

VARIABILITY AND DISTRIBUTION OF DITRICHUM FLEXICAULE SENSU LATO IN THE CZECH AND SLOVAK REPUBLICS

VARIABILITA A ROZŠÍRENÍ MECHU DITRICHUM FLEXICAULE SENSU LATO
V ČESKÉ A SLOVENSKÉ REPUBLICE

IVAN NOVOTNÝ

Abstract

Novotný, I., 1997: Variability and distribution of *Ditrichum flexicaule* sensu lato in the Czech and Slovak Republics. *Acta Mus. Moraviae, Sci. nat.*, 81(1996):157–192 (with Czech summary).

The variability, fructification and distribution of the moss *Ditrichum flexicaule* s. l. in the Czech and Slovak Republics is evaluated. Methods of multivariate analysis were used in the evaluation of variability.

Key words: Mosses, multivariate analysis, *Ditrichum gracile* (Mitt.) Kunze, fructification.

Ivan Novotný, Department of Botany, Moravian Museum, Preslova 1, 602 00 Brno, Czech Republic.
E-mail mzm@mzm.anet.cz

Introduction

Ditrichum flexicaule s. l. is a variable taxon distributed over almost all the world. Frisvöll (1985) reports this complex from the following territories (according to Index Muscorum Wijk & al. 1962): Europe, North America 1, Central America 2, Asia 1, Asia 2, Asia 4, Australia 2.

In the Czech and Slovak Republics, two groups can be distinguished within this collective species. Besides *D. flexicaule* (Schleich. ex Schwaegr.) Hampe there is another conspicuous taxon. At present, according to Allen et al. (1994), this taxon should be named *D. gracile* (Mitt.) Kunze, described from Ecuador (= *D. crispatissimum* (C. Müll.) Par.). The taxonomy of the whole group has been treated by Frisvöll (1985).

Crum & Anderson (1981) report that *D. flexicaule* shows exceptional variability, and they furthermore write that at the extremes of development, several habitat responses have been recognized. Small plants with small leaves and only slightly excurrent costae have been called the var. *densum* (BSG) Braithw., and a form with even smaller leaves is called the var. *densum* fo. *brevifolium* (Kindb. ex Macoun) Grout. The var. *densum* frequently produces stout erect "flagelliform" branches; to this form the name fo. *estellae* Habeeb can be applied. Robust plants with long, loosely flexuose, and more or less twisted leaves with long excurrent costae have been called *D. giganteum* Williams and *D. flexicaule* fo. *sterile* (De Not.) Smirn.

According to Tuomikoski & al. (1973), *Ditrichum giganteum* appears to be distinct from *D. flexicaule*, 'judged from the growing immixed'. From our experience in the

Canadian Rockies and many other places, we have drawn just the opposite conclusion and have related all differences in size, appearance, and microscopic detail to conditions of growth (especially shade and moisture)." Duell (1992) also prefers evaluation of *D. crispatissimum* (= *D. gracile*) at the variety level only.

Frisvoll (1985), having evaluated taxonomically the whole collective taxon *D. flexicaule* s. l., conceives *D. crispatissimum* (C. Müll.) Par. (= *D. gracile*) on the species level. More recently, after Frisvoll's evaluation, the species was studied by Casas & al. (1990, 1992) in the Iberian Peninsula and the adjacent islands, and by Smith (1993) in Great Britain and Ireland. Smith (1993) writes of this taxon: "Although most specimens are easily identifiable, *D. flexicaule* and *D. crispatissimum* are poorly defined on a par with species such as *Racomitrium heterostichum* and *R. affine* or *Ulotrichum bruchii* and *U. crispa*."

The taxonomy of this group is difficult, in the first place because the ecological amplitudes of the two taxa overlap. *D. gracile* is apparently a relatively young taxon and is separated from *D. flexicaule* s. s. by a barrier which probably shows different intensity in different parts of its range, in depending on the ecological condition in each region.

This paper is part of a treatment of the genus *Ditrichum* Hampe in the region under study. Its purpose is also to evaluate and illustrate the variability of the taxa under study, using multivariate analyses. On the basis of a study of available herbarium material, the distribution in the region under study is also evaluated. Both species are comprehended as a poorly-defined species, as there exist some transitive forms between them, even if most specimens are easily identifiable.

Material

The results presented here are based on a study of herbarium specimens from the collections of BRA, BRNM, BRNU, CB (one specimen), LIT, OLM, OP, PL, PRC and those from private herbariums of B. Buryová (herb. BUR), RNDr. Z. Hradílek (herb. HRA), Z. Pilous (herb. ZP), and Prof. Dr. J. Váňa, DrSc. (herb. VAN). It was impossible to borrow material from the herbarium SLO for the necessary studies.

In herbarium specimens the term mixed "population" is given in quotation marks, as it only pertains to dead plants which have only been studied morphometrically. In the case of material included in multivariate analyses, the numbers of the respective samples are printed in boldface type in the list of localities. The multivariate analyses also included a number of specimens coming from territories other than the study region. These are listed in Table 2.

Methods

In order to understand the boundary between the two taxa within *D. flexicaule* s. l., it was necessary to carry out a morphometrical analysis. The use of multivariate methods in the evaluation of such series has been summarized, e. g., by Podani (1994). For the morphometrical analysis, I selected at random 95 specimens, coming mostly from the Slovak and Czech Republics. Ten such specimens came from other territories (see Table 2). Within this series, I also evaluated duplicate specimens deposited in various herbariums. In all, I have measured 29 duplicate specimens belonging to 13 "populations" from 13 localities.

