FISHERIES RESEARCH BOARD OF CANADA

Technical Reports

FRB Technical Reports are research documents that are of sufficient importance to be preserved, but which for some reason are not suitable for scientific publication. No restriction is placed on subject matter and the series should reflect the broad research interest of FRB.

These Reports can be cited in publications, but care should be taken to indicate their manuscript status to prevent erroneous implications being drawn from data and analysis that may be preliminary. Some of the material in these Reports will eventually appear in scientific publication.

Inquiries concerning any particular Report should be directed to the issuing FRB establishment which is indicated on the title page.

A Laboratory Manual for the  
Identification of British Columbia Marine Zooplankton

by  
John Fulton

INTRODUCTION

The systematics of the zooplankton of the Northeastern Pacific coastal waters has been investigated by various workers since the pioneer work of Herdman, Thompson and Scott in 1898. The present report is an attempt to summarize the work to date and to sort out some of the synonymies and the errors which have occurred in the past. This work has been done in conjunction with an extensive study of the biological oceanography of the Strait of Georgia.

The Strait of Georgia biological oceanography program began in January 1965 and is continuing. Thus far, some 1200 samples have been taken with a modified Hensen net hauled vertically, and some 1300 samples have been taken with high speed Miller nets towed horizontally. The nets were constructed from "Nitex" mesh with 350  $\mu$  openings. Quantitative results of the plankton sampling have been reported by Bishop et al (1966), Stephens et al (1947) and Fulton et al (1967).

At the beginning of the program it was necessary to sort and identify all the species of zooplankton collected. To facilitate the work, a reference collection of identified zooplankton species was established. Although the bulk of the specimens in the present collection were captured in regular plankton nets, a few specimens were captured with other types of gear, notably mid-water trawls. All of the specimens in the present collection

have been taken in the Strait of Georgia, Saanich Inlet, or Juan de Fuca Strait, since 1964, by personnel of the Fisheries Research Board. In addition, species found in British Columbia coastal waters by earlier workers are included in the lists.

For some species, it has been possible to include a few brief semi-quantitative remarks on their ecology. The following terms have been used throughout:

X - Species observed in the present collection.

A - Species observed by previous workers but not in the present collection.

Surface	Samples taken from less than 50 m
Mid-depth	Samples taken from deeper than 50 m but less than 200 m
Deep	Samples taken from deeper than 200 m
Rare	Less than one organism per 25 m <sup>3</sup>
Common	1-25 organisms per 25 m <sup>3</sup>
Abundant	More than 25 organisms per 25 m <sup>3</sup>
Very Abundant	More than 25% of the biomass

It is to be noted that the above terminology refers to the distribution and abundance most frequently observed and does not seek to delimit or define the absolute limits of a species.

The bibliography has been selected, wherever possible, from systematic work done in British Columbia coastal waters. Where there is no local reference or taxonomic description of a species in the present collection, the author has included references to taxonomic descriptions from other parts of the world. References which the author found most useful for identifications are marked with an asterisk.

Artificial keys based on gross features of whole specimens are included for some of the more difficult groups for easy recognition. Measurements of the life history stages of some of the common species of copepods and the length-weight relationships for dominant organisms are taken from specimens preserved in 10% formalin-seawater solutions. It should be noted that some organisms shrink as much as 10% when preserved.

The Strait of Georgia is a rectangular basin connected to the ocean by Discovery Passage to the northwest and by Juan de Fuca Strait to the south. Surface salinity is mainly influenced by runoff water from the Fraser River and land drainage from the coastal mountains. Euryhaline plankters, and occasionally fresh water plankters, occur in runoff water from the Fraser River and in some shallow bays and inlets. Oceanic plankton is carried into the basin when deep water is formed in channels of the San Juan Islands, mainly during the late summer and autumn.

Biological Oceanography of Georgia Strait has been previously reported by Cameron and Mounce (1922), Lucas and Hutchinson (1927), and Hutchinson (1928). The Physical Oceanography is given by Waldichuk (1957). Complete references to the oceanography and fisheries of the Strait of Georgia are included.

#### Acknowledgement

The author is grateful to his colleagues and especially to Mr. R.J. LeBrasseur for discussion and assistance in the preparation of this manuscript.

CTENOPHORA

Ctenophores are the most important invertebrates in the euphotic zone of the Strait of Georgia from late June until mid-October. Mayer (1912) discusses their biology and taxonomy.

Pleurobrachia pileus (Müller, 1776)

<u>Pleurobrachia bachei</u>	A. Agassiz, 1865 Wailes, 1929
<u>Pleurobrachia rhododactyla</u>	A. Agassiz, 1865
<u>Pleurobrachia pileus</u>	Mayer, 1912 Wailes, 1929 *Liley, 1958

Remarks: X; Surface; Very abundant; Summer and Fall.

Bolinopsis infundibulum (Müller, 1776)

<u>Bolinopsis infundibulum</u>	Mayer, 1912
<u>Bolinopsis microptera</u>	Wailes, 1929
<u>Bolinopsis infundibulum</u>	*Liley, 1958

Remarks: X; Surface; Abundant; This is a fragile species which disintegrates in a plankton net. Bolinopsis was observed in the shallow water of Departure Bay and Long Harbour in the spring of 1967.

