VERA C. RUBIN  
OBSERVATORY

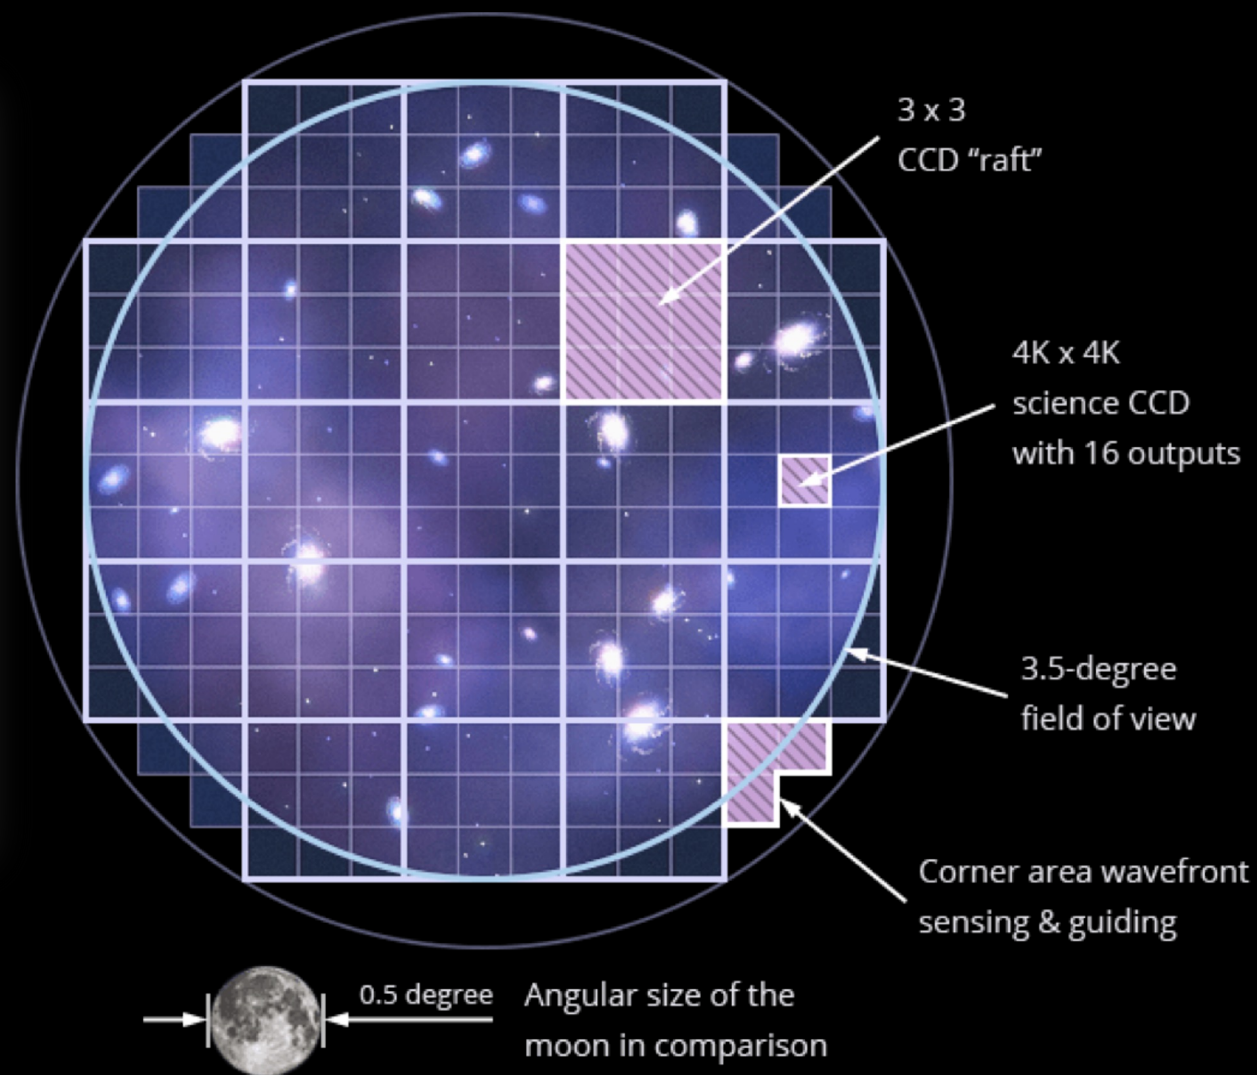

# The Vera C. Rubin Observatory

- 8m class
- telescope assembly weighs ~40t
- can slew 90 degrees in 9 s
- 5 sec slew & settle

