Checklist of Ukrainian lichens

Abstract

Kondratyuk, S., Navrotskaya, I., Khodosovtsev, A. & Solonina, O.: Checklist of Ukrainian lichens. — *Bocconea* 6: 217-294, 1996. — ISSN 1120-4060.

This first-approximation checklist of the lichenized and lichenicolous fungi of Ukraine is based on 270 papers which were listed in previous summarizing articles, plus several recent or previously overlooked literature reports, and on original results deriving from the revision of herbarium material. Approximately 80 new or previously overlooked records were added to the previously known bibliography. The number of taxa accepted in the checklist is: 269 genera, 1222 species, 21 subspecies and 16 varieties. 1147 species are consistently or facultatively lichenized; 29 non-lichenized (but mainly not lichenicolous); and 46 are lichenicolous fungi (excluding lichenicolous lichens).

Introduction

The regular publication of national or regional checklists is fundamental for lichen taxonomy, floristics and phytogeography. Until recently, very few lichen checklists were available for southern Europe (e.g. that of Kusan, 1953, for the former Yugoslavia). In recent years, however, especially thanks to the activity of the OPTIMA Commission for Lichens, there has been a rapid increase in the production of checklists for several south European areas, like Austria (Türk & Poelt 1993), Italy (Nimis 1993), Morocco (Egea, this volume), Sardinia (Nimis & Poelt 1987), Tunisia (Seaward, this volume), Mediterranean Turkey (John, this volume); noteworthy in this respect is also the checklist of lichens and lichenicolous fungi of Macaronesia published by Hafellner (1995).

This paper contains a checklist of lichens and lichenicolous fungi of the Ukraine, a country which, although not belonging to the Mediterranean region, also includes some coastal regions with a quasi-Mediterranean climate, sharing many species with the lichen flora of the Mediterranean region in the strict sense. The most comprehensive works on the lichens of Ukraine were "Vyznachnyk lishaynikov URSS" (Oxner 1937) and the three volumes of "Flora lishaynikov Ukrainy" (Oxner 1956, 1968, 1993). These floras were written during various historical periods, when the administrative delimitation of Ukraine was quite different from the present one; moreover, the flora by Oxner (1956-1993) was not completed. Much has changed in lichenology during this period, certainly not least within the field of lichen systematics. Until now, no updated lichen checklist for the whole of the present Ukraine was available. There are, however, regional lists for various

parts of the country: the Carpathians (Makarevich & al. 1982), Crimea (Kopachevskaya 1986) the Ukrainian Plains (Kondratyuk & Solonina 1990a). These works include extensive synonymies for each taxon, and all relevant literature as well. The present paper contains a preliminary checklist of the lichen and lichenicolous fungi of Ukraine, based on the previously mentioned sources, on new literature records, and on the original revision of several herbarium specimens.

Study Area

Ukraine, in the southern part of eastern Europe, has a surface area of 603,700 km², extending for 1,300 km from east to west and for 900 km from north to south. On the west, it borders with Poland, Slovakia, Hungary and Romania, on the north with Byelorussia; on the south-east and east with Russia, on the south-west with Moldova. On the south it borders with the Sea of Azov and the Black Sea.

Ukraine may be divided into five geographic zones, which run more or less parallel from west to east:

1) the belt of mountains including the Carpathians in the west and the Crimean Mts. in the south. It accounts for no more than 5% of the total surface. The highest peaks are Hoverla (2,001 m) in the Carpathians and Roman Kosh (1,543 m) in the Crimean Mountains;

2) the belt of the northern Valhynia, including lands extending east of the Dnieper River up to the northeastern boundary of Ukraine;

3) the central plateau and upland belt including much of Volhynia, eastern Galicia, and Podolia, which is connected by the ridges of Zaporozhia to uplands further east in the Donbas;

4) the East European upland north of the Ukraine/Russia boundary;

5) the belt of coastal lowlands near the Black Sea from the mouth of the Danube to the northern shore of the Sea of Azov, including the northern part of Crimea.

The climate of Ukraine is moderately continental on the north and east, and warm on the extreme south. Average temperatures in January range from -8°C on the north-east to 4°C in the southern shores of Crimea. In July they are of 18°C on the north-west and 24°C on the south-east. Precipitation varies from 300 mm/year in the south-east to 1600 mm in the Carpathians.

