

Tree Planting and Management

Breadth of Opportunity

The spread of the Commission's responsibilities over some 148 countries in temperate, mediterranean, tropical and desert climates provides wonderful opportunities to experiment with nature's wealth of tree species.

We are particularly fortunate in being able to grow many interesting and beautiful trees and we will explain how we manage them and what splendid specimens they can make.

Why Plant Trees?

Trees are planted for a variety of reasons: their amenity value, leaf shape and size, flowers, fruit, habit, form, bark, landscape value, shelter or screening, backcloth planting, shade, noise and pollution reduction, soil stabilisation and to encourage wild life. Often we plant trees solely for their amenity value. That is, the beauty of the tree itself. This can be from the leaves such as those in *Robinia pseudoacacia 'Frisia'*, the flowers in the tropical tree *Tabebuia* or *Albizia*, the crimson stems of the sealing wax palm (*Cyrtostachys renda*), or the fruit as in *Magnolia grandiflora*.

above: Sealing wax palms at Taiping War Cemetery, Malaysia with insert of the fruit of *Magnolia grandiflora*

Selection

Generally speaking the form of the tree is very often a major contributing factor and this, together with a sound knowledge of the situation in which the tree is to be grown, guides the decision to the best choice of species.

Exposure is a major limitation to the free choice of species in northern Europe especially and trees such as *Sorbus*, *Betula*, *Tilia*, *Fraxinus*, *Crataegus* and fastigate yews play an important role in any landscape design where the elements are seriously against a wider selection. The variety of trees we grow in all corners of the world is extensive. A list of trees grown in our five main Areas is provided at the end of this article.

left: The tropical tree *Tabebuia*

below: Flowers of the tropical tree *Albizia julibrissin*

Planting Design

Scale is of major importance when considering the type of tree to plant in a cemetery. The layout of the borders and plots will, to a greater extent, dictate where trees can be planted as they are never planted in headstone or pedestal borders. Avenues offer a splendid opportunity for adventurous schemes as can be seen by the planting of Cypresses in **Florence War Cemetery, Italy** compared to the broad-leaved trees grown previously.

A fine avenue of fastigate hornbeam (*Carpinus betulus 'Fastigiata'*) blankets the hill at **Villers Bretonneux Military Cemetery, France** to mimic lines of marching soldiers. These trees have grown well on the shallow chalk soils of the cemetery. In the tropics palms can make attractive avenue trees. Roystonea elata palms at **Taiping War Cemetery, Malaysia**,

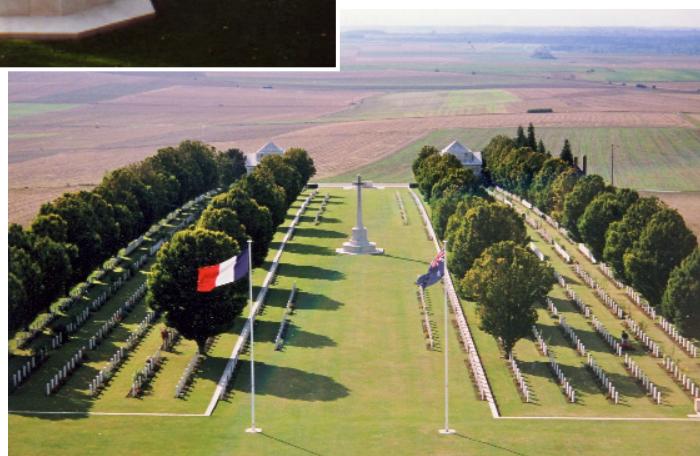

lead to the Cross of Sacrifice and contrast with the dense jungle beyond. When a choice of tree has been made they are planted at final spacings rather than planting more to thin later. The exception is with shelter belts where a quicker effect may be needed.

Choice of Stock

The deciduous trees planted in northern Europe are generally planted bare rooted. In warmer climates, only container grown plants are available because in many cases trees do not have a dormant season. Evergreens are nearly always planted as container grown stock because of their dislike of root disturbance.

Root balling is used for trees which are not easy to move bare rooted, and this includes extra heavy standards which are moved with a substantial amount of soil attached to the roots. Conifers and evergreens over 1.5 metres are successfully moved as root balled specimens and can be sprayed with an anti-dessicant the day before lifting.