# LSSTCam: the world's biggest wide-field camera

acquire a 20 Gb image every 40 s

Laser Mirror (LM 4-8)  
*Assembly Station*

# Construction status

- Telescope Mount Assembly is “99%” complete!
- The dome is progressing well (but work remains).
- LSSTCam is essentially ready to be shipped.
- Data Management: pipelines on schedule, new data facility (USDF) at SLAC, pipelines deployed for Subaru’s HSC and alert distribution for ZwickyTF
- System Integration and Commissioning is well under way (including data acquisition, transfer from the summit and processing at USDF).
- Education and Public Outreach (EPO) just passed their close-out review and the team has moved to Operations

# The Legacy Survey of Space and Time

Baseline v2.1 (baseline\_v2.1\_10yrs)

Duration: 10 yrs  
Filters: ugrizy

Wide Fast Deep (WFD)  
North Ecliptic Spur (NES)  
Galactic Plane (GP)  
Deep Drilling Fields (DDF)  
South Central Plane (SCP)

Major assessment by SSSC of [cadence simulations V1.5-2.2](#) over the last 18 months

Schwamb+ (submitted to ApJS Special Issue)  
[https://iopscience.iop.org/journal/0067-0049/page/rubin\\_cadence](https://iopscience.iop.org/journal/0067-0049/page/rubin_cadence)

# The Legacy Survey of Space and Time

	Currently Known	LSST expected Discoveries
near-Earth Objects (NEOs)	~ 28,000	60,000
Main Belt Asteroids (MBAs)	~ 1,000,000	5,000,000
Jupiter Trojans	~ 10,000	200,000
Trans-Neptunian Objects (TNOs)	~ 4,000	40,000
Comets	~ 4,000	10,000
Interstellar Objects	2	>10 (??)

