## General Directions

---

The product is irritant and painful when injected extravascularly. The product may be administered via the intracardiac or intraperitoneal route. However, this may be associated with distress, discomfort and/or a delayed effect. Sequential use of sedatives, tranquilizers and/or local anaesthetics should be considered to prevent and/or ameliorate undesirable effects. Premedication with a suitable sedative is recommended in horses and cattle. For euthanasia of pregnant animals - allow for increased BW. Wait at least 25 minutes before accessing the foetus and euthanase separately if necessary. Poikilotherms must be maintained at optimum temperature to ensure effectiveness. Species appropriate measures, e.g. pithing or freezing, should be taken after unconsciousness to prevent spontaneous recovery.

## First Aid

---

If poisoning occurs, contact a doctor or Poisons Information Centre. Phone Australia on 13 11 26.

## GHS Information

---

For GHS information see Safety Data Sheet.

## Presentation

---

Injection, 250 mL (HDPE break resistant plastic bottle)

## Storage

---

Store below 30°C (room temperature). Protect from light.

## Poisons Schedule

---

S4.

## APVMA Number

---

APVMA No. 36208