The great physiographic and climatic diversity produces a great complexity of vegetation types, from subalpine vegetation in the mountains to semi-deserts in the southern plains. The northern part of the Ukraine Plains lies in the zone of broad-leaved forests, the middle and southern parts in the forest-steppe and steppe zones. In Crimea and on the Kerch Peninsula the most widespread vegetation types are steppe in the lowlands, oak-forest-steppe on foothills, broad-leaved forest in the mountains, mountain steppe and meadow on summit plateaux, dry juniper-oak forest and scrub of the Mediterranean type along the southern coast.

Data

This first-approximation lichen checklist of Ukraine is based on 270 literature reports, which were listed in previous papers (Oxner 1956, 1968, 1993; Makarevich & al., 1982; Kopachevskaya 1986; Kondratyuk & Solonina 1990a), plus several recent or previously overlooked literature reports, and original results deriving from the revision of herbarium material. Approximately 80 new or previously overlooked records were added to the previously known bibliography. Altogether, the number of papers dealing with lichens of

this region is ca. 350, starting from the work of Gablitz (1785, see Kopachevskaya 1986) up to several papers published in 1995. Many new records derive from unpublished revisions of herbarium specimens, primarily from KW, but also from LE, BRA, BM and LD.

Data on the Carpathians are mainly based on Makarevich & al. (1982), plus some further additions (Bystrek 1986; Bystrek, Sulma 1982 a, d, 1984; Culberson, Culberson 1968, 1976; Gyelnik, 1932 a, b 1935; Maas Gesteranus 1947; Magnusson 1947; Mayrhofer 1984; Moberg 1977; Motyka 1958 a, b, c, 1960; Nadvornik 1948; Purvis & al. 1995; Schindler 1975; Servit, Cernohorsky 1934; Sulma 1933; Suza 1932-1935, 1949). New to the Ukrainian Carpathians are the following species: *Bryoria kuemmerleana*, *B. pseudofuscescens* (Kondratyuk 1990); *Pyrrhospora quernei*, *Caloplaca irrubescens*, *C. obliterans* (Oxner & al. 1989); *Anapthychia bryorum* (Lisicka & Kondratyuk 1989); *Scoliosporum chlorococcum* (Kondratyuk & Solonina 1990b); *Caloplaca xantholyta*, *Aspicilia moenium*, *Caloplaca grimmiae*, *Leptorhaphis parameca*, *Lecanora conizaeoides* (unpublished data by Kondratyuk).

Particular attention was devoted to the Ukrainian Plains. The following species, previously known from literature reports, were considered as dubious for this region: *Biatora ocelliformis*, *Caloplaca herbidella*, *Leproloma membranaceum*, *Lobaria scrobiculata*, *Polychidium muscicola*, *Pyrenula boberskiana*. The analysis of new literature (Kilias 1981; Hale 1990; Mayrhofer & al. 1990; Timdal 1991), brought to the addition of the following taxa, which were not considered by Kondratyuk & Solonina (1990a): *Agonimia allobata*, *Aspicilia moenium*, *Peridiothelia fuliguncta*, *Leptorhaphis parameca* (Kondratyuk & Blum 1985; Kondratyuk & Beznis 1989); here were found also *Collempsidium iocarpum*, *Lecanora conizaeoides*, *L. persimilis*, *Buellia griseovirens*, *Tuckermannopsis ciliaris*, *Strangospora moriformis*, *Caloplaca grimmiae*, *C. proteus*, *Fulgensia bracteata*, *Ramalina dilacerata* and *Bryoria pseudofuscescens*, as new to Ukraine (Kondratyuk & Blum 1985; Bairak, Kondratyuk 1989; Kondratyuk 1990), and about 80 species new to this part of the country.