The morphometrical analyses involved 7 characters which have also been used by other authors to separate the two taxa, and which are practically possible to evaluate in each specimen. They are the following: absolute number of hyaline cells at the edge of leaf base (hyacel); curvature of cell wall at leaf base near costa (curvat), using a 1-3

scale (straight, intermediate, curved); absolute length of leaf (leafle) in mm; awlness of leaf (awlnes), using a 1–3 scale (not awl-shaped, intermediate, awl shaped); length ratio of cells on costa: cells on leaf edge in its awl-shaped part (shorte), using a 1–3 scale (longer on costa, intermediate, shorter on costa than on edge); denticulation of leaf tip (tootne), using a 1–4 scale (1 = not toothed, 4 = most toothed); absolute breadth of tip at a distance of 35 µm. The values of each of these characters were determined three times and averaged for the multivariate analyses. The metric characters include hyacel, leafle, and tipbre. Ordinal scale was used to estimate the curvat, awlnes, shorte and tootne. Such a series, common in taxonomic studies, in which characters are estimated using various scale types, can be termed mixed data.

Two methods of multivariate analysis have been used to evaluate the data obtained:

1. First the principal component analysis (PCA) was used (Fig. 3) (ter Braak 1987). The method is based on correlation matrices. The individual samples were ordinated by means of this method. However, the use of this method is not quite correct, as it presumes that most characters show normal distribution. This, however, can only be presumed in the series under study for three of the seven characters measured (leafle, tipbre, hyacel). Using the PCA, however, the series was divided into two groups corresponding to my evaluation, those samples that were subjectively evaluated as transitive lying more or less between the two groups. The PCA has also made it possible to estimate the significance of the characters mentioned above (hyacel, curvat, leafle, awlnes, shorte, tootne, tipbre).

2. Second, the principal co-ordinate analysis (PCoA) was carried out (Figs. 4, 5), performed by the PRINCOOR programme from the SYN-TAX 5.0 parcel (Podani 1994) using the Gower coefficient. This method is earmarked for mixed data and thus can be considered to be quite appropriate for the case of the series under study. By means of this programme, I have obtained the co-ordinates of the particular samples on three axes. Fig. 4 shows the plots of these points on the base level. For both taxa, this figure shows only the visible samples, the intermediate types (rings) and the boundary separating them.

3. A dendrogram has also been constructed (Fig. 6) with the use of the Gower coefficient and the average linkage clustering method. The dendrogram clearly shows the position of all samples under study. Various letters have been used to indicate duplicate specimens from the same "population". Dashes denote transitive samples.

In 20 specimens included in multivariate analyses, also the axillary hairs were evaluated (Fig. 7). I measured their length (µm) and determined the number of cells that formed them. On the basis of results obtained from the PCoA, the specimens were classified under either taxon. The t-test was used to compare the mean lengths of axillary hairs in the two series. The specimens belonging to the intermediate series were not evaluated.

Since the fructification of the taxa under study may differ in different regions, it is important to estimate the fructification of the two taxa. Data on the percentages of fertile specimens of *D. flexicaule* are based on all herbarium specimens except those deposited in BRA, OP and LIT. In the region under study, *D. flexicaule* is more frequently fertile, and thus the approximate value of percentage of specimens which developed sporogons is sufficiently significant. In the study region, *D. gracile* is only exceptionally fertile, and I have evaluated all known fertile specimens from that region.

The localities in the Czech Republic are listed according to the phytogeographic division of Skalický (1988), those in Slovakia according to Futák (1980). Within individual districts the localities are arranged chronologically. In case a taxon was

repeatedly collected in a locality, this locality is included according to the earliest finding. The localities are indicated in cartograms by separate symbols only if they are more than 3 km apart. The central European mapping grid is included for better orientation (cf. Slavík 1986).

Tab. 1. Comparison of *D. flexicaule* and *D. gracile*, with emphasis on gametophytic characteristics (modified according to Frisvold 1985).

Character	<i>Ditrichum flexicaule</i>	<i>Ditrichum gracile</i>
Robustness and size (Table 1, 2: C, B)	usually the smaller of the two, usually not robust, (0.5) 1–5(–6) cm	usually the larger of the two, usually robust, (3)4–7.5 cm
Colour	usually dull green or brownish green	usually glistening yellowish-green or golden
Tomentum (Table 1, 2:A)	stems often densely matted with red-brown tomentum, but slightly tomentose tufts occur	usually less tomentose and the cushions looser, but rather densely tomentose tufts occur
Leaves, orientation when dry (Table 1, 2:A, B)	subulae rarely spirally twisted together, rarely falcate, not secund	subulae often spirally twisted together, often falcate, sometimes secund
Leaves, length (Table 1, 2:C)	relatively short, ± 3 mm	relatively long, 4–7 mm
Leaves, (Table 1, 2:C)	from base rather suddenly narrowed into a comparatively short subula	lamina more gradually tapering towards a comparatively long subula
Leaves, dentation of subula (Table 1, 2:D)	none or a few small teeth at the extreme apex, rarely more denticulate	frequently spinulose-denticulate at the apex and minutely denticulate for quite a distance down the margin, sometimes almost entirely
Costa, appearance and delimitation (Table 1, 2:E)	dorsally convex and well-defined towards the lamina	less dorsally convex and ill-defined
Costa, dorsal cells (Table 1, 2:G)	usually longer than the adjacent laminar cells	usually shorter than the adjacent laminar cells
Cells of the leaf base, structure (Table 1, 2:F)	isodiametric	or shortly rectangular with straight to slightly curved walls
Cells of the marginal border of the leaf base (Table 1, 2:F)	relatively short and thick-walled, usually distinctly marked towards the inner laminar cells in (0) 1–2(3) rows	narrow, elongate and frequently pseudohyaline, usually less marked towards the inner cells in (1)2–4 rows