Beroe cucumis Fabricius, 1730

<u>Idyia roseola</u>	A. Agassiz, 1865
<u>Beroe ovata</u>	Mayer, 1912
<u>Beroe cucumis</u>	Mayer, 1912
<u>Beroe abyssiicola</u>	Mortensen, 1927
<u>Beroe abyssorum</u>	Wailes, 1929
<u>Beroe abyssiicola</u>	Berkeley, 1930
<u>Beroe cucumis</u>	*Liley, 1958

Remarks: X; Deep; Rare; All year. There seems to be no trace in the literature of Wailes' species B. abyssorum. Specimens from the deep water of Strait of Georgia resemble Mayer's description of B. cucumis.

University J. Coll. Sci., 36 (5): 1-14.

1. The first part of the document discusses the importance of maintaining accurate records of all transactions.

2. It is essential for the company to have a clear understanding of its financial position at all times.

3. This involves regular audits and reconciliations to ensure that the books are balanced.

4. In addition,

5. it is important to have a strong internal control system in place.

6. This helps to prevent fraud and errors, and ensures that the company's assets are protected.

7. Finally,

8. it is crucial to have a clear understanding of the company's tax obligations.

9. This includes keeping up to date with changes in tax laws and regulations.

10. The second part of the document discusses the importance of having a clear understanding of the company's legal obligations.

11. This involves regular consultations with legal counsel to ensure that the company is in compliance with all applicable laws.

12. In addition,

13. it is important to have a clear understanding of the company's contractual obligations.

14. This includes reviewing all contracts carefully before signing them.

CLADOCERA

Aside from Wailes' list (1929), there are no records of Cladocera from this coast. The size of the mesh openings of the nets (350  $\mu$ ) used in the present program may allow Cladocera to pass through. Apstein (1901) or Dakin and Colefax (1940) give a good account of their systematics. The Cladocera taken in the present programme were not positively identified.

OSTRACODA

The benthic and littoral ostracods of the Vancouver Island region are described by Smith (1952). McHardy (1964) describes the ecology of the planktonic ostracods of Indian Arm. Only the planktonic forms are listed here.

Conchoecia elegans Sars, 1865

Conchoecia elegans Smith, 1952  
\*McHardy, 1964

Remarks: X; Mid-depths and deep; Abundant.

Conchoecia alata minor McHardy, 1964

Conchoecia alata minor \*McHardy, 1964

Remarks: X; Mid-depth and deep; Common. Type species from "British Columbia inlets".

Conchoecia spirostris Claus, 1891

Conchoecia spirostris Smith, 1952

Remarks: A

COPEPODA

Campbell (1929) was the first person to make an intensive study of the copepod systematics of this area. Cameron (1957) lists and discusses the distribution of copepods in the Queen Charlotte Island region; Légaré (1957) does the same for the Strait of Georgia region.

For some time now there has been discussion in the literature as to the status of such species as Calanus finmarchicus, C. glacialis and C. helgolandicus. Brodsky (1948) treats them as separate species while some authors - Fleminger (1967)- suggest they may be variations of the same species caused by environmental factors. Shan (1962) compares the morphology of three Indian Arm species with their North Atlantic counterparts. This report accepts the North Pacific names for those species under question.

Brodsky's work (1950) is the most useful reference for calanoid copepods of the North Pacific and has been followed here unless otherwise noted.

The author wishes to thank Dr. T. S. Park of the Woods Hole Oceanographic Institute for his help in identifying difficult species.

COPEPODA

Order: Calanoida

<u>Calanus pacificus</u>	Brodsky, 1948
<u>Calanus finmarchicus</u>	McMurrich, 1916 Campbell, 1929 Davis, 1949 Cameron, 1957 Légaré, 1957 Brodsky, 1948 *Brodsky, 1950
<u>Calanus sp.</u>	Shan, 1962

Remarks: X; Surface and mid-depth; Abundant all year; For a discussion of the taxonomic status of this species see Shan (1962).

Calanus plumchrus Marukawa, 1921

<u>Calanus</u> sp.	Sato, 1913
<u>Calanus plumchrus</u>	Marukawa, 1921

Campbell, 1929  
Davis, 1949  
\*Brodsky, 1950  
Cameron, 1957  
Légaré, 1957

Remarks: X; Surface & Mid-depth; Abundant.

Pseudocalanus minutus (Krøyer, 1849)

Pseudocalanus elongatus McMurrich, 1916  
Campbell, 1929  
\*Brodsky, 1950  
Pseudocalanus minutus Davis, 1949  
Tanaka, 1956  
Cameron, 1957  
Légaré, 1957  
Frolander, 1962

Remarks: X; Surface & Mid-depth; Abundant. For a discussion of the taxonomic status of Pseudocalanus see Frolander (1962).

Microcalanus pusillus (Sars, 1903)

Microcalanus pusillus Campbell, 1929  
Brodsky, 1950  
Légaré, 1957

Remarks: X; Surface; Abundant.

Clausocalanus acuiicornis (Dana, 1849)

Clausocalanus acuiicornis \*Brodsky, 1950  
Cameron, 1957

Remarks: A.

Spinocalanus brevicaudatus Brodsky, 1950

Spinocalanus brevicaudatus Brodsky, 1950

Remarks: X; Deep; Common in Pendrell Sound.

Aetidius armatus Boeck, 1872

Aetidius armatus

Campbell, 1929  
Davis, 1949  
\*Brodsky, 1950  
Cameron, 1957  
Légaré, 1957

Remarks: X; Mid-depth & Deep; Common.

