## **APPENDIX A**

**Standard Operating Procedures (SOPs)** 

Calculation of Baseline and Test Values for the Benthic Diversity Indices and Opportunists at the MWRA Outfall Nearfield.

Calculation of the Annual Threshold Value for Redox Potential Discontinuity Depth in Sediment

Calculation of the Annual Threshold Values for Sediment Toxic Contamination

### Standard Operating Procedure (SOP) for the Calculation of Baseline and Test Values for the Benthic Diversity Indices and Opportunists at the MWRA Outfall Nearfield.

### **Revision History:**

Revision 1: October 13, 2004 -

- a) Reduced station sets for even and odd year used in revised monitoring program (MWRA, 2004), are now used to calculate baseline and post-discharge results.
- b) Modified the merge list to reflect the recent species consolidation implemented in the database and the new merges per Ken Keay, Nancy Maciolek, Jim Blake, and Isabelle Williams.

The contingency plan threshold comparisons for the nearfield benthic diversity indices and percent opportunists are performed each year. The diversity indices include total species, log-series alpha, Shannon-Wiener H', and Pielou's J'. The nearfield averages of the benthic diversity indices and benthic opportunists are compared to the thresholds to determine if there is an exceedance. The table below shows the caution thresholds for the benthic diversity indices and benthic opportunists for testing on even and odd years.

Table 1: Benthic diversity indices and percent opportunist thresholds.

|       | Parameter     | Threshold ID | Caution<br>Level | Warning<br>Level | Baseline<br>Years | Baseline<br>Method |
|-------|---------------|--------------|------------------|------------------|-------------------|--------------------|
| Even  | Total species | SBDTOTMAXE   | 82.00            | -                | 1992-2000         | Central            |

### Data Source (Data from EM&MS database):

- The benthic infaunal data and sample information are obtained from the ABUNDANCE and SAMPLE tables.
- Taxa are classified as "good" (GOOD\_BAD = 'G', generally, identified to species), "bad" (GOOD\_BAD = 'B', identified only to a higher taxonomic level) or "worse" (GOOD\_BAD = 'W', non-infaunal taxa) in the INFAUNA\_REF table. Species classified as "worse" are excluded from calculation. "Worse" refers to pelagic, epifaunal, or colonial species.

### Data To Be Used In The Analysis:

- For even year thresholds, the following stations are used for baseline calculations and threshold testing: NF12, NF17, FF10, FF13, NF05, NF07, NF08, NF09, NF16, NF18, NF19, NF22, NF23, NF01, NF03, NF06, NF11. (Note NF01, NF03, NF06, and NF11 were sampled only in 1992.)
- For odd year thresholds, the following stations are used for baseline calculations and threshold testing: NF01, NF02, NF03, NF04, NF06, NF10, NF11, NF12, NF13, NF14, NF15, NF17, NF20, NF21, FF12, NF24. (Note NF01, NF03, NF06, and NF11 were sampled only in 1992.)
- There is one survey event in August each year, except that there are surveys in May and August 1992. Survey S9202 in May 1992 is excluded from the baseline calculations because the time of data collection and the sampling method are inconsistent with all other surveys.
- Data qualified as suspect/invalid (VAL\_QUAL contains 's') and investigation pending (VAL\_QUAL contains 'q') are not used.
- Include only "good" species for benthic diversity index calculations, as defined in INFAUNA\_REF table, with the following exceptions:
  - 1. Treat *Turbellaria* spp. 3901SPP as good
  - 2. Treat Micrura spp. 43030205SPP as good
- Include both "good" and "bad" species for calculating the percent benthic opportunists.
- Do not merge taxa in each sample with the following exceptions:
  - 1. Merge *Turbellaria sp. 1* (3901SP01) with *Turbellaria spp.* (3901SPP)
  - 2. Merge Turbellaria sp. 2 (3901SP02) with Turbellaria spp. (3901SPP)
  - 3. Merge *Pholoe tecta* (50020601TECT) with *Pholoe minuta* (5001060101)
  - 4. Merge *Apistobranchus tullbergi* (5001420101) with *Apistobranchus typicus* (5001420103)
  - 5. Merge *Maldane glebifex* (5001630302) with *Maldane sarsi* (5001630301)
  - 6. Merge Euclymene cf. collaris (5001631102CF) with Euclymene collaris (5001631102)
  - 7. Merge *Clymenura polaris* (5001631202) with *Clymenura sp.* A (50016312SP01)
  - 8. Merge *Proclea sp. 1* (50016817SP01) with *Proclea graffi* (5001681702)
  - 9. Merge Ascidacea (8401SPP) and *Molgula* spp. (84060301SPP) with *Molgula manhattensis* (8406030108)
  - 10. Merge *Ampharete baltica* (5001670216) with *Ampharete acutifrons* (5001670208)
  - 11. Merge *Nereis* spp. (50012404SPP) with *Nereis grayi* ( 5001240409 )
  - 12. Merge Scaphopoda (56SPP) with *Dentalium entale* (5601010201)

