene of Central Honshū.

Cymatium andoi n. sp.

Pl. VIII (III), Figs. 21a, 21b.

Shell rather small, ovate fusiform, consisting of about 6 moderately convex whorls, separated by well impressed sutures. Surface marked by prominent, alternately large and small spiral ridges, 6 on penultimate, and about 15 on ultimate whorl, crossed by longitudinal threads making surface somewhat crenulate. Interspaces nearly equal to those of ridges in breadth on upper whorls, and wider on body-whorl. Aperture longly ovate; outer lip thickened by a terminal varix behind, transversely dentate within; inner lip almost free from callous deposits, obliquely corrugate; canal partly broken, but it is seemingly short and oblique.

A single specimen. Height, 28 mm.; diameter, 21.8 mm.

This is a very unique species, and no allied species have been reported either as recent or fossil from Japan and eastern Asia. It somewhat resembles in form a member of the genus *Gelagna* SCHANFUSS, 1869.

Fossil occurrence: Byōritu Beds.—Wangwa: station 14; Reg. No. 53973.

Genus **Distorsio** (BOLTEN) RÖDING, 1798

Distorsio reticulata (LINK), 1807

Distorsio reticulata. KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 49, 1928: NOMURA and ZINBÔ, Sci. Rep. Tôhoku Imp. Univ., Ser. 2 (Geol.), Vol. 16, No. 2, p. 136, No. 136, 1934.

1) LINNAEUS: Syst. Nat. Ed., Vol. 12, p. 1217 (not Ed., 10).

Persona (Distortrix) reticulata. TESCH, Paläont. von Timor, Vol. 5, p. 69, Pl. 82, fig. 151, 1915: FISCHER, Paläont. von Timor, Vol. 15, p. 65, 1927.
Distortrix reticulata. SUGITANI, Cat. Luchu Shells, p. 18, 1926.
Distortio cancellianus. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 44, Pl. 3, fig. 8, 1928.

Two well preserved specimens. The larger one 49 mm. in height, and 39 mm. in diameter.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—400 m. SE. of Zyō-tūsyōwan: station 13; Reg. No. 51160. Sikō; Reg. No. 49415.

Living: Western Honsyū to Ryūkyū. China. The Philippines. Indian Ocean. West Indies and South America(?).

Geologic distribution: Pleistocene of Kikai-zima; Post-Pliocene of New Guinea; Pliocene of Java, Timor, Seran and Sumatra; Miocene of Java and Sumatra.

Family Cassididae

Genus **Phalium** LINK, 1807

Subgenus **Phalium** s. s.

Phalium (Phalium) areolum (LINNAEUS), 1758

Pl. VIII (III), Fig. 38.

Phalium areolum. KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 50, No. 577, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 36, No. 1173: YAGURA, Cat. Moll. Hyōgo-ken, p. 38, No. 474, 1932.

Cassis areola. REEVE, Conch. Icon., Vol. 5, Pl. 9, fig. 24, 1848: KÜSTER in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 3, p. 33, Pl. 49, figs. 5, 6, 1857: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 276, Pl. 6, fig. 84, 1885.

Several specimens, mostly ill-preserved. The largest ca. 57 mm. in height.

This shell is closely related to *P. strigatum* (GMELIN), a common living species in Japan. But it is distinguished from that species in the shell is less higher and consequently it is more globose in outline. In the full grown specimen, the spiral grooves of the body-whorl are indistinct on its upper part, while in the young, they are uniformly marked all over it.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—Wanga: station 6; Reg. No. 53128. Wangwa: station 13; Reg. No. 53136. 500 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 53139. Bōsiho: station 14; Reg. No. 53138. Wangwa: station 14; Reg. No. 53137. 550 m. SE. of Zyō-tūsyōwan: station 16; Reg. No. 53140. 500 m. E. of Sankwakō: station 41; Reg. No. 53135. Sikō; Reg. No. 53141.

Raised Coral Reef.—S. of Sisitō; Reg. No. 37467.

Living: Central Honsyū to Ryūkyū. Japan Sea. The Philippines. Indian Ocean.

Phalium (Phalium) cancellianum, n. sp.

Pl. VIII (III), Figs. 25a, 25b.

Shell small, oblong-oval, with a single varix on each mature whorl; test thick and solid; spire short, conical, apex acute. Whorls 8, granular, cancellate, apical 3 (or 2½) embryonal, globular and smooth, the fourth also globular, the rest somewhat shouldered above, regularly convex below and marked with longitudinal ribs crossed by incised spiral grooves; the former about 30, and the latter 17 in number on body-whorl. Aperture narrow, elongate, somewhat tapering above; outer lip thickened by terminal varix, coarsely lirate within; inner lip has more or less punctate-corrugations at the lower part.

Type: Height, 30.4 mm. diameter, 18.6 mm. length of aperture 24.2 mm.

This new species has a great resemblance in form and sculpture to the preceding, but is distinguished from that species by having a smaller shell, more prominently cancellated sculpture and with a different ornamentation of the lower part of the inner lip.

Fossil occurrence: Byōritu Beds.—700 m. E. of Hakusyatōn: station 3; Reg. No. 53144. Wangwa: station 15; Reg. No. 53146. Wangwa: station 16; Reg. No. 53142. Wangwa: station 26; Reg. No. 53145.

Phalium (Phalium) decussatum (LINNAEUS), 1758

Pl. VIII (III), Fig. 24.

Cassis decussata. REEVE, Conch. Icon., Vol. 5, Pl. 2, fig. 4, 1848: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 277, Pl. 7, figs. 87, 88, 1885.

Shell small, consisting of 7 whorls, separated by somewhat marginated sutures. Spire short and conical, straight in outline. Last whorl roundly shouldered, area above it somewhat concave. Surface of spire ornamented by numerous fine vertical riblets crossed by a few spiral grooves. Last whorl also with vertical riblets and spiral grooves, but the former entirely obsolete on surface below shoulder, while the latter, on the contrary, becoming gradually distinct towards base. Inner lip with many oblique folds; outer lip fractured. A single varix behind inner lip showing a tendency of spination at the upper end. Height, about 31 mm. It is nearly identical with the named species in form and sculpture and perhaps represents an immature individual, but is slightly questionable due to being imperfectly preserved.

Type locality: Unknown; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 39; Reg. No. 53143.

Living: Unknown, ?tropic seas in Asia.

Geologic distribution: Pliocene of Java (?).

Subgenus **Semicassis** MÖRCH, 1852

Phalium (Semicassis) japonicum (REEVE), 1848

Cassis japonica. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 46, Pl. 3, fig. 3, 1928.

This shell which has already been mentioned and figured by Dr. YOKOYAMA in the above cited work is represented in our collection by a few fine specimens as well as several fragments. The largest and finest specimen, 47 mm. in height, and 32 mm. in diameter.

Leaving aside the European *P. saburon* (ADANSON) from the present consideration, the Oriental forms, namely, *P. pilum* (REEVE), *P. japonicum* (REEVE), *P. pfeifferi* (HIDALGS), and *P. bisulcatum* (SCHUB. and WAGN.), are closely related to each other and are perhaps conspecific as maintained by TRYON and may prove to be so by future study; if so then, the name *pilum* is prior to *japonicum*.

Type locality: Japan; Recent.

Fossil occurrence: Byōritu Beds.—1600 m. N. of Sikwakō: station 10; Reg. No. 53130. Wangwa: station 12; Reg. No. 53124. 700 m. SW. of Kōkwān: station 23; Reg. No. 53127. Wangwa: station 24; Reg. No. 53123. 1000 m. E. of Hakusyatōn: station 25; Reg. No. 53122. 1660 m. E. of Sinpo: station 56; Reg. No. 53125. Hakusyatōn; Reg. No. 53126. Sikō; Reg. No. 48989.

Living: Central Honshū to Kyūshū. Japan Sea. China.

Geologic distribution: Pliocene of Honshū; Pliocene of Java, Timor and Seran; Miocene of Java.

Genus **Morum** (BOLTEN), RÖDING, 1798

Morum subcancellatum, n. sp.

Pl. VIII (III), Figs. 23a, 23b.

Shell small, elongate-ovate; spire short, conical, body-whorl very large. Whorls 7, apical two embryonal, smooth and globular; the rest shouldered, longitudinally ribbed and spirally ridged; ribs 11 on body-whorl (including terminal one), rounded, separated by interspaces two times wider; ridges regular, equidistant, 11 on body-whorl; tuberculated at crossing points of ribs, especially spiny on shoulder of whorls. Suture impressed, distinct by submarginal cord. Aperture narrow, slightly oblique; outer lip reflected, coarsely dentate, or undulated, corresponding to spiral ridges of outer surface; inner lip with thin callosity and rather irregularly corrugate. Canal short, widely open being truncated at sinuated base. Height, 39 mm.; diameter, 24 mm.; length of aperture, 34 mm.

A single specimen. It is closely related to *M. cancellatum* (Sow.)¹⁾ from the China Sea. But the present species is distinguished from SOWERBY's species in having fewer and broader ribs, and by having narrower callosity with less corrugations on the lower part of the inner lip.

Fossil occurrence: Byōritu Beds.—Sikō; Reg. No. 48972.

Family **Tonnidae**

Genus **Tonna** BRÜNNICH, 1772

Tonna zonata (GREEN), 1830

Pl. VIII (III), Fig. 29.

Dolium zonatum. REEVE, Conch. Icon., Vol. 5, Pl. 7, figs. 12a, b, 1849: KÜSTER in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 3, p. 75, Pl. 57, fig. 2; Pl. 63, fig. 3, 1857: LISCHKE, Jap. Meeres-Conch., Vol.

1) TRYON: Man. Conch., 1 Ser., Vol. 7, p. 282, Pl. 10, fig. 21, 1885.

1, p. 66, 1869: LISCHKE, ibid., Vol. 2, p. 58, 1871: DUNKER, Ind. Moll. Mar. Jap., p. 57, 1882: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 263, Pl. 3, fig. 17, 1885: PILSBRY, Cat. Mar. Moll. Jap., p. 49, 1895: MARTIN, Foss. von Java, Vol. 1, p. 159, Pl. 25, figs. 368, 369, 1906.
Dolium crenulatum. PHILIPPI, Abbild. Vol. 3, Pt. 2, p. 1, No. 1, Pl. 1, fig. 1, 1851.

Several rather small specimens. A perfect one 59 mm. in height, and about 32 mm. in diameter. Interspaces between ribs provided with small riblet which is divided into three on upper part of body-whorl and penultimate. Growth lines rather coarse and distinct, somewhat latticed, especially in interspaces.

Is this *T. olearium* LINNÆUS (not of BRUGUIÈRE)?

Type locality: The Eastern Sea.

Fossil occurrence: Byōritu Beds.—550 m. NW. of Rinsuikwa: station 7; Reg. No. 53131. Wangwa: station 19; Reg. No. 53132. Wangwa: station 37; Reg. No. 53133. Sikô; Reg. No. 49407.

Living: Central Honsyû to Kyûsyû. China.

Geologic distribution: Pliocene of Java, Sumatra and Seran.

Tonna melanostoma (JAY), 1889

Pl. X (V), Figs. 29a, 29b.

Tonna melanostoma. SUGITANI, Cat. Luchu Shells, p. 19, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 51, No. 585, 1928.

Dolium melanostoma. REEVE, Conch. Icon., Vol. 5, Pl. 2, fig. 2, 1848: KÜSTER in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 3, p. 67, Pl. 59, 1857: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 261, Pl. 1, figs. 4, 5, 1885.

A very large, deformed mould, similar in size and sculpture with the named species.

Type locality: Friendly Islands; Recent.

Fossil occurrence: Kaizan Beds.—Ari-san; Reg. No. 52999.

Living: Southern Kyûsyû and Ryûkyû. Friendly Islands. Hawaiian Islands. Southern Pacific.

Tonna luteostoma (KÜSTER) 1857

Dolium luteostoma. YOKOYAMA, Jour. Coll. Sci. Imp. Univ. Tôkyô, Vol. 39, Art. 6, p. 66, Pl. 4, fig. 2, 1920.

Fragmental specimens.

Type locality: Indian Ocean.

Fossil occurrence: Byōritu Beds.—700 m. SW. of Kôkwan: station 23; Reg. No. 53134. 580 m. E. of Zyô-tûsyôwan: station 58; Reg. No. 53129.

Living: Widely distributed in Japan from North to South. Indian Ocean.

Geologic distribution: Post-Pleistocene, Pleistocene and Pliocene of Central Honsyû. Pliocene of Sikoku. Pleistocene of Kikai-zima.

Family **Ficidae**Genus **Ficus** (BOLTEN) RÖDING, 1798**Ficus ficoides** (LAMARCK), 1822

Ficus ficoides. SUGITANI, Cat. Luchu Shells, p. 19, 1926: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 36, No. 1197, 1931: YAGURA, Cat. Moll. Hyôgo-ken, p. 38, No. 484, 1932: KURODA, Cat. Moll. Hukui-ken, p. 187, No. 143, 1933.

Three imperfect specimens, all lacking the lower parts of the body-whorl. The surface sculpture consists of fine growth lines and spiral threads; their intersections being cancelled. The spirals are irregular in strength, periodically with relatively large ones.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byôritu Beds.—1000 m. E. of Hakusyatōn: station 6; Reg. No. 53000. 1000 m. SE. of Hakusyatōn: station 32; Reg. No. 53870.

Living: Central Honshū to Taiwan. Japan Sea. Indian Ocean. West coast of Africa.

Geologic distribution: Pleistocene of Central Honshū. Pliocene of Seran; Miocene of Java and the Philippines; Neogene of Europe.

Family **Cypraeidae**Genus **Cypraea** LINNEAUS, 1758**Cypraea arabica** LINNEAUS, 1758

Pl. IX (IV), Fig. 2.

Cypraea arabica. KIENER, Spec. Coq. viv., p. 105, Pl. 17, fig. 1, 1835–1857: REEVE, Conch. Icon., Vol. 3, Pl. 1, fig. 2, 1845: LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 69, 1869: LISCHKE, ibid., Vol. 2, pp. 66, 167, 1871: SOWERBY, Thes. Conch., Vol. 4, p. 15, Pl. 10, figs. 59–61, 1880: WEINKAUFF in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 5, Pt. 2, p. 51, Pl. 16, figs. 3–6, 1881: DUNKER, Ind. Moll. Mar. Jap., p. 98, 1882: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 174, Pl. 8, figs. 18, 19, 23, 24, 1885: PILSBRY, Cat. Mar. Moll. Jap., pp. 50, 172, 1895: SUGITANI, Cat. Luchu Shells, p. 16, 1926: KURODA, Cat. Shell-bearing Moll., Amami-Ōshima, p. 44, No. 497, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 33, No. 1067, 1931.

Two rather well preserved specimens. Shell solid, ovately subcylindrical in form, thickly margined by callous deposits. Ventral surface flattish with narrow and slightly arcuate aperture. Teeth rather small. The larger one, height, 38.7 mm., lateral diameter, 25 mm., dorso-ventral diameter, 19 mm.

Type locality: Indian Ocean.

Fossil occurrence: Raised Coral Reef.—S. of Kontei; Reg. No. 37469.

Living: Central Honshū to Taiwan. Indo-Pacific. Red Sea. Madagascar.

Geologic distribution: Post-Pliocene of Java.

Cypraea caput-serpentis LINNAEUS, 1758

Pl. IX (IV), Fig. 3.

Cypraea caput-serpentis. KIENER, Spec. Coq. viv., p. 112, Pl. 49, figs. 1, 1a, 1b, 1835–1857: REEVE, Conch. Icon., Vol. 3, Pl. 11, fig. 44, 1845: LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 70, 1869: LISCHKE, ibid., Vol. 2, pp.

64, 167, 1871: SOWERBY, Thes. Conch., Vol. 4, p. 16, Pl. 12, figs. 72, 73, 1880: WEINKAUFF in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 5, Pt. 3, p. 21, Pl. 5, figs. 20, 21, 1881: DUNKER, Ind. Moll. Mar. Jap., p. 99, 1882: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 173, Pl. 6, figs. 98–100; Pl. 23, fig. 59, 1885: PILSBRY, Cat. Mar. Moll. Jap., p. 50, 1895: SUGITANI, Cat. Luchu Shells, p. 16, 1926: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 33, No. 1069, 1931: NOMURA and ZINBÔ, Sci. Rep. Tôhoku Imp. Univ., Ser. 2 (Geol.), Vol. 16, No. 2, p. 140, No. 144, 1934.
Pustularia caput-serpentis. YAGURA, Cat. Moll. Hyôgo-ken, p. 36, No. 448, 1932: KURODA, Cat. Moll. Hukui-ken, p. 187, No. 128, 1933.

This is a very common shell in the recent fauna of Southern Japan, but is represented in the collection by only a single specimen. Height, 33.8 mm.; lateral diameter, 25 mm.; dorso-ventral diameter, 17 mm.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Raised Coral Reef.—S. of Kontei; Reg. No. 37470.

Living: Central Honshû to Taiwan Japan Sea. China. Indo-Pacific. Red. Sea. Australia.

Geologic distribution: Pleistocene of Kikai-zima.

Cypraea caurica LINNAEUS, 1758

Pl. IX (IV), Fig. 8.

Cypraea caurica. KIENER, Spec. Coq. viv., Vol. 1, p. 54, Pl. 10, figs. 2, 3, 1835–1857: REEVE, Conch. Icon., Vol. 3, Pl. 11, fig. 46, 1845: LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 71, 1869: WEINKAUFF in MARTINI u. CHEMNITZ, Syst. Conch., Cab., Vol. 5, Pt. 3, p. 12, Pl. 3, figs. 4, 5, 13, 14, 1881: DUNKER, Ind. Moll. Mar. Jap., p. 100, 1882: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 171, Pl. 5, figs. 88, 89, 90, 1885: PILSBRY, Cat. Mar. Moll. Jap., p. 50, 1895: SUGITANI, Cat. Luchu Shells, p. 16, 1926: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 33, No. 1079, 1931.

Erronea caurica. KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 45, No. 508, 1928.

A single specimen. Length, 37 mm.; lateral diameter, 22.5 mm.; dorso-ventral diameter, 17 mm.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Raised Coral Reef.—S. of Kontei; Reg. No. 37474.

Living: Southern Kyûshû to Taiwan. Indian and Pacific Islands. E. coast of Africa.

Cypraea cincta MARTIN, 1906

Pl. IX (IV), Figs. 5a, 5b, 6a, 6b.

Cypraea cincta. MARTIN, Foss. von Java, Vol. 1, p. 172, Pl. 28, figs. 399–402, 1906.

Three rather ill-preserved specimens. They are identical with the figures given by MARTIN for the specimens from Sedan.

Type locality: Java; Miocene.

Fossil occurrence: Byôritu Beds.—Rokuzyûkei; Reg. No. 25256.

Geologic distribution: Miocene of Java.

Cypraea felina GMELIN, 1792

Cypraea felina. KIENER, Spec. Coq. viv., p. 96, Pl. 33, fig. 3, 1835-1857: REEVE, Conch. Icon., Vol. 3, Pl. 19, fig. 105, 1846: LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 71, 1769: LISCHKE, ibid., Vol. 2, p. 63, 1871: SOWERBY, Thes. Conch., Vol. 4, p. 9, Pl. 323, figs. 392, 394, 395, 1880: WEINKAUFF in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 5, Pt. 3, p. 11, Pl. 3, figs. 2, 3, 1881: DUNKER, Ind. Moll. Mar. Jap., p. 98, 1882: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 169, Pl. 4, figs. 52, 55, 59, 60, 1885: PILSBRY, Cat. Mar. Moll. Jap., p. 50, 1895: KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 45, No. 513, 1928.

Eronea felina. YAGURA, Cat. Moll. Hyōgo-ken, p. 36, No. 455, 1932.

Two, rather ill-preserved specimens are identified with *C. felina* with some doubt.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Ryūkyū Limestone.—Hanpeizan; Reg. No. 37429.

Living: Western Honsyū to Ryūkyū. Japan Sea. Indo-Pacific. Red Sea. Australia.

Cypraea mappa LINNAEUS, 1758

Pl. IX (IV), Fig. 10.

Cypraea mappa. KIENER, Spec. Coq. viv., p. 9, Pl. 20, figs. 1, 2, 1835-1857: REEVE, Conch. Icon., Vol. 3, Pl. 6, fig. 18, 1845: SOWERBY, Thes. Conch., Vol. 4, p. 15, Pl. 5, figs. 24-28, 1880: WEINKAUFF in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 5, Pt. 3, p. 73, Pl. 22, figs. 1-4, 1881: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 174, Pl. 7, figs. 12-14; Pl. 8, fig. 17, 1885: SUGITANI, Cat. Luchu Shells, p. 16, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 44, No. 496, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 33, No. 1066, 1931.

A single mould; the form and teeth are quite similar in the named one. Height, ca. 63.5 mm.; lateral diameter, 47.5 mm.; dorso-ventral diameter, 38 mm.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Ryūkyū Limestone.—Kotobuki-yama; Reg. No. 38208.