Aetidius pacificus Brodsky, 1950

Aetidius pacificus

\*Brodsky, 1950

Remarks: X; Deep; Rare.

Bradyvidius saanichi Park, 1965

Bradyvidius saanichi

Park, 1965

Remarks: X; Mid-depth to Deep; Common. Type locality: Saanich Inlet. This species is common in Saanich Inlet. It rarely occurs in the Strait of Georgia.

Chiridius gracilis Farran, 1908

Chiridius gracilis

\*Vervoort, 1952  
Cameron, 1957

Remarks: X; Deep; Common.

Pseudoaetideus armatus (Boeck, 1873)

Chiridius armatus

Wailes, 1929

Pseudoaetideus armatus

\*Brodsky, 1950

Remarks: A; This species was listed by Wailes (1929), but it seems likely that Wailes, working in the same Laboratory as Campbell, mistakenly listed Chiridius armatus instead of Chiridius tenuispinis which was on Campbell's list. C. tenuispinis occurred on Clemens' lists (1933) which Wailes helped to compile, but C. armatus did not.

Gaidius columbiae Park, 1967

Chiridius tenuispinis Campbell, 1929 ?

Légaré, 1957

Gaidius columbiae

Park, 1967

Remarks: X; Deep; Abundant; Type locality: Strait of Georgia.  
Campbell notes that her specimens of C. tenuispinis had shorter spines than was described at that time. It seems likely that she was looking at G. columbiae.

Gaidius pungens Giesbrecht, 1895

Gaidius pungens

Campbell, 1929

Key to the Adult Copepoda - Strait of Georgia

This Key is designed for the identification of adult Copepods which have reached their largest size. In the adults the segments of the urosome are generally well defined; there are usually 3-4 segments in the female and 4-5 segments in the male. The first segment in the urosome of the female is usually swollen. Stage V Copepods may be identified using these Keys bearing in mind the above differences.

THE UNIVERSITY OF CHICAGO

It is the policy of the University of Chicago to provide a liberal education for all students. The University is committed to the highest standards of academic excellence and to the development of the individual. The University is also committed to the advancement of the human race and to the betterment of the world.

Copepods 3.2 to 5.5 total length

- |  |                                  |            |
|--|----------------------------------|------------|
| (4) prominent black photophore on the side of the body               | <u>Pleuromamma quadrangulata</u> | 3.3-5.0 mm |
| (5) one of the seta of the urosome enlarged and longer than the body | <u>Heterorhabdus tanneri</u>     | 3.8-4.2    |

Posterior corners of prosome angular or produced as spines -

- |                                     |                           |         |
|-------------------------------------|---------------------------|---------|
| (6) spines pointed and symmetrical  | <u>Gaidius pungens</u>    | 3.0-3.5 |
| (7) spines rounded and asymmetrical | <u>Candacia columbiae</u> | 3.5-4.1 |

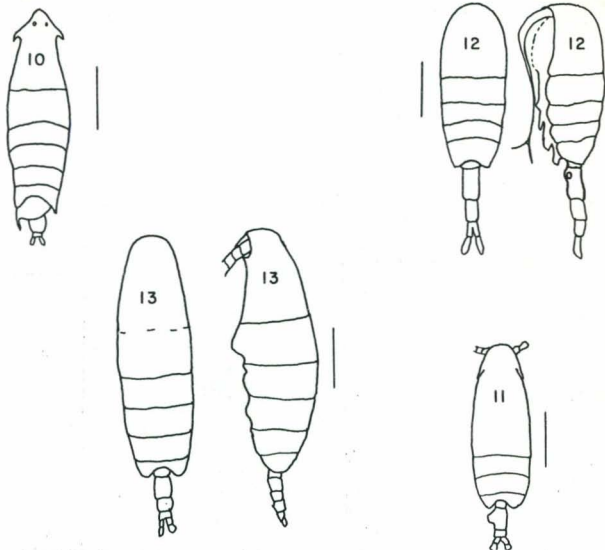

FIG. 1. Pupa of *Chironomus tentans* (left), *C. tentans* (middle), and *C. tentans* (right). Scale bars represent 0.5 mm.

1950. *Journal of the Royal Microscopical Society*, 70, 1-12.

Copepods 3.2 to 5.5 mm total length (cont'd)

Posterior corners of prosome angular or produced as spines (cont'd) -

- |      |  |                                  |            |
|------|--|----------------------------------|------------|
| (9)  | spines variable, sometimes rounded and sometimes pointed | <u>Gaidius variabilis</u>        | 4.0-4.1 mm |
| (10) | prominent eyes, lateral edges of head produced as hooks  | <u>Epilabidocera amphitrites</u> | 3.2-4.0    |

Posterior corners of prosome not angular or produced as spines -

- |      |  |                            |         |
|------|--|----------------------------|---------|
| (11) | urosome asymmetrical                         | <u>Euchirella pulchra</u>  | 3.4-4.0 |
| (12) | urosome more than 1/3 the length of the body | <u>Metridia okhotensis</u> | 4.1-4.5 |
| (13) | urosome less than 1/3 the length of the body | <u>Calanus plumchrus</u>   | 4.0-5.4 |

The body is divided into three parts, the head, the thorax and the abdomen. The head is small and rounded, with two small antennae. The thorax is the largest part, and is divided into three segments. The abdomen is the smallest part, and is also divided into three segments. The legs are short and thick, and are attached to the thorax. The drawings show the general shape and structure of the organism, but do not show any fine details.