Key distinction of the two taxa can be made as follows:

- a) Plants more robust, leaves 4–7 mm long, subulate, spirally twisted when dry, denticulate at the apex, dorsal costal cells on the upper part of the leaf usually shorter than the adjacent laminar cells. Cells of the leaf base usually elongate with curved walls. Cells of the marginal border of the leaf base narrow, elongate and frequently pseudohyaline.
- aa) Plants smaller, leaves ± 3 mm long, subulate, no denticulation at the apex, dorsal costal cells in the upper part of the leaf usually longer than the adjacent laminar cells. Cells of the leaf base isodiametric, or shortly rectangular with straight to slightly curved walls. Cells of the marginal border of the leaf base relatively short and thick-walled.

Ditrichum gracile

Ditrichum flexicaule

Results

Fig. 1 shows a typically developed *D. gracile* plant and details. The same parts of a typically developed *D. flexicaule* plant are shown in Fig. 2. The differences between these two taxa are shown in Table 1.

Fig. 3 shows the results of the PCA. The transitive forms, indicated by crosses (problematical samples by slanting dashes) lie between *D. flexicaule* (*D. f.*) and *D. gracile*

Figure 1. *Ditrichum gracile* (Mitt.) Kunze – A. Plant. B. Detail of the plant part. C. Leaves. D. Subula. E. Cross sections of the leaves. F. Cells of the leaf base. G. Dorsal costal and laminar cells of the leaf.

(D. g.). The vectors indicate characters on the basis of which the multivariate analysis has been implemented (hyacel, curvat, leafle, awlnes, shorte, tootne, tipbre). The distribution of the samples along axis 1 is explained by hyacel, curvat, leafle, awlnes and shorte. The fairly uniform distribution of the characters and the proximity of the vectors indicating them (awlnes – a supplementary vector) suggest their mutual correlation. The distribution of the samples along axis 1 is the least clearly explained by tootne and tipbre. The greater variability of characters found at the leaf tips, as compared with other parts of plant, is logical, since the leaf tips are the least protected against the influence of external environment. A similar phenomenon is also encountered in some other taxa (e. g. *Racomitrium*, *Schistidium* etc.). It is evident from the results of the PCA that the two groups pass into each other through the transitive types.

Fig. 4 shows the results of PCoA. The diagram only includes the visible samples of the series under study. The samples are densely aggregated in the right part of the dia-

gram (*D. f.*), indicating greater homogeneity of the *D. flexicaule* group as compared with *D. gracile*, the plots of which are more scattered in the left part of the diagram (*D. g.*). The transitive types are indicated by rings and surrounded by a solid line. The horseshoe shape of the belt they form is the result of the so-called arch (or horseshoe) effect, which is usually considered an undesirable property of metric ordination methods (Podani 1994). Furthermore, it is evident from the diagram that the two groups merge through transitive types which are less abundant than the typical taxa. The series is primarily divided along the first axis, which expresses the highest variability after the reduction of the original multidimensional space (Podani 1994). It is evident from Fig. 5 that the variability in the size of the third axis is greatest in the transitive samples.

In many respects, the results are much more clearly shown in the dendrogram in Fig. 6. From the dendrogram the exact position of all samples is evident. The position of duplicate "populations" indicates two facts: 1) The series under study comprises a mixed "population" (A, B, F, K). 2) The variability of the individual "populations" is considerable (C, H, J). The two groups into which the series under study is divided in case that the considerable variability and mixed "populations" are disregarded, are defined only at a high level of the Gower coefficient. The morphology and variability of the axillary hairs of both species is shown in Fig. 7. The mean length of the axillary hairs in specimens of *D. flexicaule* was $x = 184.0$ mm, s. d. = 22.9 mm ($n = 12$), that of *D. gracile* was