Tree Planting Specification

Timing

November to March is the best time to plant bare rooted stock in northern Europe. Container grown trees are planted October to April in northern Europe and at the onset of rains in warmer regions. Where water is available, container grown trees can practically be planted the year round but the cooler season (November to February) is preferred in the Mediterranean and Middle East. Evergreens are best planted in October or November and March or April in Europe.

Tim Sandall, The Garden

Positioning the tree

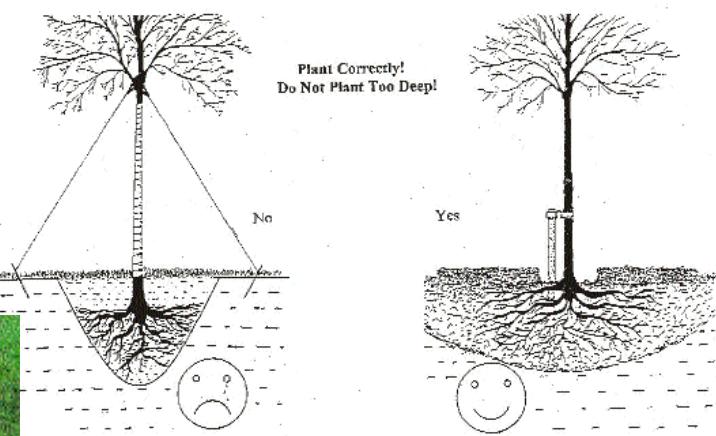

The Planting Site

The illustration (right) and photographs show clearly the importance of preparing a planting site, a square hole in a circle of 1.5m in diameter is prepared to a depth of 30cm, (wide rather than deep holes result in better tree establishment).

Tim Sandall, The Garden

Positioning the tree

The incorrect and correct method of planting and staking a tree

The sides of the hole are broken to aid root penetration and the soil returned to the pit allowing space for the tree. Organic matter is generally not added.

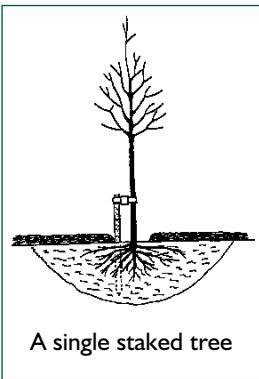

Positioning an irrigation tube

Planting

The tree is placed upright in the centre of the tree pit and the roots spread out. Roots of container grown trees are teased out and encouraged to grow outwards. It is critical that the tree is planted at the correct depth: planting too deep is a major cause of losses and the root collar should be level with the surrounding ground (see above). The backfill is firmed around the roots gently shaking the tree to settle the soil as the tree is heeled in. During this process, mycorrhizal fungi, in the form of a powder, are added and mixed with the backfill around the roots. If the site has poor, dry soil conditions a water retaining polymer is well mixed with the backfill, but is only added if it can be regularly 'recharged' with water during dry periods. It is also good practice to place an irrigation tube around the roots where water can be provided in times of drought where no irrigation systems are installed.