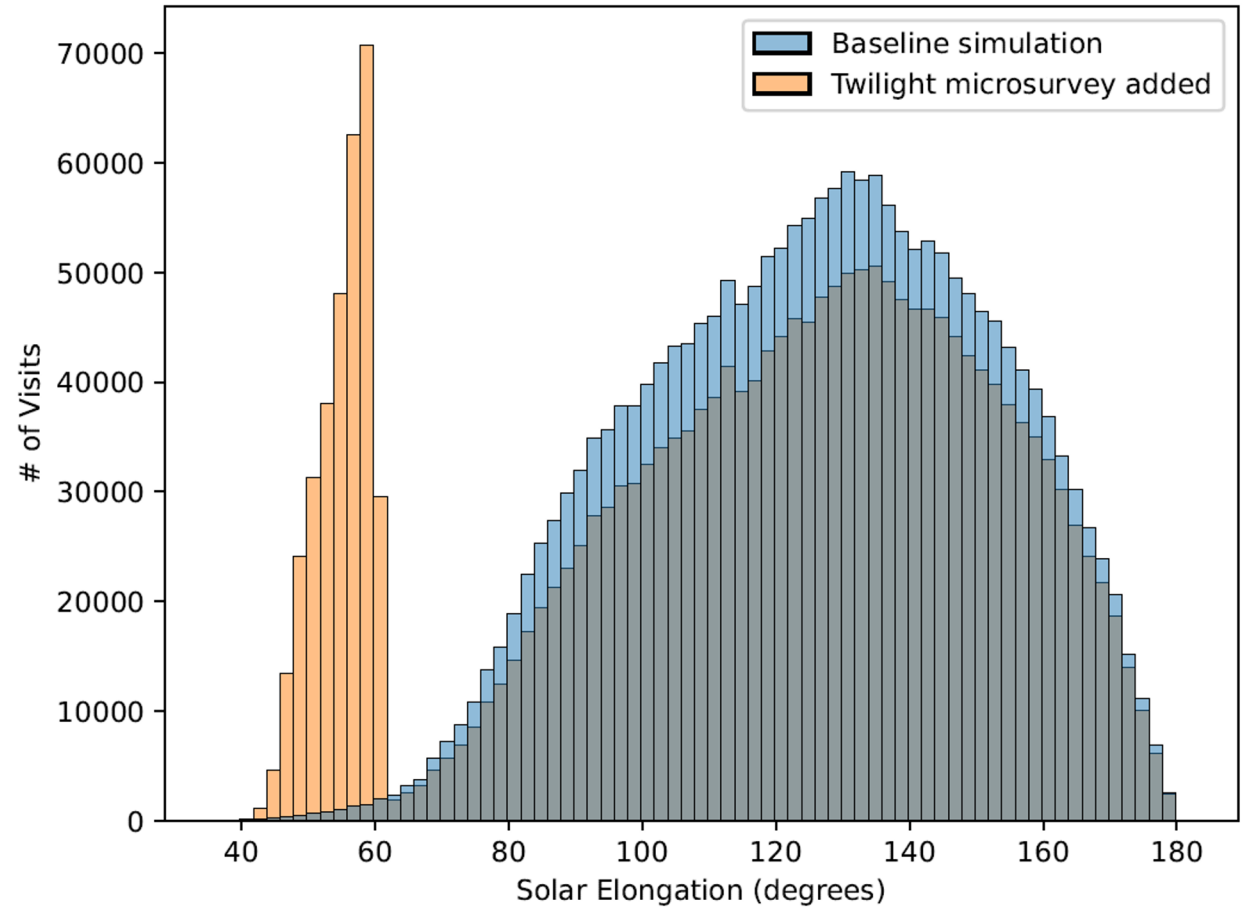

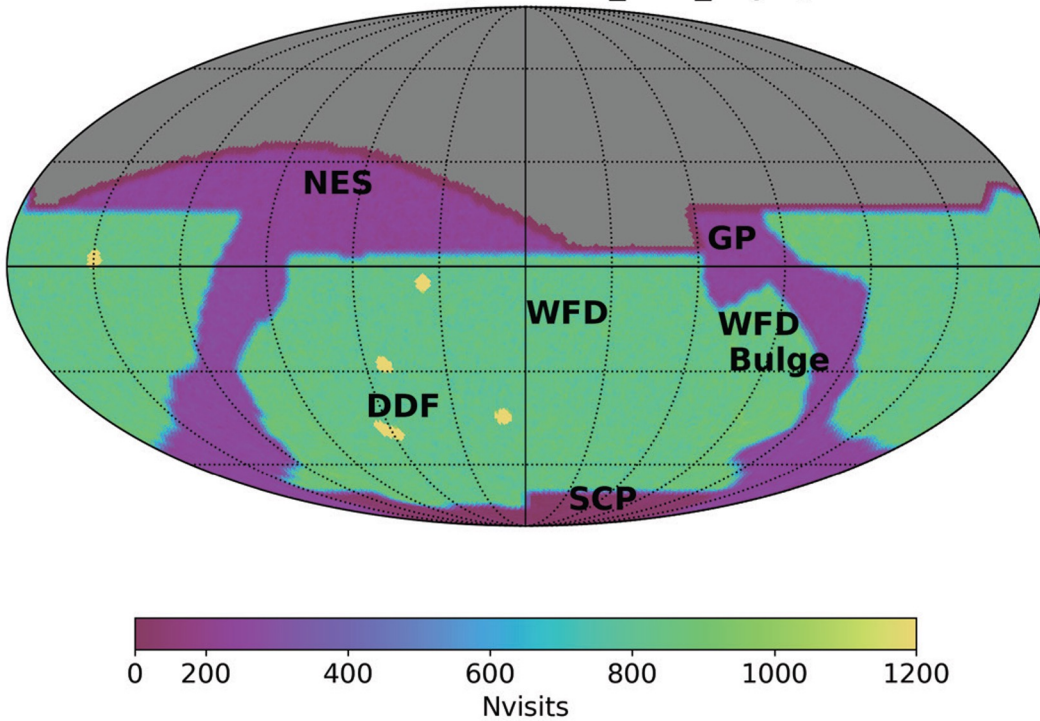

Most discoveries will happen early in the survey , except NEOs, ISOs and some comets.