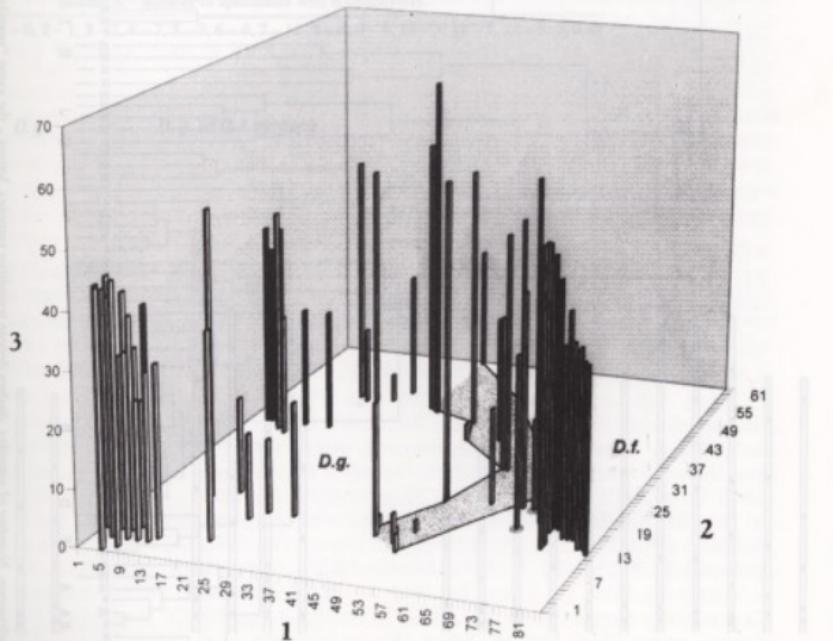

Figure 5. Principal co-ordinate analysis performed by PRINCOOR programme. Tridimensional diagram. Explanations as in Figure 4, dotted area = transitive samples.

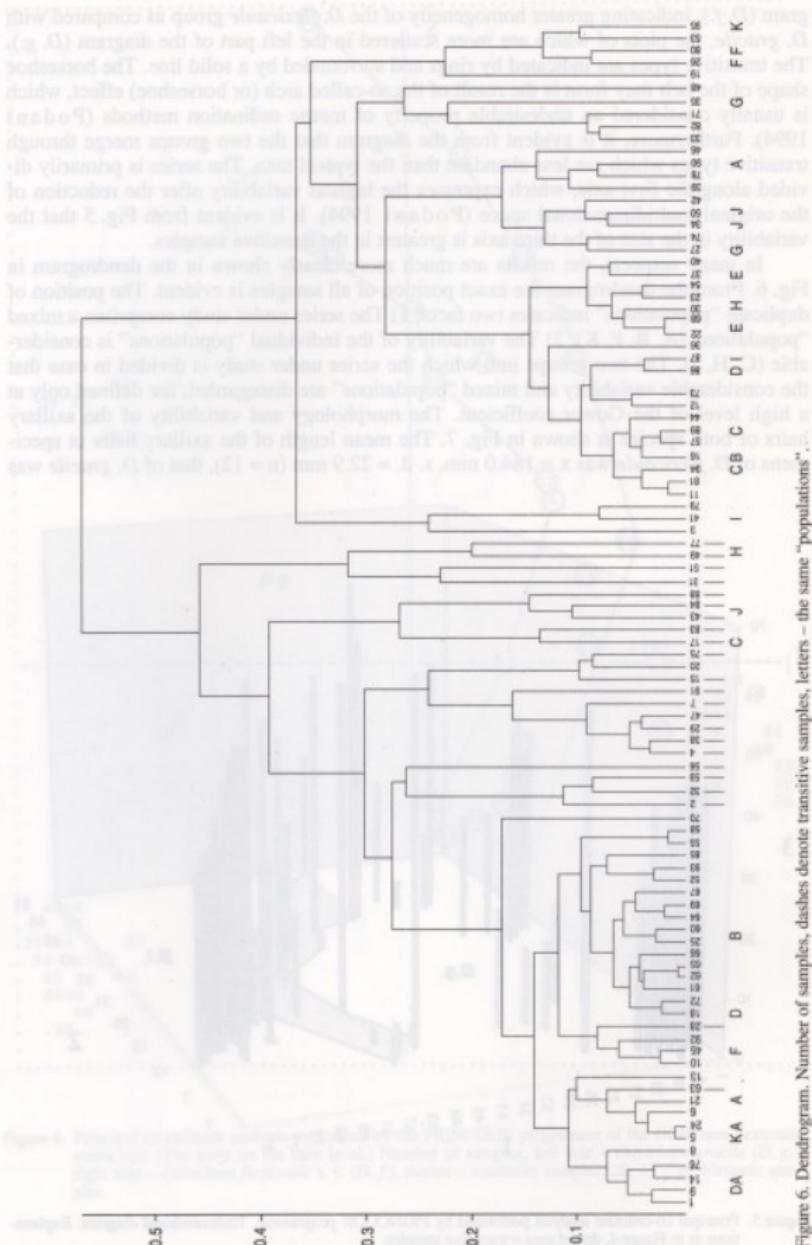

Figure 6. Dendrogram. Number of samples, dashes denote transitive samples, letters – the same "populations".

$x = 269.3$ mm, s. d. = 94.8 mm ($n = 4$). These mean values are statistically non-significantly different at $p = 0.05$. The evaluation of axillary hairs is impracticable in all specimens.

Taxonomical estimation of the group under study

In the case of typically developed plants, the two taxa can be separated by using a number of characters given in the table and key below. As follows from the preceding section, the series of the characters mentioned is variable and thus the table and key are not reliable in the case of transitive plants.

Distribution in the Czech and Slovak Republics

9 Biele Karpaty (south part)

Zemianské Podhradie, on Chúmov Ridge from Ivanovská dolina Valley, 7. 1869, J. L. Holuby, BRA; Limestone hill near Zemianské Podhradie (Nemes Podhragy), 8. 6. 1870, J. L. Holuby, BRA; Dry limestone hill near Bošáca, 6. 1870, J. L. Holuby, BRA; Zemianské Podhradie (Nemes Podhragy), on limestone rocks of the "Rešetárowec" Hill, 24. 10. 1886, J. L. Holuby, BRA. Nové Mesto, Černochov, 8. 1885, V. Schiffner, BRA.