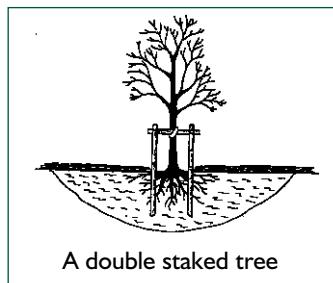

Tree Staking and Mulching

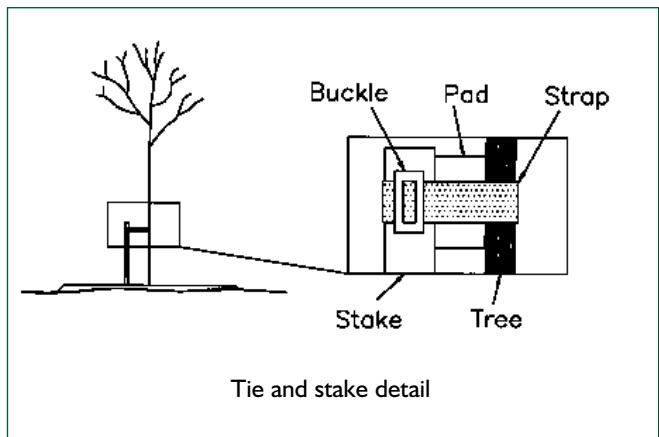

A single staked tree

While the tree is being positioned in the middle of the hole, a short, round stake, 10cm diameter, no more than one third the height of tree above the ground and 75cm below, is placed on the windward side of the tree. The stake is there to support and stabilise the roots as regeneration of the finer, nutrient seeking root hairs takes place. The short stake allows the stem to sway with the wind which increases stem diameter. In the early years of growth it is important that weeds do not compete with the tree's roots for moisture and nutrients and therefore a thick (8cm) layer of bark mulch is placed around the base of the tree keeping the stem clear to avoid suffocation. This may need topping up in future years.

Where more support is required and a larger tree is being planted, crossbar staking is used. All stakes are generally removed the second spring after planting.

A double staked tree

Tie and stake detail

Initial pruning?

Apart from removing any dead or crossing branches, which should not be necessary if good quality stock has been purchased, the tree is not pruned. Older practices have often recommended that branches are removed to compensate for the loss of roots after transplanting. Modern arboricultural practice no longer recommends this.

Reducing the number of buds and consequently leaves on a transplanted tree removes starch and sugars and other photosynthetic by-products which would otherwise be translocated to the roots and aid root regeneration.

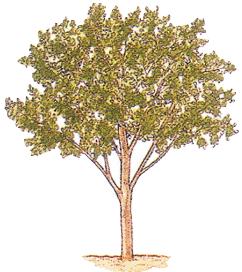

above: An avenue of clipped *Ficus retusa* at Alexandria (Hadra) War Cemetery, Egypt

left: Staking a large tree

Forms and Uses of Trees

The five main forms of trees described are the branched-head standard such as the *Prunus avium* 'Plena' (below left), multi-stemmed such as the *Arbutus andrachne* on the Gallipoli peninsular (below right), weeping standard such as these weeping willows (centre left), fastigiate trees such as the yews, over the page, and central-leader standard such as this tulip tree (*Liriodendron tulipifera* - centre right). Specific forms such as these can be produced by careful pruning, but the choice of tree often dictates the ultimate form that will result.

Branched-head standard

Prunus avium 'Plena' at
Ovillers Military Cemetery, France

Arbutus andrachne at
7th Field Ambulance Cemetery, Gallipoli

Multi-stemmed tree

Weeping willows at
Lijssenthoek Military Cemetery, Belgium

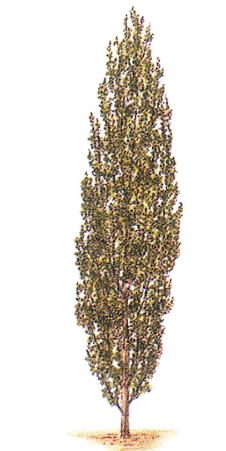

Tulip tree at
Ypres Reservoir Cemetery, Belgium

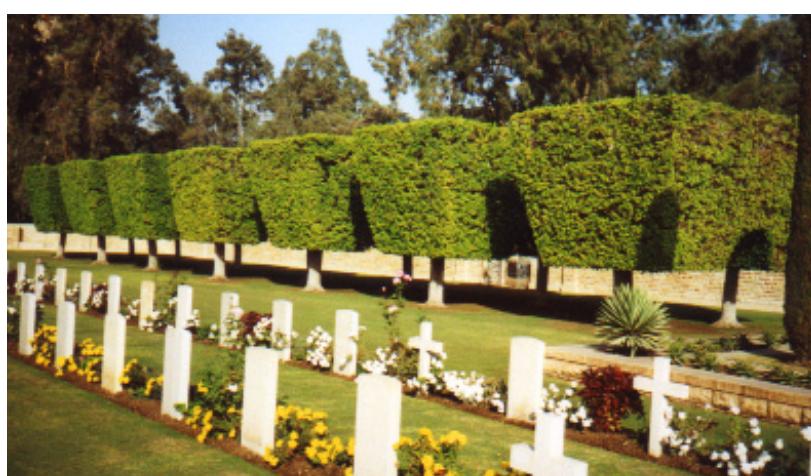

Trees can be grown into a variety of shapes and forms, some of which are shown here. **Topiary** is the art of clipping trees into architectural or geometrical forms as illustrated by the *Ficus retusa* at **Alexandria (Hadra) War Memorial Cemetery, Egypt**, previous page, where there is insufficient space to grow a full sized tree, or at **Arras Road Cemetery, France**, over the page, where *Carpinus betulus* has been clipped into cones. The effect is particularly striking in mid-winter. At **Heliopolis War Cemetery, Egypt**, (left) *Ficus retusa* trees have been shaped into a covered walk: an interesting type of formal training.