# The Legacy Survey of Space and Time

Baseline survey

Micro/Nanosurveys

Baseline v2.1 (baseline\_v2.1\_10yrs)

Schwamb+ (submitted to ApJS)

# Survey strategy: an iterative ongoing process

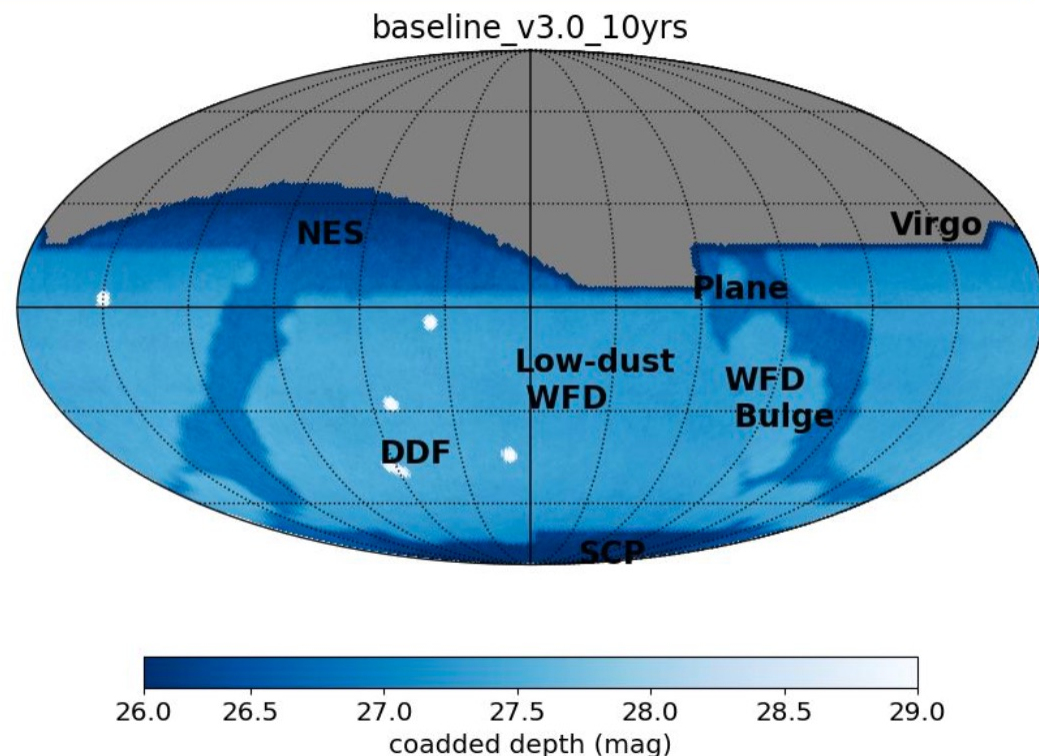

- Cadence selection is in progress
  - So many decisions: year 1 cadence, nightly visit pair/triplet, filter distribution, footprint, rolling cadence, deep drilling fields, twilight survey, 2 x 15 s or 1 x 30 s exposure (8% boost in on-sky visits)... Schwamb+ (submitted to ApJS)
- Phase 2 recommendation made!

- Filter Balance & Footprint refinements
- Intranight Cadence recommendations
- Finalized DDF Selection
- Recommends twilight NEO microsurvey and Northern Stripe microsurvey to start in year 1
- Recommending ½ sky Rolling Cadence
- Recommending a ToO program to  $\leq 3\%$  of the LSST time

[pstn-055.lsst.io](http://pstn-055.lsst.io)

To be defined:

- Details of the observing strategy for DDFs
- Details of the observing strategy for ToOs
- Details of Galactic sky footprint and strategy
- Year 1 observations (work with Early science Ops team)

A. Real-time Alerts ( $\geq 2M$ SSO observations/night)	
Astrometry	$\pm 10$ mas (bright; $\pm 140$ faint)
PSF flux	$\pm 10$ mmag (bright end)
Aperture flux	$\pm 10$ mmag (bright end)
Trailed source fit	Flux and on-sky motion for fast-moving (trailed) objects
Appearance characterization	Moments and extendedness of the object's image
Spuriousness score	Probability that the detection is an artifact
Nearby static objects	Information on adjacent objects (up to three)
MPC designation	Given for known objects
Predicted position and magnitude	Given for known objects

Details: DIASource tables in <http://ls.st/oug>

# I. Real-Time Alerts within 60 sec

Measurements of all detections on difference images, including known and unknown SSOs.

Suitable for real-time discovery of trailed objects, and activity of known objects.