Data concerning Crimea are mainly based on the results of Kopachevskaya (1986) as well as on additions by other authors (Mereschkowsky 1913, Poelt & Vezda 1978, Mayrhofer 1984, Brun & Gizbullina 1990, Hale 1990, Timdal 1991). The following species are new to Crimea: *Clauzadea immersa* (Oxner & al. 1989), *Cetrelia chicitae* (Randlane & al. 1989), *Physcia biziana* (Lisicka & Kondratyuk 1989), *Caloplaca grimmiae*, *Micarea denigrata* (Kondratyuk 1990), *Scoliosporum chlorococcum* (Kondratyuk & Solonina 1990b), *Caloplaca proteus*, *Xanthoria soledata*, *Ochrolechia alboflavescens* (Oxner 1993), *Umbilicaria grisea*, *Usnea scabrata*, *Fulgensia bracteata*, *Protoblastenia siebenhaariana* (Kondratyuk, unpublished data).

Organization of the checklist

This checklist includes all accepted names of lichen-forming fungi treated in the papers mentioned above. Lichenicolous fungi (suffixed "[LF]") are included as well. Some non-lichenized taxa are also included (suffixed "[F]"), which were cited by Oxner (1956, 1968, 1993) and/or traditionally treated by lichenologists. New combinations are given in Appendix 1. A list of more than 80 recently discovered lichen species is also included in Appendix 2; these taxa will be treated in detail in forthcoming papers. The symbol "?" indicates that the actual presence of a given taxon is uncertain, or that the synonymy is probable, but not certain.

The checklist is arranged alphabetically by genus and species. Accepted taxa are printed in bold, synonyms in italics. References have been kept to a minimum, as these

are given in the Flora (Oxner 1956, 1968, 1993), and in regional summarizing paper (Makarevich & al. 1982; Kopachevskaya 1986; Kondratyuk & Solonina 1990a) which should be consulted for further information. A complete list of literature on the lichens of Ukraine is in preparation, and will be published elsewhere.

The checklist also includes information on the presence of each taxon within the seven regions of Ukraine, which are abbreviated as follows: **A, B**: Carpathians (**A**: Transcarpathian or "Zakarpat'ye", **B**: the mountainous part); **C, D, E**: Ukraine Plains (**C**: Forest zone, **D**: Forest-Steppe zone, **E**: Steppe zone), **F, G**: Crimea (**F**: lowlands, **G**: mountains). The limits of these regions are according Geobotanichne Rayonuvannya (1977).

The number of taxa accepted in the checklist is: **269** genera, **1222** species, **21** subspecies and **16** varieties. **1147** species are consistently or facultatively lichenized; **29** non-lichenized (but mainly not lichenicolous); and **46** are lichenicolous fungi (excluding lichenicolous lichens).

Acknowledgements

We would like to thank the several colleagues who helped us in the compilation of this checklist with constructive criticism and new information: Dr. I. Pisut (Bratislava), Dr A. Lackovicova (Bratislava), Dr. H. Trass (Tartu), Dr. T. Randlane (Tartu), Dr. N. S. Golubkova (St. Petersburg), Dr. A. Titov (St. Petersburg), the late Dr. J. Poelt (Graz), Dr. H. Mayrhofer (Graz), Dr. D. J. Galloway (Dunedin), Mr. P. W. James, Dr. W. P. Purvis (London), Dr. B. J. Coppins (Edinburgh), Dr E. I. Kärnefelt (Lund), Mr. A. Thell (Lund), Dr. T. Ahti (Helsinki), Dr. C. Scheidegger (Birmensdorf), Dr. U. Söchting (Copenhagen), Dr. M. S. Christiansen (Copenhagen), Dr. H. Hertel (Munich), Dr. P. M. Joergensen (Bergen), Dr. R. Moberg (Uppsala), Dr. R. Santesson (Uppsala), Dr. P. L. Nimis (Trieste). Special thanks are due to Prof. P. L. Nimis for his kind and generous help in the editing and publication of this list. The first author is indebted to the late Dr. J. Poelt, Dr. D. J. Galloway, Dr. B. J. Coppins, Dr E. I. Kärnefelt, and to Dr. U. Söchting for their kind assistance during his work in GZU, BM, E, LD and Copenhagen. He is much also obliged to the staff members of the Institute of Botany of the University of Graz, British Natural History Museum (London), Royal Botanical Gardens of Edinburgh, Botanical Museum and Department of Systematic Botany of Lund University, Department of Mycology and Botanical Museum of University of Copenhagen. He is thankful to the Ministry of Education and Research of Austria, to the Royal Society and the Swedish Institute for financial support as well.