Weeping standard

Dorling Kindersley Limited

Formative Pruning

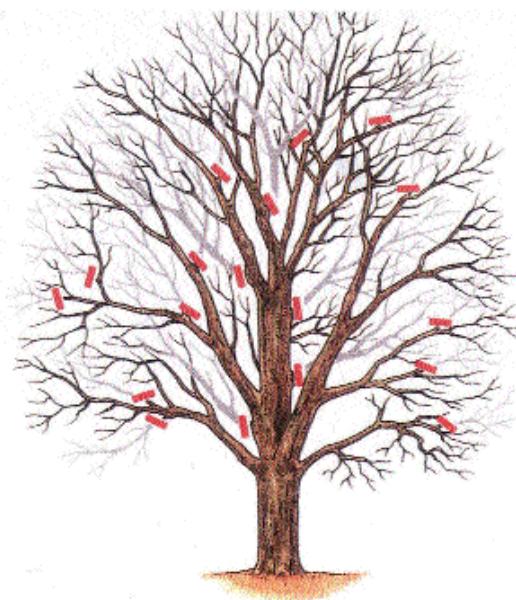

Prior to such specific pruning it is important to ensure that in the early stages of growth any double-leaders are removed if the form required is a tree with a central-leader. Omitting to do so can create a weak junction and failure of one of the codominant branches in later years.

Carpinus betulus at Arras Road Cemetery, France

Pruning Mature Trees

Pruning established trees is a professional job which is performed by qualified arborists within the Commonwealth War Graves Commission. There are numerous operations which can be carried out to trees: three of the most important are described. **Crown lifting** is an operation which removes the lower branches of a tree allowing more light to penetrate beneath the canopy or to allow the passage of vehicles or pedestrians. Raising the crown can also open up a vista or view beneath the

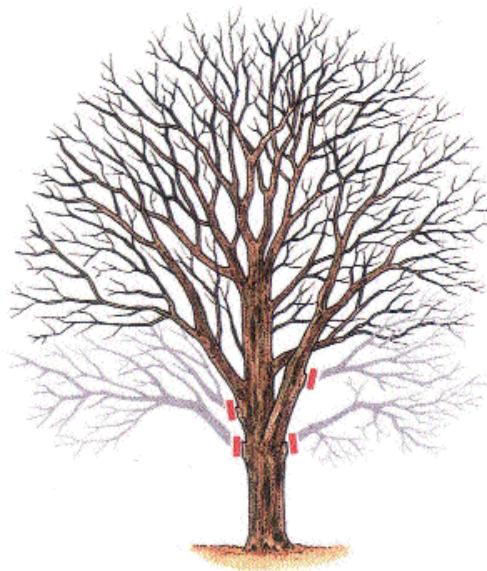

Crown Thinning and Reduction

These operations are often combined to reduce the size of a tree and allow more light and air to penetrate through the crown, reducing wind resistance and stress from wide-spreading, heavy branches

By permission of Dorling Kindersley Limited

tree which may have previously been obscured. **Crown reduction** reduces the size of the crown by either removing the tips of most of the branches all around the sides of the tree or all over the canopy. It is performed to reduce the spread of the tree, often in restricted