**Allows us to monitoring  $\sim 0.5-1M$  small bodies for activity, each night.**

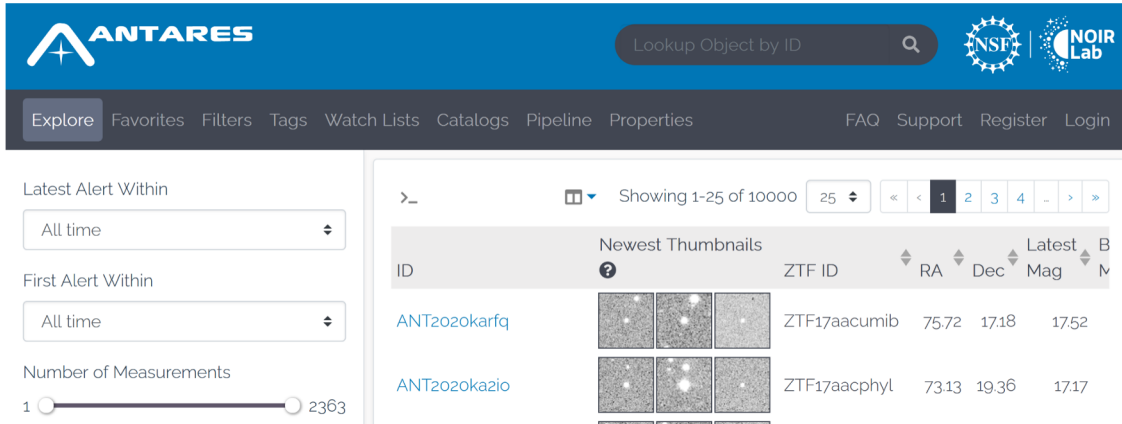

2014 MF6 (PHA), 60sec exposure, MPC Q62 (Guido, Howes & Nicolini)

(6478) Gault outburst (Ye et al, for the ZTF Collaboration)

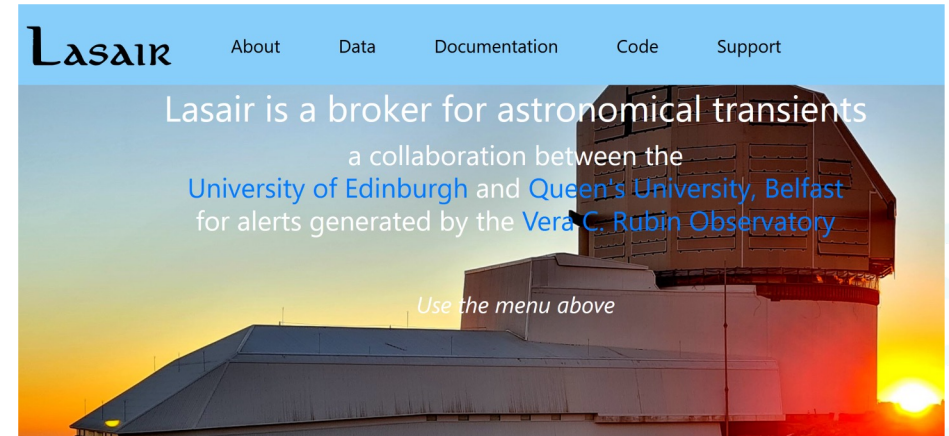

# Community can retrieve events from Alert Brokers

The screenshot shows the ANTARES website interface. At the top, there is a search bar labeled "Lookup Object by ID" and logos for NSF and NOIR Lab. Below the search bar is a navigation menu with options like "Explore", "Favorites", "Filters", "Tags", "Watch Lists", "Catalogs", "Pipeline", "Properties", "FAQ", "Support", "Register", and "Login". On the left side, there are filter controls for "Latest Alert Within" (set to "All time"), "First Alert Within" (set to "All time"), and "Number of Measurements" (set to 2363). The main content area displays a table of alerts with columns for ID, Newest Thumbnails, ZTF ID, RA, Dec, and Latest Mag. Two alerts are visible: ANT2020karfq and ANT2020ka2io.

<https://antares.noirlab.edu/>

**The Solar System Notification Alert Processing System (SNAPS, D. Trilling)**

The screenshot shows the Lasair website interface. At the top, there is a navigation menu with options like "About", "Data", "Documentation", "Code", and "Support". Below the menu, there is a main heading: "Lasair is a broker for astronomical transients" followed by "a collaboration between the University of Edinburgh and Queen's University, Belfast for alerts generated by the Vera C. Rubin Observatory". There is also a sub-heading "Use the menu above" and a background image of a building at sunset.