Living: Ryūkyū and Taiwan. Indo-Pacific. Red Sea.

Cypraea miliaris GMELIN, 1792

Pl. IX (IV), Figs. 4a, 4b.

Cypraea miliaris. REEVE, Conch. Icon., Vol. 3, Pl. 10, fig. 36, 1845: SOWERBY, Thes. Conch., Vol. 4, p. 36, Pl. 308, fig. 109, 1880: WEINKAUFF in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 5, Pt. 3, p. 110, Pl. 33, figs. 9, 12, 1881: DUNKER, Ind. Moll. Mar. Jap., p. 99, 1882: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 192, Pl. 17, fig. 18, 1885: PILSBRY, Cat. Mar. Moll. Jap., p. 51, 1895: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 34, No. 1090, 1931.

Pustularia miliaris. YAGURA, Cat. Moll. Hyōgo-ken, p. 36, No. 447, 1932.

Three specimens. This species is characterized by its small sized shell, ovate outline, swollen behind, and flattened in front. The teeth are rather large, and elongated, about 16 on the right side and 12 on the left. The surface is entirely smooth except for coarse crenulation on both sides of the shell. The largest specimen, 32 mm. in height, 20 mm. in the lateral diameter, and 16 mm. in the dorso-ventral diameter.

C. guttata GRAY, *C. lamarcki* GRAY and *C. eburnea* BARNES are similar species.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—400 m. SE. of Zyō-tūsyōwan: station 13; Reg. No. 53507. Wangwa: station 16; Reg. No. 53505. 1000 m. E. of Hakusyatōn: station 25; Reg. No. 53506.

Living: Central Honshū and Inland Sea. Molucca.

Cypraea talpa LINNAEUS, 1758

Pl. IX (IV), Fig. 1.

Cypraea talpa. KIENER, Spec. Coq. viv., p. 79, Pl. 12, fig. 2, 1835-1857: REEVE, Conch. Icon., Vol. 3, Pl. 2, fig. 51, 1845: SOWERBY, Thes. Conch., Vol. 4, p. 6, Pl. 12, figs. 74, 75, 76, 1880: WEINKAUFF in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 5, Pt. 3, p. 18, Pl. 4, figs. 5, 6; Pl. 7, figs. 6, 7, 1881: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 167, Pl. 3, figs. 31-33, 1885: SUGITANI, Cat. Luchu Shells, p. 16, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 44, No. 490, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 33, No. 1060, 1931.

One small specimen. It is probably an immature specimen of *C. talpa* judged by its form and dentition. The spire is slightly exposed as is the usual case of an immature *Cypraea*. Height, 45 mm.; lateral diameter, 25 mm.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Raised Coral Reef.—S. of Kontei; Reg. No. 37475.

Living: Central Honshū to Taiwan. Indo-Pacific. Red Sea.

Cypraea testudinaria LINNAEUS, 1758

Pl. IX (IV), Fig. 7.

Cypraea testudinaria. KIENER, Spec. Coq. viv., p. 78, Pls. 15, 16, fig. 1, 1835-1857: REEVE, Conch. Icon., Vol. 3, figs. 9a, b, 1845: LISCHKE, Jap. Meeres-Conch., Vol. 3, p. 4, Pl. 13, figs. 83, 84, 1880: WEINKAUFF in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 5, Pt. 3, p. 16, Pl. 4, figs. 3, 4, 1881: DUNKER, Ind. Moll. Mar. Jap., p. 97, 1882: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 165, Pl. 1, figs. 9, 10, 1885: PILSBRY, Cat. Mar. Moll. Jap., p. 50, 1895: SUGITANI, Cat. Luchu Shells, p. 16, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 44, No. 495, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 33, No. 1058, 1931.

A single mould. The shell is large and subcylindrical in form bearing many, rather small teeth in front.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Ryūkyū Limestone.—Hanpeizan; Reg. No. 37450.

Living: Kyūshū to Taiwan. The Philippines. Mauritius, Ambon, New Caledonia. Viti and Samoa Islands. Indian Ocean.

Cypraea onyx LINNEAUS, 1758

Pl. IX (IV), Figs. 9a, 9b.

Cypraea onyx. TRYON, Man. Conch., 1 Ser., Vol. 7, p. 183, Pl. 13, figs. 77, 80, 81, 1885: PILSBRY, Cat. Mar. Moll. Jap., p. 51, 1895.

Two small specimens. One of them retains the peculiar blackish color on the base and sides. Height, 27 mm.; lateral diameter, 16.5 mm.; dorso-ventral diameter, 18.5 mm.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 24; Reg. No. 53508.

Ryūkyū Limestone:—Hanpeizan; Reg. No. 53509.

Living: Central Honsyū to Kyūsyū. The Philippines. Indo-Pacific.

Geologic distribution: Miocene of Nias.

Cypraea species indet. (1)

A fragment of a thickly margined *Cypraea* with obsolete teeth. It seems to be very characteristic, but is indeterminable.

Fossil occurrence: Byōritu Beds.—Sikō; Reg. No. 53510.

Cypraea species indet. (2)

A mould showing a rather highly exposed spire. It seems to be an immature individual of a large *Cypraea*, but the specific identification is at present in question.

Fossil occurrence: Byōritu Beds.—Wangwa: station 12; Reg. No. 53511.

Genus **Pustularia** SWAINSON, 1840

Pustularia cicercula (LINNAEUS), 1758

Pl. IX (IV), Figs. 11a, 11b.

Pustularia cicercula. KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 45, No. 518, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 84, No. 1099, 1931.

Cypraea (Pustularia) cicercula. SUGITANI, Cat. Luchu Shells, p. 17, 1926.

Cypraea cicercula. REeve, Conch. Icon., Vol. 3, Pl. 21, fig. 116, 1845: KIENER, Spec. Coq. viv., p. 156, Pl. 50, figs. 3, 4, 1835–1857: SOWERBY, Thes. Conch., Vol. 4, p. 41, No. 142, Pl. 322, figs. 343–346, 1880: WEINKAUFF in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 5, Pt. 1, p. 140, Pl. 37, figs. 1, 2, 1881: DUNKER, Ind. Moll. Mar. Jap., p. 100, 1882: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 197, Pl. 20, figs. 55–58, 61, 62, 1885.

Cypraea (Epuna) cicercula. PILSBRY, Cat. Mar. Moll. Jap., p. 173, 1895.

A single, well preserved specimen. Length, 38 mm.; lateral diameter, 11.5 mm.; dorsoventral diameter, 10 mm.

The specimen, not only coincides with the figures and descriptions given in the works cited above, but also perfectly agrees with recent specimens collected from Ryūkyū.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Raised Coral Reef.—S. of Sisitō; Reg. No. 37398.

Living: Southern Kyūsyū and Ryūkyū. Mauritius. Isle Anna. Borneo. New Caledonia.

Genus **Volva** (BOLTEN) RÖDING, 1798

Volva volva (LINNAEUS), 1758

Pl. IX (IV), Figs. 12a, 12b.

Volva volva. YAGURA, Cat. Moll. Hyôgo-ken, p. 37, No. 460, 1931: KURODA, Cat. Moll. Hukui-ken, p. 186, No. 125, 1933.

Sulcocypraea (*Volva*) *volva*. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Imp. Geol. Surv. Jap., p. 34, No. 1120, 1931.

Ovulum volva. SOWERBY, Thes. Conch., Vol. 2, p. 482, No. 48, Pl. 99, figs. 6-8, 1855: REEVE, Conch. Icon., Vol. 15, Pl. 9, fig. 41, 1865.

Ovula volva. WEINKAUFF in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 5, Pt. 3, p. 196, Pl. 50, figs. 4, 5, 1881: KIENER, Spec. Coq. viv., p. 26, Pl. 4, fig. 1, 1835-1857: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 525, Pl. 4, figs. 94, 95, 1885.

Three specimens from two localities. They quite agree with the recent specimens from Japan, although somewhat fractured at both extremities in both specimens.

Type locality: The Eastern Sea.

Fossil occurrence: Byôritu Beds.—Wangwa: station 33; Reg. No. 53401. Sikô; Reg. No. 48980.

Living: Central Honshû to Kyûshû. Japan Sea. China. The Philippines.

Genus **Erato** RISSO, 1826

Erato callosa ADAMS and REEVE, 1850

Erato callosa. REEVE, Conch. Icon., Vol. 15, Pl. 1, fig. 2, 1865: YOKOYAMA, Jour. Coll. Sci. Tôkyô Imp. Univ., Vol. 44, Art. 1, p. 69, Pl. 3, fig. 11, 1922.

A single specimen exactly identical with *E. callosa* which is considered by some as a variety of *E. lachryma* GRAY.

Type locality: China; Recent.

Fossil occurrence: Byôritu Beds.—550 m. E. of Sankwakô: station 43; Reg. No. 53926.

Living: Northern Honshû to Ryûkyû. China Sea.

Geologic distribution: Post-Pleistocene, Pleistocene and Pliocene of Honshû.

Family **Strombidae**

Genus **Strombus** LINNAEUS, 1758

Strombus tawanicus n. sp.

Pl. VIII (III), Figs. 15a, 15b, 16a, 16b.

Shell resembling *S. japonicus* REEVE in general aspects, but smaller and relatively narrower and being less concave in the upper slope of its whorls; the angle of the shoulder more rounded and the sculpture much more distinct, and somewhat finer. The revolving ridges on the upper half of the body-whorl in this species are invariably divided into two or three equal or unequal parts, though it is a rare case in *S. japonicus*.

S. taiwanicus is most closely related to *S. swainsoni* REEVE, from which our shell is distinguished by having more marked spiral grooves on the body-whorl and a much higher spire.

In deep revolving grooves on the body-whorl, this new species apparently closely resembles *S. deformis* GRAY of Australia.

Annexed are some of the measurements (in mm.):

	1	2	3	4	5	6
Height	51.0	48.5	48.0	40.5	32.0	28.0
Diameter	22.5	22.7	23.5	20.8	12.5	10.5

Fossil occurrence: Byōritu Beds.—700 m. E. of Hakusyatōn: station 3; Reg. No. 53148. 1000 m. E. of Hakusyatōn: station 4; Reg. No. 53161. Wangwa: station 4; Reg. No. 53156. 1000 m. NW. of Rinsuikwa: station 6; Reg. No. 53168. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 53171. Wangwa: station 6; Reg. No. 53152. Wangwa: station 9; Reg. No. 53172. 1100 m. SW. of Rinsuikwa: station 11; Reg. No. 53174. Wangwa: station 12; Reg. No. 53158. Bōsiho: station 13; Reg. No. 53175. 400 m. SE. of Zyō-tūsyōwan: station 13; Reg. No. 53170. Wangwa: station 13; Reg. Nos. 53164, 53149. 1450 m. W. of Hokkō: station 14; Reg. No. 53181. Wangwa: station 14; Reg. No. 53187. 500 m. S. of Zyō-tūsyōwan: station 14; Reg. No. 53165. 550 m. SE. of Zyō-tūsyōwan: station 16; Reg. No. 53166. Wangwa: station 16; Reg. No. 53186. 600 m. SE. of Zyō-tūsyōwan: station 17; Reg. No. 53180. Wangwa: station 17; Reg. No. 53155. Wangwa: station 18; Reg. No. 53154. Wangwa: station 19; Reg. No. 53160. 1000 m. E. of Hakusyatōn: station 20; Reg. No. 53163. Wangwa: station 22; Reg. No. 53157. Wangwa: station 23; Reg. No. 53151. 1000 m. E. of Hakusyatōn: station 25; Reg. No. 53147. Wangwa: station 25; Reg. No. 53150. Wangwa: station 32; Reg. No. 53183. Wangwa: station 35; Reg. No. 53182. 1100 m. E. of Zyō-tūsyōwan: station 37; Reg. No. 53167. Wangwa: station 40; Reg. No. 53153. Tyō-tūsyōwan: station 47; Reg. No. 53173. Keiyukwa: station 50; Reg. No. 53176. 940 m. NW. of Keiyukwa: station 55; Reg. No. 53169. 1200 m. SE. of Sankwakō: station 60; Reg. No. 53178. 900 m. SE. of Naikotō: station 66; Reg. No. 53177. 1520 m. E. of Sinpo: station 68; Reg. No. 53179. 1550 m. E. of Sinpo: station 69; Reg. No. 53186. Hakusyatōn; Reg. No. 53159. Sikō; Reg. Nos. 53184, 48991.

Strombus bivaricosus, n. sp.

Pl. VIII (III), Figs. 14a, 14b.

Shell small, fusiform. Whorls 10, apical $3\frac{1}{2}$ embryonal, smooth and rounded. Post-embryonal whorls bluntly shouldered at two-thirds of height of whorl, separated by submarginated, impressed sutures with 2 varices on each lower 4 whorls. Sculpture consists of longitudinal plicae as well as revolving threads. Plicae numerous, about 22 on shoulder of last whorl (excluding varices) vanishing on surface below periphery; interspaces somewhat wider than plicae. Threads subequal, (often with smaller ones between), about 7 on a whorl of spire, over 40 in number on last whorl; points of intersection of plicae and threads minutely beaded, especially distinct on spire whorls. Body-whorl 2 times longer than spire; aperture narrow and fusiform. Outer lip thickened by a terminal varix, but not expanded, transversely lirate within; inner lip smooth with a rather thin callosity; canal short, substraight and truncate at base.

Two specimens; the larger one, 21.5 mm. in height, 8.5 mm. in diameter, and 12.9 mm. in length of aperture.

This species is characterized by its small shell, beaded surface, and with two varicies on the lower whorls. No allied form has been reported from eastern Asia except *S. sondensis* MARTIN,¹⁾ a Neogene species from Java.

Fossil occurrence: Byōritu Beds.—1000 m. SE. of Hakusyatōn: station 32; Reg. No. 53162. 1550 m. E. of Sinpo: station 69; Reg. No. 53512.

***Strombus dentatus* LINNAEUS, 1758**

Strombus dentatus. REEVE, Conch. Icon., Vol. 6, Pl. 9, fig. 17, 1850: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 118, Pl. 6, figs. 68, 70; Pl. 7, figs. 67–72, 1885: SUGITANI, Cat. Luchu Shells, p. 13, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 41, No. 445, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 31, No. 982, 1931.

A single, fractured specimen. TRYON states that, “the difference between this species and *S. urceus* is so slight, and there is so much variation in the shells, that it is very doubtful whether their separation can be maintained.” If the two are surely identical, the name *urceus* should be used. Our sole representative, however, has many narrow axial plicae on the surface with a denticulate inner lip, and agrees perfectly with the named one.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—1000 m. E. of Hakusyatōn: station 25; Reg. No. 53189.

Living: Southern Kyūshū and Ryūkyū. The Philippines. New Caledonia. Viti Island. Maurites. Red Sea.

Geologic distribution: Pliocene of Java.

***Strombus luhuanus* LINNAEUS, 1758**

Pl. IX (IV), Fig. 23.

Strombus luhuanus. NOMURA and NIINO, Sci. Rep. Tōhoku Imp. Univ. Ser. 2 (Geol.), Vol. 15, No. 3, p. 192, Pl. 11, fig. 14, 1932.

A single, perfect specimen; the spire is somewhat more depressed than those of the usual recent specimens.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—Sikō; Reg. No. 49403.

Living: Central Honshū to Ryūkyū. China. The Philippines. Pacific Islands. New Guinea. Australia.

Geologic distribution: Post-Pleistocene and Miocene of Central Honshū; Pleistocene of the Philippines (?); Post-Pliocene of Celebes and Timor.

***Strombus succinctus* LINNAEUS, 1758**

Strombus succinctus. REEVE, Conch. Icon., Vol. 6, Pl. 17, fig. 43, 1851: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 116, Pl. 6, figs. 56, 57, 1885: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 31, No. 980, 1931.

1) MARTIN: Foss. von Java, Vol. 1, p. 319, Pl. 45, figs. 739, 740, 1906.

A single specimen lacking the larger part of the body-whorl. The identification is somewhat doubtful due to the imperfect state of preservation.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—Sōkeisi; Reg. No. 54209.

Living: Western Honshū. The Philippines. Indian Ocean.

Strombus species indet.

A single mould having coarse spiral ridges like *S. taiwanicus* mentioned in the preceding, but the spire is much shorter.

Fossil occurrence: Byōritu Beds.—Wangwa: station (?); Reg. No. 53188.

Genus **Tibia** (BOLTEN) RÖDING, 1798

Tibia fusus (LINNAEUS), 1758

Pl. IX (IV), Figs. 19, 20.

Rostellaria fusus. REEVE, Conch. Icon., Vol. 6, Pl. 2, figs. 5, 7, 1857: TRYON, Man. Conch., 1 Ser., Vol. 7, p. 128, Pl. 10, fig. 17; Pl. 11, fig. 21, 1885: DICKERSON, Rev. Philip. Paleont., Pl. 5, figs. 1a, 1b, 1922:

YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 104, p. 13, Pl. 7, fig. 1, 1929.

Rostellaria sp. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 5, Pl. 4, fig. 2, 1928.

REEVE described this interesting species as: "Shell very slenderly fusiform, spire very much acuminated, the first few whorls convex and longitudinally very closely ribbed, the rest smooth, concavely slanting round the upper part, then rounded, last whorl grooved at the base, columella arched, callous, canal slender, very long, aperture rather small, lip five to six toothed, teeth prominent, lip callous at the upper part, very shortly canaliculate produced and curled."

Several fragmental specimens. Compared with recent specimens collected from Taiwan, the present fossil shows slight evolutional or ecological change, having invariably a greater number of decorated upper whorls than those of the recent.

Type locality: China; Recent.

Fossil occurrence: Byōritu Beds.—900 m. NW. of Rinsuikwa: station 6; Reg. No. 53197. 1500 m. E. of Sinpo: station 67; Reg. No. 53193. Wangwa: station 40; Reg. No. 53196. 500 m. E. of Sankwakō: station 41; Reg. No. 53194. Keiyukwa: station 50; Reg. No. 53195. E. of Goko; Reg. No. 37351.

Living: Taiwan. China.

Geologic distribution: Pliocene of Sikoku; Miocene of the Philippines.

Tibia formosana (YOKOYAMA), 1923

Rostellaria (Rimella) spinifera var. *formosana*. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 50, Pl. 4, fig. 9, 1928.

Several specimens. Judging from the figures of "*Rostellaria*" given by REEVE, the present species stands between "*Rostellaria crispata* SOWERBY" and "*Rostellaria cancellata*

LAMARCK (=*R. spinifera* MARTIN). The long anterior sinus in the present species is quite identical with that of *R. cancellata*, but the short canal and slight sinuation on the lower part of the outer lip reminds one of *R. crispata*, although the two living forms differ from the Formosan fossil by having invariably shorter spires.

The species of this genus are said to be tolerably variable, hence the specific or sub-specific value of *T. formosana* is doubtful.

Type locality: Taiwan; Pliocene.

Fossil occurrence: Byōritu Beds.—Wangwa: station 8; Reg. No. 53199. 550 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 53198. Wangwa: station 16; Reg. No. 53191. 1000 m. E. of Hakusyatōn: station 25; Reg. No. 53192. 300 m. E. of Sankwakō: station 39; Reg. No. 53190. Western side of Syōgun-yama; Reg. No. 37337. 300 m. E. of Zyō-tūsyōwan; Reg. No. 53198.

Genus *Cerithium* BRUGTIÈRE, 1789

Cerithium kochi PHILIPPI, 1848

Cerithium kochi. PHILIPPI, Abbild u. Beschr., Vol. 3, *Cerithium*, p. 2, Pl. 1, fig. 3, 1851.

Cerithium (Clava) kochi. YOKOYAMA, Jour. Coll. Sci. Tōkyō Imp. Univ., Vol. 44, Art. 1, p. 71, Pl. 3, fig. 13, 1922.

Several specimens. One of rather perfect specimens, 25.3 mm. in height, and 8 mm. in diameter.

It is a small and an elongate-turreted shell having the surface granular by the intersection of longitudinal ribs and spiral cords. The latter are regularly arranged as alternately large and small, while the former often form a varix.

Type locality: E. coast of Africa; Recent.

Fossil occurrence: Byōritu Beds.—600 m. SE. of Zyō-tūsyōwan: station 17; Reg. No. 53469. 700 m. NE. of Nanseizan: station 19; Reg. No. 53468. 300 m. E. of Zyō-tūsyōwan; Reg. Nos. 37541, 37568.

Raised Coral Reef.—S. of Sisitō; Reg. No. 37395.

Living: Central Honshū to Taiwan. Japan Sea. E. coast of Africa.

Geologic distribution: Post-Pleistocene and Pleistocene of Honshū.

Cerithium sinense (GMELIN), 1792

Pl. IX (IV), Fig. 13.

Cerithium (Vertagus) sinense. KOBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 1, Pt. 26, p. 20. Pl. 4, figs. 2–8, 1898.