The first drawing (top left) shows a larva with a rounded head and a segmented body. The second drawing (top middle) shows a larva with a more elongated head and a segmented body. The third drawing (top right) shows a larva with a rounded head and a segmented body. The fourth drawing (bottom left) shows a larva with a rounded head and a segmented body. The fifth drawing (bottom right) shows a larva with a rounded head and a segmented body.

Copepods 2.0 to 3.1 mm total length

Posterior corners of prosome angular or produced as spines -

- (14) posterior corners angular, urosome  
with lateral projections

Gaidia bipinnata

2.2-2.5 mm

- (15) spines blunt or rounded

Gaidia columbiae

3.0-3.2

Spines acute -

- (16) cephalic spine  
(17) spines extend less than 1/2 the  
length of the genital segment  
(18) genital segment nearly round  
(19) genital segment rectangular  
(6) spines curving inwards towards  
genital segment

Gaetanus intermedius

2.1

Chiridius gracilis

2.4-4.8

Aetidius pacificus

2.2-3.0

Bradyidius saanichi

2.3-2.6

Gaidia pungens

3.0-3.5

Copepods 2.0 to 3.1 mm total length (cont'd) -

Posterior corners of prosome not angular or produced -

- |      |  |                                 |            |
|------|--|---------------------------------|------------|
| (20) | 1st antennae as long or longer than body   | <u>Calanus pacificus</u>        | 2.5-3.5 mm |
| (21) | 1st antennae shorter than the body, body robust, urosome relatively short; urosome swollen when viewed laterally | <u>Euchirella rostrata</u>      | 2.9-3.1    |
| (22) | urosome not swollen  | <u>Scolecithricella ovata</u>   | 2.2        |
| (23) | body not particularly robust; urosome medium (less than 1/3 body length)   | <u>Racovitzanus antarcticus</u> | 2.1-2.4    |
| (24) | urosome long (more than 1/3 body length)   | <u>Metridia lucens</u>          | 2.5-2.9    |

*[Faint, illegible text, likely bleed-through from the reverse side of the page]*

Copepods  $\leq$  2 mm total length

Posterior corners of prosome angular or produced as spines or wings -

(25)	body robust, urosome relatively short	<u>Tharybis fultoni</u>	1.2-1.3 mm
(26)	posterior corners produced as symmetrical spines	<u>Aetidius armatus</u>	1.3-2.0
(27)	posterior corners produced as asymmetrical spines, urosome asymmetrical	<u>Centropages abdominalis</u>	1.6-2.1
(28)	posterior corners produced as symmetrical rounded spines, urosome asymmetrical	<u>Tortanus discaudatus</u>	1.4-2.3
(29)	posterior corners produced as "wings", last segment of urosome covered with spinules	<u>Eurytemora americana</u>	1.6-1.8
(30)	posterior corners produced as "wings", last segment of urosome smooth	<u>Eurytemora hirundoides</u>	1.0-1.6

Copepods  $\leq$  2 mm total length (cont'd)

Posterior corners of prosome not angular or produced as spines;  
 urosome of three segments -

- (31) last segment of metasome rounded,  
 with two short stiff setae  
 (32) last segment of metasome rounded,  
 with 3-5 marginal spinules

Acartia longiremis

0.98-1.25 mm

Acartia clausi

0.91-1.22

Urosome of four segments -

- (33) body robust, urosome relatively  
 short  
 (34) total length less than 1 mm  
 (35) 5th leg present but reduced,  
 urosome relatively thick  
 (36) no 5th leg, genital segment swollen

Scolecithricella minor

1.25-1.4

Microcalanus pygmaeus  
pusillus

0.7-0.9

Paracalanus parvus

0.7-1.3

Pseudocalanus minutus

1.2-2.0

Copepods  $\leq$  2 mm total length (cont'd)

Posterior corners of prosome not angular or produced as spines;  
 urosome of four segments -

- (37) segments 5-15 of 1st antennae wider than long
- (38) 5th leg present but reduced, urosome relatively slender
- (39) no 5th leg, 1st antennae longer than body

<u>Scaphocalanus echinatus</u>	1.7-2.0 mm
<u>Scaphocalanus brevicornis</u>	1.9-2.1
<u>Spinocalanus brevicaudatus</u>	1.6-1.8

Urosome of five segments or more; 5th leg on 1st segment of urosome -

- (40) head pointed when viewed dorsally
- (41) head rounded
- (42) 1st antennae short
- (43) head provided with cuticular lenses

<u>Oithona spirostris</u>	0.7-1.2
<u>Oithona helgolandica</u>	0.7-0.96
<u>Oncaea borealis</u>	0.7-1.4
<u>Corycaeus anglicus</u>	0.8-1.1

(continued from page 1)

The following are the names of the insects which have been identified in the collection.

- 1. Chrysomelidae

Table 2

Size of Some Copepod Nauplii Preserved in Formalin.