<https://lasair-ztf.lsst.ac.uk/>

<https://fink-broker.org/>

## II. Daily Catalog

### ***B. Daily Solar System Products ( $\geq 5.5M$ objects)***

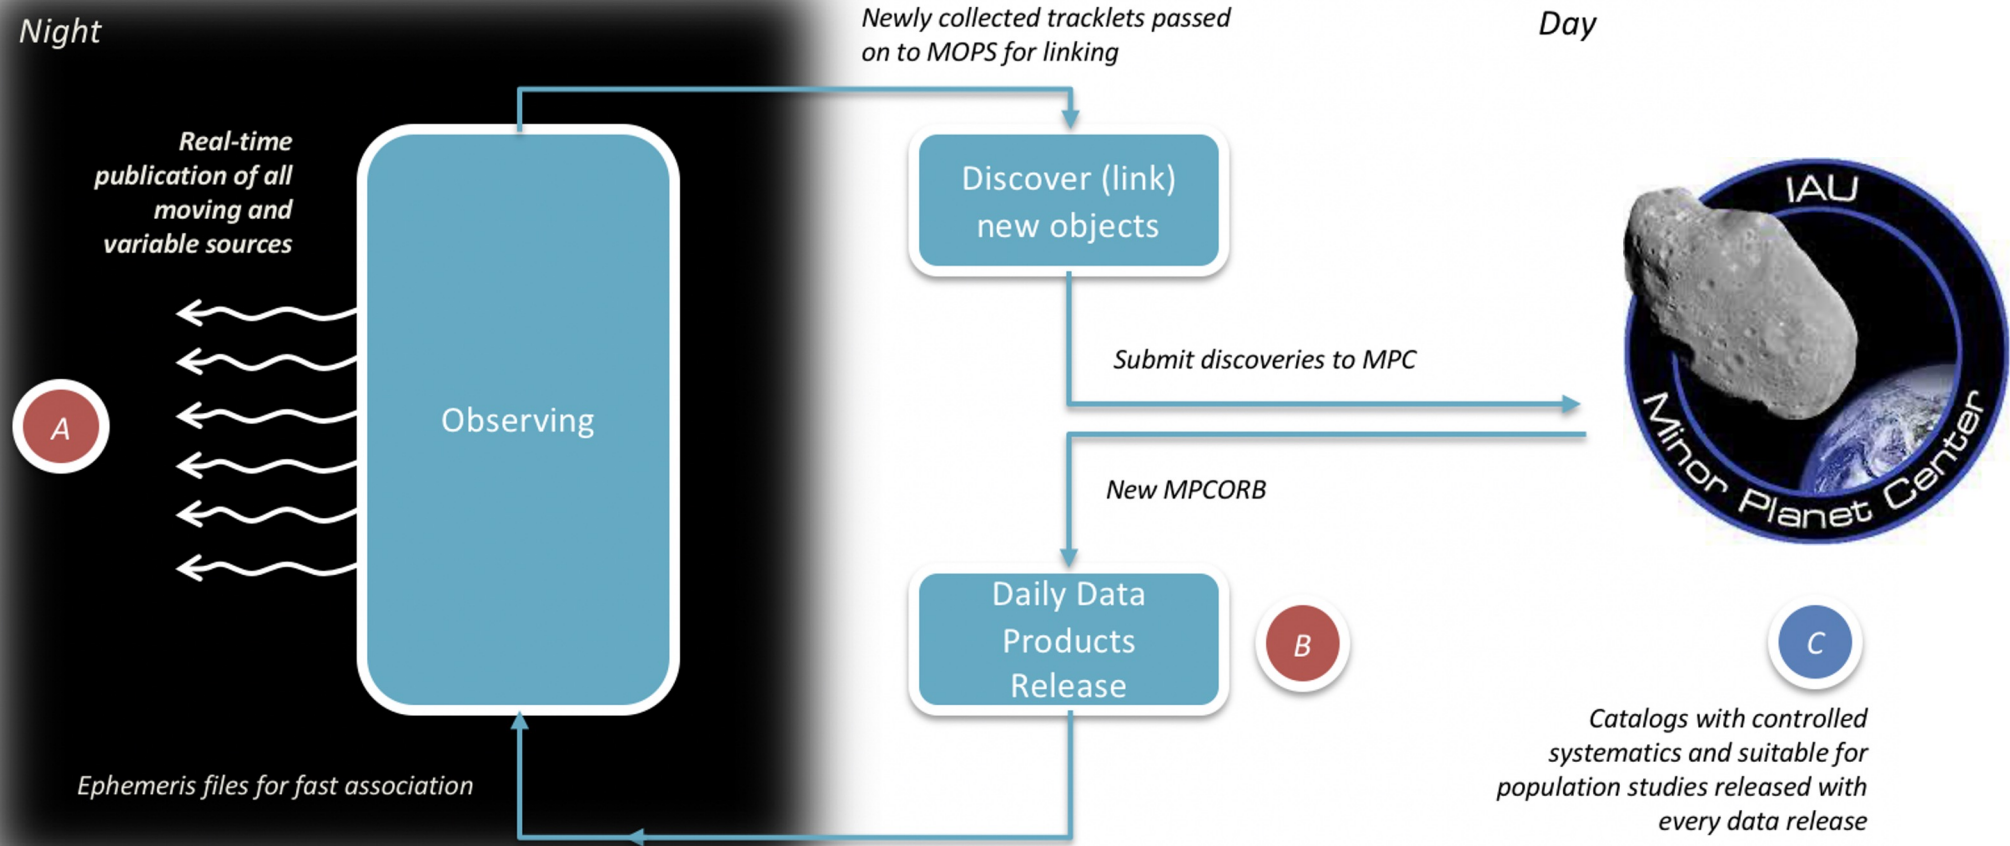

Orbits	Computed by the MPC
Light-curve characterization	Period, light curve shape, other features
Absolute magnitude estimates	Estimates of (H, G12) in u,g,r,i,z,y bands
MOID	Minimum Orbit Intersection Distance (Earth)
Extendedness indicators	Is/was the object comet-like in its appearance?

A catalog of orbits and physical properties, recomputed daily. The orbit solutions and designations will be obtained from the MPC.

The physical properties (absolute magnitudes, light curves, extendedness characterization) will be computed from LSST data.

**The most up-to-date catalog of physically well-characterized small bodies in the Solar System.**

# LSST Solar System Processing

See the handout at <http://ls.st/Document-29545> for a one-page summary!

# The state of things Rubin: minor planet detection

- Moving-object pipeline (HelioLinC+) is operational 🎉
  - 95.6% completeness of recovery of ISOs with  $H=18-23$  (11 had  $H=22$ )
  - Asteroids (some NEOs, full main belt, some Jupiter Trojans) even better
- Minor Planet Center has stress-tested with Rubin, and can handle LSST nightly input 😄 (as per F. Soto, SBAG June '22)
- Preccovery integrated into LSST pipelines