Clava sinensis. PILSBRY, Cat. Mar. Moll. Jap., p. 56, 1895: SUGITANI, Cat. Luchu Shells, p. 11, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 36, No. 386, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 28, No. 898, 1931.

Vertagus chinensis. DUNKER, Ind. Moll. Mar. Jap., p. 107, 1882.

Cerithium obeliscus. KIENER, Spec. Coq. viv., p. 15, Pl. 5, fig. 1, 1835–1857: SOWERBY, Thes. Conch., Vol. 2, p. 851, Pl. 177, figs. 30–32, 1855.

Cerithium (Vertagus) obeliscus. TRYON, Man. Conch., 1 Ser., Vol. 9, p. 146, Pl. 27, figs. 39, 40, 1887: MARTIN, Foss. von Java, Vol. 1, p. 206, 1906.

Vertagus obeliscus. REEVE, Conch. Icon., Vol. 15, Pl. 2, fig. 7, 1865.

A single specimen, it is rather small and short in form, 28 mm. in height, and 11.5 mm. in diameter.

The locality: The Far East; Recent.

Fossil occurrence: Raised Coral Reef.—S. of Sisitô; Reg. No. 37486.

Living: Southern Kyûsyû to Taiwan. Pacific Islands. Indian Ocean.

Geologic distribution: Pliocene of Java.

Genus *Gourmya* FISCHER, 1884

Gourmya corallia (KIENER) 1841-2

Pl. IX (IV), Figs. 19, 20.

Cerithium corallium. KIENER, Spec. Coq. viv., p. 32, Pl. 8, fig. 3, 1835-1857: SOWERBY, Thes. Conch., Vol. 2, p. 863, Pl. 179, fig. 63, 1855: REEVE, Conch. Icon., Vol. 15, Pl. 5, fig. 29, 1865: TRYON, Man. Conch., 1 Ser., Vol. 9, p. 125, Pl. 21, fig. 36; Pl. 24, fig. 46, 1887: KOBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 1, Pt. 26, p. 218, Pl. 319, figs. 1, 2, 1898: SUGITANI, Cat. Luchu Shells, p. 11, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 37, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 29, No. 910, 1931.

Cerithium (s. str.) corallium. MARTIN, Foss. von Java, Vol. 1, p. 201, Pl. 31, fig. 461, 1906.

Several small specimens from a single locality.

Shell rather long, medium in size, surface finely granular by intersection of longitudinal ribs and spiral cords. Main cords three in number on a whorl, provided with a few fine and smooth threads between their intervals. Longitudinal rib often tends to varix. Whorls 9-10, separated by well defined sutures: height, about 25.5 mm., diameter, about 16.5 mm.

Fossil occurrence: Raised Coral Reef.—S. of Sisitô; Reg. No. 37399.

Living: Southern Kyûsyû and Ryûkyû. The Philippines. Indian Ocean.

Geologic distribution: Pliocene of Sumatra; Miocene of Java.

Gourmya carbonaria (PHILIPPI) 1848

Pl. IX (IV), Fig. 18.

Cerithium carbonarium. TRYON, Man. Conch., 1 Ser., Vol. 9, p. 133, Pl. 24, fig. 24 only, 1887: KOBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 1, Pt. 26, p. 276, Pl. 47, figs. 3, 4, 1898: PILSBRY, Cat. Mar. Moll. Jap., p. 56, 1895.

Cerithium bronii. SOWERBY, Thes. Conch., Vol. 2, p. 869, Pl. 182, fig. 175, 1855: REEVE, Conch. Icon., Vol. 15, Pl. 5, fig. 26, 1865.

Several fine specimens.

This species is characterized by the two revolving series of granules on each whorl of the spire (4 on the last whorl). The original blackish color of the tubercles is still fairly well preserved.

Cerithium carbonarium of REEVE¹⁾ is a distinct species.

Annexed are some of the measurements (in mm.):

	1	2	3
Height	28.5	26.7	25
Diameter	ca. 15.0	ca. 14.3	14

Type locality: The Far East; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 31; Reg. No. 53472.

Living: Southern Japan. China.

Gourmya satoi (YOKOYAMA), 1928

Cerithium satoi. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 51, Pl. 3, fig. 7, 1928.

Several fine specimens, especially from Sikô. The shell grows larger than the type first described by Dr. YOKOYAMA; some of them measure (in mm.):

	1	2	3	4	5
Height	14.2	14.1	14.0	13.1	12.5
Diameter	5.2	5.2	5.0	4.1	4.0

Type locality: Taiwan; Pliocene.

Fossil occurrence: Byōritu Beds.—Sikô; Reg. Nos. 48970, 53481. The upper course of Sairyôkyô; Reg. No. 53481.

Geologic distribution: Known only from the Pliocene of Taiwan.

Genus Trochocerithium SACCO, 1897

Trochocerithium shikoense (YOKOYAMA), 1928

Cerithiopsis(?) shikoensis. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 55, Pl. 4, fig. 10, 1928.

A single specimen; height, 6.5 mm., diameter, 3 mm. This species certainly belongs to the group of "*Cerithium*" *excelsum* YOKOYAMA,¹⁾ which according to Mr. KURODA is a member of *Trochocerithium*.

Type locality: Taiwan; Pliocene.

Fossil occurrence: Byōritu Beds.—Keiyukwa: station 50; Reg. No. 53478.

Geologic distribution: Known only from the Pliocene of Taiwan.

Genus Bittium GRAY, 1847

Bittium alutaceum (GOULD), 1861

Pl. IX (IV), Figs. 15, 16.

Bittium alutaceum. TRYON, Man. Conch., 1 Ser., Vol. 9, p. 154, Pl. 30, fig. 10, 1887.

1) REEVE: Conch. Icon., Vol. 15, Pl. 9, fig. 59, 1865.

2) YOKOYAMA: Jour. Fac. Sci. Imp. Univ. Tôkyô, Sec. 2, Vol. 2, Pt. 7, p. 346, Pl. 67, fig. 8, 1928.

Three specimens. Shell small, turreted with rather distinct longitudinal folds, crossed by three spiral threads forming a series of granular rows. Suture distinctly marked, rather widely excavated. One of them, 6 mm. in height, and 2 mm. in diameter.

Type locality: China Sea.

Fossil occurrence: Byōritu Beds.—Wangwa: station 40; Reg. No. 53946.

Living: China Sea.

Family **Potamididae**

Genus **Telescopium** MONTORT, 1840

Telescopium telescopium (LINNAEUS), 1758

Pl. IX (IV), Figs. 21, 22.

Telescopium telescopium. MARTIN, Foss. von Java, Vol. 1, p. 220, Pl. 33, fig. 509, 1906: TESCH, Paläont. von Timor, Vol. 8, p. 58, Pl. 132, fig. 191, 1920: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 29, No. 940, 1931.

Potamides (Telescopium) telescopium. TRYON, Man. Conch., 1 Ser., Vol. 9, p. 161, Pl. 33, fig. 56, 1887: PILSBRY, Cat. Mar. Moll. Jap., p. 57, 1895.

Telescopium fuscum. REEVE, Conch. Icon., Vol. 15, Pl. 1, figs. 1a, b, 1865.

Several rather ill-preserved specimens; the characteristic features of the species are still retained.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—W. of Sanzyūkei: station 43 (TORII); Reg. No. 53457. N. of Sakityō: station 52 (TORII); Reg. No. 53458.

Raised Coral Reef.—S. of Sisitō; Reg. No. 37447.

Living: Japan. Taiwan. The Philippines. Malay Archipelago.

Geologic distribution: Post-Pliocene of Celebes, New Guinea; Pliocene of Timor; Miocene of Java and Borneo.

Genus **Cerithidea** SWAINSON, 1880

Cerithidea cingulata (GMELIN), 1791

Potamides (Tympanotonos) fluviatilis. YOKOYAMA, Jour. Coll. Sci. Imp. Univ. Tōkyō, Vol. 39, Art. 6, p. 68, Pl. 4, fig. 14, 1920: YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 53, 1928.

Several, more or less imperfect specimens. The form and sculpture of the Formosan fossils fit those of Japanese living ones. Some Javan fossil species of "Potamides" described by MARTIN are certainly related to the present species in sculpture.

Type locality: The Eastern Sea (?).

Fossil occurrence: Byōritu Beds.—1600 m. N. of Sikwakō: station 10; Reg. No. 53464. Wangwa: station 17; Reg. No. 53464. Kōsirin: station 35 (TORII); Reg. No. 53462. W. of Sanzyūkei: station 47 (TORII); Reg. No. 53466. Wanzaki: station 55 (TORII); Reg. No. 53467. The upper course of Sairyōkyō; Reg. No. 53465.

Raised Coral Reef.—S. of Sisitō; Reg. No. 37405.

Living: Widely distributed in Japan from North to South. The Philippines. Indian Ocean.

Geologic distribution: Post-Pleistocene, Pleistocene, Pliocene and Miocene of Honshū.

Cerithidea morchii A. ADAMS, 1855

Cerithidea morchii. REEVE, Conch. Icon., Vol. 15, Pl. 3, fig. 18, 1866: TRYON, Man. Conch., 1 Ser., Vol. 9, p. 163, Pl. 33, fig. 1887: SUGITANI, Cat. Luchu Shells, p. 12, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 38, No. 408, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 29, No. 930, 1931.

Cerithium (Cerithidea) moerchii. KOBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 1, Pt. 26, p. 154, Pl. 26, fig. 3, 1898.

A single imperfect specimen.

C. decollata (LINNAEUS), *C. rhizoporara* (A. ADAMS) and *C. morchii* are closely related to each other, and are sometimes confounded, especially in fossil specimens. Diameter, ca. 18 mm.

Type locality: The Philippines; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 17; Reg. No. 53471.

Living: Southern Kyūsyū and Ryūkyū. The Philippines.

Genus **Terebralia** SWAINSON, 1840

Terebralia caledonica (JOUSSSEAUME), 1884

Potamides (Tympanotonus) caledonicus. TRYON, Man. Conch., 1 Ser., Vol. 9, p. 160, Pl. 32, figs. 43, 44, 1887.

Several specimens, mostly imperfect.

Shell large, whorls flat; surface sculptured by many longitudinal ribs crossed by 3 spiral grooves on each whorl; suture deep, well marked; base of full grown specimen flattish with many revolving ridges and grooves; columella with a single fold, oblique and strong; outer lip with a few strong tubercular teeth within.

Although the shell is narrower, and has more distinct axial ribs than those of *T. palustris* (LINNAEUS), it may perhaps prove to be only a varietal form, or at least a subspecies of LINNAEUS's species by future study.

Potamides sp.¹⁾ once figured by DICKERSON from the Pleistocene of the Philippines is nearly the same.

Type locality: New Caledonia; Recent.

Fossil occurrence: Raised Coral Reef.—S. of Sisitō; Reg. No. 37446.

Living: New Caledonia.

1) DICKERSON: Rev. Philip. Paleont., Pl. 15, fig. 4, 1922.

Terebralia sulcata (BORN), 1778

Pl. IX (IV), Fig. 23.

Potamides (Terebralia) sulcatus. TRYON, Man. Conch., 1 Ser., Vol. 9, p. 160, Pl. 32, figs. 46–47, 1887: MARTIN, Tiefb. auf Java, Vol. 3, p. 146, 1887: MARTIN, Foss. von Java, Vol. 1, p. 211, 1906: TESCH, Paläont. von Timor, Vol. 8, p. 56, Pl. 131, fig. 182, 1920.

Pyrazus sulcatus. REEVE, Conch. Icon., Vol. 15, Pl. 1, figs. 1a, b, c, 1865.

Cerithium sulcatum. SOWERBY, Thes. Conch., Vol. 2, p. 883, Pl. 185, fig. 262, 1855: KIENER, Spec. Coq. viv., p. 89, Pl. 27, fig. 2, 1835–57.

Cerithium (Pyrazus) sulcatum. KOBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 1, Pt. 26, p. 40, Pl. 8, figs. 7, 8, 1898.

Although the peculiarly coiled outer lip which is the characteristic feature of this species is unfortunately unpreserved, the other respects are quite similar to the named species. The number of spiral grooves is 4 on the penultimate whorl.

A single specimen. Height, ca. 40 mm.; diameter, ca. 18.5 mm.

Type locality: Oriental Sea.

Fossil occurrence: Raised Coral Reef.—S. of Sisitô; Reg. No. 53479.

Living: China. The Philippines. Indo-Pacific.

Geologic distribution: Post-Pliocene of Timor(?); Pliocene of Java(?), Timor and Sumatra; Miocene of Java.

Terebralia semitrifurcata (BOLTEN), 1798

Pl. IX (IV), Fig. 24.

Potamides (Terebralia) semitrifurcata. TRYON, Man. Conch., 1 Ser., Vol. 9, p. 160, Pl. 32, fig. 45, 1887.

Tymanonotus (Terebralia) semitrifurcata. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 29, No. 935, 1931.

Cerithium semitrifurcatum. SOWERBY, Thes. Conch., Vol. 2, p. 884, Pl. 185, fig. 263, 1855.

Pyrazus semitrifurcatus. REEVE, Conch. Icon., Vol. 15, Pl. 1, fig. 4, 1865.

Cerithium semistriatum. KOBELT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 1, Pt. 26, p. 37, Pl. 8, figs. 3, 4, 1898.

Cerithium sulcatum var. KIENER, Spec. Coq. viv., p. 89, Pl. 27, fig. 1, 1835–1857.

A single imperfect specimen. Height, 43 mm.; diameter, ca. 18.5 mm. It has five revolving grooves on the penultimate whorl.

Type locality: Australia(?); Recent.

Fossil occurrence: Byōritu Beds.—Wanzaki: station 55 (TORII); Reg. No. 53470.

Living: Ryūkyū. Pacific Islands. Java. Australia.

Genus Batillaria BENSON, 1842**Batillaria zonalis (BRUGUIÈRE), 1792**

Pl. IX (IV), Fig. 17.

Lampania zonalis. LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 73, Pl. 6, figs. 15, 16, 1869.

?*Potamides murayamai.* YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 53, Pl. 4, figs. 5, 6, 1928.

Several well preserved specimens. They are quite identical with a certain living varietal form from Japan. A perfect specimen collected from Sikô, 33.5 mm. in height, and 12 mm. in diameter with tuberculate whorls.

"*Lampania*" *australis* figured by REEVE¹⁾ is perhaps the same.

Type locality: Australia; Recent.

Fossil occurrence: Byôritu Beds.—Kôsirin: station 35 (TORII); Reg. No. 53475. E. of Sanzyûkei: station 47 (TORII); Reg. No. 53473. N. of Sakityô: station 52 (TORII); Reg. No. 53476. Wanzaki: station 55 (TORII); Reg. No. 53474. The upper course of Sairyôkyô; Reg. No. 53477. Sikô; Reg. No. 49410.

Raised Coral Reef.—S. of Sisiô; Reg. No. 87480.

Living: Widely distributed in Japan. China. Australia.

Geologic distribution: Post-Pleistocene, Pleistocene and Pliocene of Honshû; Neogene of Java.

Family *Triphoridae*

Genus *Triphora* BLAINVILLE, 1828

Subgenus *Viriola* JOUSSEAUME, 1884

Triphora (Viriola) corrugata (HINDS) 1843

Pl. IX (IV), Fig. 14.

Triforis corrugatus. TRYON, Man. Conch., 1 Ser., Vol. 9, p. 189, Pl. 39, fig. 59, 1887.

Two imperfect specimens closely similar to the named species in sculpture, but the number of whorls is seemingly fewer. *T. malayana* (FISCHER)²⁾ is said to be related to the present species.

Type locality: New Guinea; Recent.

Fossil occurrence: Byôritu Beds.—Wangwa: station 23; Reg. No. 53945. 700 m. SE of Kôkwan: station 23; Reg. No. 53972.

Living: New Guinea.

Family *Thiaridae*

Genus *Melanoides* OLIVER, 1807

Melanoides obliquegranosa (SMITH), 1878

Melanoides obliquegranosa. KURODA, The Venus, Vol. 1, No. 5, p. 187, No. 10, Pl. 4, fig. 7, 1929.

Melania submandiunensis. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 59, Pl. 5, figs. 2–5, 1928.

Several well preserved specimens; the largest, about 25 mm. in height. *M. submandiunensis* YOKOYAMA, cited above is apparently identical.

1) REEVE: Conch. Icon., Vol. 15, Pl. 1, fig. 4, 1866.

2) FISCHER: Paläont. von Timor, Vol. 15, p. 54, Pl. 112, fig. 21, 1927.

Type locality: Taiwan(?) ; Recent.

Fossil occurrence: Byôritu Beds.—Sikô; Reg. No. 53865. The upper course of Sairyô-kyô; Reg. No. 53866.

Living: Ryûkyû and Taiwan.

***Melanoides tuberculata* (MÜLLER), 1774**

Pl. IX (IV), Fig. 47.

Melanoides tuberculata. KURODA, The Venus, Vol. 1, No. 5, p. 186, No. 1, Pl. 4, figs. 1, 2, 1929.

Melania tuberculata. REEVE, Conch. Icon., Vol. 12, Pl. 13, fig. 87, 1859; BROT in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 1, Pt. 24, p. 247, Pl. 26, figs. 11, 11a-h, 1874.

A single specimen lacking the apex. The preserved whorls are only four, but it is characterized by its finely lattice-sculpture.

Type locality: Indo-Pacific?; Recent.

Fossil occurrence: Byôritu Beds.—Wangwa: station 18; Reg. No. 53867.

Living: Ryûkyû and Taiwan. The Philippines. Indian and Pacific Islands. Egypt.

Geologic distribution: Post-Pliocene of Java and Celebes; Pliocene and Miocene of Java.

***Melanoides grossula* (YOKOYAMA), 1928**

Melania grossula. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 61, Pl. 5, fig. 8, 1928.

A single specimen. Height (preserved portion), 14 mm.; diameter, ca. 6 mm.

Type locality: Taiwan; Pliocene.

Fossil occurrence: Byôritu Beds.—Kozantyô: station 24; Reg. No. 53864.

Geologic distribution: Known only from the Pliocene of Taiwan.

“*Melania*” *saigoi* YOKOYAMA, 1928

Melania saigoi. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 60, Pl. 5, fig. 10, 1928.

A single specimen. The generic position of this species is still doubtful; it is perhaps not a member of *Thiaridae*. Dr. YOKOYAMA compared it with *M. authurii* BROT, from the South Sea, but that species is apparently quite distinct in form and sculpture.

Type locality: Taiwan; Pliocene.

Fossil occurrence: Byôritu Beds.—550 m. SE. of Zyô-tûsyôwan: station 16; Reg. No. 53927.

Geologic distribution: Known only from the Pliocene of Taiwan.

Family **Rissoinidae**Genus **Rissoina** d'ORBIGNY, 1840Subgenus **Rissoina**, s. s.**Rissoina (Rissoina) formosana** n. sp.

Pl. IX (IV), Figs. 48a, 48b.

Shell small, rather elongated, highly conic, apical angle about 24°. Whorls about 8, moderately convex, regularly tapering from last whorl. Test rather thick. Sculpture of many rounded, obliquely longitudinal, more or less sinuous ribs which increase their number towards the lower, about 30 or more upon penultimate whorl, not extending to basal part below periphery. Interspaces wider than ribs in upper few whorls, but much narrower in the lower ones, crossed by numerous, fine, subequal spiral threads. Suture deeply impressed, very distinct. Base rounded with many, rather marked spiral threads. Aperture semi-oval; outer lip thickened and sinuous, produced outwardly; columellar margin slightly concave, with a shallow, but distinct basal furrow. Height, 5.5 mm.; diameter, 2.1 mm.

Similar in form to *R. zeltnerioides* YOKOYAMA¹⁾ from the Pleistocene deposits of Yokosuka, but differs from that species in being spirally finely striated over the surface.

Fossil occurrence: Byōritu Beds.—400 m. SE. of Zyō-tūsyōwan: station 13; Reg. No. 53944.

Family **Turritellidae**Genus **Turritella** LAMARCK, 1799**Turritella filiola** YOKOYAMA, 1928

Turritella filiola. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 57, Pl. 4, fig. 7, 1928.

Numerous specimens. This is a small and rather slender shell having minutely beaded revolving ridges on the upper whorls; the number and strength of these ridges seem to be somewhat variable. *T. fascialis* MENKE from Japan and China is a closely related species.

Type locality: Taiwan; Pliocene.

Fossil occurrence: Byōritu Beds.—Hakusyatōn: station 1; Reg. No. 52333. 700 m. E. of Hakusyatōn: station 3; Reg. No. 52329. Wangwa: station 5; Reg. No. 52324. 1000 m. NW. of Rinsuikwa: station 5; Reg. No. 52589. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 52299. Wangwa: station 6; Reg. No. 52317. Wangwa: station 8; Reg. No. 53887. Wangwa: station 11; Reg. No. 52321. 800 m. NE. of Hakusyatōn: station 12; Reg. No. 52313. Wangwa: station 12; Reg. No. 52588. 400 m. SE. of Zyō-tūsyōwan: station 13; Reg. No. 52331. Bōsiho: station 13; Reg. No. 52304. Wangwa: station 13; Reg. No. 52326. 500 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 52328. 1450 m. W. Hokkō: station 14; Reg. No. 52311. Wangwa: station 14; Reg. No. 52315. Wangwa: station 15; Reg. Geologic distribution: Pliocene of Ryūkyū.