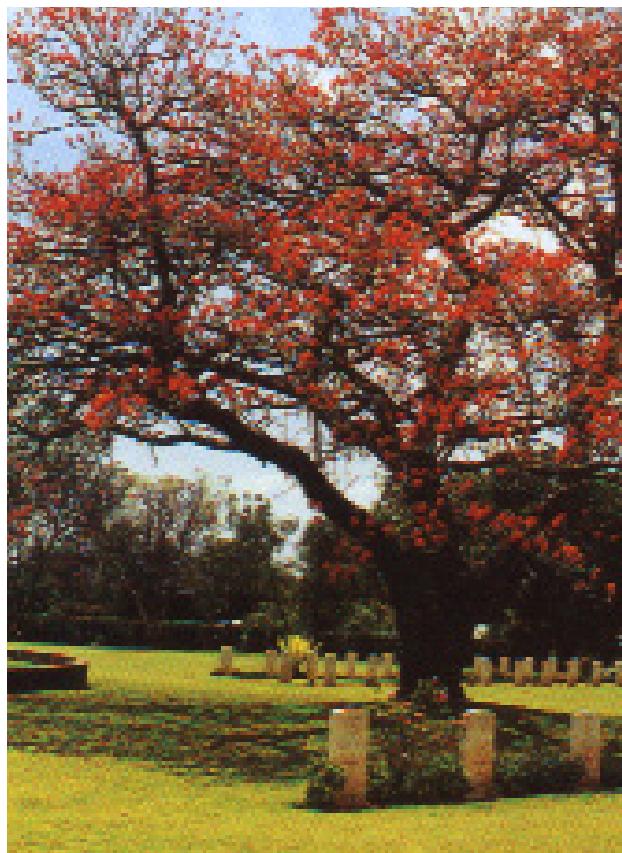

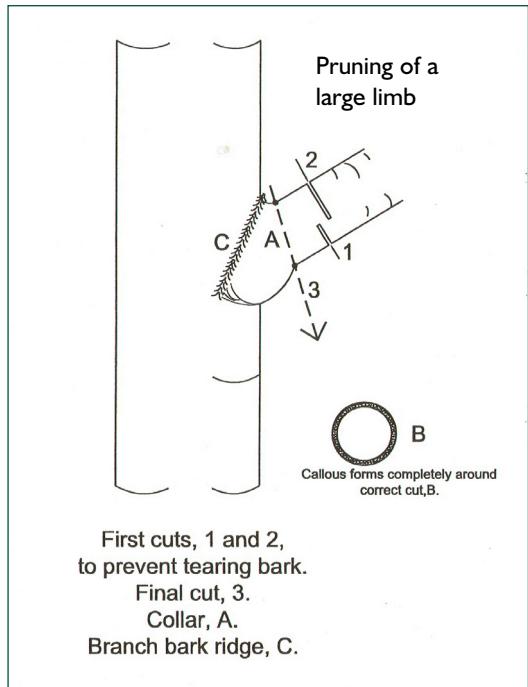

Crown Lifting

Sections or all of some lower branches are removed to create more room below the tree, for example to allow a bus to pass freely below or to expose a street light that has become hidden in the branches

By permission of Dorling Kindersley Limited

situations. **Crown thinning** aims to thin the canopy, possibly due to a congested branch system, allowing more light into the tree and consequently to shrubs or plants beneath it. Crossing and dead branches are removed at the same time. The correct way to prune a large limb is illustrated over the page. Cuts are made to ensure minimal damage is caused to the tree avoiding snags or flush cutting.

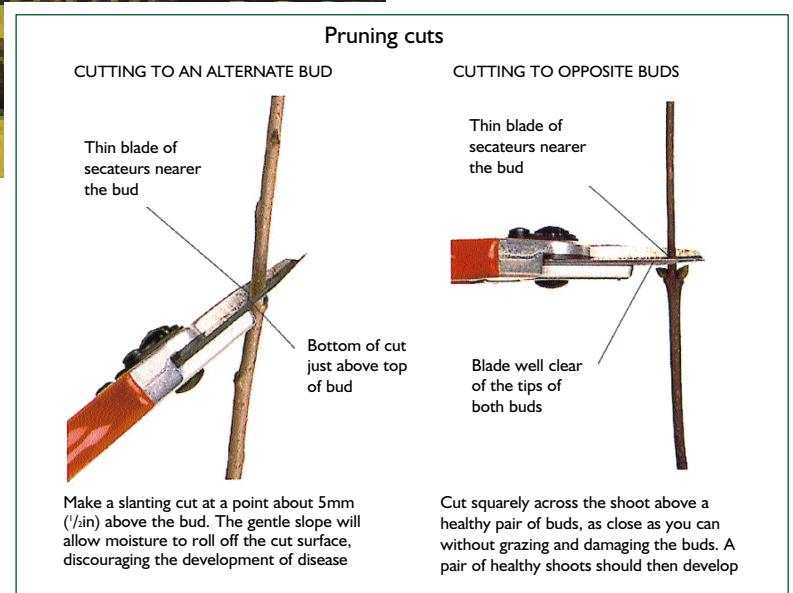

Pollarding must start when the tree is young and describes the practice of annually or regularly pruning branches back to a framework (see illustration on last page). Plane trees in the town of Aix en Provence, France or Lagerstroemia indica trees in northern Italy are regularly pruned in this way. **Lopping** or **topping** are