- 13. Merge *Chaetozone* spp. (50015004SPP), *Chaetozone* sp. 4 (500150043SP04), and *Chaetozone* sp. 5 (50015004SP05) with *Chaetozone* setosa (50015004MB).
- Do not merge genus spp. and species just because there is only one species found in that genus.
- The list of benthic opportunists includes the following:

| Species                    | Species Code |
|----------------------------|--------------|
| Polydora cornuta           | 5001430448   |
| Capitella capitata complex | 5001600101   |
| Capitella spp.             | 50016001SPP  |
| Streblospio benedicti      | 5001431801   |
| Mulinia lateralis          | 5515250301   |
| Ampelisca macrocephala     | 6169020101   |
| Ampelisca abdita           | 6169020108   |
| Ampelisca vadorum          | 6169020109   |

### Data Aggregation:

 Calculate the benthic diversity indices and percent opportunists for each sample. These are defined as follows:

S = total distinct "good" species in the sample

N = total number of "good" individuals in the sample

N(i) = total number of "good" individuals in *i*th species

Sa = total distinct opportunist species in the sample

Na = total number of individuals (include "good" and "bad" species) in the sample

- 1. Total species = S
- 2. Log series alpha = N \* (1-x)/x

where:

x is defined by (x-1)/x\*ln(1-x) = S/N, and is determined numerically with a look up table in wh

and is determined numerically with a look up table in which x varies from 0 to 1 in increments of 0.000001

3. Shannon-Wiener H' = 
$$-\sum_{i=1}^{S} [(N(i)/N)*log_2(N(i)/N)]$$

- 4. Pielous  $J' = H'/log_2(S)$
- 5. Benthic opportunists = (Sa/Na)\*100%
- All samples within a station are treated as independent measurements so there is no data aggregation within a station.

• Calculate the yearly means of benthic diversity indices and percent opportunists using all samples from each year.

### **Baseline Calculation:**

- The distribution of the nine yearly means for each benthic diversity index was determined to be normal using Kolmogorov-Smirnov (Lilliefors Significance Correction) and Shapiro-Wilk tests for normality.
- The central 95th percentiles for these thresholds were calculated using: Upper threshold = baseline mean + 1.96\*(baseline standard deviation) Lower threshold = baseline mean - 1.96\*(baseline standard deviation)
- Benthic opportunist threshold is not based on baseline values.

### Threshold Testing:

• For each post-discharge even year, the average for the one (August) survey from the even year station set is compared against the caution and/or warning thresholds for even years in table 1. Likewise, for each post-discharge odd year, the average from the odd year station set is compared against the caution and/or warning thresholds for odd years in table 1. If the average of any benthic diversity index is greater than the upper threshold or smaller than the lower threshold, there is an exceedance for that year. If the average of benthic opportunists is greater than the threshold, there is an exceedance for that year.

## Standard Operating Procedure (SOP) for the Calculation of the Annual Threshold Value for Redox Potential Discontinuity Depth in Sediment

The methods used to calculate the baseline value of redox potential discontinuity (RPD) depth in sediment are described in this SOP.

**Threshold Testing** Caution Warning Baseline Param code **Baseline Years** ID Level (cm) Level (cm) Method area 1992-2000 (data available only in 1992, Arithmetic AVG RPD **SRPD** Nearfield 1.18 1995, 1997, 1998 through mean 2000)

Table 1: Sediment RPD Thresholds.

Data Source (Data from EM&MS database):

- Apparent RPD data are obtained from the SED\_PROF\_PARAM and SED\_PROF\_IMAGE table.
- Nearfield stations are specified as station IDs beginning with 'N', plus stations FF10, FF12, and FF13.
- There is one survey event each year. All events were conducted in August, except that the event S9702 in 1997 was done in August and October.

### Data To Be Used In The Analysis:

- Baseline calculations and threshold testing are performed on all nearfield.
- All RPD data from all baseline years are included. Exceptions are specified in the following:
  - 1. Data qualified as suspect/invalid (VAL\_QUAL contains 's'), investigation pending (VAL\_QUAL contains 'q'), and (VAL\_QUAL contains 'e') are not used. There are no 's' or 'q' qualified data in the current data set.
  - 2. For data qualified as above maximum detection limit (VAL\_QUAL='A'), the prism penetration value (PARAM\_CODE='AVG\_PEN') is used as a surrogate for RPD value.

### Data Aggregation:

- All RPD measurements within a station are treated as independent measurements so there is no data aggregation within station. This is consistent with how the faunal data are analyzed and thresholds calculated.
- The yearly mean is calculated using all nearfield measurements from each year.