Turritella terebra (LINNAEUS, 1758)

Turritella terebra. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 56, Pl. 4, fig. 3, 1928.

Turritella bacillum. YOKOYAMA, ibid., p. 56, Pl. 4, fig. 1, 1928.

The *Turritella* now under consideration, has been treated as two distinct species under the name of *T. terebra* (LIN.) and *T. bacillum* KIEN. Having examined fossil as well as recent specimens from Taiwan, the convexity of the whorl on which the distinction of the two species is based seems to be variable, although the number of main revolving ribs is rather constant, being six.

T. archimedis DILLWYN, *T. spectrum* REEVE, *T. cerea* REEVE, and *T. crocea* KIENER are synonyms.

The alliance of *T. terebra* and *T. bacillum*, was first pointed out by TRYON.¹⁾

A few specimens were examined. The largest which was collected from S. of Sisitō measures 27 mm. in diameter.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—1450 m. W. of Hokkō: station 14; Reg. No. 52298. Kwandenkei; Reg. No. 8072. Sōkeisi; Reg. No. 52594.

Raised Coral Reef.—S. of Sisitō; Reg. No. 37457.

Living: Kyūsyū and Taiwan. China. Singapore. Java. The Philippines. Indian Ocean.

Geologic distribution: Post-Pliocene of Java and Celebes; Miocene of Java and Sumatra.

Turritella kityoensis, n. sp.

Pl. IX (IV), Figs. 45a, 45b.

A single specimen lacking the apical portion, preserved whorls 9 in number.

1) TRYON: Man. Conch., 1 Ser., Vol. 8, p. 196, 1886.

Shell small, high-turrete; whorls many, strongly angulated at about one-third of height of whorl; surface above angle nearly flat and sloping, below it receding. Sculpture consisting of unequal, rather sharp spiral cords; 5 on a whorl, middle one which forms angle is strongest; interspaces rather wide and concave, provided with small threads between, but in upper surface of lower whorls, there intervenes a finer one of the third cycle. Incremental lines obsolete. Aperture quadratic; base flat and quite smooth.

Approximate dimensions: Height, ca. 15.5 mm.; diameter, 4.2 mm.

This species is somewhat related to *T. vittulata* ADAMS and REEVE from the China Sea in general outline, but differs from that species in detail sculpture.

Fossil occurrence: Byōritu Beds.—N. of Kityō; Reg. No. 53110.

***Turritella millepunctata*, n. sp.**

Pl. IX (IV), Figs. 44.

Two imperfect specimens.

Shell turrete. Whorls many, apical two embryonal, smooth and globular; the rest strongly angulated near lower suture. Spirally ridged and longitudinally striated; ridges or cords unequal, 3 on sloping surface above angle stronger than others. Of the three ridges, the lowest one which forms the angle is strongest. Several unequal threads also on ribs and in their inter-spaces; those are distinctly crenulated by the intersection of incremental lines. Aperture fractured. The preserved portion of a smaller specimen, 20.2 mm. in height, and 6.2 mm. in diameter.

Similar to *Turritella cingulifera* SOWERBY in sculpture, but the whorls of the present species are decidedly angular.

Fossil occurrence: Byōritu Beds.—1550 m. E. of Sinpo: station 69; Reg. No. 53111.

***Turritella* species indet.**

Only fragmental specimens, differing from any of the preceding ones by sculpture. Indeterminable.

Fossil occurrence: Byōritu Beds.—On road S. of Bōsiho; Reg. No. 52489. 1000 m. E. of Hakusyatō: station 4; Reg. No. 53112. Wangwa: station 18; Reg. No. 53485.

Family Mathildidae

Genus *Mathilda* SEMPER, 1865

***Mathilda sinensis* FISCHER, 1867**

Pl. IX (IV), Fig. 42.

Mathilda sinensis. TRYON, Man. Conch., Vol. 8, p. 211, Pl. 65, fig. 39 (erroneously printed as fig. 19), 1886.

A single specimen lacking its upper whorls. Height, ca. 16 mm.; diameter, 5 mm.

Of the four revolving ribs (or cords), the one which forms the shoulder of a whorl is the strongest.

Type locality: China; Recent.

Fossil occurrence: Byôritu Beds.—700 m. SW. of Kôkwan: station 23; Reg. No. 53738.

Living: Isle of Chusan, China Sea.

Family Vermiculariidae

Genus **Lemintina** RUSSO, 1826¹⁾

Lemintina javana (MARTIN), 1880

Pl. VIII (III), Fig. 39.

Vermetus javanus. MARTIN, Tertiärsch., p. 77, Pl. 14, fig. 13, 1880: MARTIN, Tiefb. auf Java, p. 170, 1887: MARTIN, Foss. von Java, p. 223, Pl. 34, figs. 513–516, 1906: TESCH, Paläont. von Timor, Vol. 8, p. 59, Pl. 132, fig. 192, 1920.

Shell rather small, often attached to a foreign shell, loosely coiled. Whorl circular in cross-sections when free. Surface sculptured with axial series of tubercles by the intersection of narrow, longitudinal cords and slightly raised revolving plicae. Longitudinal cords rather irregular, some being discontinuous and often associated with smaller interstitial cords; inter-spaces between cords generally much wider than the cords themselves. No internal septa were found, and hence it is a member of *Lemintina*.²⁾

Diameter of an aperture of the largest specimen is 7 mm.

Type locality: Java; Miocene.

Fossil occurrence: Byôritu Beds.—Wangwa: station 1; Reg. No. 53753. 700 m. E. of Hakusyatōn: station 3; Reg. No. 53755. E. of Hakusyatōn: station 4; Reg. No. 53745. 1000 m. E. of Hakusyatōn: station 4; Reg. No. 53743. Wangwa: station 7; Reg. No. 53750. Wangwa: station 9; Reg. No. 53751. Wangwa: station 11; Reg. No. 53741. Wangwa: station 13; Reg. No. 53752. 400 m. No. 37430. 600 m. E. of Hakusyatōn; Reg. No. 37432. E. of Goko; Reg. No. 37431.

Geologic distribution: Pliocene and Miocene of Java; Pliocene of Timor.

Lemintina (?) species indet.

Fragments of a tubular shell, uncoiled and apparently smooth.

Fossil occurrence: Byôritu Beds.—Wangwa: station 12; Reg. No. 53758.

Genus **Siliquaria** LAMARCK, 1799

Siliquaria cumingii MÖRCH, 1860

Pl. VIII (III), Fig. 37.

Siliquaria cumingii. SOWERBY in REEVE, Conch. Icon., Vol. 20, Pl. 1, fig. 2 (erroneously printed on plate as fig. 3 instead fig. 2b), 1878: TRYON, Man. Conch., 1 Ser., Vol. 8, p. 190, Pl. 57, fig. 19; Pl. 58, fig. 21,

1) KURODA: The Venus, Vol. 4, No. 1, appendix p. 49, 1933.

2) *Serpulus* MONTFORT, 1910 seems to be prior to *Lemintina*.

1886: PILSBRY, Cat. Mar. Moll. Jap., p. 60, 1895: SUGITANI, Cat. Luchu Shells, p. 13, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 40, No. 434, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 31, No. 963, 1931: YAGURA, Cat. Moll. Hyôgo-ken, p. 33, No. 405, 1932: NOMURA, Sci. Rep. Tôhoku Imp. Univ. Sendai, Ser. 2 (Geol.), Vol. 15, No. 2, P. 109, No. 304, 1932: NOMURA and ZINBÔ, ibid., Vol. 16, No. 2, p. 143, No. 162, 1934.

Fragmental specimens characterized by their fissured, and loosely coiled tubes.

Type locality: The Philippines; Recent.

Fossil occurrence: Byôritu Beds.—Wangwa: station 11; Reg. No. 53757; Wangwa: station 23; Reg. No. 53925.

Living: Central Honsyû to Ryûkyû. Japan Sea. The Philippines.

Geologic distribution: Post-Pleistocene of Honsyû; Pleistocene of Kikai-zima.

Family Litiopidae

Genus *Diala* A. ADAMS, 1862

Diala angustifera n. sp.

Pl. IX (IV), Figs. 49a, 49b.

Shell small, narrow and turreted. Whorls about 8, apical two embryonal, the succeeding few ones convex, the rest angulate at about one-third the height of whorl from lower suture, surface above angle sloping and slightly convex, receding below. Each lower whorl sometimes provided with a revolving thread above the angle, biangular in aspect. Surface smooth except for numerous, fine spiral striae which can be seen under a lens. Periphery rounded. Base narrowed, convex, sculptured by indistinct spiral threads. Aperture ovate; outer lip thin and smooth within; inner lip with a thin callosity.

There are numerous specimens found in the collection. Annexed are some of the measurements (in mm.):

	1	2	3	4	5
Height	5.3	5.1	4.5	4.1	4.0
Diameter	2.0	2.0	1.8	1.7	1.6

This species somewhat resembles "*Rissoa (Cingula)*" *plebeja* YOKOYAMA¹⁾ in general features, but the Formosan fossil has invariably more angular whorls.

Fossil occurrence: Byôritu Beds.—700 m. E. of Hakusyatô: station 3; Reg. No. 53948. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 53956. 1100 m. NE. of Hakusyatô: station 9; Reg. No. 53959. 1900 m. Family Architectonicidae

Genus *Architectonica* (BOLTEN) RÖDING, 1798

Architectonica perspectiva (LINNAEUS), 1758

Pl. IX (IV), Fig. 41.

Architectonica perspectiva. SUGITANI, Cat. Luchu Shells, p. 34, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ōsima, p. 81, No. 1057, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 54, No. 1878, 1931: NOMURA and ZINBŌ, Sci. Rep. Tōhoku Imp. Univ., Ser. 2 (Geol.), Vol. 16, No. 2, p. 144, No. 164, 1934.

Solarium perspectivum. KIENER, Spec. Coq. viv., p. 3, Pl. 1, fig. 1, 1835-1857: REEVE, Conch. Icon., Vol. 15, Pl. 2, figs. 11 a, b, 1864: SOWERBY, Thes. Conch., Vol. 3, p. 228, Pl. 4, figs. 36, 37, 38, 1866: LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 97, 1869: LISCHKE, ibid., Vol. 2, p. 73, 1871: DUNKER, Ind. Moll. Mar. Jap., p. 92, 1882: PILSBRY, Cat. Mar. Moll. Jap., p. 65, 1895: MARTIN, Foss. von Java, Vol. 1, p. 246, Pl. 37, figs. 594-597, 1906: TESCH, Paläont. von Timor, Vol. 8, p. 65, Pl. 132, fig. 200, 1920.

This large and beautiful living species is represented in the collection by several well preserved specimens. According to TRYON, *A. trochlearis*, *A. formosa*, *A. zonata* and *A. incisa* are synonyms. The largest specimen, 17.5 mm. in height, and 40.6 mm. in diameter.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—700 m. E. of Hakusyatōn: station 3; Reg. No. 53703. 1000 m. E. of Hakusyatōn: station 4; Reg. No. 53715. 400 m. SE. of Zyō-tūsyōwan: station 13; Reg. No. 53491. Wangwa: station 14; Reg. No. 53496. Wangwa: station 15; Reg. No. 53489. 700 m. NE. of Nanseizan: station 19; Reg. No. 53492. Wangwa: station 19; Reg. No. 53494. 1000 m. E. of Hakusyatōn: station 20; Reg. No. 53487. Wangwa: station 21; Reg. No. 53495. 700 m. SW. of Kōkwan: station 23; Reg. No. 53859. Wangwa: station 33; Reg. No. 53493. 1200 m. E. of Zyō-tūsyōwan: station 36; Reg. No. 53488. 1520 m. E. of Sinpo: station 68; Reg. No. 53490. Sikō; Reg. Nos. 48988, 53486.

Living: Southern Kyūshū to Taiwan. China. Indo-Pacific. Australia.

Geologic distribution: Pleistocene of Kikai-zima; Pliocene of Sikoku(?); Post-Pliocene and Pliocene of Timor; Pliocene of Sumatra; Pliocene and Miocene of Java; Neogene of New-Guinea.

Architectonica maxima (PHILIPPI), 1848

Pl. IX (IV), Fig. 40.

Architectonica maxima. SUGITANI, Cat. Luchu Shells, p. 34, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ōsima, p. 81, No. 1058, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 54, No. 1870, 1931.

Solarium maximum. PHILIPPI in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 6, p. 6, Pl. 1, figs. 3, 4, 1853: REEVE, Conch. Icon., Vol. 15, Pl. 1, fig. 4, 1864: SOWERBY, Thes. Conch., Vol. 3, p. 229, Pl. 1, figs. 5, 6, 1866: TRYON, Man. Conch., 1 Ser., Vol. 9, p. 9, Pl. 3, figs. 31-34, 1887: PILSBRY, Cat. Mar. Moll.

Jap., p. 65, 1895: MARTIN, Foss. von Java, Vol. 1, p. 247, Pl. 37, figs. 598, 599, 1906: TESCH, Paläont. von Timor, Vol. 8, p. 66, Pl. 132, fig. 201, 1920.
Solarium perspectivum. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 62, Pl. 5, fig. 7, 1928. (non LINNAEUS).

Several well preserved specimens.

Although the shell is closely related to the preceding, the surface sculpture is somewhat less coarse.

“*Solarium*” *perspectivum* of YOKOYAMA from the Byōritu Beds of Taiwan certainly belongs here from the consideration of his accompanying figures. *A. taylori* (HANLEY) is said to be a synonym of *A. maxima*. The largest specimen, 19 mm. in height, and 44 mm. in diameter.

Type locality: Indian Ocean.

Fossil occurrence: Byōritu Beds.—Wangwa: station 13; Reg. No. 53710. Wangwa: station 14; Reg. No. 53497. Wangwa: station 17; Reg. No. 53707. Wangwa: station 24; Reg. No. 53713. 1000 m. E. of Hakusyatōn: station 25; Reg. No. 53701. 900 m. NW. of Keiyukwa: station 33; Reg. No. 53711. 1200 m. E. of Zyō-tūsyōwan: station 36; Reg. No. 53705. Wangwa: station 40; Reg. No. 53704. Keiyukwa: station 50; Reg. No. 53712. 1000 m. E. of Zyō-tūsyōwan: station 59; Reg. No. 53709. 1200 m. SE. of Sankwakō: station 60; Reg. No. 53708. 1520 m. E. of Sinpo: station 68; Reg. No. 53714. Hakusyatōn; Reg. No. 53702.

Ryūkyū Limestone.—Hanpeizan; Reg. No. 53706.

Living: Western Honshū to Taiwan. The Philippines. Indian Ocean.

Geologic distribution: Pliocene of Timor, Sumatra and Seran; Pliocene and Miocene of Java.

Genus *Heliacus* d'ORBIGNY, 1842

Heliacus dorsuosus (HINDS), 1844

Pl. X (V), Figs. 39a, 39b.

Heliacus dorsuosus. SUGITANI, Cat. Luchu Shells, p. 34, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 82, No. 1065, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 54, No. 1886, 1931.
Torinia dorsuosa. SOWERBY, Thes. Conch., Vol. 3, p. 238, Pl. 5, figs. 73, 74, 1886: TRYON, Man. Conch., 1 Ser., Vol. 9, p. 17, Pl. 5, figs. 80, 81, 1887: PILSBRY, Cat. Mar. Moll. Jap., p. 65, 1895.
Solarium dorsosum. PHILIPPI in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, p. 37, 1853: DUNKER, Ind. Moll. Mar. Jap., p. 92, 1882.

Two well preserved specimens of nearly equal size. The body-whorl is sculptured by about 10 revolving series of decussated ribs, of which two peripheral ones are stronger. Height, 2.4 mm.; diameter, 6.3 mm.

Type locality: Pacific Island; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 5; Reg. No. 53720. Wangwa: station 15; Reg. No. 53719.

Living: Central Honshū to Ryūkyū. Pacific Islands.

Heliacus asperus (HINDS). 1844

Pl. X (V), Figs. 2a, 2b.

Torinia aspera. TRYON, Man. Conch., 1 Ser., Vol. 9, p. 21, Pl. 6, figs. 7, 8, 1887.*Solarium asperum*. PHILIPPI in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 6, p. 22, Pl. 3, fig. 12, 1853; SOWERBY, Thes. Conch., Vol. 3, p. 241, Pl. 5, figs. 77, 78, 1866.

Three rather well preserved specimens.

The shell somewhat resembles *Architectonica maxima* in form, but the sculpture is finner, the base more convex, the umbilicus exceedingly larger and the umbilical crenulations are indistinct. The shell does not attain as large a size as *A. maxima*. The largest specimen, 3.7 mm. in height, and 10 mm. in diameter.

Type locality: Straits of Macassar.

Fossil occurrence: Byōritu Beds.—Wangwa: station 6; Reg. No. 53722. Bōsiho: station 13; Reg. No. 53723. 510 m. SE. of Zyō-tūsyōwan: station 15; Reg. No. 53721.

Living: Indo-Pacific.

Heliacus taiwanicus (YOKOYAMA), 1928*Gibbula (?) taiwanicus*. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 66, Pl. 6, fig. 3, 1928.

Several specimens. The shell apparently belongs to *Heliacus* and not *Gibbula*. The largest specimen in our collection is slightly larger than the type, and measures 15 mm. in diameter.

Type locality: Taiwan; Pliocene.

Fossil occurrence: Byōritu Beds.—Wangwa: station 26; Reg. No. 53716. Sōkeisi; Reg. No. 53781. The upper course of Sairyōkyō; Reg. No. 53717.

Geologic distribution: Known only from the Pliocene of Taiwan.

Family **Hipponycidae**Genus **Hipponyx** DEFRANCE, 1819**Hipponyx danieli** CROSSE, 1858

Pl. IX (IV), Figs. 38a, 38b.

Hipponyx danieli. TRYON, Man. Conch., 1 Ser., Vol. 8, p. 136, Pl. 41, figs. 21, 22, 1886.

Two specimens.

Suborbicular in outline and rather thin-shelled species with the surface radially as well as concentrically finely striated. The beak is high and mammilar, being coiled at end. The generic position is still in question, it has somewhat the aspect of *Capulus*.

Type locality: New Caledonia; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 24; Reg. No. 53759. S. of Bōsiho; Reg. No. 34709.

Living: New Caledonia.

Family **Calyptraeidae**Genus **Calyptrea** LAMARCK, 1799**Calyptrea taiwanensis** n. sp.

Pl. IX (IV), Figs. 39a, 39b.

Shell small, depressed, spirally coiled, nearly orbicular in outline. Test thin. Spire conical being slightly raised from the rest of shell (base), situated subterminal; apex mammilar. Surface ornamented by very fine concentric growth lines and with a few prominent lamellar ridges. Interior umbilicated; appendage very thin and fragile, subterminal having a small hollowed ridge near the umbilicus.

A single specimen. Diameter, 5.5 mm.; height, 1.5 mm.

Calyptrea is a rare genus in the oriental regions. Only two species have been described from Japan and the Philippines, they are: *C. yokoyamai* KURODA¹⁾ (= *C. mammilaris* of YOKOYAMA, not of BRODERIP) from Central Honshū and *C. pellucida* REEVE²⁾ from the Philippines.

The Formosan fossil may be distinguished from the two above mentioned forms by having a flatter shell, a more terminal apex, with a somewhat different internal appendage.

Fossil occurrence: Byōritu Beds.—500 m. E. of Sankwakō: station 41; Reg. N. 53802.

Genus **Crepidula** LAMARCK, 1799Subgenus **Syphopatella** LESSON, 1831(*=Ergaea* H. and A. ADAMS, 1854)**Crepidula (Syphopatella) walshi** REEVE, 1859

Pl. IX (IV), Figs. 28a, 28b.

Syphopatella walshi. KURODA, Cat. Moll. Hukui-ken, p. 186, No. 114, 1933.

Crepidula walshi. REEVE, Conch. Icon., Vol. 11, Pl. 3, figs. 17a, b, 1859.

Crepidula orbella. YOKOYAMA, Jour. Coll. Sci. Imp. Univ. Tōkyō, Vol. 39, Art. 6, p. 76, Pl. 4, figs. 22, 23, 1920.

Several well preserved specimens. One of the specimens measures 22 mm. in greater diameter. According to TRYON, *Crepidula plana* ADAMS and REEVE (non SAY) and *Crepidula scabies* REEVE are synonyms; further *Crepidula chinensis* GRAY suspected by him is also possibly identical, it represents a rather free growth of this species. It is true, that the shell is tolerably variable in regard to its form.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—700 m. E. of Hakusyatō: station 3; Reg. No. 53735. Wangwa: station 6; Reg. No. 53737. Wangwa: station 19; Reg. No. 53736.