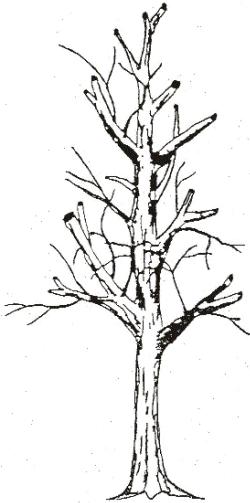

above: *Fastigiate yew planting at Hersin Communal Cemetery Extension*

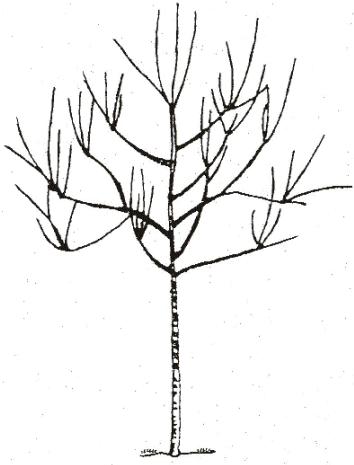

left: *The beautiful Erythrina abyssinica tree at Nanyuki War Cemetery, Kenya*

often confused with pollarding which is a sound and good arboricultural practice. The practice of lopping or topping is not recommended and often results in an ugly and unsightly tree as a consequence. It is often done on trees which have 'become too large', the problem having originated by poor species selection at the beginning. See illustrations over the page.

Lopping and Topping is wrong

Pollarding is right

Renovation, Replanting and Recycling

After the First World War much planting was done in the mid 1920s and many of our oldest trees date from this period. The devastation inflicted by the war brought a need to recreate a green landscape in the shortest time possible. There were far fewer cultivars to choose from then but earlier selections were made from those trees which could withstand severe exposure of a northern European climate. Deciduous trees such as *Acer campestre*, *Betula*, *Carpinus*, *Crataegus*, *Fraxinus*, *Sorbus (aria and aucuparia)* and *Tilia* were probably the favoured few. *Taxus baccata* (in its *Fastigiata* form) long associated with cemetery landscapes, *Pinus nigra* and *Thuja* were hardy conifers also frequently used.

Cypresses (*Cupressus sempervirens 'Stricta'*) were a familiar sight in the countries bordering the Mediterranean and known for their association with

cemeteries and it also became one of the more common trees for cemetery landscaping from northern Italy to the Middle East, as the yew was in colder, northern Europe.

The passage of time inevitably meant many of the earliest plantings, which were rather dense, needed thinning. Much of this was started in the 1980s in earnest, but work did begin before when considered necessary. Periodically all of the trees in a cemetery may decline, reaching the end of their useful life within an often restricted space in which to flourish. They will need to be removed and new trees chosen suited to the present growing conditions which may, in certain circumstances, be quite different to what they were when the trees were first planted. Dying trees are normally removed with their stumps especially if some have succumbed to fungal infections, otherwise the stumps are ground in-situ. Infected wood is burnt and the rest is chipped and shredded to be composted and returned to the soil at a later date. The Commonwealth War Graves Commission has an environmental policy and is committed to achieving environmental best practise throughout its activities wherever this is practicable. One of its objectives, is to maximise environmentally sound waste reuse and recycling . It is the aim of the Commonwealth War Graves Commission as far as practicable, to eliminate green waste disposal in its operations throughout the world by composting and recycling plant waste.