Species	Stage	Length in mm						For a detailed account see
		I	II	III	IV	V	VI	
<u>Acartia longiremis</u>		0.12	0.14	0.16	0.19	0.23	0.27	Oberg, 1906
<u>Oithona spinirostris</u>		0.13	0.15	0.17	0.20	0.24	0.27	Gibbons & Ogilvie, 1933
<u>Pseudocalanus minutus</u>		0.18	0.18	0.26	0.33	0.38	0.44	Ogilvie, 1953
<u>Metridia lucens</u>		0.19	0.21	0.27	0.34	0.41	0.46	Ogilvie, 1953
<u>Calanus finmarchicus</u>		0.22	0.27	0.40	0.48	0.55	0.61	Ogilvie, 1953
<u>Calanus plumchrus</u>		0.29	0.30	0.35	0.46	0.56	0.70	Campbell, 1934
<u>Eucalanus bungii bungii</u>		0.22	0.30	0.49	0.66	0.82	0.97	Johnson, 1937
<u>Euchaeta japonica</u>		0.59	0.64	0.66	0.69	0.80	0.87	Campbell, 1934

Remarks: Measurements are taken from preserved samples. Specimens may shrink as much as 10% during preservation. Our experience suggests that there is little or no size difference between North Pacific and North Atlantic representatives of the same species.

Table 1

Estimated values of the parameters of the model

Parameter	Estimate	Standard Error	t-ratio	Probability >  t
$\alpha_1$	0.12	0.02	6.0	0.0001
$\alpha_2$	0.05	0.01	5.0	0.0001
$\alpha_3$	0.02	0.005	4.0	0.0001
$\alpha_4$	0.01	0.002	5.0	0.0001
$\alpha_5$	0.005	0.001	5.0	0.0001
$\alpha_6$	0.002	0.0005	4.0	0.0001
$\alpha_7$	0.001	0.0002	5.0	0.0001
$\alpha_8$	0.0005	0.0001	5.0	0.0001
$\alpha_9$	0.0002	0.00005	4.0	0.0001
$\alpha_{10}$	0.0001	0.00002	5.0	0.0001

The results of the regression analysis are presented in Table 1. The coefficients of the model are all positive and statistically significant at the 1% level. The constant term is also positive and significant. The adjusted R-squared value is 0.95, indicating a very good fit of the model to the data.

Figure 4. Relationship of wet weight to dry weight of fresh Copepods in the Strait of Georgia.

Figure 1: A line graph showing the relationship between DBA Weight (mg) on the x-axis and Mel Weight (mg) on the y-axis. The x-axis ranges from 0 to 6, and the y-axis ranges from 0 to 20. A straight line passes through the origin (0,0) and the point (6, 20).

Figure 5. Relationship of Copepod dry weight to prosome length.

INDEX OF REFRACTION IN GLASS WITH VARYING CATIONS

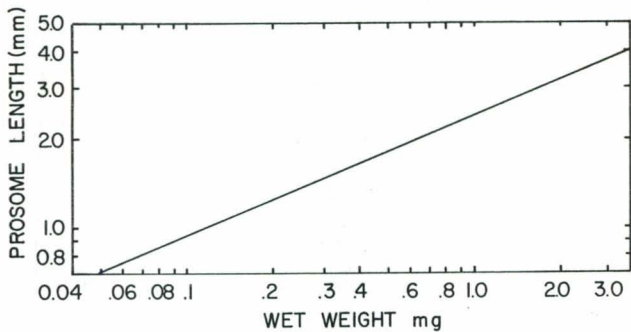

Figure 6. Relationship of Copepod wet weight to prosome length  
Saanich Inlet, June-July, 1966.

Figure 1. A linear relationship between weight and absorbance is observed for the standard solution of the compound.

Figure 7. Relationship of Copepod total length to prosome length.

Figure 7. Relationship of Covered caral length to prosome length.

1944

1. The first part of the report deals with the general situation of the country in 1944. It is a very interesting and detailed account of the political and economic conditions of the time. The author has done a great deal of research and has gathered a wealth of material which is presented in a clear and concise manner.

2. The second part of the report deals with the specific details of the country's development. It is a very thorough and comprehensive study of the country's progress in various fields. The author has done a great deal of research and has gathered a wealth of material which is presented in a clear and concise manner.

3. The third part of the report deals with the country's future prospects. It is a very interesting and detailed account of the country's potential for growth and development. The author has done a great deal of research and has gathered a wealth of material which is presented in a clear and concise manner.

4. The fourth part of the report deals with the country's current situation. It is a very thorough and comprehensive study of the country's progress in various fields. The author has done a great deal of research and has gathered a wealth of material which is presented in a clear and concise manner.

5. The fifth part of the report deals with the country's future prospects. It is a very interesting and detailed account of the country's potential for growth and development. The author has done a great deal of research and has gathered a wealth of material which is presented in a clear and concise manner.

MYSIDACEA

The mysids of the area have been described by Tattersall (1933) and Banner (1948). More recent revisions are given by Tattersall (1951) and Banner (1954). Although there are only four species in the present collection, all the species recorded from this area are listed, since it is anticipated that more species will be captured when other types of gear are used. The author wishes to thank Mr. O.D. Kennedy, of the Pacific Oceanographic Group, Biological Station, Nanaimo, for identifying the specimens in the present collection.

CUMACEA

Although the Cumacea are considered to be benthic animals, adults of both sexes are found in surface tows during the spring and early summer. Of the seventeen species recorded from the Vancouver Island Region by Hart (1930), three were found in the present collection. The author wishes to thank J.F.L. Hart of the British Columbia Provincial Museum, Victoria, B.C., for identifying the specimens in the present collection.