10 Malé Karpaty

Vápenná (Raxturm), 23. 5. 1926, J. Podpěra, c. sp., PR. Limestone slope below ruin near Plavecké Podhradie, 450 m, 15. 8. 1938, J. Šmarda, BRNM; Pohanská hora Hill near Plavecké Podhradie, limestone rocks, 450 m, 15. 8. 1938, J. Šmarda, BRNM; Near cave below Plavecký hrad Ruin, 5. 4. 1958, Z. Pilous, herb. ZP; Plavecké Podhradie, limestone rocky steppe N of village, 300 m, 27. 9. 1967, V. Pospíšil, BRNM; Plavecký hrad Ruin, cave, 8. 1968, Z. Pilous, herb. ZP. Holý vrch Hill near Smolenice, 4. 5. 1951, J. Šmarda, BRNM; Trstín, Holý vrch, W slope, 370 m, 23. 6. 1954, M. Růžička, BRA. Ostrý kameň Rock, 4. 4. 1958, Z. Pilous, herb. ZP. About 1.5 km NE of the village Hradiště pod Vrátnom, on limestone rocks on right side of the road, 260 m, 20. 5. 1976, R. Doležal, BRA, BRNM, OP.

12 Tribeč

Nitra, Kalvárie, Jurassic limestone above Nitra, 200 m, 25. 5. 1928, R. Doležal, BRNU. Nitra, Gýmeš castle Ruin, on rocks, 450 m, 26. 5. 1928, R. Doležal, BRNU. Nitra, in crevices of rocks on top of Zobor, 570 m, 24. 5. 1928, R. Doležal, BRNU, dtto, 560 m, 26. 5. 1928, BRNU; Steppe plateau above Svorádova jeskyně Cave below Zobor near Nitra, 12. 4. 1936, V. Vlach, BRNM, dtto, 23. 5. 1952, BRNM; On limestone rocks south of the Zobor Mt. near Nitra, 400–500 m, 3. 6. 1958, A. Boros, OP. Limestone rocks on N slope of Žíbrica above Žírány, 9. 6. 1938, V. Vlach, BRNM. Pleška near Dražovce in the Zobor group of Tribečské vrchy mts. near Nitra, 18. 6. 1952, V. Vlach, BRNM.

13 Strážovské a Súľovské vrchy

Súľov, on rocks, 5. 1871, J. L. Holuby, BRA; Near Súľov, limestone rocks, 3. 6. 1922, J. Podpéra, c. sp.; Near Petrikova skála limestone rock, 5. 6. 1922, J. Podpéra, c. sp., PR; Manín, 1935, Z. Pilous, herb. ZP, PRC; Súľov, In valley of the river E of village, 5. 4. 1947, J. Jedlička, BRNM; On sandy limestone rock in the valley near Maninská soutěška Defile, near Záskalie village, 400 m, 6. 4. 1947, J. Jedlička, J. Müller, partly c. sp., BRNM, BRNU, OP; On limestone rock in Maninská soutěška Defile, 6. 4. 1947, J. Jedlička, c. sp., BRNM; Maninská soutěška Defile, limestone rock towards NW, 400 m, 17. 10. 1967, V. Pospíšil, BRNM; Small Maninská soutěška Defile, rocks, 30. 8. 1971, Z. Pilous, BRA, OP; Súľov, defile around spring, 30. 8. 1971, Z. Pilous, BRA, OP, dtto, rocks around waterfall, 30. 8. 1971, Z. Pilous, BRA; Súľovská soutěška Defile, lateral gorge, 30. 8. 1971, Z. Pilous, BRA; Súľov above church, sunlit limestone rocks, 3. 9. 1971, Z. Pilous, BRA; Súľov, shady side of limestone rocks above church, 3. 9. 1971, Z. Pilous, OP, BRA; Maninská soutěška Defile, mouth of gorge, 3. 9. 1971, Z. Pilous, BRA, OP. Trenčanské Teplice, "Baba", limestone soil, 6. 6. 1922, J. Podpéra, PR. Trenčín baths and environs, on ground at Klepáč Mt., 5. 1929, M. Béňa, BRA, dtto, on rocks, 8. 5. 1934, M. Béňa, BRA. On limestone slope above locality of *Rhus cotinus* near Timoradza, 6. 1936, V. Vlach, BRNM; Bánovce n. B., Smradlavý vrch Hill near Timoradza, limestone rocks, 11. 8. 1938, J. Šmarda, BRNM, PR. Bánovce n. B., limestone rocks near Slatinka, 11. 8. 1938, J. Šmarda, BRNM; Slatinka n. B., on ground, 300 m, 1. 5. 1949, M. Ballogh, herb. ZP, dtto, near spring, 350 m, 4. 5. 1949, M. Ballogh, herb. ZP, dtto, s. d., M. Ballogh, BRA. Bánovce n. B., Latkovský les Forest, on ground, s. d., M. Ballogh, BRA, dtto, Uhrovec, on rock, s. d., M. Ballogh, BRA. Povážská Tepľá, valley 2 km SW of village, on limestone stones and rocks, 350 m, 21. 10. 1969, V. Pospíšil, BRNM. Dolný Hričov, 0.5 km SE of village, pasture, 350 m, 13. 8. 1970, V. Pospíšil, BRNM. Strážov, top, small limestone rocks, 14. 9. 1976, J. Kúrková, BRNM; Zliechov village, Strážov Mt., 1200 m, 21. 6. 1989, J. Váňa, herb. VAN. Trenčanské Mitice, steppe slope near quarry 3 km SW by W of church in Kostolné Mitice, 360 m, 25. 7. 1977, V. Pospíšil, BRNM. Hričovské Podhradie, 350 m, 10. 5. 1986, J. Duda, OLM, dtto, Kominy, 450 m, 2. 5. 1987, J. Duda, herb. ZP; Lietavská Lúčka village, limestone W slopes, 400 m, 28. 9. 1986, J. Duda, herb. ZP; Lietavská Svinná, Strážná Hill, 680 m, 19. 4. 1987, J. Duda, herb. ZP; Lietava village, rocks near road, 430 m, 15. 8. 1991, Jiří Duda, herb. ZP; Dubnica n. V., Košecké Podhradie village, ruin, 350–400 m, 11. 8. 1991, J. Duda, herb. ZP 51. Porúbka village, valley of river below Borgy Hill, 380 m, 25. 3. 1989, J. Duda, BRNM, herb. ZP 13, dtto, hill toward E, 480–500 m, 2. 2. 1991, Jiří Duda. Jasenové, valley of river, 500 m, 26. 3. 1989, Jiří Duda, BRNM.

