

BRYOZOA

By I. VIGELAND

Zoological Museum, University of Oslo, Norway

Abstract

The survey collections contained 114 species which are discussed; 95 of these are determined to species level, and the remaining 19 have been placed in their appropriate genera. Appended is a list of the 300 species with their localities recorded by MacGillivray in his monograph; 153 of these are recorded from Port Phillip Heads, and 78 of them were taken on the present Survey.

Introduction

The Bryozoa of the original Port Phillip Survey set up by the Royal Society of Victoria in July 1888 were included in P. H. MacGillivray's monograph of the Victoria Bryozoa published in McCoy's *Prodromus of Zoology* 1879-89. Port Phillip Heads is a locality listed for 153 of the 300 species discussed, and is the only one for 125 of these species; 81 species are listed for Queenscliff, 42 for Portland and 22 for Warrnambool, W. Victoria.

The present Survey Bryozoan collections have been worked in detail, and it has been possible to identify 95 species, while a further 19 have been identified to genus level only. These are discussed in the present paper. A table of the species discussed by MacGillivray in McCoy's *Prodromus of Zoology* is included together with their authors, dates, currently accepted nomenclature, and localities as listed in the *Prodromus*. The 78 species collected in this survey are marked with an asterisk.

Last century Bryozoologists proposed several new families, genera and species. However, Professor Raymond C. Osburn 1952: 284) frankly admitted that where to place several species still puzzled him greatly. He quoted Shakespeare, 'They fool me to the top of my bent', and continued '*The Lichenopores* have always been "a thorn in the flesh" to those who have attempted to work with them.' Likewise several times in this study the question arose as to whether one genus is congeneric with another. In several species a great deal of varia-

tion in most of the characters has been recorded. One species may resemble another species from the coast of Europe, so transfer by ship cannot be excluded.

It is necessary that the Bryozoan collections in the National Museum of Victoria be revised. They have been put in order recently both systematically and alphabetically, but not revised.
