Ednie Flower Bulbs

Amaryllis

Hippeastrum

Introduction to Amaryllis Hippeastrum

The genus Amaryllis belongs to the family Amaryllidaceae which is a large group containing perennial herbs grown from bulbs, rhizomes or fibrous roots. The family originated in tropical to subtropical areas. The best known flower bulbs are Amaryllis, Galanthus (Snowdrops), Hippeastrum and Narcissus, while Eucharis (Lily) is lesser known. The better known rhizomes are Agapanthus, Clivia, and Nerine.

Although the Amaryllis offered in this catalog (both from Northern and Southern Hemispheres) are in reality Hippeastrums, the name Amaryllis is most common.

The major difference between Amaryllis and Hippeastrum is in the stem of the flower.

Amaryllis have solid stems, while Hippeastrums have hollow stems.

Because both originate in warmer climates, they do well (and mature faster) when grown warm.

Amaryllis can be grown nearly Year-Round. The new Southern Hemisphere crop arrives starting in late Summer followed by the Northern Hemisphere bulbs in late Fall.

After the proper programming (precooling) at various temperatures, the bulbs are available for shipping. The first bulbs ready to ship (and plant) are the Southern Hemisphere Amaryllis which can be grown to bloom starting the middle of November (including the US Thanksgiving). These bulbs can easily be used for subsequent holidays including Mother's Day and each week in between.

The Northern Hemisphere bulbs arrive later and receive their programming to be ready for shipping (planting) in time to bloom for Christmas and beyond. Later plantings (after January) do not need programming and are stored cold to prevent premature sprouting.

What is the difference between Southern and Northern Hemisphere Bulbs?

SOUTHERN HEMISPHERE BULBS

Are grown and produced outside. Although various countries do this, we promote Peruvian grown bulbs.

NORTHERN HEMISPHERE BULBS

Are grown (the majority) and produced in greenhouses, mainly in The Netherlands.

Diseases and insects are not really a major concern as long as the grower adheres to the following:

- 1. GOOD AIR CIRCULATION** prevents storage mold and in worse cases mold due to negligent handling: *Fusarium*.
- 2. HANDLE WITH CARE** (like all bulbs). They are living organisms, NOT ROCKS or soccer balls. They cry "silently" by showing red stripes on the flower stalks, causing quality reduction.

Bulb Pack per Crate

Size	# bulbs
26-28 cm.	60
28-30 cm.	50
30-32 cm.	40
32-34 cm.	35
34-36 cm.	25
36-38 cm.	20
40-up cm.	15

What to expect from the various size bulbs?

As with all bulbs, larger sizes produce more flowers than smaller ones. Larger Amaryllis bulbs produce more stems of flowers than the smaller ones. Depending on the variety, each stem produces 4 or more flowers. Single flowers generally produce more flowers than doubles.

UPON RECEIPT of BULBS

- Upon arrival, check the bulbs carefully.
- The bulbs should be dry. If there is moisture from shipping, use fans to move air through the crates. The roots should not dry out too much which can prevent new root growth.
- If the bulbs are not planted immediately, they should be stored at 45°F. (7°C) to prevent extreme sprouting, except the white varieties, especially DENVER, which should be stored at 55°F. (13°C).
- Humidity in cold storage should be 65%-70%.
- For planting information and further details, see pages 10 and 11.

PLANTING BULBS

Soil should be porous with a pH of 6 - 7. If possible, do not use bark or fresh compost or use a limited amount. Use clean pots with drainage holes. Plant the bulbs with one-third of the bulb above the soil. Tamp down the potting mixture to make sure the bulb sits firmly in the pot. This is especially important as the plants can get top-heavy when in full bloom.

Water soil well after planting. Once roots are established, keep the soil moist. Too much water reduces root development.

RULE of THUMB (... or rule of finger)

The pot should be larger than the bulb; one finger should fit comfortably between the bulb and pot.

For step-by step weekly recommendations, see pages 10 and 11 of this catalog.

How far apart must bulbs be planted either in crates or ground beds?

There should be a minimum of 1 inch (2.5 cm.) between the bulbs. For crates (depending on size bulb used, it will be approximately 12 (size 28-30) or 10 (size 30-32).

STARLIGHT	Pure white petals have feathered red edges and red veins and markings towards center.		STARLIGHT
STRAWBERRIES & CREAM	White petals have strawberry red lines and shading over most of the petals. Green throats.		STRAWBERRIES & CREAM

Ednie Flower Bulbs

Amaryllis

for Cut Flowers

Amaryllis are becoming more popular as cut flowers; they last equally as long or longer than when used as potted plants.

They are being used in floral arrangements, especially for the holidays and also as simple (bride's) bouquets.

The growing procedure is not different from pot culture, except that the emphasis on pot culture is to keep the plants short(er). For cut flowers the longer stem length is beneficial as is with all cut flowers.

Although most varieties listed in this catalog can be used for cut flowers, each variety has "C / P" listed, meaning they can either be used for both applications or if "P" only, meaning they are not suggested for Cut Flowers. In general, the Dutch varieties will do better than the Peruvian varieties for cut.

A few tips for optimum cut flowers:

- Use clean water for the flowers and add a few drops bleach (chlorine) or Hydro-Peroxide to the water.
- Cut the flower stem at an angle of about 1 inch (2.5 cm.) immediately before placing the flowers in the water container. As always, use a sharp knife!
- Remove extra leaves, (although they can be used in arrangements).
- Remove any ethylene producing items to improve vase life.
- In order to prevent curled-up stems, use tape (if necessary).
- Follow the instructions on page 11 for when to cut stems and at what temperature to store.