14b Vtáčnik

Veľké Pole, Molerov Štál 4 km W of church, limestone grassy hill (pasture), 580 m, 10. 6. 1975, V. Pospíšil, BRNM.

14e Štiavnické vrchy

Sklenné Teplice, 1.5 km S of village, on limestone rocks in forest, 400 m, 7. 6. 1984, I. Novotný, BRNM. **Vyhne**, 2 km E of village, limestone rock on limit of forest, in pasture, 500 m, 7. 6. 1984, I. Novotný, BRNM.

14f Javorie

Pliešovce near the town of Zvolen, 1 km E of village on limestone stones, 450 m, 9. 6. 1984, I. Novotný, BRNM.

16 Muránská planina

Near path to Muráň castle ruin, 950 m, 5. 1929, R. Doležal, c. sp., BRNM. **Dolní Martinová**, between Tisovec and Muráň, 420 m, 5. 1929, R. Doležal, BRNM. **Cigánka**, above Muráň village, 940 m, 5. 1929, R. Doležal, c. sp., BRNM. Not far from gamekeeper's lodge on Veľká lúka Meadow, 1000 m, 5. 1929, R. Doležal, BRNM. NW slope of Cigánka along hiker's path toward Muráň, limestone rock, 500–800 m, 24. 9. 1963, V. Pospíšil, BRNM. **Červená skala** Rock, small limestone rocks on left bank of Hron River, 750 m, 16. 8. 1976, J. Dvořák, BRA, BRNM. **Veľká Stožka** nature reserve, limestone rocks, 1100–1200 m, 19. 9. 1995, B. Buryová, herb. BUR.

17 Slovenský raj

Kláštorisko, 12. 7. 1938, Z. Pilous, c. sp., herb. ZP; On limestone rocks between Kláštorisko and foot of Suchá Belá Mt., 13. 7. 1959, J. Šmarda, c. sp., BRNM. **Kyseľ**, limestone walls, 600 m, 26. 7. 1938, J. Šmarda, BRNM, ditto, 26. 8. 1938, BRNM. **Pusté Pole** in Dobšinská dolina Valley, limestone rocks, 700 m, 18. 12. 1957, J. Tomášek, BRNM; Above Hnilec (Göllnitz) River near Pusté Pole, 900 m, 11. 6. 1958, A. Boros, OP; Pusté Pole, on limestone rocks at Vernár railway station, 910 m, 1. 8. 1967, L. Pokluda, c. sp., BRNM. **Vernár**, small limestone rocks above village, 850 m, 15. 7. 1968, L. Pokluda, c. sp., BRNM. **Železná vrata**, S shaded side, 14. 10. 1969, V. Pospíšil, BRNM. Čingov, exp. S 30°, limestone rocks, *Brachypodium-pinetum*, 550 m, 13. 8. 1971, J. Michalko, BRA, ditto, 600 m, BRA; Hrabišice, Hornád River gorge, 6. 1978, Z. Pilous, BRA, BRNM, OP, herb. ZP; Hrabišice, 1 km NW of Kláštorisko group of cottages, 9. 6. 1979, J. Kúrková, BRNM. **Stratená** near Dobšinská Ľadová Cave, Z. Pilous, BRNM.