Living: Central and Western Honshū. Japan Sea. China. Singapore. Ceylon.

Geologic distribution: Post-Pleistocene and Pliocene of Honshū.

1) KURODA: The Venus, Vol. 1, No. 3, p. 94, 1929.

2) TRYON: Man. Conch., 1 Ser., Vol. 8, p. 120, Pl. 34, figs. 60, 61, 1886.

Family **Xenophoridae**Genus **Xenophora** FISCHER, 1808**Xenophora exuta** (REEVE), 1843

Pl. X (V), Figs. 35a, 35b.

Phorus exutus. REEVE, Conch. Icon., Vol. 1, Pl. 2, fig. 7, 1843.*Xenophora exuta*. YOKOYAMA, Jour. Fac. Sci. Imp. Univ. Tôkyô, Sec. 2, Vol. 2, Pt. 4, p. 176, Pl. 47, fig. 10, 1927.

Several specimens, though mostly somewhat broken due to the thin and fragile nature of the shell. The upper few whorls agglutinate sands and fragments of shells, and may likely be confounded with *X. calculifera* REEVE in young stage.

Type locality: China; Recent.

Fossil occurrence: Byôritu Beds.—700 m. E. of Hakusyatô: station 3; Reg. No. 53726. 500 m. SE. of Zyô-tûsyôwan: station 14; Reg. No. 53734. Wangwa: station 15; Reg. No. 53732. Wangwa: station 17; Reg. No. 53728. 1000 m. E. of Hakusyatô: station 20; Reg. No. 53729. 1000 m. E. of Hakusyatô: station 25; Reg. No. 53730. 550 m. E. of Sankwakô: station 43; Reg. No. 53733. Tyû-tûsyôwan: station 47; Reg. No. 53727. Sikô; Reg. Nos. 49419, 53731. 300 m. E. of Hakusyatô; Reg. No. 37412.

Living: Central Honsyû to Kyûsyû. Ogasawara-zima. Japan Sea. China.

Geologic distribution: Pliocene and Miocene(?) of Honsyû; Pliocene of Sikoku.

Family **Naticidae**Genus **Natica** SCOPOLI, 1777Subgenus **Natica**, s. s.**Natica** (**Natica**) *ala-papilionis* (BOLTEN), 1788*Natica ala-papilionis*. REEVE, Conch. Icon., Vol. 9, Pl. 14, fig. 60, 1855: KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 43, No. 468, 1928: NOMURA and ZINEÔ, Sci. Rep. Tôhoku Imp. Univ. Ser. 2 (Geol.), Vol. 16, No. 2, p. 145, No. 170, 1934.*Natica colliei*. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 63, Pl. 4, fig. 1, 1928. (not of RECLUZ).

Several specimens; one of them faintly retains its original coloration. *N. colliei* of YOKOYAMA (non RECLUZ) is perhaps identical with this species; the former shows also a close similarity with *N. marochiensis* GMELIN from which, this shell is often indistinguishable among fossil specimens.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byôritu Beds.—900 m. NW. of Rinsuikwa: station 6; Reg. No. 52292. 500 m. SE. of Zyô-tûsyôwan: station 14; Reg. No. 522262. 510 m. SE. of Zyô-tûsyôwan: station 15; Reg. No. 52268. 1000 m. E. of Hakusyatô: station 25; Reg. No. 52265. Wangwa: station 33; Reg. No. 52946. 300 m. E. of Sankwakô: station 39; Reg. No. 52952. Wangwa: station 40; Reg. No. 52266. 900 m. SE. of Naikotô: station 66; Reg. No. 52950.

Living: Southern Kyûsyû to Taiwan. The Philippines. Indian Ocean.

Geologic distribution: Pleistocene of Kikai-zima; Pliocene of Java, Sumatra, Timor and Seran; Miocene of the Philippines (?).

Natica (Natica) solida BLAINVILLE, 1827

Pl. IX (IV), Figs. 37a, 37b.

Natica solida. REEVE, Conch. Icon., Vol. 9, Pl. 16, fig. 71, 1855: TRYON, Man. Conch., 1 Ser., Vol. 8, p. 45, Pl. 20, fig. 98, 1886: SUGITANI, Cat. Luchu Shells, p. 15, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 43, No. 473, 1928.

Several small specimens. Shell thick, solid, callous heavy, covering umbilicus and leaving a narrow but deep groove at the lower. Surface marked by fine growth lines crossed by microscopis revolving ones; spire rather acutely conical, and more or less elevated from upper margin of body-whorl.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byôritu Beds.—Wangwa: station 8; Reg. No. 53923. 700 m. NE. of Nanseizan: station 19; Reg. No. 52269. 1000 m. E. of Hakusyatō: station 25; Reg. Nos. 53922, 53924. Wangwa: station 40; Reg. No. 52275. Sikō; Reg. No. 48983. E. of Goko; Reg. No. 37542.

Living: Southern Kyûsyû and Ryûkyû. Pacific Islands. Singapore. The Philippines.

Geologic distribution: Pliocene of Java (?).

Natica (Natica) zebra LAMARCK, 1822

Pl. IX (IV), Figs. 25a, 25b.

Natica zebra. PHILIPPI in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 1, p. 18, Pl. 2, figs. 13, 14, 1852: REEVE, Conch. Icon., Vol. 9, Pl. 12, fig. 53, 1855: TRYON, Man. Conch. 1 Ser., Vol. 8, p. 16, Pl. 2, fig. 32, 1886: MARTIN, Foss. von Java, Vol. 1, p. 258, Pl. 38, fig. 615, 1906: SUGITANI, Cat. Luchu Shells, p. 15, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 42, No. 467, 1928.

Although the coloration which is the characteristic feature of this species is entirely faded in the fossil specimens, the form and umbilical feature is quite identical with the named species. The Formosan fossils, however, are mostly small; the figured specimen measures 22 mm. in length and height. *N. lineata* LAMARCK figured by MARTIN¹⁾ is a similar species.

Type locality: The Philippines; Recent.

Fossil occurrence: Byôritu Beds.—1000 m. NW. of Rinsuikwa: station 5; Reg. No. 52256. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 52263. Wangwa: station 6; Reg. No. 52257. Keiyukwa: station 25; Reg. No. 52955. 300 m. E. of Sankwakō: station 35; Reg. No. 52296. Keiyukwa: station 50; Reg. No. 52258. Hakusyatō; Reg. No. 52260. Between Kôsui and Zyuna; Reg. No. 37434.

Living: Kyûsyû and Ryûkyû. The Philippines. Molucca.

Geologic distribution: Pliocene of Java and Seran; Miocene of Java and Borneo.

1) MARTIN: Foss. von Java, Vol. 1, p. 257, Pl. 38, figs. 613, 614, 1906.

***Natica (Natica) rufa* BORN, 1778**

Pl. IX (IV), Figs. 29a, 29b, 29c.

Natica rufa. PHILIPPI in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 1, p. 14, Pl. 2, figs. 1, 2, 1852: REEVE, Conch. Icon., Vol. 9, Pl. 16, fig. 70, 1855: TRYON, Man. Conch., Vol. 8, p. 29, Pl. 9, figs. 62, 63, 1886: MARTIN, Foss. von Java, Vol. 1, p. 260, Pl. 39, figs. 621-623, 1906: TESCH, Paläont. von Timor, Vol. 8, p. 69, Pl. 133, fig. 208, 1920: FISCHER, Paläont. von Timor, Vol. 15, p. 46, Pl. 212, fig. 6, 1927.

Several well preserved specimens. The largest in the collection attains 41 mm. in length, and 32 mm. in height (figured).

Shell moderate in size rather solid, obliquely subglobose; spire short; whorls 6, separated by well defined sutures; last whorl rather rapidly enlarging, more or less flattened above, regularly convex below. Surface sculptured by numerous, fine growth lines which are markedly plicated on area close to suture and down to a short distance from it; aperture subovate, almost straight on inner side, regularly arcuate on outer side, slightly angulated above and rounded below; umbilicus large with a small ridge entering it; callous rather narrow, reflected upon body-whorl above umbilicus. Operculum subovate and concentrically, spirally striated.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 4; Reg. No. 52957. 400 m. SE. of Zyō-tūsyōwan: station 6; Reg. No. 52289. Nanseizan: station 11; Reg. Nos. 52278, 52953. 500 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 52279. 510 m. SE. of Zyō-tūsyōwan: station 15; Reg. No. 52272. 550 m. SE. of Zyō-tūsyōwan: station 16; Reg. No. 52264. Wangwa: station 19; Reg. No. 52267. 700 m. NE. of Nanseizan: station 19; Reg. No. 52958. Wangwa: station 21; Reg. No. 52289. 1000 m. E. of Hakusyatōn: station 25; Reg. Nos. 52270, 52951. Sankwakō: station 38; Reg. No. 52293. Living: Southern Japan. Taiwan. China. Singapore. The Philippines. Mauritius. Indian Ocean. Red Sea.

Geologic distribution: Pliocene of Java, Sumatra, Timor, New Guinea and Seran; Miocene of Java, Sumatra, Borneo and ?the Philippines.

***Natica (Natica) vitellus* (LINNAEUS, 1758)**

Pl. IX (IV), Figs. 33a, 33b.

Natica vitellus. PHILIPPI in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 1, p. 12, Pl. 1, figs. 10, 11, 1852: REEVE, Conch. Icon., Vol. 9, Pl. 10, fig. 39, 1855: TRYON, Man. Conch. 1 Ser., Vol. 9, p. 29, Pl. 8, fig. 60, 1886: PILSBRY, Cat. Mar. Moll. Jap., p. 176, 1895: MARTIN, Foss. von Java, Vol. 1, p. 261, Pl. 39, figs. 624, 625, 1906: TESCH, Paläont. von Timor, Vol. 8, p. 70, Pl. 132, fig. 207, 1920: FISCHER, Paläont. von Timor, Vol. 15, p. 45, 1927: SUGITANI, Cat. Luchu Shells, p. 15, 1927: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 32, No. 1023, 1931.

?*Natica adamsiana*. YOKOYAMA, Jour. Fac. Sci. Imp. Univ. Tōkyō, Sec. 2, Vol. 2, Pt. 7, p. 346, Pl. 67, fig. 9, 1928 (non DUNKER).

Several well preserved small specimens. One of them, 17.5 mm. in length, and 16 mm. in height.

This closely resembles *Natica rufa*, mentioned above with which it is sometimes confused, but this species has a more widely reflected callous over the umbilicus. *N. globosa* and *N. chinensis* are also related to the present species. The Formosan specimens, however, show rather closer affinity to the Javan fossil figured by MARTIN than to the recent specimens figured by REEVE, and by others.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 6; Reg. No. 52259. 900 m. NE. of Rinsuikwa: station 6; Reg. No. 52294. 500 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 52261. 300 m. E. of Zyō-tūsyōwan; Reg. No. 37304. Wangwa: station 19; Reg. No. 52948. Wangwa: station 23; Reg. No. 52954.

Living: Western Honshū to Taiwan. China. Singapore. The Philippines. Indian Ocean.

Geologic distribution: Pliocene of Kyūshū; Pliocene of Java, Seran and Timor; Miocene of Java, Nias and the Philippines(?).

Subgenus **Tectonatica** Sacco, 1890

Natica (Tectonatica ?) andoi, n. sp.

Pl. IX (IV), Figs. 35a, 35b, 35c, 36a, 36b, 36c.

Shell rather small, more or less obliquely subglobose; test rather solid. Whorls 6 in number, ventricose, regularly convex, smooth except for fine growth lines; spire short, hardly elevated from upper margin of last volution; umbilicus moderate, and filled entirely with a rounded callous; aperture semilunar, slightly narrowed above; outer lip gently curving; inner lip substraight with a reflected callous above.

Approximate dimensions (in mm.):

	1	2
Length	19.0	17.0
Diameter	19.0	17.5

Natica andoi n. sp. is similar in outline to *N. clausa* BRODERIP and SOWERBY from the boreal seas, it differs from that species by having a more depressed spire. *N. janthostoma* DESHAYES, a common living and fossil species in Japan also differs from the present by having a slightly higher shell and by the last whorl being obscurely shouldered. *N. lineata* LAMARCK from tropic Asia is also related to the Formosan fossils, and at first I was tempted to treat the present fossils as a variety of that species, but I am now convinced that they are quite distinct by their umbilical characters.

Fossil occurrence: Byōritu Beds.—Wangwa: station 24; Reg. No. 52295.

Genus **Polinices** MONTFORT, 1810

Subgenus **Polinices**, s. s.

Polinices (Polinices) columnalis (RECLUZ), 1850

Polinices columnalis. KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 43, No. 485, 1928: NOMURA and ZINBÔ, Sci. Rep. Tôhoku Imp. Univ. Ser. 2 (Geol.), Vol. 16, No. 2, p. 146, No. 173, 1934.

Natica columnalis. REEVE, Conch. Icon., Vol. 9, Pl. 5, fig. 19, 1855: TRYON, Man. Conch., 1 Ser., Vol. 8, p. 47, Pl. 20, fig. 4, 1886.

Polinices sagamiensis. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 63, Pl. 6, fig. 2, 1928.

Several, rather small specimens.

Shell depressed, globose, much broader than high, ventricose, consisting of about five whorls which are quite smooth except for the growth lines. Spire very small and hardly elevated from upper margin of body-whorl. Aperture large, almost semilunar in outline. Umbilicus large and striated, a heavy, rounded, flat-topped collar projects into it leaving a wide umbilical hollow. The largest specimen collected from Wangwa measures about 55 mm. in length.

MARTIN¹⁾ considers, this species is only a color variety of *P. powisianus* (RECLUZ); in fact, the two are closely related to each other, however, the spire is apparently less elevated in the present species, I therefore, treat them as distinct species. What MARTIN figured as *Natica (Polinices) powisiana* from the Pliocene of Java²⁾ shows rather closer affinity to *P. columnalis* than to *P. powisiana* figured by REEVE.

P. sagamiensis PILSBRY,³⁾ a living species of Central and Western Honshū, is perhaps only a local variation of *P. powisiana* or *P. columnalis* as formerly considered by that author; the size of the umbilical lobe is greatly variable as can be seen in *Polinices didyma* and other allied forms.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 6; Reg. No. 52274. 600 m. SE. of Taikwa: station 9; Reg. No. 52285. 1100 m. SW. of Taikwa: station 11; Reg. No. 52965. 400 m. SE. of Zyō-tūsyōwan: station 13; Reg. No. 52271. Wangwa: station 13; Reg. No. 52288. 1440 m. W. of Hokkō: station 14; Reg. No. 52273. Wangwa: station 15; Reg. No. 52968. Wangwa: station 16; Reg. No. 52970. Wangwa: station 24; Reg. No. 52291. Wangwa: station 33; Reg. No. 52967. Wangwa: station 40; Reg. No. 52290. Sikō; Reg. No. 48994. On road S. of Bōsiho; Reg. No. 37553. Keiyukwa: station 50; Reg. No. 52969. Sōkeisi; Reg. No. 52966.

Raised Coral Reef.—S. of Sisitō; Reg. No. 37487.

Living: Ryūkyū. The Philippines. Mauritius.

Geologic distribution: Pleistocene of Kikai-zima; Neogene of Java (?).

Polinices (Polinices) mamilla (LINNAEUS), 1758

Pl. IX (IV), Figs. 31a, 31b.

Polinices mamilla. SUGITANI, Cat. Luchu Shells, p. 15, 1926: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 32, No. 1035, 1931.

Polinices mammilla. KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 43, No. 481, 1928.

Natica mamilla. PHILIPPI in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 1, p. 31, Pl. 4, figs. 7, 8, 1852: REEVE, Conch. Icon., Vol. 9, Pl. 7, fig. 27, 1855: TRYON, Man. Conch., 1 Ser., Vol. 8, p. 49, Pl. 16, figs. 46, 48; Pl. 15, fig. 43; Pl. 17, figs. 65, 69, 1886: TESCH, Paläont. von Timor, Vol. 8, p. 71, Pl. 133, fig. 209, 210, 1920: DICKERSON, Rev. Philip. Paleont., Pl. 4, fig. 5, 1922.

1) MARTIN: Foss. von Java, Vol. 1, p. 264, 1906.

2) MARTIN: l.c., p. 263, Pl. 39, figs. 633–637.

3) PILSBRY: Proc. Acad. Nat. Sci. Philad., p. 23, Pl. 4, fig. 37, 1904.

A single, small specimen, about 27 mm. in height, and 23 mm. in length.

Shell conically ovate in outline, spire small and acute with a polished surface except for fine growth striae. Body-whorl large, slopingly flat above and convex below. Callous strongly heavy and broad by which the umbilicus is entirely closed.

Type locality: Oriental sea.

Fossil occurrence: Raised Coral Reef.—S. of Sisitô; Reg. No. 37402.

Living: Central Honshû to Taiwan. East Indies. The Philippines. Caroline Islands. New Caledonia. Central Polynesia.

Geologic distribution: Post-Pliocene of Java, Celebes and Billiton; Pliocene of Java, Sumatra and Timor; Miocene of Java and the Philippines.

Polinices (Polinices) melanostoma (GMELIN), 1792

Pl. IX (IV), Fig. 32.

Polinices melanostoma. PILSBRY, Cat. Mar. Moll. Jap., p. 72, 1895: SUGITANI, Cat. Luchu Shells, p. 15, 1926: KURODA, Cat. Shell-bearing Moll., Amami-Ôshima, p. 43, No. 477, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 32, No. 1032, 1931: NOMURA and ZINBÔ, Sci. Rep. Tôhoku Imp. Univ., Ser. 2 (Geol.), Vol. 16, No. 2, p. 145, No. 171, 1934.

Natica melanostoma. PHILIPPI in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 1, p. 30, Pl. 4, figs. 5, 6, 15, 16, 1852: REEVE, Conch. Icon., Vol. 9, Pl. 8, fig. 30, 1855: TRYON, Man. Conch., 1 Ser., Vol. 8, p. 50, Pl. 21, figs. 13-18; Pl. 22, fig. 21, 1886: MARTIN, Foss. von Java, Vol. 1, p. 266, Pl. 39, fig. 642, 1906: TESCH, Paläont. von Timor, Vol. 8, p. 72, Pl. 133, fig. 212, 1920: FISCHER, Paläont. von Timor, Vol. 15, p. 47, 1927.

Several small specimens. According to TRYON, *P. zanzibarica* (RECLUZ), *P. melanostomoides* (QUOY), *P. fibrosa* (SOULEYET) and *P. succinoides* (REEVE) are only varieties; in fact, they are hardly distinguishable from each other when color markings are faded. *Sigaretus (Eunaticina) oblongus* of YOKOYAMA¹⁾ (non REEVE) from the Upper Musasino Formation of Kadusa is apparently similar to the present fossil, though not quite identical.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byôritu Beds.—Wangwa: station 6; Reg. No. 52989. 1100 m. SW. of Taikwa: station 11; Reg. No. 52972. Wangwa: station 11; Reg. No. 52971. 510 m. SE. of Zyô-tûsyôwan: station 15; Reg. No. 52974. Wangwa: station 16; Reg. No. 52973.

Living: Central Honshû to Taiwan. The Philippines. Caroline Islands. Indian Ocean. Madagascar. Red Sea.

Geologic distribution: Pleistocene of Kikai-zima; Post-Pliocene of Celebes; Pliocene of Java, Timor, Sumatra and Seran; Miocene of Java.

Polinices (Polinices?) filosus (REEVE), 1855

Pl. IX (IV), Fig. 34.

Polinices filosus. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 32, No. 1034, 1931.

Natica filosa. REEVE, Conch. Icon., Vol. 9, Pl. 17, fig. 72, 1855.

1) YOKOYAMA: Jour. Coll. Sci. Imp. Univ. Tôkyô, Vol. 44, Art. 1, p. 85, Pl. 4, fig. 11; Pl. 5, fig. 9, 1922.

REEVE described this shell as: "Shell rather narrowly umbilicated, comparatively ovate, inflated, *Sigaretus*-shaped, spire short, acuminate, whorls slantingly convex, arcuately longitudinally striated, decussated with minute, waved, spiral, impressed striae, last whorl large, inflated, aperture large, columella rather broadly reflected; whitish encircled with two broad, diluted, rust brown bands, columella purple-black."

A single, small specimen lacking the spire, but agrees with the above description. According to REEVE, the habitat of this species is unknown, but TRYON gives it as Australia.

This is *Natica filosa* REEVE, but not *Natica filosa* of PHILIPPI.

Type locality: Not known to the writer.

Fossil occurrence: Byôritu Beds.—700 m. NE. of Nanseizan: station 19; Reg. No. 52981.

Living: Central Honsyû. Australia.

Geologic distribution: Post-Pliocene of Celebes.

Subgenus *Neverita* RISSO, 1826

Polinices (Neverita) didyma (BOLTEN), 1798

Polinices ampla. YOKOYAMA, Jour. Coll. Sci. Imp. Univ. Tôkyô, Vol. 39, Art. 6, p. 78, Pl. 5, figs. 5, 6, 1920, and several other subsequent papers.