AMPHIPODA

Wailles' list (1931) was based on specimens which he sent to Shoemaker for identification. Shoemaker himself did not publish any of his findings. The first systematic account of the amphipods of British Columbia coastal waters was Thorsteinson (1941). Bowman (1953) deals with the Hyperid Amphipods off the California coast. Some North Pacific species not dealt with by Bowman are described by Hurley (1956, 1963). Hart (1961) gives records of three of the larger Hyperids found near Victoria. The systematics of the Gammeriids of the North western Pacific is covered extensively by Gur'janova (1951).

In the present collection there are twelve species of amphipod, two species which are likely new to science.

Hyperia medusarum (Muller, 1776)

Hyperia mudusarum

Wailles, 1931 (Shoemaker)  
\*Bowman, 1953  
Dunbar, 1963

Remarks: A

Hyperia spinigera Bovallius, 1889

Hyperia galba  
Hyperia spinigera

Wailles, 1931 (Shoemaker)  
Thorsteinson, 1941  
\*Bowman, 1953  
Hurley, 1956  
Dunbar, 1963

Remarks: A; Length 7.5 mm collected from a medusae near Friday Harbour, (Thorsteinson, 1941).

Hyperia latreillei Milne-Edwards, 1830

Hyperia latreillei \*Bowman, 1953

Remarks: X; Deep; Rare. See Bowman (1953) for a discussion of the taxonomic status of the genus.

Parathemisto pacifica Stebbing, 1888

Themisto abyssorum Shoemaker, 1930 (specimens from Nanaimo)  
Parathemisto abyssorum Thorsteinson, 1941  
Parathemisto japonica Bowman, 1953  
Hurley, 1956  
Parathemisto pacifica \*Bowman, 1960

Remarks: X; Surface & Mid-depth; Abundant. For a discussion of synonymy and distribution of this species see Bowman (1960).

Hyperoche medusarum Krøyer, 1838

Hyperoche leutkeni ? Thorsteinson, 1941  
Hyperoche medusarum \*Bowman, 1953  
Hurley, 1956  
Dunbar, 1963

Remarks: X; Surface; Common; Summer. This species seems to be associated with the coelenterate Phialidium gregarium.

Hyperoche mediterranea Senna, 1906

Hyperoche leutkeni ? Thorsteinson, 1941  
Hyperoche mediterranea \*Bowman, 1953

Remarks: A; From Thorsteinson's description it is impossible to distinguish between H. medusarum, H. mediterranea and H. leutkeni.

Euprimno abyssalis Bowman, 1953

Primno macropa (?) Thorsteinson, 1941  
Euprimno abyssalis \*Bowman, 1953

Remarks: X; Mid-depth and deep; Common. According to Bowman, Thorsteinson's description and figures of the female Primno macropa were undoubtedly based on Euprimno abyssalis. He goes on to say that it is impossible to ascertain from her account whether or not she also had Euprimno macropa. Both species as described by Bowman occur in the present collection but E. abyssalis is the most common.

Euprimno macropa Guerin, 1836

Euprimno macropus Wailes, 1931 (Shoemaker)  
Primno macropa ? Thorsteinson, 1941  
Euprimno macropa \*Bowman, 1953  
Hurley, 1956

Remarks: X; Mid-depth; Rare. The validity of the record of this species in B.C. Coastal waters was under question (Bowman, 1953). However, this species occurs in the present collection.

Phronima sedentaria (Forskal, 1775)

Phronima sedentaria Thorsteinson, 1941 (Gulf of Alaska)  
Hurley, 1956  
Hart, 1961  
\*Shih & Dunbar, 1963

Remarks: X; Mid-depth; Rare. Hart's record (1961) is of two specimens found intertidally in the vicinity of Victoria. The one specimen in the present collection was captured in a trawl at a depth of 64 meters in the waters of Juan de Fuca Strait off Victoria.

Cystisoma pellucidum (Willemoes-Suhm, 1873)

Cystisoma pellucidum Thorsteinson, 1941 (Gulf of Alaska)  
Hurley, 1956  
\*Hart, 1961

Remarks: A; Length, 67 mm; Found on the beach near Victoria.

Cystisoma fabricii Stebbing, 1888

Cystisoma fabricii Hurley, 1956  
\*Hart, 1961

Remarks: A; Length 45 mm; Found on the beach near Victoria.

Scina borealis (Sars, 1882)

Scina borealis Thorsteinson, 1941  
\*Hurley, 1956

Remarks: X; Deep; Common.

Cyphocaris challengerii Stebbing, 1888

Cyphocaris challengerii Wailes, 1931 (Shoemaker)  
Thorsteinson, 1941  
Cyphocaris kincaidi Thorsteinson, 1941  
Cyphocaris challengerii Bernard, 1958  
\*Gur'janova, 1951  
Hurley, 1963

Remarks: X; Mid-depth & deep; Abundant.

Orchomenella obtusa (Sars, 1890)

Orchomenella affinis ? Holmes, 1908  
Orchomenella obtusa Gur'janova, 1951  
Bernard, 1958  
\*Hurley, 1963

Remarks: X; Mid-depth & deep; Common. This species is common in Saanich Inlet and Burke Channel. See Hurley (1963) for a discussion of the genera on the coast of North America.