### III. High-Quality Data Release Catalogs

#### C. Solar System Data Release Products (every year)

High-fidelity reprocessing	Catalogs derived from re-reductions of all survey data using improved calibrations and a single, well-characterized, software release. <b>A “gold” version of the daily catalog.</b>
The LSST Catalog of Solar System Objects	<b>A catalog, suitable for population studies,</b> of objects detected by LSST with orbits estimated using only LSST data.

LSST will reprocess all data once a year, publishing well-characterized and manually QA-ed data releases (DR).

The Solar System aspects of a data release include a “gold” version of the daily catalog (improved astrometry and photometry), and a special “LSST-only” catalog of Solar System objects, suitable for population studies.

We will also deliver the linking software, information about the selection functions, and metadata necessary to enable debiasing of the population.

# The state of things Rubin: data and support

So once LSST begins:

- Same-night alert reporting; MPC discovery reporting the next day
- First Solar System catalogue with survey characterization with DR1, 1-1.5 years after LSST start
- more details at: [lsst-sssc.github.io](https://lsst-sssc.github.io)
- In 2021-22 Rubin community support scaled up: seed grants, PhD student schools, postdoc fellowships, funded software incubators
- Much of this *is not continuing* in the coming year
  - no postdocs, no seed funding
- How best to support the community?