Several, rather small specimens. The largest which was collected from the vicinity of Hakusyatón measures 25 mm. in length. The Formosan fossils differ from those of Japan proper, in being invariably a little more depressed. This depressed form was once named by RECLUZ as *Natica petiveriana* to which the present form certainly belongs.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byôritu Beds.—700 m. E. of Hakusyatón: station 3; Reg. No. 52284. 900 m. NW. of Rinsuikwa: station 6; Reg. No. 52283. 550 m. NW. of Rinsuikwa: station 7; Reg. No. 52280. Bôsiho: station 13; Reg. No. 52276. 500 m. SE. of Zyô-tûsyôwan: station 14; Reg. No. 52286. 1450 m. W. of Hokkô: station 14; Reg. No. 52277. Wangwa: station 17; Reg. No. 52962. 1000 m. E. of Hakusyatón: station 20; Reg. No. 52281. 1000 m. E. of Hakusyatón: station 25; Reg. No. 522282. Wangwa: station 28; Reg. No. 52956. 300 m. E. of Sankwakô: station 39; Reg. No. 52960. Keiyukwa: station 50; Reg. No. 52963. 1520 m. E. of Sinpo: station 68; Reg. No. 53816. Between Kôsui and Zyuna; Reg. No. 37584. Western side of Syôgun-yama; Reg. No. 37544. N. of Kityô; Reg. No. 52964.

Living: Widely distributed in Japan from Hokkaidô to Taiwan. Tyôsen. China. Mauritius. Indian Ocean. Australia.

Geologic distribution: Post-Pleistocene, Pleistocene, Pliocene and Miocene of Honsyû; Pliocene of Sikoku and Kyûsyû; Pliocene of Java and Sumatra; Miocene of Java.

Polinices (Neverita) species indet.

Several small specimens resembling an immature individual of *P. didyma* (BOLTEN) in form, but has a smaller umbilical lobe which is apparently not grooved.

Fossil occurrence: Byōritu Beds.—900 m. NW. of Keiyukwa: station 33; Reg. No. 52458. 300 m. E. of Sankwakō: station 39; Reg. No. 52979.

Genus **Eunaticina** FISCHER, 1885

Eunaticina papilla (GMELIN), 1792

Pl. IX (IV), Figs. 27a, 27b.

Sigaretus (Eunaticina) papilla. YOKOYAMA, Jour. Coll. Sci. Imp. Univ. Tōkyō, Vol. 44, Art. 1, p. 84, Pl. 5, fig. 8.

A single specimen, 19 mm. in height.

Type locality: The Philippines?; Recent.

Fossil occurrence: Byōritu Beds.—1100 m. SW. of Taikwa: station 11; Reg. No. 52978. Sikō; Reg. No. 49411.

Living: Widely distributed in Japan from North to South. Japan Sea. Tyōsen. The Philippines. Moluccas.

Geologic distribution: Post-Pleistocene, Pleistocene, Pliocene and Miocene of Honsyū; Post-Pliocene, Pliocene and Miocene of Java; Pliocene of Timor.

Genus **Sinum** (BOLTEN) RÖDING, 1798

Sinum neritoideum (LINNAEUS), 1758

Pl. IX (IV), Figs. 26a, 26b.

Sinum neritoideum. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 32, No. 1048, 1931.

Sigaretus neritoideus. REEVE, Conch. Icon., Vol. 15, Pl. 1, fig. 5, 1864: WEINKAUFF in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 6, Pt. 1, p. 18, Pl. 3, figs. 7–11, 1883: TRYON, Man. Conch., 1 Ser., Vol. 8, p. 55, Pl. 22, fig. 35; Pl. 23, figs. 38–40, 1886: SOWERBY, Thes. Conch., Vol. 5, p. 40, Pl. 441, fig. 1; Pl. 2, figs. 16, 17, 1887.

Shell depressed, globose and ear-shaped, sculptured by incised grooves and alternating flat ridges; they are decussated by rather coarse, irregular concentric lines of growth. Base more or less concave and with no spiral grooves. Larger part of umbilicus closed. Diameter, 31 mm.

Among the several allied forms which have been reported from the tropic and subtropic regions of Asia, *S. latifasciatum* (ADAMS and REEVE), *S. insculptum* (ADAMS and REEVE), *S. javanicum* (GRAY) and *S. leachii* (PHILIPPI) are synonyms according to TRYON.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—1000 m. E. of Hakusyatōn: station 4; Reg. No. 52984. 550 m. SE. of Zyb-tūsyōwan: station 16; Reg. No. 52982. Wangwa: station 24; Reg. No. 52988. Wangwa: station 40; Reg. No. 52983. Sikō; Reg. No. 49412.

Living: Western Honsyū. The Philippines. Malaccas.

Family **Patellidae**Genus **Cellana** H. ADAMS, 1869**Cellana toreuma** (REEVE), 1855

Pl. X (V), Fig. 34.

Cellana toreuma. KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 22, No. 222, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 17, No. 493, 1931: YAGURA, Cat. Moll. Hyôgo-ken, p. 22, No. 261, 1932.

Helcioniscus toreuma. PILSBRY, Cat. Mar. Moll. Jap., p. 113, 1895: SUGITANI, Cat. Luchu Shells, p. 2, 1926.

Patella toreuma. REEVE, Conch. Icon., Vol. 8, Pl. 27, fig. 69, 1855: LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 109, Pl. 8, figs. 12-15, 1869: LISCHKE, ibid., Vol. 2, p. 102, 1871: DUNKER, Ind. Moll. Mar. Jap., p. 159, 1882: PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 13, p. 135, Pl. 18, figs. 50-53, 1891.

Patella amusitata. REEVE, Conch. Icon., Vol. 8, Pl. 30, fig. 83, 1855: LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 109, 1869: LISCHKE, ibid., Vol. 2, p. 100, Pl. 6, figs. 7-10, 1871: DUNKER, Ind. Moll. Mar. Jap., p. 156, 1882.

A single specimen. Shell depressed, longly oval in outline, test rather thin. Surface ornamented with many, unequal radiating threads, more or less beaded. Height, 6 mm.; length, ca. 23 mm.; width, ca. 16 mm.

Type locality: The Oriental Sea.¹⁾

Fossil occurrence: Byôritu Beds.—Sikô; Reg. No. 54207.

Living: Widely distributed in Japan from North to South. Ogasawara-zima. The Philippines.

Geologic distribution: Post-Pleistocene of Honshû.

Family **Turbinidae**Genus **Turbo** (LINNAEUS) LAMARCK, 1799Subgenus **Turbo**, s. s.**Turbo (Turbo) petholatus** LINNAEUS, 1758

Pl. X (V), Fig. 31.

Turbo petholatus. PHILIPPI in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 2, p. 7, Pl. 2, figs. 1-16; Pl. 3, figs. 1-4, 1846: REEVE, Conch. Icon., Vol. 4, Pl. 3, fig. 12, 1848: SOWERBY, Thes. Conch., Vol. 5, p. 191, No. 4, Pl. 5, figs. 46, 47, 1887: TRYON, Man. Conch., 1 Ser., Vol. 10, p. 193, Pl. 40, fig. 14, 1888: PILSBRY, Cat. Mar. Moll. Jap., pp. 88, 179, 1895: TESCH, Paläont. von Timor, Vol. 8, p. 77, Pl. 134, fig. 221, 1920: SUGITANI, Cat. Luchu Shells, p. 5, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 28, No. 293, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 21, No. 622, 1931.

A small, but beautifully preserved specimen with its operculum nearly in natural coloration. Shell rather small, ovate in outline, no umbilicus. Surface entirely smooth and polished except for numerous fine growth lines and microscopic revolving threads. Height, 27 mm.; diameter, 23 mm.

T. reevi PHILIPPI (=*T. variabilis* REEVE) and *T. caledonicus* FISCHER may be synonyms.

1) REEVE gives the locality of "Patella" *toreuma* as Monterey, California, but this is certainly a mistake.

Type locality: The Eastern Sea.

Fossil occurrence: Byōritu Beds.—Sikō; Reg. No. 49409.

Living: Inland Sea to Taiwan. The Philippines. New Caledonia. Indian Ocean. Red Sea.

Geologic distribution: Post-Pliocene of Timor and Celebes; Pliocene and Miocene of Java.

Turbo (Turbo) argyrostomus LINNAEUS, 1758

Turbo argyrostomus var. *margaritacea*. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 65, Pl. 5, fig. 11, 1928.

A tolerably variable species in surface sculpture. The varietal name "*margaritacea*" may perhaps be considered unnecessary, although our sole representative is quite identical with that variety.

Type locality: Indian Ocean.

Fossil occurrence: Raised Coral Reef.—S. of Sisitō; Reg. No. 87417.

Living: Southern Kyūsyū and Ryūkyū. China. The Philippines. Pacific Islands. Indian Ocean.

Turbo (Turbo) ticaonicus REEVE, 1843

Turbo ticaonicus. REEVE, Conch. Icon., Vol. 13, Pl. 5, fig. 23, 1843.

Two small specimens, moulds; they are somewhat questionably referred to the named species.

Type locality: The Philippines; Recent.

Fossil occurrence: Ryūkyū Limestone.—Hanpeizan; Reg. Nos. 37367, 37368.

Living: Taiwan. The Philippines. Pacific Islands. Indian Ocean.

Geologic distribution: Pliocene of Timor and Java.

Turbo (Turbo) regenfussi DESHAYES, 1843

Pl. X (V), Figs. 30a, 30b.

Turbo regenfussi. PHILIPPI in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 2, p. 88, Pl. 4, figs. 3, 4, 1846: PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 10, p. 193, Pl. 48, fig. 40, 1888.

A single well preserved specimen still retaining the original color bands. Shell quite smooth save for lines of growth. Last whorl large and ventricose having a revolving series of tubular bands at the shoulder, surface above angle flat and sloping, below it rounded. Imperforate. Height, 60 mm.; diameter, 51.5 mm.

Type locality: Indian Ocean.

Fossil occurrence: Raised Coral Reef.—S. of Sisitō; Reg. No. 87407.

Living: Indian Ocean.

Subgenus **Lunella** (BOLTEN) RÖDING, 1798**Turbo (Lunella) granulatus** GMELIN, 1788

Turbo (Marmorostoma) granulatus. YOKOYAMA, Jour. Coll. Sci. Tôkyô Imp. Univ., Vol. 44, Art. 1, p. 107, Pl. 5, fig. 10, 1922.

Several well preserved specimens. This species may prove to be a mere variety of *T. coronatus* GMELIN, from which it is hardly distinguished.

Type locality: Indian Ocean.

Fossil occurrence: Byôritu Beds.—Wangwa: station 5; Reg. No. 53835. Wangwa: station 31; Reg. No. 53834.

Living: Northern Honsyû to Taiwan. Japan Sea. China. Indian Ocean.

Geologic distribution: Post-Pleistocene and Pleistocene of Honsyû.

“Turbo” species indet.

A single imperfect mould, about, 48 mm. in height and 41 mm. in diameter. Its specific determination is impossible, although it may perhaps be a member of *Turbo*.

Fossil occurrence: Byôritu Beds.—The upper course of Sairyôkyô; Reg. No. 53840.

Genus **Astraea** (BOLTEN) RÖDING, 1798**Astraea pseudomodesta** n. sp.

Pl. X (V), Figs. 1a, 1b, 1c.

Shell resembling *A. modesta* in general respects, rather small, conically turbinated. Test medium in thickness. Whorls 8, apical two embryonal, very small and depressed, the rest angulate at one-third of height of whorl, surface above angle convexly sloping, below it nearly vertical. Suture distinct, impressed, but not canaliculated. Surface radially plicate near suture, and spirally threaded, beaded all over, and with revolving series of spines as those of *A. modesta*. Base nearly flat, ornamented by rather coarse radial incremental lines as well as spiral threads; the latter rather small, unequal and about 18 in number, somewhat alternately large and small. Aperture transversely oval, smooth and pearly within; columella short and well curved; callous very thin, covering the umbilical region and a part of base. Quite imperforate.

A single specimen. Height, 27 mm.; diameter 29 mm.

It may be distinguished from *A. modesta* (REEVE) from Japan, by its smaller size, and much finner surface sculpture which is especially well exposed on the base.

Fossil occurrence: Byôritu Beds.—Sikô; Reg. No. 48987.

Genus **Collonista** IREDAL, 1918**Collonista laeta** (MONTROUZIER), 1863

Pl. X (V), Figs. 25a, 25b.

Collonista laeta. KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 29, No. 299, 1928: NOMURA and ZINBO, Sci. Rep. Tôhoku Imp. Univ., Ser. 2 (Geol.), Vol. 16, No. 2, p. 147, No. 177, 1934.

Leptothyra laeta. PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 10, p. 258, Pl. 63, figs. 29, 30, 1888.

A single specimen. Shell subglobose, surface spirally unequally lirate. Upper whorls as well as base minutely beaded; interior of outer lip transversely dentate. Umbilicus narrow and curved, surrounded behind by a granular ridge.

The shell agrees very well with the description given by PILSBRY, in the work cited above, although the figure of the species shown in that work is rather poor.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Raised Coral Reef.—S. of Sisitô; Reg. No. 37483.

Living: Southern Kyûsyû. New Caledonia. Viti and Solomon Islands. Australia.

Geologic distribution: Pleistocene of Kikai-zima.

Genus *Liotia* GRAY, 1847

Liotia hanzawai n. sp.

Pl. X (V), Figs. 43a, 43b, 43c, 44a, 44b.

Shell small, discoidal, consisting of 4, angular whorls; surface above angle flat, below it vertical. Sculptured by radiating ribs numbering about 16 on upper surface of last whorl; interspaces smooth, generally wider than ribs themselves. Periphery biangulated by revolving cords which are connected by longitudinal ribs. Base convex, obsoletely ribbed in outer half, and distinctly crenulated in the interior part bordering a rather small and deep umbilicus. Dimensions: Height, 2 mm., diameter, 3.5 mm.

This species somewhat resembles *L. discoidea* REEVE¹⁾ from the Philippines but it may be distinguished from the latter by having a slightly more elevated spire.

Fossil occurrence: Byôritu Beds.—On road S. of Bôsiho: station 7; Reg. No. 37416. Bôsiho: station 13 (HANZAWA); Reg. No. 53863.

Liotia species indet. (1)

A single imperfect specimen, 6.2 mm. in height. The shell is small, solid and globose in form being somewhat related to *L. semiclathurata* SCHRENCK,²⁾ but the sculpture is not perfectly identical.

Fossil occurrence: Byôritu Beds.—On road S. of Bôsiho: station 7 (HANZAWA); Reg. No. 53858.

Liotia (?) species indet. (2)

A small imperfect specimen, somewhat similarly sculptured with *L. australis* (KIENER).³⁾ Diameter, ca. 3.2 mm.

Fossil occurrence: Byôritu Beds.—The upper course of Sairyôkyô; Reg. No. 53863.

1) REEVE: Conch. Icon., Vol. 1, *Delphinula*, fig. 15, a, 1843.

2) SCHRENCK: Moll. Amurl-Lande, p. 370, Pl. 16, figs. 16-25, 1867.

3) KIENER: Spec. Coq. viv., *Delphinula*, p. 8, Pl. 4, fig. 7, 1835-1857.

Family **Cyclostrematidae**Genus **Cyclostrema** MARRYATT, 1818**"Cyclostrema" eburneiforme**, n. sp.

Pl. X (V), Figs. 38a, 38b, 38c.

Shell resembling *C. eburnea* in some respects, very small and sublenticular, being narrowly umbilicated. Whorls 4, distinctly angulated near lower suture; surface above angle flattened, below it vertical; suture well defined being neither canaliculated nor marginated. Surface sculptured with radial, somewhat curved plicae, about 25, on upper surface of body-whorl, separated by slightly wider interspaces which are spirally, minutely striated. Periphery angulated by a corded carina. Base convex, ornamented with 20, radial plicae as well as striated interspaces. Aperture nearly circular. Dimensions: Height, 1.8 mm., diameter, 4.1 mm.

This shell may be distinguished from *C. eburnea* NEVILL²⁾ of Bengal Bay, by its continuous radial plicae and non-marginated suture; farther the peripheral carina in NEVILL's species is said to be bordered by an impressed line, above and below, but in our's it is absent.

Fossil occurrence: Byōritu Beds.—700 m. NE. of Nanseizan: station 19; Reg. No. 53861.

"Cyclostrema" sulcatum A. ADAMS, 1850

Pl. X (V), Figs. 40a, 40b.

Cyclostrema sulcatum. PILSBRY, Cat. Mar. Moll. Jap., p. 103, 1895: NOMURA and ZINEÔ, Sci. Rep. Tôhoku Imp. Univ. Sendai, Ser. 2, (Geol.), Vol. 16, No. 2, p. 148, No. 186, 1934.

Cyclostrema sulcata. SOWERBY, Thes. Conch., Vol. 3, p. 250, No. 7, Pl. 255, figs. 11, 12, 1866: SOWERBY in REEVE, Conch. Icon., Vol. 19, Pl. 1, fig. 3, 1874: PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 10, p. 94, Pl. 32, figs. 77, 78, 1888.

A single specimen, 3 mm. in diameter.

Type locality: Japan; Recent.

Fossil occurrence: Byōritu Beds.—Nanseizan: station 11; Reg. No. 53860.

Living: Japan. China Sea. The Philippines.

Geologic distribution: Pleistocene of Kikai-zima and Honsyû(?).

"Cyclostrema" species indet.

A small and thin shelled species, somewhat water-worn. It is depressed, flatly convex with the surface spirally striate. The base is plano-convex being provided with obsolete fine threads. The umbilicus widely perforate.

Fossil occurrence: Byōritu Beds.—S. of Bôsiho: station 7; Reg. No. 37437.

1) TRYON: Man. Conch., 1 Ser., Vol. 10, p. 89, Pl. 31, figs. 29, 30, 1888.

Family **Trochidae**

Genus **Trochus** LINNAEUS, 1758

Subgenus **Trochus**, s. s.

Trochus (Trochus) incrassatus LAMARK, 1822

Pl. X (V), Fig. 14.

Trochus incrassatus. PHILIPPI in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 3, p. 109, Pl. 18, fig. 3, 1851; REEVE, Conch. Icon., Vol. 13, Pl. 13, fig. 77, 1861; PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 11, p. 26, Pl. 6, figs. 48-50; 1889: SUGITANI, Cat. Luchu Shells, p. 3, 1926; KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 24, No. 248, 1928; YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 18, No. 528, 1931.

Seven well preserved specimens. They are quite identical with the type of *T. incrassatus*, having five spiral series of grains on each whorl, and with the upper-most one being the largest. The test is thick and heavy; the lateral outline of the spire is slightly convex. The largest specimen, 32 mm. in height, and 38.3 mm. in diameter.

Type locality: Indian Ocean.

Fossil occurrence: Raised Coral Reef.—S. of Kontei; Reg. No. 37595. N. of Kaikô; Reg. No. 53809.

Living: Southern Kyûsyû to Taiwan. Sandwich Islands. Viti Island. Indian Ocean.

Trochus (Trochus) calcaratus SOUVERBIE, 1875

Pl. X (V), Fig. 16.

Trochus calcaratus. PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 11, p. 30, Pl. 2, fig. 15; Pl. 8, figs. 83, 84, 1889; KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 24, No. 249, 1928; YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 18, No. 541, 1931.

A single well preserved specimen, 20.7 mm. in height, and 22.1 mm. in diameter. It is slightly less higher than the type figured by TRYON, but the difference may be regarded as mere variation.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Raised Coral Reef.—N. of Kaikô; Reg. No. 53803.

Living: Southern Kyûsyû and Ryûkyû. The Philippines. New Caledonia.

Subgenus **Pyramidea** SWAINSON, 1840

Trochus (Pyramidea) niloticus LINNAEUS, 1767

Pl. X (V), Fig. 46.

Trochus niloticus. PHILIPPI in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 3, p. 32, Pl. 1, fig. 1; Pl. 8, fig. 1, 1851; DUNKER, Ind. Moll. Mar. Jap., p. 187, 1882; PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 11, p. 17, Pl. 1, figs. 5-8, 1889; SUGITANI, Cat. Luchu Shells, p. 3, 1926.

Pyramidea nilotica. KURODA, Cat. Shell-bearing Moll., Amami-Ôshima, p. 25, No. 251, 1928.

A single, large specimen, 120 mm. in diameter. The shell is locally called "Takase-gai, and is used for making buttons.

T. maxima (KOCH) PHILIPPI is a synonym.

Type locality: Indian Ocean.

Fossil occurrence: Raised Coral Reef.—S. of Kontei; Reg. No. 52998.

Living: Kyūsyū to Taiwan. Pacific Islands. Indian Ocean. Australia.

Geologic distribution: Pliocene of Sumatra.