In 1996 a programme of recycling commenced with the aim of reducing disposal and eliminating burning. Challenging targets were set for different regions and good progress has been made with many regions reaching a target of 70%-80% of plant waste now being recycled.

|---|---|
| Betula utilis var. jacquemontii | Crataegus laciniata (syn. orientalis) |
| Betula verrucosa | Crataegus laevigata |
| Betula verrucosa 'Pendula' | Crataegus laevigata 'Paul's Scarlet' |
| Carpinus betulus | Crataegus laevigata 'Plena' |
| Carpinus betulus 'Columnaris' | Crataegus laevigata 'Rosea Flore Plena' |
| Carpinus betulus 'Fastigiata' | Crataegus monogyna |
| Carpinus betulus 'Frans Fontaine' | Crataegus orientalis sanguinea |
| Carpinus betulus 'Pyramidalis' | Crataegus persimilis 'Prunifolia' |
| Carya cordiformis | Crataegus tanacetifolia |
| Carya ovata | Crataegus x lavalleei |
| Carya tomentosa | Crataegus x lavalleei 'Carreirei' |
| Castanea sativa | Cryptomeria japonica |
| Catalpa erubescens | Cupressus glabra |
| Catalpa bignonioides | Cupressus lusitanica |
| Cedrus atlantica | Cupressus macrocarpa |
| Cedrus deodara | Cupressus torulosa |
| Cedrus libani | Davidia involucrata |
| Cercidiphyllum japonicum | Eucalyptus gunnii |
| Cercis siliquastrum | Eucalyptus niphophila |
| Chamaecyparis lawsoniana | Eucalyptus nitens |
| Chamaecyparis lawsoniana 'Allumii' | Euodia hupehensis |
| Chamaecyparis lawsoniana 'Columnaris' | Fagus sylvatica |
| Chamaecyparis lawsoniana 'Columnaris Glauca' | Fagus sylvatica Cuprea Group |
| Chamaecyparis lawsoniana 'Ellwoodii' | Fagus sylvatica 'Dawyck' |
| Chamaecyparis lawsoniana 'Erecta' | Fagus sylvatica 'Dawyck Gold' |
| Chamaecyparis lawsoniana 'Erecta Viridis' | Fagus sylvatica 'Fastigiata' |
| Chamaecyparis lawsoniana 'Lanei' | Fagus sylvatica 'Heterophylla' |
| Chamaecyparis lawsoniana 'Pembury Blue' | Fagus sylvatica 'Purpurea' Tricolor |
| Chamaecyparis lawsoniana 'Stardust' | Fagus sylvatica 'Riversii' |
| Chamaecyparis lawsoniana 'Stewartii' | Fagus sylvatica 'Zlatia' |
| Chamaecyparis lawsoniana 'Triomf Van Boskoop' | Fraxinus americana |
| Chamaecyparis lawsoniana 'Wisellii' | Fraxinus angustifolia |
| Chamaecyparis nootkatensis 'Glauca' | Fraxinus excelsior |
| Chamaecyparis obtusa | Fraxinus excelsior 'Jaspidea' |
| Chamaecyparis obtusa 'Nana Gracilis' | Fraxinus excelsior 'Pendula' |
| Chamaecyparis pisifera | Fraxinus excelsior 'Westhof's Glorie' |
| Corylus colurna | Fraxinus ornus |
| Crataegus crus-galli | Fraxinus oxycarpa |
| Crataegus grignonensis | Fraxinus oxycarpa 'Raywood' |

<i>Cassia siamea</i>	<i>Ipomoea arborescens</i>
<i>Cassia spectabilis</i>	<i>Lagerstroemia indica</i>

Trees used in the Tropics continued

Lagerstroemia macrocarpa var. *reflexa*
Lagerstroemia speciosa
Mamitoa browneoides
Mangifera indica
Markhamia lutea
Mesua ferrea
Michelia alba
Michelia champaca
Milingtonia hortensis
Mimusops elengi
Peltophorum pterocarpum syn. *ferrugineum*
Phoenix reclinata
Phoenix robellini
Picrasma ailanthoides
Plumeria alba
Plumeria rubra
Polyalthia longifolia 'Pendula'
Pritchardia pacifica
Pterocarpus macrocarpus
Roystonea elata
Roystonea regia
Spathodea campanulata
Sterculia acerifolia (syn. *Brachychiton acerifolius*)
Swietenia mahogani
Syagrus romanzoffiana (syn. *Arecastrum romanzoffianum*)
Tabebuia rosea
Tamarindus indicus
Warszewiczia coccinea