# When is LSST data going to be available?

- forecast **System First Light** is now **July 2024**.
  - System First Light is expected about 3 months after First Photon,
  - Scheduler-driven LSST data acquisition will start about 4 months after System First Light.
- There will be no engineering first light with the single-raft ComCam (originally expected in 2023).
  - *Less clear what the first data preview release will contain*
- **2023: shipping LSSTCam from SLAC to Chile, dome completion**, full system integration
  - Solar System data products may not be in data preview from commissioning data
- **Anticipate a start to the LSST of February 2025**

*Your LSST Early Science Plan:*

*2023: Develop analysis against simulated data on the Rubin Science Platform (data previews, DPs)*

*2024: Preparation for real data; First Light; data preview release and analysis*

*2025: Survey starts, first Alerts; significant data preview release and analysis*

*2026: Data release 1 and analysis (first 6 months of Legacy Survey of Space and Time)*

**Rubin will look into  
a hyper-industrialized sky**  
currently 0.5 million artificial satellites planned for launch by 2035

Satellite trail induces  
image artifacts

Tyson et al. 2020

evidence of satellite  
trails will clearly be in  
the data at  $S/N \sim 100$

how to avoid  
systematics-limited science?

# Satellite trail induces image artifacts

Tyson et al. 2020

## Rubin will mask when feasible

dodging would cost ~10% of LSST's time;  
10% of images will have Starlink/Oneweb streaks,  
particularly the Twilight Survey, where  
90% of images will have streaks (Hu et al. 2022)

# Satellite constellations: the reality of industrial pollution

## Mitigations?

- Keep talking to industry
  - Agreements e.g. NSF–SpaceX, 10 Jan '23
- Engage FCC's new Space Bureau

# Rubin Education & Public Outreach program is built

- Launching Jan/Feb at [rubinobservatory.org](https://rubinobservatory.org)

A new mobile-first, accessible website with engaging, conversational content in English and Spanish

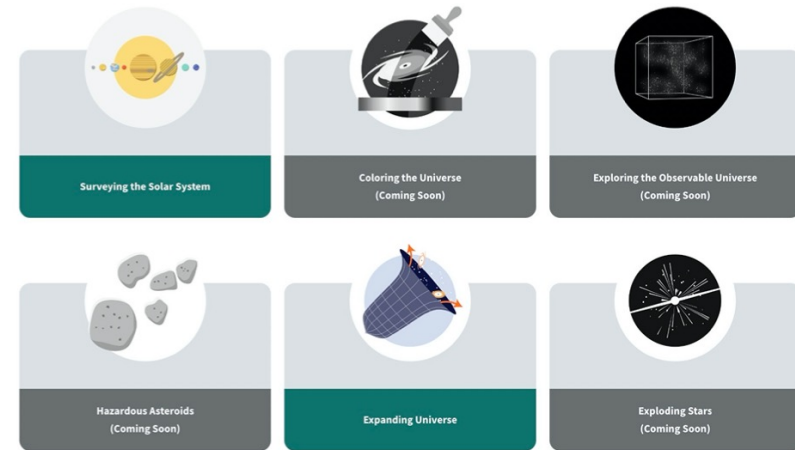

**[rubinobs.org](https://rubinobs.org)**  
(soon to be [rubinobservatory.org](https://rubinobservatory.org))

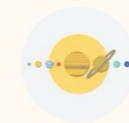

Animated videos about Rubin and its science, on Youtube in English and Spanish

**[youtube.com/RubinObservatory](https://youtube.com/RubinObservatory)**

Formal education investigations with resources for teachers

### Surveying the Solar System

[Start Investigation](#)

  
 Investigation total duration  
**2 hours**

#### Contents and suggested sequence

To get the most out of each investigation, here is a suggested sequence:

- 1 Read the Teacher Guide
- 2 Check out the Investigation
- 3 Review the Implementation Guide
- 4 Examine the Assessments
- 5 Examine the Phenomenon
- 6 Check out Videos and Auxiliary

# Rubin Education & Public Outreach program is built

Citizen Science  
with Zooniverse

Time left: 0m 14s

Capturing

Discovered objects tonight **22** ☄ x1 🚀 x2 🌀 x4 ★ x13 ✨ x2

The interface shows a dark blue night sky filled with stars. A large, semi-transparent grid is centered over the sky, with the word "Capturing" written in white text across it. At the top, a progress bar indicates "Time left: 0m 14s". In the bottom right corner, a summary of discoveries is shown: "Discovered objects tonight 22", followed by icons and counts for different object types: a comet (☄ x1), a rocket (🚀 x2), a swirl (🌀 x4), a star (★ x13), and a spark (✨ x2). The entire scene is framed by dark grey vertical bars on the left and right sides.

Rubin offers a vast new set of targets  
— future missions will have plenty to choose from...

Outstanding issues:

- community funding support for preparatory work
- Engage FCC's new Space Bureau on satcon impacts