Genus **Monodonta** LAMARCK, 1799

Monodonta labio (LINNAEUS), 1858

Monodonta labio. YOKOYAMA, Jour. Coll. Sci. Imp. Univ. Tōkyō, Vol. 45, Art. 1, p. 34, Pl. 2, fig. 8, 1924.

Several well preserved specimens, though rather small.

M. confusa TAP.-CAN.¹⁾ may be an immature form of the present species.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—Wangwa: station 5; Reg. No. 53805. Wangwa: station 31; Reg. No. 53804.

Living: Widely distributed in Japan from North to South. China. Pacific Islands. The Philippines. Indian Ocean.

Geologic distribution: Post-Pleistocene of Honshū; Pliocene of Java.

Genus **Turcica** H. and A. ADAMS, 1854

Turcica elisa (GOULD), 1849

Pl. X (V), Fig. 15.

Turcica elisa. PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 11, p. 417, Pl. 67, figs. 67, 68, 69, 74, 1889.

Trochus elisus. GOULD, Proc. Bost. Soc. Nat. Hist., Vol. 3, p. 92, 1849.

Several fine specimens. The largest specimen in our possession, 15 mm. in diameter, and hence it is larger than those of the types given by GOULD and by TRYON.

Like *T. imperialis* A. ADAMS in some respects, but the sculpture is coarser, and has a toothed columella. TRYON classed it under the section of *Perrinia* H. and A. ADAMS.

Type locality: China Sea.

Fossil occurrence: Byōritu Beds.—700 m. E. of Hakusyatōn: station 3; Reg. No. 53810. Wangwa: station 7; Reg. No. 53807. Wangwa: station 8; Reg. No. 53815. Wangwa: station 9; Reg. No. 53816. Wangwa: station 16; Reg. No. 53817. 100 m. E. of Hakusyatōn: station 25; Reg. No. 53808. Wangwa: station 25; Reg. No. 53811. Wangwa: station 33; Reg. No. 53814.

1) TRYON: Man. Conch., 1 Ser., Vol. 11, p. 87, Pl. 22, fig. 37, (as a variety of *M. labio*), 1889.

500 m. SE. of Naikotô: station 28; Reg. No. 53818. Keiyukwa: station 50; Reg. No. 53813. 940 m. NW. of Keiyukwa: station 55; Reg. No. 53812. Western side of Syôgun-yama; Reg. No. 37424. 300 m. E. of Hakusyatô; Reg. No. 37426. E. of Goko; Reg. No. 37438.

Living: China Sea. Singapore.

Genus *Tegula* LESSON, 1834**Subgenus *Chlorostoma* SWAINSON, 1840*****Tegula (Chlorostoma) pfeifferi* (PHILIPPI), 1846**

Tegula (Chlorostoma) pfeifferi. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 19, No. 570, 1931: YAGURA, Cat. Moll. Hyôgo-ken, p. 24, No. 303, 1932: NOMURA, Sci. Rep. Tôhoku Imp. Univ. Ser. 2 (Geol.), Vol. 15, No. 2, p. 98, No. 223, 1932.

Chlorostoma pfeifferi. DUNKER, Ind. Moll. Mar. Jap., p. 144, 1882: PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 11, p. 169, Pl. 26, figs. 13-15, 1889: PILSBRY, Cat. Mar. Moll. Jap., p. 95, 1895.

Trochus pfeifferi. PHILIPPI in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 3, p. 152, Pl. 25, fig. 2, 1851: LISCHKE, Jap. Meeres-Conch., Vol. 1, p. 98, 1869.

The typical form of this species is defined by TRYON as:

"The typical *C. pfeifferi* is strictly conical, with nearly straight lateral outline; the whorls are obsoletely longitudinally plicated; the base is slightly concave, and radiately striated or streaked with white."

A single specimen, 17.7 mm. in height, and 17 mm. in diameter, coincides, almost exactly with the above description, although smaller and somewhat imperfect in its preservation.

According to LISCHKE, *Chlorostoma achates* GOULD and *Chlorostoma nordmanni* (SCHRENCK) are synonyms.

Type locality: Japan?; Recent.

Fossil occurrence: Byôritu Beds.—Wangwa: station 31; Reg. No. 53806.

Living: Northern to Western Japan.

Geologic distribution: Post-Pleistocene of Honsyû.

Genus *Umbonium* LINK, 1807**Subgenus *Umbonium*, s. s.*****Umbonium (Umbonium) vestarium* (LINNAEUS), 1758**

Pl. X (V), Figs. 26a, 26b.

Umbonium vestarium. PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 11, p. 450, Pl. 58, fig. 1-8, 1889.

Several specimens of *Umbonium* having slightly convex whorls and with smooth surfaces. They agree with *U. vestarium* (LINNAEUS) in general respects, though smaller. The largest specimen, 5 mm. in diameter.

Type locality: Indian Ocean.

Fossil occurrence: Byôritu Beds.—700 m. SW. of Kôkwan: station 23; Reg. No. 53826. Bôsiho: station 24; Reg. No. 53827. Western side of Syôgun-yama; Reg. No. 37419.

Living: Singapore. The Philippines. Indian Ocean.

Geologic distribution: Pliocene of Java.

Subgenus **Suchium** MAKIYAMA, 1924

Umbonium (Suchium) moniliferum (LAMARCK), 1822

Pl. X (V), Fig. 12.

Umbonium moniliferum. PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 11, p. 456, Pl. 58, figs. 22, 23, 29, 30, 31, 1889.

Umbonium costatum. YOKOYAMA, Imp. Geol. Surv. Jap., Rep. No. 101, p. 69, 1928.

Several specimens sculptured almost identically with the named species. According to Mr. KURODA, *U. costatum* (VAL.), *U. superbum* (GOULD), and *U. suturale* (LAM.) are only local varieties, and are referred to *U. moniliferum*.

In regard to the fossil species of the Japanese *Umbonium*, the reader is referred to the interesting papers by Dr. MAKIYAMA,¹⁾ and by K. SUZUKI.²⁾

Type locality: Japan; Recent.

Fossil occurrence: Byōritu Beds.—700 m. E. of Hakusyatōn: station 3; Reg. No. 53822. 1900 m. NE. of Hakusyatōn: station 10; Reg. No. 53824. 1600 m. N. of Sikwakō: station 10; Reg. No. 53820. 650 m. SE. of Zyō-tūsyōwan: station 18; Reg. No. 53810. Wangwa: station 26; Reg. No. 53825. Kōsui: station 61; Reg. No. 53823. Sōkeisi; Reg. No. 53821. On road S. of Bōsiho; Reg. No. 37404.

Living: Widely distributed in Japan, from Hokkaidō to Taiwan.

Geologic distribution: Post-Pleistocene, Pleistocene and Pliocene of Honshū.

Umbonium (Suchium) equistriatum n. sp.

Pl. X (V), Figs. 3a, 3b, 4, 5, 6, 7, 8, 9, 10, 11.

Shell resembling *U. moniliferum* in general respects, small, depressed-conical in form. Whorls about six, apical one embryonal, smooth and rounded, post-embryonal ones a trifle convex and ornamented with spiral threads, 8 or 9 on body-whorl above periphery, separated by almost equidistant grooves. No subsutural bands or tubercular cords. Base flattish and entirely smooth with a closed umbilicus, and a circular callous, which is not very heavy.

This species is distinguishable from *U. moniliferum* in the shell being smaller, the spiral threads are more in number, and has no subsutural band or tubercles.

There are several specimens found in our collection, though from a single locality. Unfortunately all the specimens are more or less deformed; the approximate dimensions of two specimens are (in mm.):

1) MAKIYAMA: Jap. Jour. Geol. and Geogr., Vol. 3, No. 3-4, pp. 119-130, Pl. 20, 1924.

2) SUZUKI: Jour. Geol. Soc. Tōkyō, Vol. 41, No. 485, p. 67, 1934. (in Japanese).

	1	2
Height	8.0	7.4
Diameter	11.5	6.3

Fossil occurrence: Byōritu Beds.—Sinsui; Reg. No. 37415.

Genus **Ethalia** A. ADAMS, 1853

Ethalia pulchella (A. ADAMS), 1853

Pl. X (V), Figs. 24a, 24b.

Ethalia pulchella. PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 11, p. 460, Pl. 59, figs. 59–63, 1889.

Several well preserved specimens. The diagnosis given by TRYON is: "Shell sublenticular, obtusely angulated, umbilicate, smooth, shining.....; spire a little prominent, apex a little acute, whitish; base around the umbilicus rather broadly, perspectively, radiately corrugated and angulate; aperture subrhomboidal, very oblique, throat pearly; peristome straight, obtuse, whitish, basal margin arcuate, columellar margin expanded in a rosy, tongue-shaped callous, partly covering the umbilicus."

The color marking as preserved in our fossil specimens consists of longitudinal oblique threads. The largest specimen measures 8.2 mm. in diameter, and 4.8 mm. in height being slightly larger than the subsequent type measured by MARTENS in his Systematic Conchylien Cabinet.

Type locality: The Philippines?; Recent.

Fossil occurrence: Byōritu Beds.—1000 m. E. of Hakusyatō: station 25; Reg. No. 53830. 1200 m. SE. of Sankwakō: station 60; Reg. No. 53831. Western side of Syōgun-yama; Reg. No. 53828.

Living: The Philippines. Owen Is., Marqui Archipelago.

Genus **Monilea** SWAINSON, 1840

Monilea lentiginosa A. ADAMS, 1851

Pl. X (V), Figs. 23a, 23b.

Monilea lentiginosa. PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 11, p. 248, Pl. 41, figs. 8–10; Pl. 60, figs. 23, 24, 1889.

Five specimens: A perfect one, 9.8 mm. in height, and 13 mm. in diameter.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Byōritu Beds.—SW. of Kōryō; Reg. No. 53833.

Raised Coral Reef.—S. of Sisitō; Reg. No. 37479.

Living: The Philippines. Singapore. Australia.

Genus **Calliostoma** SWAINSON, 1840**Calliostoma cecillei** (PHILIPPI), 1849

Pl. X (V), Fig. 13.

Calliostoma cecillei. PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 11, p. 342, Pl. 67, fig. 64, 1889.*Trochus cecillei*. PHILIPPI in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 3, p. 291, Pl. 43, fig. 2, 1851.*Calliostoma unicum*. TRYON, Man. Conch., 1 Ser., Vol. 11, p. 341, Pl. 16, figs. 10, 5, 1889: PILSBRY, Cat. Mar. Moll. Jap., p. 99, 1895: YOKOYAMA, Jour. Coll. Sci. Imp. Univ. Tôkyô, Vol. 45, Art. 2, p. 13, 1923: YOKOYAMA, Jour. Fac. Sci. Imp. Univ. Tôkyô, Sec. 2, Vol. 1, Pt. 9, p. 346, Pl. 51, fig. 13, 1926: MAKI-YAMA, Mem. Coll. Sci. Kyôto Imp. Univ., Ser. B, Vol. 3, No. 1, Art. 1, p. 60, 1927: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 20, No. 596, 1931: YAGURA, Cat. Moll. Hyôgo-ken, p. 25, No. 314, 1932: NOMURA, Sci. Rep. Tôhoku Imp. Univ. Ser. 2 (Geol.), Vol. 15, No. 2, p. 99, No. 232, 1932.*Trochus unicus*. DUNKER, Moll. Jap., p. 23, Pl. 3, fig. 3, 1861: LISCHKE, Jap. Meeres-Conch., Vol. 3, p. 64, 1874.
Zigyphinus unicus. REEVE, Conch. Icon., Vol. 14, Pl. 2, fig. 8, 1863.

The Japanese form hitherto known under the name of *C. unicum* (DUNKER) certainly belongs to PHILIPPI's species; the Formosan specimen seems to have a more granulate surface than the usual type of *unicum* of Japan, but the difference is regarded as local variation, the two forms are surely linked to one another by intermediate forms. Height, 19.2 mm.; diameter, 20 mm.

Type locality: Taiwan; Recent.

Fossil occurrence: Byôritu Beds.—Wangwa: station 14; Reg. No. 53829.

Living: Northern Honshû to Taiwan.

Geologic distribution: Post-Pleistocene, and Pliocene of Honshû.

Calliostoma semigranatum n. sp.

Pl. X (V), Figs. 17a, 17b.

Shell small, perforate; spire conical, outline almost straight. Whorls 8, separated by broad and subchanneled sutures. Sculpture: lower whorl with four, unequal cord-like lirae, the upper-most one obsoletely beaded, the rest smooth, the second from the upper smallest and the lowest largest: 3 lirae on upper whorl, all finely and closely beaded; entire surface ornamented by rather distinct lines of growth, more marked in interspaces than on lirae. Periphery biangulate by smooth lirae. Base rather flat, with many distinct incremental lines as well as 8, subequal, rather low spiral cords, separated by narrower interspaces, the inner-most one being beaded. Aperture angular; outer lip lirate within; columella very short and smooth terminating in a tooth-like process. Umbilicus rather narrow, semilunar in form, encircled behind by a smooth ridge.

Several well preserved specimens. Annexed are some of the measurements (in mm.):

	1	2	3
Height	9.0	8.0	2.5
Diameter	7.7	7.1	5.0

Although there are several forms of *Calliostoma* resembling this new species in form, none of them are identical.

Fossil occurrence: Byōritu Beds.—Nanseizan: station 11; Reg. No. 53837. Wangwa: station 15; Reg. No. 53838. 700 m. NE. of Nanseizan: station 19; Reg. No. 53839. Wangwa: station 40; Reg. No. 53836.

Genus **Teinostoma** H. and A. ADAMS, 1853

Teinostoma andoi n. sp.

Pl. X (V), Figs. 45a, 45b, 45c.

Shell resembling *T. morlieri* JOUSSEAUME in form, very small, discoidal, consisting of 5, rather rapidly increasing convex whorls; spire short, depressed; suture distinct, subchannelled, slightly margined and more apparent in body whorl; flattened next to suture then convex. Surface with fine growth lines and microscopic spiral striae; the latter marked only in whorls of spire. Periphery well rounded. Base nearly flat, or more or less convex, being sculptured with growth lines only; umbilicus closed by heavy callous deposits leaving a narrow and slightly depressed area. Dimension: Height, 1.8 mm.; diameter, 3.5 mm.

This small and neat shell is characterized by its revolving lines on the surface that are limited only on the spire whorls; it is a good distinguishing character from *T. morlieri* JOUSSEAUME¹⁾ and *T. punctatum* JOUSSEAUME.²⁾

Fossil occurrence: Byōritu Beds.—700 m. SW. of Kôkwan: station 23; Reg. No. 53857.

Genus **Solariella** S. WOOD, 1842

Solariella formosana, n. sp.

Pl. X (V), Figs. 42a, 42b, 42c.

Shell small, umbilicate, turbinate conical; test rather thin. Whorls about 5, apical ones lost, sharply angulate slightly above middle, flattened, or more or less concave above angle, and almost vertical below. Sculpture of a rather prominent spiral ridge at shoulder of each whorl, both above and below; penultimate whorl with a single spiral cord; body-whorl with 2 (one is obsolete) on upper flat surface and 3 on lower vertical surface between shoulder and periphery; in the latter, each provided with a smaller cord in their interspaces. Entire surface marked by longitudinal threads (or riblets), minutely subgranular in appearance. Periphery rounded. Base slightly convex with 7 nearly equal spiral cords, separated by grooves which are narrower than cords themselves. Umbilicus deep, moderately wide, with its upper margin as well as inner wall crenulate. Aperture fractured, but may be nearly circular with a thin outer lip. A single specimen; height, ca. 4 mm.; diameter, 4.5 mm.

S. philippensis (WATSON)³⁾ from Australia resembles the present species in form, but differs from that species in having a coarser sculpture.

Fossil occurrence: Byōritu Beds.—1000 m. SE. of Hakusyatōn: station 32; Reg. No. 54214.

1) PILSBRY in TRYON: Man. Conch., 1 Ser., Vol. 10, p. 104, Pl. 34, figs. 50, 51, 1888.

2) PILSBRY in TRYON: ibid., p. 104, Pl. 34, figs. 48, 49, 1888.

3) WATSON: Challenger Rep. Gastr., Vol. 15, p. 73, Pl. 6, fig. 10, 1886, (not of YOKOYAMA, 1922).

Family **Neritidae**Genus **Nerita** LINNAEUS, 1758**Nerita undata** LINNAEUS, 1758

Pl. X (V), Fig. 21.

Nerita undata. TRYON, Man. Conch., 1 Ser., Vol. 10, p. 28, Pl. 5, figs. 86-95; Pl. 6, figs. 96-3; Pl. 7, fig. 30
1888.

Four well preserved specimens. This is a very variable species and it possess many synonyms. The Formosan fossils, as a whole, agree with *N. funiculata* REEVE¹⁾ a variety of *N. undata* L. The largest in the collection, 30 mm. in height, and 32 mm. in diameter.

Type locality: Indo-Pacific; Recent.

Fossil occurrence: Raised Coral Reef.—S. of Sisitô; Reg. No. 37400.

Living: Southern Kyûsyû to Taiwan. East Indies. The Philippines. Pacific Islands. Indian Ocean.

Geologic distribution: Miocene of Java and ?the Philippines.

Nerita chamaeleon LINNAEUS, 1758

Pl. X (V), Fig. 18.

Nerita chamaeleon. WATSON, Challenger Gastr., Vol. 15, p. 679, 1886: TRYON, Man. Conch., 1 Ser., Vol. 10, p. 20, Pl. 2, figs. 31-39; Pl. 6, fig. 4; Pl. 9, fig. 66, 1888: MARTENS in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 11, p. 19, Pl. 2, figs. 13-16; Pl. 5, figs. 5-15, 1889: TESCH, Paläont. von Timor, Vol. 8, p. 73, Pl. 15, fig. 213, 1920: SUGITANI, Cat. Luchu Shells, p. 6, 1926: FISCHER, Paläont. von Timor, Vol. 15, p. 42, 1927: KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 30, No. 317, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 22, No. 657, 1931.

Two perfect and one imperfect specimens. This is one of the most well known Indo-Pacific living species having many synonyms due to its extensive variation of color markings. Height, 29 mm.; diameter, 20 mm.

Type locality: Indian Ocean.

Fossil occurrence: Byôritu Beds.—Wangwa: station 31; Reg. No. 53883.

Living: Southern Kyûsyû to Taiwan. East Indies to Polynesia. E. coasts of Africa.

Geologic distribution: Pliocene of Java, Timor and Seran (as *N. chamaeleon* var. *squamulata*).

Nerita planospira ANTON, 1839

Pl. X (V), Fig. 20.

Nerita planospira. TRYON, Man. Conch., 1 Ser., Vol. 10, p. 21, Pl. 3, fig. 48, 1888: MARTENS in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 11, p. 23, Pl. 4, figs. 4-7, 1889: PILSBRY, Cat. Mar. Moll. Jap., p. 88, 1895.

Nerita atro-purpurea. REEVE, Conch. Icon., Vol. 9, Pl. 8, fig. 38 a, b, 1855.

1) REEVE: Conch. Icon., Vol. 9, Pl. 2, fig. 9, 1855.

One well preserved specimen. It has a flattened spire with rather small revolving ridges which are somewhat alternately large and small especially towards the lower half of the outer lip. Height, 19.4 mm.; diameter, 24 mm.

Type locality: The Philippines; Recent.

Fossil occurrence: Raised Coral Reef.—S. of Sisitô; Reg. No. 37477.

Living: Japan. Polynesia. Indian Ocean. Australia.

Nerita plicata LINNAEUS, 1758

Pl. X (V), Fig. 19.

Nerita plicata. REEVE, Conch. Icon., Vol. 9, Pl. 9, fig. 42 a, b, c, d, 1855: TRYON, Man. Conch., 1 Ser., Vol. 10, p. 27, Pl. 5, figs. 81–83, 1888: MARTENS in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 11, p. 63, Pl. 10, figs. 6–10, 1889: SUGITANI, Cat. Luchu Shells, p. 7, 1926: KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 31, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 22, No. 666, 1931.

One well preserved specimen. Height, 21.5 mm.; diameter, 21 mm. REEVE gives the locality as "West Indies," but this is most probably a mistake; it may be an Indo-Pacific species.

Type locality: Indo-Pacific(?); Recent.

Fossil occurrence: Raised Coral Reef.—S. of Kontei; Reg. No. 37401.

Living: Southern Kyûsyû to Taiwan. Caroline Islands. Indian Ocean. Sandwich Island. Polynesia.

Geologic distribution: Miocene of Java.

Genus **Theodoxus** MONTFORT, 1810

Subgenus **Clithon** MONTFORT, 1810

Theodoxus (Clithon) sowerbianus (RECLUZ), 1842

Pl. X (V), Fig. 22.

Theodoxus sowerbianus. KURODA, Cat. Shell-bearing Moll. Amami-Ôshima, p. 30, No. 312, 1928: YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 22, No. 675, 1931: YAGURA, Cat. Moll. Hyôgo-ken, p. 27, No. 336, 1932.

Theodoxus sowerbyanus. SUGITANI, Cat. Luchu Shells, p. 7, 1926.