Calliopius laeviusculus (Krøyer, 1838)

Calliopius laeviusculus Wailes, 1931 (Shoemaker)  
Gur'janova, 1951  
Bernard, 1958

Remarks: X; Surface; Common; Spring.

Melphidippa sp.

Melphidippa (?) goesi Wailes, 1931 (Shoemaker)

Remarks: X; Deep; Rare. The specimens in the present collection most nearly resemble M. goesi but there seem to be sufficient differences to establish a new species. This amphipod has been consistently found at one station in Haro Strait.

Stilipes distincta Holmes, 1909

Stilipes distincta ? Holmes, 1909

Remarks: X; Deep; Rare. The specimens in the present collection belong to the genus as described by Holmes but with sufficient difference to be a new species.

Pelagic Amphipods from "off the British Columbia Coast" identified by Shoemaker and listed by Wailes (1931) which do not occur in the present collection.

<u>Ampelisca macrocephala</u>	Lillj.	<u>Nicippe tumida</u>	(Bruzelius)
<u>Eurystheus tenuicornis</u>	(Holmes)	<u>Opisa eschrichti</u>	Krøyer
<u>Eusirus leptocarpus</u>	Sars ?	<u>Oxycephalus clausi</u>	Bov.
<u>Harpina affinis</u>	Holmes ?	<u>Pontogenia inermis</u>	Krøyer
<u>Harpina oculata</u>	Holmes	<u>Rhachotropis inflata</u>	(Sars)
<u>Maera dubio</u>	Calman	<u>Rhachotropis helleri</u>	(Boeck)
<u>Melita palmata</u>	(Mont. ?)	<u>Westwoodilla caecula</u>	Bate
<u>Monoculodes carinatus</u>	Bate		

Below are listed the full and partial names of the  
persons who have been identified as being in the  
company of the subject at the time of the  
incident.

Full Name	Address	City	State
James Earl Ray	1000 1/2 North 1st Street	St. Louis	Missouri
John Edgar Hoover	1600 Pennsylvania Avenue	Washington	D.C.
Richard M. Daley	100 North Dearborn Street	Chicago	Illinois
Robert Kennedy	100 North Dearborn Street	Chicago	Illinois
Lyndon B. Johnson	100 North Dearborn Street	Chicago	Illinois
Hubert H. Humphrey	100 North Dearborn Street	Chicago	Illinois

Key to the Pelagic Amphipods - Strait of Georgia

- 1) Compound eye usually covering the entire head region. Head segment usually as large or larger than first body segment.
- (A) Longer than 7 mm, body pigmented or opaque
- (a) fifth leg prominently chelate  
adult longer than 10 mm  
adult shorter than 10 mm
- (b) fifth leg not chelate, first and second legs subchelate
- (B) Longer than 7 mm, body transparent
- (a) fifth leg prominently chelate
- (b) legs not chelate
- (C) Smaller than 7 mm, body pigmented or opaque
- (a) fifth leg prominently chelate
- (b) fifth leg not chelate; legs 5-7 longer than 3 and 4
- (c) fifth leg not chelate; legs 5-7 not longer than 3 and 4; first 2 legs chelate
- 2) Compound eyes not covering the entire head region.
- (A) Head segment as large or larger than first body segment.
- (a) longer than 15 mm, head bulbous
- (b) shorter than 15 mm, vaulted forehead when viewed laterally
- (c) antennae projecting like "horns" when viewed dorsally
- Euprimno sp.  
E. abyssalis  
E. macropa
- Hyperia
- Euprimno
- Cystisoma
- Euprimno
- Parathemisto
- Hyperoche
- Stilipes
- Cyphocaris
- Scina

1. The following information is required for the purpose of the audit:

(a) A statement of the nature and extent of the audit, including the scope of the audit and the objectives to be achieved.

(b) A statement of the responsibilities of the auditor, including the duties and obligations of the auditor.

(c) A statement of the responsibilities of the management, including the duties and obligations of the management.

(d) A statement of the responsibilities of the shareholders, including the duties and obligations of the shareholders.

(e) A statement of the responsibilities of the creditors, including the duties and obligations of the creditors.

(f) A statement of the responsibilities of the employees, including the duties and obligations of the employees.

(g) A statement of the responsibilities of the public, including the duties and obligations of the public.

(h) A statement of the responsibilities of the government, including the duties and obligations of the government.

(i) A statement of the responsibilities of the community, including the duties and obligations of the community.

(j) A statement of the responsibilities of the environment, including the duties and obligations of the environment.

(k) A statement of the responsibilities of the future generations, including the duties and obligations of the future generations.

(l) A statement of the responsibilities of the world, including the duties and obligations of the world.

(m) A statement of the responsibilities of the universe, including the duties and obligations of the universe.

(n) A statement of the responsibilities of the cosmos, including the duties and obligations of the cosmos.

(o) A statement of the responsibilities of the galaxy, including the duties and obligations of the galaxy.

(p) A statement of the responsibilities of the universe, including the duties and obligations of the universe.

(q) A statement of the responsibilities of the world, including the duties and obligations of the world.

(r) A statement of the responsibilities of the universe, including the duties and obligations of the universe.