### Baseline Calculation:

- The average of the six yearly means is the baseline mean.
- Caution threshold is 0.5\* baseline mean.

### Threshold Testing:

• For each post-discharge year, the annual average is compared against the caution threshold in table 1. If the annual average is smaller than the threshold, there is an exceedance for that year.

# Standard Operating Procedure (SOP) for the Calculation of the Annual Threshold Values for Sediment Toxic Contamination

The methods used to calculate the baseline values of sediment contaminants and to compare the nearfield average to the threshold are described in this SOP.

There are 26 thresholds related to toxic contaminants in sediments, based on NOAA Effects Range-Median sediment guidelines. The thresholds for DDT, PCB, LMWPAH, HMWPAH, and total PAH are based on the sum of concentrations of several chemicals.

| Parameter                   | Threshold ID | Testing area | Caution<br>Level | Warning<br>Level | Units    | Baseline Years                                  | Averaging Method |

| Parameter | ID        | area      | Level   | Level   |          |   |                 |
| cadmium   | STNCD     | Nearfield | -       | 9.6     | ug/g dry | 1992-2000 (data avail. only in 1992-1995, 1999) | Arithmetic mean |
| chromium  | STNCR     | Nearfield | -       | 370     | ug/g dry | 1992-2000 (data avail. only in 1992-1995, 1999) | Arithmetic mean |
| copper    | STNCU     | Nearfield | -       | 270     | ug/g dry | 1992-2000 (data avail. only in 1992-1995, 1999) | Arithmetic mean |
| lead      | STNPB     | Nearfield | -       | 218     | ug/g dry | 1992-2000 (data avail. only in 1992-1995, 1999) | Arithmetic mean |
| mercury   | STNHG     | Nearfield | -       | 0.71    | ug/g dry | 1992-2000 (data avail. only in 1992-1995, 1999) | Arithmetic mean |
| nickel    | STNNI     | Nearfield | -       | 51.6    | ug/g dry | 1992-2000 (data avail. only in 1992-1995, 1999) | Arithmetic mean |
| silver    | STNAG     | Nearfield | -       | 3.7     | ug/g dry | 1992-2000 (data avail. only in 1992-1995, 1999) | Arithmetic mean |
| zinc      | STNZN     | Nearfield | -       | 410     | ug/g dry | 1992-2000 (data avail. only in 1992-1995, 1999) | Arithmetic mean |

Table 1: Sediment Contamination Thresholds (continued).

### Data Source (Data from EM&MS database):

- Laboratory data from the Massachusetts Bay Soft Bottom Monitoring study for the parameters shown in table 2 for the various groups are used. These data are stored in the ANALYTICAL\_RESULTS table with supporting data in the BOTTLE and SAMPLE tables.
- Nearfield stations are specified as station IDs beginning with 'N', plus stations FF10, FF12, and FF13.
- There is one survey event each year, in August.

| Threshold              | Group        | Parameter | Parameter Description  | Parameter    |
|------------------------|--------------|-----------|------------------------|--------------|
|                        | (Group Code) | Code      | ·                      | Abbreviation |
| acenaphthene           | STNANP       | 83-32-9   | ACENAPHTHENE           |              |

Table 2: Sediment Contaminants included in each Threshold (continued).

### Data To Be Used In The Analysis:

- Baseline calculations and threshold testing are performed on the entire nearfield.
- All data from years in which all stations were sampled are included. Exceptions are specified in the following:
  - 3. Data qualified as suspect/invalid (VAL\_QUAL contains 's'), investigation pending (VAL\_QUAL contains 'q'), and (VAL\_QUAL contains 'e'), above maximum detection limit (VAL\_QUAL='A') are not used. There are no 's' or 'q' qualified data in the current data set.
  - 4. Data qualified as below detection limit ('a' qualifier) are treated as zero values.

### Data Aggregation:

- Laboratory analytical replicates, if any, are first averaged (bottle averages).
- All sediment chemical measurements within a station are treated as independent
  measurements so there is no data aggregation within a station. This is consistent with how
  the faunal data are analyzed and thresholds calculated.

- Annual averages for each parameter are calculated by averaging across all nearfield samples (or bottles) for a given year for each parameter.
- The annual values for DDT, PCB, and LMWPAH, HMWPAH, and total PAH are calculated by summing the annual averages of the parameters listed in table 2.

### **Baseline Calculation:**

• The threshold is based on NOAA sediment guidelines, rather than baseline values. However, the threshold testing script can be run for any year in which the nearfield was sampled. Note that in August 2000 only a subset of nearfield stations were sampled for contaminants, so those data are not included in the baseline computations and caution must be used if comparing them to baseline or discharge averages of all nearfield data.

### Threshold Testing (STN.SQL):

• For each post-discharge year, the nearfield average is compared against the caution threshold in table 1. If the nearfield average is greater than the threshold, there is an exceedance for that year.