18 Stredné Pohornádie

Košice, on serpentine rocks at Jaklovce, near Margecany, 26. 5. 1928, R. Doležal, BRNU, ditto, (Jekelsdorf b. Göllnitz), 8. 1930, H. Laus, PR, ditto, (Kalkberg b. Jekeldorf), 8. 1930, H. Laus, OP. Margecany, Vápenica, limestone rocks, 669 m, 28. 7. 1937, J. Šmarda, BRNM. Margecany, Sivec (784 m), limestone rocks, 27. 7. 1937, J. Šmarda, c. sp., BRNM. Branisko, Rajtopiky (1,043 m), limestone rocks, 1. 8. 1938, J. Šmarda, BRNM. Margecany, Folkmarská skala Rock, limestone rocks, 918 m, 6. 8. 1938, J. Šmarda, BRNM. Košice, Malá Vieska, 8. 7. 1958, J. Šmarda, BRNM. Prešov, Rudník, limestone rocks on ridge, S below top, 1,000 m, 3. 8. 1959, V. Pospíšil, BRNM. Prešov, Lipovce, "Kamenná baba" valley, 600 m, 4. 8. 1959, V. Pospíšil, BRNM, ditto, SW of "Húrky", 5. 8. 1959, V. Pospíšil, c. sp., BRNM, ditto, "Húrka", 6. 8. 1959, V. Pospíšil, BRNM; Lipovce, "Kamenná baba" valley, 9. 1973, Z. Pilous, OP, herb. ZP 21, 24; 4. 1989, Z. Pilous, herb. ZP 14.

20 Vihorlatské vrchy

Podhorod, 15. 3. 1937, J. Buček, BRNM; Popričný Mts., Podhorod, NW by N village outskirts, pasture near ruin, limestone rocks, 18. 6. 1970, V. Pospíšil, BRNM.

21a Lúčanská Fatra

On Klak Mt., 1,200 m, 6. 1931, J. Suza, PR; Klak, 7. 9. 1940, J. M. Novacký, BRA; Klak, 1,362 m, 9. 1937, Z. Pilous, BRA, OP, herb. ZP 4. Strečno, 1934, Z. Pilous, herb. ZP 9, 18. Žilina, on rock, s. d., M. Balloch, BRA. Turčianská kotlina Valley, Valča, exp. S 40°, dolomite, *Brachypodio-pinetum*, 520 m, 13. 7. 1971, J. Michalko, BRA. Stráňavy, defile in the valley of Hyrov, 500 m, 27. 6. 1978, J. Duda, herb. ZP. Žiar, Jasenovo, limestone rocks above left bank of brook 0.5 km SW of village, exp. S, 630 m, 3. 7. 1980, V. Pospíšil, BRNM. Višňové village, top of Valentínov diel Mt., 800 m, 17. 8. 1984, Jiří Duda, BRNM, ditto, rock at foot of Valentínov diel Mt., in Višňovská dolina Valley, 600 m, 6. 8. 1989, J. Duda, BRNM, herb. ZP. Turie village, top of Kozol Mt., 1,140 m, 20. 10. 1984, J. Duda, BRNM, OLM, herb. ZP, ditto, Turská skála Rocks at Turianský potok Brook, 400 m, 26. 9. 1987, J. Duda, herb. ZP, ditto, valley of Turianský potok Brook, 500 m, 8. 5. 1988, J. Duda, herb. ZP 20, ditto, top of Čipiecie Mt., 932 m, 13. 8. 1988, Jiří Duda, OLM. Kamenná village Poruba, valley of Porubský potok Brook, 550 m, 21. 10. 1989, J. Duda, BRNM. Martinské hole mts., mountain between Minčol Mt. and Jastrabná Mt., 1,100 m, 17. 8. 1992, Jiří Duda, BRNM.

21b Krivánská Fatra

Below Suchý vrch Hill, 8. 1928, R. Doležal, BRNU; Suchý, 1,400 m, 1934, Z. Pilous, herb. ZP, ditto, mountain peak among dwarf pines, 7. 1979, Z. Pilous, BRA, OP, herb. ZP. Suchý, Biele skaly Rocks, 9. 1979, Z. Pilous, OP, herb. ZP 45. On limestone rocks near ruin of Starý hrad Castle, 460 m, 6. 1933, Z. Pilous, BRA, BRNU, OP, PR. Ozhora Valley, 1934, Z. Pilous, herb. ZP. Stráže, 1934, Z. Pilous, c. sp., herb. ZP. Párnica, granite, 1935, Z. Pilous, herb. ZP. Rozsutec, limestone rocks, 1,500 m, 8. 1936, J. Šmarda, BRNM; On limestone rock of peak Malý Rozsutec, 1,226 m, 6. 7. 1951, J. Duda, OP; Bílé skály Rocks near Velký Rozsutec Mt., 1,150 m, 6. 7. 1951, J. Duda, OP; On limestone rock in valley of Biela River SE slope of Rozsutec Mt., 1,100 m, 17. 6. 1965, I. Pišút, BRA; Rozsutec, Nové diery Rocks, limestone rocks, 8. 1972, Z. Pilous, c. sp., OP, herb. ZP, ditto, rocks on peak, 8. 1972, Z. Pilous, BRA, OP, herb. ZP, ditto, Skalné mesto, limestone rocks, 8. 1972, Z. Pilous, BRA, OP, herb. ZP, ditto, Poľudňové skály Rocks, limestone rocks, 8. 1972, Z. Pilous, BRA, OP, herb. ZP, ditto, Štefanová, pastures above Slahorka, 8. 1972, Z. Pilous, BRA, OP; Chleb, limestone rocks, 1,500 m, 8. 1937, J. Šmarda, BRNM. Jánošíkove diery Rocks, on rock, 700 m, 9. 7. 1971, A. Fekiačová, BRA. Tiesňavy, 7. 1978, Z. Pilous, herb. ZP 2. Veľká Bránica, 9. 1978, Z. Pilous, BRA, OP, herb. ZP, ditto, 7. 1978, herb. ZP. Strateneč, 8. 1979, Z. Pilous, herb. ZP. Vrátná Reserve, 9. 1980, Z. Pilous, BRA, OP, herb. ZP; Vrátné, s. d., A. Zlatník, BRNM. Fatranský Kriváň Reserve, 9. 1980, Z. Pilous, BRA, BRNM, OP, herb. ZP 5. Sokolec Reserve, 6. 1984, Z. Pilous, BRA, OP, herb. ZP 25. Nezbudská Lúčka village, limestone rocks, 400 m, 27. 9. 1986, J. Duda, herb. ZP.