Neritina sowerbiana. MARTENS in MARTINI u. CHEMNITZ, Syst. Conch. Cab., Vol. 2, Pt. 10, p. 171, Pl. 18, figs. 1–4, 10, 1879: TRYON, Man. Conch., 1 Ser., Vol. 10, p. 67, Pl. 24, fig. 45; Pl. 25, figs. 46–51, 1888: PILSBRY, Cat. Mar. Moll. Jap., p. 88, 1895.

Neritina sowerbiana. SOWERBY, Thes. Conch., Vol. 2, No. 70, p. 528, Pl. 109, figs. 5–8, 1855.

Neritina sowerbii. REEVE, Conch. Icon., Vol. 9, Pl. 20, fig. 89 a–d, 1855.

Two specimens; they are almost in natural coloration. The largest one which is figured measures 8 mm. in diameter and height.

Type locality: The Philippines; Recent.

Fossil occurrence: Byôritu Beds.—500 m. SE. of Zyô-tûsyôwan: station 14; Reg. No. 53884. 940 m. NW. of Keiyukwa: station 55; Reg. No. 53885.

Living: Widely distributed in Japan from Hokkaidô to Taiwan. China. Siam. The Philippines.

Geologic distribution: Post-Pleistocene of Honshû.

Family Fissurellidae

Genus **Fissuridea** SWAINSON, 1840

Fissuridea crucifera (PILSBRY), 1890

Pl. X (V), Figs. 50a, 50b.

Glyphis crucifera. PILSBRY in TRYON, Man. Conch., 1 Ser., Vol. 12, p. 225, Pl. 32, figs. 27-30, 1890.

A single specimen. Height, 6 mm.; length, 18.5 mm.; width, 10.5 mm.

According to PILSBRY, this is *F. cruciata* KRAUSSE 1848, but not *F. cruciata* GOULD, 1846. This species may approach to *F. singaporense* REEVE from Singapore. *Fissuridea ticaonica* (REEVE) is a much higher shell than the present one, though the sculpture is nearly similar.

Type locality: Natal; Recent.

Fossil occurrence: Byôritu Beds.—Sikô; Reg. No. 48999.

Living: Natal.

Family Epitonidae

Genus **Epitonium** (BOLTEN) RÖDING, 1798

Epitonium neglectum (ADAMS and REEVE), 1850

Pl. IX (IV), Fig. 46.

Epitonium neglectum. YOSIMURA, The Venus, Vol. 2, No. 1, p. 13, text-fig. 1, 1930.

Scalaria neglecta. SOWERBY in REEVE, Conch. Icon., Vol. 19, Pl. 1, fig. 1, 1874: TRYON, Man. Conch., 1 Ser., Vol. 9, p. 55, Pl. 11, figs. 34, 35, 1887.

One well preserved specimen. Height, 14 mm.; diameter, 8 mm. The lamellar ribs on the shoulder are less erect than the figures given by TRYON.

Type locality: China; Recent.

Fossil occurrence: Byôritu Beds.—Sikô; Reg. No. 49418.

Living: Japan Sea. China. Sea.

Epitonium pulcherrimum (SOWERBY),

Scala pulcherrima. YOKOYAMA, Jour. Fac. Sci. Imp. Univ. Tôkyô, Sec. 2, Vol. 1, Pt. 10, p. 416, Pl. 47, fig. 5, 1927.

A small imperfect specimen, longitudinally costate and spirally striate like that of *S. pulcherrima* figured by Dr. M. YOKOYAMA in the work, above cited.

Type locality: The Philippines; Recent.

Fossil occurrence: Byôritu Beds.—1000 m. E. of Hakusyatô: station 25; Reg. No. 53947.

Living: Western Japan. The Philippines.

Geologic distribution: Pleistocene of Honshū.

Family **Strombiformidae**

Genus **Melanella** BOWDICH, 1822

Melanella candida (MARRATT), 1880

Pl. X (V), Figs. 48a, 48b.

Eulima candida. TRYON, Man. Conch., 1 Ser., Vol. 8, p. 266, Pl. 68, figs. 91, 92, 1886.

TRYON gives the description as: "Whorls numerous, short, somewhat rounded, the varices impressed forming a continuous oblique line not reaching the apex".

Four rather well preserved specimens. In two specimens, the impressed varices are situated on the left side of each whorl and are referred to a varietal form. One of the typical form measures ca. 29 mm. in height, and 11.5 mm. in diameter.

"*Eulima* (s. str.)" *martini* figured by FISCHER¹⁾ from Timor is an allied species.

Type locality: Taiwan; Recent.

Fossil occurrence: Byōritu Beds.—400 m. SE. of Zyō-tūsyōwan: station 13; Reg. No. 53762. 300 m. E. of Sankwakō: station 39; Reg. No. 53763.

Living: Known only from the type locality.

Melanella tortuosa (ADAMS et REEVE), 1850

Pl. X (V), Figs. 47a, 47b.

Eulima tortuosa. SOWERBY, Thes. Conch., Vol. 2, p. 795, Pl. 169, fig. 14, 1855: REEVE, Conch. Icon., Vol. 15, Pl. 2, fig. 12, 1865: TRYON, Man. Conch., 1 Ser., Vol. 8, p. 271, Pl. 68, fig. 23, 1886.

SOWERBY described this species as: "Tortuous, acuminated; whorls twelve to fourteen, flattened, with oblique varices; aperture small, white, opaque, obscurely beneath the suture".

Several well preserved specimens. The largest, length, 13 mm.; diameter, 3.5 mm.

Type locality: China; Recent.

Fossil occurrence: Byōritu Beds.—700 m. E. of Hakusyatōn: station 3; Reg. No. 53764. 500 m. SE. of Zyō-tūsyōwan: station 14; Reg. No. 53894. 500 m. E. of Sankwakō: station 41; Reg. No. 53765.

Living: China Sea.

Genus **Niso** RISSO, 1826

Niso brunnea (SOWERBY), 1834

Pl. X (V), Fig. 28.

Niso brunnea. SOWERBY, Thes. Conch., Vol. 2, p. 801, Pl. 170, fig. 3, 1855: REEVE, Conch. Icon., Vol. 15, Pl. 1, fig. 9, 1866: DUNKER, Ind. Moll. Mar. Jap., p. 90, 1882: TRYON, Man. Conch., 1 Ser., Vol. 8, p. 288, Pl. 71, fig. 25, 1886: PILSBRY, Cat. Mar. Moll. Jap., p. 79, 1895.

1) FISCHER: Paläont. von Timor, Vol. 15, p. 51, Pl. 212, fig. 17, 1927.

Two well preserved specimens. A specimen measures 11.5 mm. in height, and 5 mm. in diameter; it still posses the original color markings, though faint. *N. interrupta* of YOKOYAMA¹⁾ (non SOWERBY) may perhaps belong to a certain varietal form of the present species; SOWERBY's type originally described was from Central America.

Type locality: China; Recent.

Fossil occurrence: Byōritu Beds.—550 m. SE. of Zyō-tūsyōwan: station 16; Reg. No. 53760. 1000 m. E. of Hakusyatōn: station 20; Reg. No. 53761.

Living: Kyūsyū. China.

Family **Pyramidellidae**

Genus **Pyramidella** LAMARCK, 1799

Subgenus **Pyramidella**, s. s.

Pyramidella (Pyramidella) teres (A. ADAMS), 1855

Pl. X (V), Fig. 27.

Pyramidella teres. TESCH, Paläont. von Timor, Vol. 8, p. 63, Pl. 82, fig. 196, 1920.

Obelicus teres. SOWERBY, Thes. Conch., Vol. 2, p. 807, Pl. 171, figs. 31, 32, 1855.

Pyramidella sulcata. REEVE, Conch. Icon., Vol. 15, Pl. 2, fig. 12, 1865: TRYON, Man. Conch., 1 Ser., Vol. 8, p. 301, Pl. 72, figs. 79-83, 1886: SUGITANI, Cat. Luchu Shells, p. 33, 1926.

Pyramidella (Longchaeus) sulcata. YOKOYAMA, Cat. Mar. Fresh-W. and Land Shells Jap., Min. Mus. Imp. Geol. Surv. Jap., p. 52, 1931.

Pyramidella (Longchaeus) sulcata. PILSBRY, Cat. Mar. Moll. Jap., p. 80, 1895.

Longchaeus sulcata. KURODA, Cat. Shell-bearing Moll. Amami-Ōshima, p. 79, No. 1024, 1928.

Obeliscus sulcatus. SOWERBY, Thes. Conch., Vol. 2, p. 807, Pl. 171, fig. 34, 1855.

A single specimen lacking its apex and outer lip. It is quite identical with figure 70 in TRYON's work, cited above, under the name of *P. prattii* BERNARDI which he considered to be a synonym.

Type localiy: Tropical Pacific; Recent.

Fossil occurrence: Byōritu Beds.—700 m. SW. of Kōkwan: station 23; Reg. No. 53796.

Living: Southern Kyūsyū and Ryūkyū. Pacific and Indian Oceans. Australia.

Geologic distribution: Post-Pliocene of Celebes; Pliocene of Timor.

Subgenus **Pharcidella** DALL, 1889

Pyramidella (Pharcidella ?) species indet.

A single small, slender specimen, 5 whorls preserved. Whorls nearly straight in lateral view, separated by well impressed sutures; surface marked by obsolete axial ribs as in some species of *Turbanilla*. It is perhaps a new species, but since its upper whorls as well as the aperture are fractured naming is left until better specimens are obtained. Preserved portion measures: height, 4 mm., diameter, 1.5 mm.

Fossil occurrence: Byōritu Beds.—The upper course of Sairyōkyō; Reg. No. 53984.

1) YOKOYAMA: Jour. Fac. Sci. Imp. Univ. Tōkyō, Sec. 2, Vol. 1, Pt. 9, p. 367, Pl. 42, fig. 5, 1926.

"Pyramidella" longicostifera, n. sp.

Pl. X (V), Figs. 41a, 41b.

Shell small, slender. Post-nuclear whorls many, flattened, distinctly shouldered at summit. Sculpture of longitudinal oblique ribs, 22 on each whorl. Interspaces nearly two times wider than ribs, with two revolving series of punctate grooves, the upper situated slightly above the middle, the lower close to lower suture and almost disappear in upper whorls. Periphery rounded, passing gradually into convex, smooth base. Aperture narrow, rather irregularly angular; outer lip thin, transversely lirate within; columella with two distinct oblique folds, of which the lower is slightly smaller, and more oblique than the upper. An imperfect specimen lacking its apical whorls was examined. The preserved portion consists of 7 whorls, 7 mm. in length, and 2.6 mm. in diameter.

The longitudinal ribs and transverse punctate grooves are the characteristic features of this species. No allied species of *Pyramidella* have been reported from Japan and other Oriental regions; thus the generic reference is somewhat questionable.

Fossil occurrence: Byōritu Beds.—1200 m. E. of Zyo-tūsyōwan: station 36; Reg. No. 53986.

Genus *Turbanilla* RISSO, 1826**Subgenus *Pyrgisculus* MONTEROSATO, 1884*****Turbanilla (Pyrgisculus) hanzawai*, n. sp.**

Pl. X (V), Figs. 32, 33.

Shell small, elongate conic; test thin. Nuclear whorls decollated or much worn. Post-nuclear whorls 5, distinctly sloping, shouldered above, gently convex below, marked by narrow, oblique axial ribs, of which about 30 occur upon last whorl, and 25 on penultimate whorl. Intercostal spaces generally much wider than ribs themselves, but sometimes they are nearly equal; these are crossed by subequal, rather regularly spaced raised threads numbering about 7, both on penultimate whorl and one above it. Periphery of last whorl well rounded, and passes gradually into base. Base convex, rather elongated, ornamented by a few, very fine spiral threads as well as the continuation of axial ribs, the latter are partly obsoleted. Aperture oval, slightly effuse anteriorly; posterior angle rather acute; outer lip thin and smooth within; columella slender and curved with indistinct fold; parietal wall covered with a thin callous deposit leaving a narrow umbilicus behind.

Below are some of the measurements (in mm.):

	1	2	3	4	5
Height	ca. 6.0	5.2	4.5	4.3	3.0
Diameter	2.2	2.0	2.0	2.3	1.3

This species somewhat resembles *T. (Pyrgisculus) candidissima* DALL and BARTSCH¹⁾ from Japan, from which, however, it differs in possession of fewer whorls and in the greater number of axial ribs which are oblique to the right.

Fossil occurrence: Byōritu Beds.—The upper course of Sairyōkyō; Reg. No. 53979.

1) DALL and BARTSCH: Proc. U.S. Nat. Mus., Vol. 30, p. 342, Pl. 17, fig. 3, 1906.

Subgenus **Turbanilla** s. s.**Turbanilla (Turbonilla) bosihoensis**, n. sp.

Pl. X (V), Figs. 37a, 37b.

Shell small, regularly conic; test rather solid. Nuclear whorls standing obliquely on edge at summit. Post-nuclear whorls 6, flattened or a little convex with 18 strong vertical axial ribs on body-whorl, separated by much narrower interspaces. Suture well marked, impressed. Periphery subangulate, base rounded, without basal threads or axial ribs. Aperture small, subovate in outline, Columella fractured at its lower portion.

A single specimen; height, 5 mm., diameter, 2 mm.

This species somewhat resembles *T. (Chemnitzia) sematana* YOKOYAMA¹⁾ from the Upper Musasino Formation of Kadusa, but differs from the latter in that the shell is flatter.

T. (Chemnitzia) acosmia DALL and BARTSCH²⁾ from Japanese waters, is larger in size with a greater number of axial ribs, and has less rapidly enlarging whorls.

Fossil occurrence: Byōritu Beds.—S. of Bōsiho: station 7; Reg. No. 37555.

Turbanilla (Turbonilla) byorituana, n. sp.

Pl. X (V), Figs. 36a, 36b.

Shell small, narrow and slender. Nuclear whorls rather large, high, helicoid, axis perpendicular to succeeding whorls. Post-nuclear whorls 8, flattened above, rounded at middle, separated by impressed sutures. Surface axially ribbed. Ribs rather strong, rounded, almost vertical or very slightly flexuous, 12 on body-whorl; interspaces nearly equal to ribs themselves in breadth, smooth. Periphery subangulate by obsolete carina. Base flat, smooth, having neither longitudinal ribs nor basal threads. Aperture small, ovately subquadangular. Columella with an indistinct fold at its insertion.

One specimen; height, 4.8 mm., diameter, 1 mm.

This species somewhat resembles *T. (Chemnitzia) dunkeri* CLESSIN figured by DALL and BARTSCH,³⁾ but is easily distinguished from that species by having much fewer axial ribs.

Fossil occurrence: Byōritu Beds.—On road S. of Bōsiho; Reg. No. 37563.

Subgenus **Strioturbonilla** SACCO, 1892**Turbanila (Strioturbonilla?)** species indet.

An elongate, small, imperfect specimen having rounded whorls. Surface marked by longitudinal ribs (about 15) crossed by rather coarse spiral threads; it is related to a certain species of *Strioturbonilla*. Preserved whorls are only three.

Fossil occurrence: Byōritu Beds.—Wangwa: station 18; Reg. No. 53985.

1) YOKOYAMA: Jour. Coll. Sci. Imp. Univ. Tōkyō, Vol. 44, Art. 1, p. 103, Pl. 4, fig. 41, 1922.

2) DALL and BARTSCH: Proc. U. S. Nat. Mus., Vol. 30, p. 339, Pl. 20, fig. 4, 1906.

3) DALL and BARTSCH: ibid., p. 336, Pl. 20, fig. 3, 1906.

Genus **Odostomia** FLEMING, 1828Subgenus **Odostomia** s. s.**Odostomia (Odostomia) limpida** DALL and BARTSCH, 1906

Odostomia (Odostomia) limpida. DALL and BARTSCH, Proc. U.S. Nat. Mus., Vol. 30, p. 364, Pl. 26, fig. 7, 1906.

Three specimens. Shell small, slender, elongate-conic in form with 5, almost flat post-nuclear whorls. Surface smooth and shining; sutures well impressed. Periphery of last whorl rather markedly angulate and passes into slightly convex base.

What Dr. YOKOYAMA figured as *O. limpida* from the Upper Musasino Formation of Simôsa¹⁾ differs from the type figure given by the above authors in having broader whorls with a less distinct peripheral angle. Height, 4.8 mm., diameter, 1.6 mm.

Type locality: Japan; Recent.

Fossil occurrence: Byôritu Beds.—700 m. E. of Hakusyatô: station 3; Reg. No. 53980. Wangwa: station 14; Reg. No. 53981. Wangwa: station 21; Reg. No. 53982.

Living: Central Honshû to Kyûshû.

Geologic distribution: Pleistocene of Honshû.

Odostomia (Odostomia) venustaeformis, n. sp.

Pl. X (V), Figs. 49a, 49b.

Shell resembling *O. venusta* YOKOYAMA in general features, small, elongate-conic, smooth and shining; test thin. Spire conical, rather short, about half the length of body-whorl. Nuclear whorls at least two in number, somewhat planorboid, about half a volution immersed, axis almost at right angles to post-nuclear whorls. Post-nuclear whorls 5, moderately convex, strongly shouldered at summit, area above shoulder very narrow. Suture well impressed. Periphery of last whorl rounded; base evenly convex. Aperture moderately large, longly oval in shape, acute behind, produced and rounded in front; outer lip evenly thin, broadly arcuate; columella strongly curved, provided with a strong fold at its insertion. Surface perfectly smooth except for fine growth lines which can be seen under a lens.

A single specimen; height, 4 mm., diameter, 1.8 mm.

This species differs from *O. venusta* YOKOYAMA²⁾ in the columellar fold being weaker and situated higher from the base of aperture.

Fossil occurrence: Byôritu Beds.—950 m. SW. of Taikwa: station 10; Reg. No. 53983.

1) YOKOYAMA: Jour. Coll. Sci. Imp. Univ. Tôkyô, Vol. 44, Art. 1, p. 96, Pl. 41, fig. 1, 1922.

2) YOKOYAMA: ibid., p. 97, Pl. 4, fig. 30, 1922.

- Fig. 34. *Cellana toreuma* (REEVE), from Sikô; Byōritu Beds.
- Fig. 35. *Xenophora exuta* (REEVE), from Sikô; Byōritu Beds.
- Figs. 36a, b. *Turbonilla (Turbonilla) byorituanus* n. sp., holotype, from S. of Bôsiho, station 7 (HANZAWA); Byōritu Beds. $\times 2$.
- Figs. 37a, b. *Turbonilla (Turbonilla) bosihensis* n. sp., holotype, from S. of Bôsiho, station 7, (HANZAWA); Byōritu Beds. $\times 2$.
- Figs. 38a, b, c. "Cyclostrema" eburneiforme n. sp., holotype, from 700 m. NE. of Nanseizan, station 19 (ANDÔ); Byōritu Beds. $\times 2$.
- Figs. 39a, b. *Heliacus dorsuosus* (HINDS), from Wangwa, station 5 (ANDÔ); Byōritu Beds.
- Figs. 40a, b. "Cyclostrema" sulcatum A. ADAMS, from Nanseizan, station 11 (ANDÔ); Byōritu Beds. $\times 2$.
- Figs. 41a, b. "Pyramidella" longicostifera n. sp., holotype, from 1200 m. E. of Zyô-tûsyôwan, station 36 (ANDÔ); Byōritu Beds. $\times 2$.
- Figs. 42a, b, c. *Solariella formosana* n. sp., holotype, from 1000 m. SE. of Hakusyatón, station 32 (ANDÔ); Byōritu Beds. $\times 2$.
- Figs. 43a, b, c. *Liotia hanzawai* n. sp., holotype, from S. of Bôsiho, station 7 (HANZAWA); Byōritu Beds. $\times 2$.
- Figs. 44a, b. *Liotia hanzawai* n. sp., paratype, from the same locality as those shown in figs. 42a, b, c; Byōritu Beds. $\times 2$.
- Figs. 45a, b, c. *Teinostoma andoi* n. sp., holotype, from 700 m. SW. of Kôkwan, station 23 (ANDÔ); Byōritu Beds. $\times 2$.
- Fig. 46. *Trochus (Pyramidea) niloticus* LINNAEUS, from Kontei; Raised Coral Reef. $\times \frac{1}{2}$.
- Figs. 47a, b. *Melanella tortuosa* (ADAMS and REEVE), from 500 m. E. of Sankwakô, station 41 (ANDÔ); Byōritu Beds.
- Figs. 48a, b. *Melanella candida* (MARRATT), from 300 m. E. of Sankwakô, station 39 (ANDÔ); Byōritu Beds.
- Figs. 49a, b. *Odostomia (Odostomia) venustaeformis* n. sp., holotype, from 950 m. SW. of Tai-kwa, station 10 (ANDÔ); Byōritu Beds. $\times 2$.
- Figs. 50a, b. *Fissuridea crucifera* (PILSBRY), from Sikô; Byōritu Beds.
