

Hårdhedsgrader af træsorter i Janka/lbf, alle leveret af www.morlanwoodgifts.com .
 Skalaen her er i lbf(libraforce), men den er omsættelig til Kgf(kiloforce), KN(kilonewton) og N(newton),
 4800 lbf = 2177 Kgf = 21.35 KN = 21350 N for quebracho, den første er mest almindelig, men omsæt-
 ningen er nemt foretaget på hjemmesiden. Ligeledes kunne man angive massefylden, men da den varierer
 meget efter jordbundsforhold og væksthastighed, ville den være mere vildledende end vejledende, så den
 har jeg udeladt. Det samme kan gøre sig gældende med hensyn til hårdhed, og derfor vil nogle træsorter
 kunne optræde med flere forskellige hårdheder (f.eks. er hurtigvokset eg betydelig hårdere og stærkere
 end langsomtvokset, mens det med andre træsorter forholder sig lige omvendt). Det er kun nogle eksem-
 pler på mere almindelige træsorter der „optræder“, men alle kendte mål er i „Nytteplanter“.