(B) Head segment smaller than first body segment

(a) first two legs chelate, last five segments  
of body produced as dorsal spines

Melphidippa

(b) first two legs chelate, no dorsal spines

Calliopijs

(c) first two legs subchelate, body usually  
bright orange

Orchomenella

The following is a list of the names of the persons who have been  
 appointed to the various positions in the office of the  
 Secretary of the State, and the date of their appointment.  
 The names are given in alphabetical order, and the date of  
 appointment is given in parentheses.

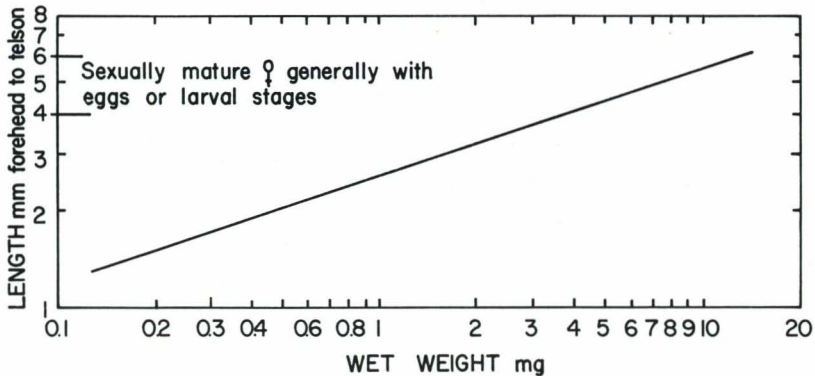

Figure 8. Relationship of length to wet weight for Parathemisto from Saanich Inlet, June-July, 1966.

1. The concentration of the solution is 0.1 M.  
 2. The volume of the solution is 100 ml.  
 3. The weight of the solution is 100 g.

DECAPODA

The systematics of the decapods of the coast of North America has been done by Rathbun (1899, 1902, 1904), Benedict (1903) and Schmitt (1921).

There are five species of decapods in the present collection. Two of them, Pasiphaea pacifica and Sergestes similis, are pelagic throughout their life cycle. The other three were identified from late juvenile forms that were sufficiently developed for positive identification.

Pasiphaea pacifica Rathbun, 1902

Pasiphaea pacifica Rathbun, 1902  
\*Rathbun, 1904  
Schmitt, 1921  
Butler, 1964  
Kennedy et al, 1966

Remarks: X; Deep; Rare; Pelagic throughout life history.

Sergestes similis Hansen, 1903

Sergestes similis \*Schmitt, 1921  
Butler, 1964  
Barracough & Herlinveaux, 1965  
Percy & Forss, 1966

Remarks: X; Mid-depth; Rare; Specimens in the present collection were captured in a large pelagic trawl.

Spirontocaris sica Rathbun, 1902

Spirontocaris sica Rathbun, 1902  
\*Rathbun, 1904  
Butler, 1964  
Barracough & Herlinveaux, 1965

Remarks: A; Reported as present in a scattering layer in Saanich Inlet by Barracough & Herlinveaux (1965).

Crago communis (Rathbun, 1899)

Crangon communis

\*Rathbun, 1904

Crago communis

Schmitt, 1921

Butler, 1955

Remarks: X; Deep; Rare; Juveniles only in the present collection.

Munida quadrispina Benedict, 1903

Munida quadrispina

\*Benedict, 1903

Rathbun, 1904

Schmitt, 1921

Remarks: X; Mid-depths; Common; Type locality: Off Cape Beal, Vancouver Island, 66 fm. Juveniles are common in the Strait of Georgia and in Saanich Inlet during the fall.

\*Lea, 1955  
Hida, 1957  
Bieri, 1959  
LeBrasseur, 1959  
Alvarino, 1965

Remarks: A; One specimen recorded by Lea from Bute Inlet.

Sagitta zetestios Fowler, 1905

Sagitta planktonis

\*Lea, 1955

Hida, 1957

Biere, 1959

Sagitta zetestios

Alvarino, 1965

Remarks: A; One specimen recorded by LeBrasseur from Bute Inlet off British Columbia West Coast in summer months.

Eukrohnia hamata Mobius, 1875

Eukrohnia hamata

\*Lea, 1955

Hida, 1957

Légaré, 1957

Bieri, 1959

LeBrasseur, 1959

Alvarino, 1965

Remarks: X; Deep; Rare; Spring and summer.

Table 6

Key to the Chaetognatha - Strait of Georgia

- 1) Anal opening anterior to tail septum - Sagitta scrippsae
- 2) Anal opening at tail septum
  - A) No pigment in eyes - Eukrohnia hamata
  - B) Eyes pigmented
    - (a) collarette extending from head to ventral ganglion - Sagitta planktonis
    - (b) no collarette
      - (i) hooks 5-7 Sagitta decipiens
      - (ii) hooks 8-13 Sagitta elegans

PTEROPODA

There has been no work done on the pelagic mollusca of this area.

McGowan (1963) discusses the distribution and variations of Limacina in the open ocean. Hida (1957) discusses distribution of some pteropods in the north central Pacific in relation to the water masses.

TUNICATA

The systematics of the pelagic Tunicates of British Columbia waters have never been reported. The Thaliacea listed by Wailes (1929) are endemic to oceanic waters, likely of transitional waters rather than of subarctic waters. They are included here only because they were listed by Wailes. The Larvacea of the North Pacific are discussed by Tokioka (1960) and the Thaliacea are discussed by Tokioka and Berner (1958).

(A) Larvacea

Oikopleura dioica Fol, 1872
