MAIN CONTENTS

Reference Dose for Chronic Oral Exposure (RfD)

0244

beta-Hexachlorocyclohexane (beta-HCH); CASRN 319-85-7

Health assessment information on a chemical substance is included in IRIS only after a comprehensive review of chronic toxicity data by U.S. EPA health scientists from several Program Offices and the Office of Research and Development. The summaries presented in Sections I and II represent a consensus reached in the review process. Background information and explanations of the methods used to derive the values given in IRIS are provided in the Background Documents.

STATUS OF DATA FOR beta-HCH

File First On-Line 09/30/1987

Category (section)	Status	Last Revised
Oral RfD Assessment (I.A.)	no data	
Inhalation RfC Assessment (I.B.)	no data	
Carcinogenicity Assessment (II.)	on-line	07/01/1993

I. Chronic Health Hazard Assessments for Noncarcinogenic Effects

_I.A. Reference Dose for Chronic Oral Exposure (RfD)

Substance Name -- beta-Hexachlorocyclohexane (beta-HCH) CASRN -- 319-85-7

II. Carcinogenicity Assessment for Lifetime Exposure

Substance Name -- beta-Hexachlorocyclohexane (beta-HCH) CASRN -- 319-85-7
Last Revised -- 07/01/1993

Section II provides information on three aspects of the carcinogenic assessment for the substance in question; the weight-of-evidence judgment of the likelihood that the substance is a human carcinogen, and quantitative estimates of risk from oral exposure and from inhalation exposure. The quantitative risk estimates are presented in three ways. The slope factor is the result of application of a low-dose extrapolation procedure and is presented as the risk per (mg/kg)/day. The unit risk is the quantitative estimate in terms of either risk per ug/L drinking water or risk per ug/cu.m air breathed. The third form in which risk is presented is a drinking water or air concentration providing cancer risks of 1 in 10,000, 1 in 100,000 or 1 in 1,000,000. The rationale and methods used to develop the carcinogenicity information in IRIS are described in The Risk Assessment Guidelines of 1986 (EPA/600/8-87/045) and in the IRIS Background Document. IRIS summaries developed since the publication of EPA's more recent Proposed Guidelines for Carcinogen Risk Assessment also utilize those Guidelines where indicated (Federal Register 61(79):17960-18011, April 23, 1996). Users are referred to Section I of this IRIS file for information on long-term toxic effects other than carcinogenicity.

_II.A. Evidence for Human Carcinogenicity

__II.A.1. Weight-of-Evidence Characterization

Classification -- C; possible human carcinogen

Basis -- Increases in benign liver tumors in CF1 mice fed beta-HCH

II.A.2. Human Carcinogenicity Data

Inadequate. One case report of a Japanese sanitation employee with acute leukemia was associated with occupational exposure to HCH and DDT (Hoshizaki et al., 1969).

II.A.3. Animal Carcinogenicity Data

Positive or marginally positive tumorigenic responses, characterized as benign hepatomas or hepatocellular carcinomas, have been observed in two strains of mice. The studies are limited in that small numbers of animals were used, no doseresponse data are available, not all of the animals were examined histologically, or the duration of exposure was less than lifetime.

Thorpe and Walker (1973) fed 30 each male and female CF1 mice dietary beta-HCH at 200 ppm for 110 weeks. This resulted in 12% mortality of males and 25% of females during the first 3 months. A significantly increased incidence of liver tumors was observed in treated males and females.

No statistically significant evidence of increased tumor incidence as a consequence of beta-HCH feeding was seen in several small (5-20/group) studies with male and female dd mice fed 0-600 ppm for 24-32 weeks (Nagasaki et al., 1972; Hanada et al. 1973; Ito et al., 1973) or in male Wistar rats (Ito et al., 1975; Fitzhugh et al., 1950) fed 0-1000 ppm for >72 weeks.

Goto et al. (1972) maintained male ICR-JCL mice on a diet containing 600 ppm beta-HCH for 26 weeks. Relative liver weight was increased in the treated animals, and there was histologic evidence of benign neoplasms at an unspecified incidence.

II.A.4. Supporting Data for Carcinogenicity

No data on genetic toxicology of beta-HCH are available.

Back to top

_II.B. Quantitative Estimate of Carcinogenic Risk from Oral Exposure

__II.B.1. Summary of Risk Estimates

Oral Slope Factor -- 1.8E+0 per (mg/kg)/day

Drinking Water Unit Risk -- 5.3E-5 per (ug/L)

Extrapolation Method -- Linearized multistage procedure, extra risk

Drinking Water Concentrations at Specified Risk Levels:

Risk Level	Concentration
E-4 (1 in 10,000)	2E+0 ug/L
E-5 (1 in 100,000)	2E-1 ug/L
E-6 (1 in 1,000,000)	2E-2 ug/L

__II.B.2. Dose-Response Data (Carcinogenicity, Oral Exposure)

Tumor Type -- hepatic nodules and hepatocellular carcinomas Test Animals -- Mouse/CF1, male Route -- diet Reference -- Thorpe and Walker, 1973

Administered Dose (ppm)	Human Equivalent Dose (mg/kg)/day	Tumor Incidence
0	0	11/45
200	1.96	22/24

II.B.3. Additional Comments (Carcinogenicity, Oral Exposure)

beta-nexactionocyclonexane (beta-nch) (CASKIN 519-65-7), IKIS, Environmental Flote Fage	ane (beta-HCH) (CASRN 319-85-7), IRIS, Environmental Prote Page 4 of 7
---	--

Animal TWA dose (26 mg/kg/day) was calculated based on exposure and lifetime of
110 weeks (reported). This unit risk should not be used if water concentration
exceeds 200 ug/L, since above this concentration the slope factor may differ from
that stated

II.B.4. Discussion of Confidence (Carcinogenicity, Oral Exposure)

The risk estimate was calculated on data from only one non-zero dose group. Relatively few animals and limited number of doses were used. A slope factor based on the data of Nagasaki et al. (1972) was calculated to be 4.7 per (mg/kg)/day and one based on Ito et al. (1973) to be 6.3 per (mg/kg)/day. These are generally supportive of the slope factor derived from Thorpe and Walker, which is the only available chronic study.

II.C. Quantitative Estimate of Carcinogenic Risk from Inhalation Exposure

II.C.1. Summary of Risk Estimates

Inhalation Unit Risk -- 5.3E-4 per (ug/cu.m)

Extrapolation Method -- Linearized multistage procedure, extra risk

Air Concentrations at Specified Risk Levels:

Risk Level	Concentration
E-4 (1 in 10,000)	2E-1 ug/cu.m
E-5 (1 in 100,000)	2E-2 ug/cu.m
E-6 (1 in 1.000.000)	2E-3 ua/cu.m

__II.C.2. Dose-Response Data for Carcinogenicity, Inhalation Exposure

The inhalation risk estimates were calculated from the oral data presented in II.B.2.

__II.C.3. Additional Comments (Carcinogenicity, Inhalation Exposure)

The unit risk should not be used if the air concentration exceeds 20 ug/cu.m, since above this concentration the unit risk may not be appropriate.

__II.C.4. Discussion of Confidence (Carcinogenicity, Inhalation Exposure)

See II.B.4.