21c Veľká Fatra

Javorina, limestone rock, 1,330 m, 8. 1936, J. Šmarda, BRNM. Čierny kameň, 8. 1952, Z. Pilous, herb. ZP. Suchý vrch (1554 m), limestone rock, 9. 7. 1953, J. Šmarda, BRNM. Gaderská dolina Valley, 1963, Z. Pilous, herb. ZP, ditto, on dry shaded limestone rocks above road, exp. N, 800 m, 9. 7. 1969, V. Peciar, BRA 93, BRNM; Blatnica, Gadier, Padva Reserve, 5. 1967, Z. Pilous, BRA, OP, herb. ZP 6; Blatnica, rocks above village, 5. 1975, Z. Pilous, herb. ZP; Blatnica, Tlstá, 1,400 m, 7. 1976, Z. Pilous, BRA, OP, herb. ZP, ditto, Blatnická dolina Valley, Jasienok, 8. 1976, Z. Pilous, BRA, OP. Foot of Žarnovka beyond Korytnica towards Donovaly, *Festucetum sulcatae*, exp. S-SE, 740 m, 1. 7. 1963, J. Michalko, BRA. Suchý vrch Mt.,

spruce forests, 1,500 m, 10. 6. 1987, A. Kubinská, BRA; Suchý vrch Mt., 15 m below peak from S, 1,535 m, 2. 10. 1987, A. Kubinská, BRA. CHPV Bukovina, travertine terrace, 640 m, 11. 8. 1988, A. Kubinská, BRA. Babia hora, s. d., Pantoczek, BRA.

21d Chočské vrchy

Prosiek, 7. 1937, J. Jedlička, BRNM; On limestone rocks in Prosecká dolina Valley, 700 m, 14. 8. 1969, R. Doležal, BRNM, ditto, 2 km NW by N of village, Prosečanský Žleb Gully, 750 m, 13. 6. 1971, V. Pospíšil, BRNM; Prosiecka dolina Valley, rocky limestone slopes above brook, 800 m, 15. 10. 1972, J. Horničková, BRNM. Choč, limestone rocks, 7. 1952, Z. Pilous, herb. ZP. Ružomberok, travertine "v Lúčkách", 7. 1958, Z. Pilous, herb. ZP; Lúčky, 7 km NW by W "Pod Holicou", grassy hill on watershed, pasture, 830 m, 6. 8. 1969, V. Pospíšil, BRNM. Ružomberok, Valaská Dubová NW, Brestová, places with limestone stones, 740 m, 6. 8. 1969, V. Pospíšil, BRNM.

22 Nízké Tatry

On dolomite rock in spruce forest on slope of Hradovica near Malužiná, 17. 7. 1935, V. Vlach, c. sp., BRNM; Malužiná, in valley of Svidný potok Brook, 1. 10. 1960, J. Smarda, BRNM; in valley below Veľký Bok Mt., 1,600 m, 17. 8. 1967, J. Váňa, herb. VAN; Small limestone rocks below peak of Veľký Bok, 1,650 m, 17. 9. 1974, J. Dvořák, BRA, BRNM; Malužiná, Veľký Bok (1,727 m), crevices of small limestone rocks on S ridge, 1,600 m, 26. 5. 1975 c. sp., 7. 7. 1978, 26. 7. 1978 c. sp., L. Pokluda, BRNM; Kráľova Lehota, Svarinka Valley, Veľký Bok (1,727 m) on limestone stones in humid gully on NW slope below E ridge, 1,480 m, 9. 9. 1981, L. Pokluda, BRNM. Liptovský Hrádok, on limestone rock of Borová hora Mt., 880 m, 2. 11. 1952, J. Duda, OP, ditto, on limestone rock near Porúbka village, 800 m, 2. 5. 1953, J. Duda, OP; Liptovská Porúbka, Selnice (1,243 m), half-shaded little limestone rocks on N foot, exp. W, 730 m, 19. 9. 1980, L. Pokluda, BRNM, ditto, half-shaded little limestone rock in brook valley towards Brtkovice, exp. NE, 780 m, 26. 5. 1982, L. Pokluda, BRNM. Poprad. Baba near Lučivná, 600 m, 19. 7. 1953, J. Smarda, BRNM. Liptovská Lužná, Salatín, 21. 7. 1957, Z. Pilous, herb. ZP, ditto (1,630 m), limestone (dolomite) little rocks on W slope, exp. SW, 1,500 m, 17. 5. 1981, L. Pokluda, BRNM. Below Siná, 7. 1958, Z. Pilous, c. sp., herb. ZP; Siná, 8. 1959, Z. Pilous, herb. ZP, ditto (1,560 m), half-shaded rock on S ridge, exp. SW, 1400 m, 14. 9. 1979, J. Pokluda, BRNM, ditto, E ridge, shaded base of small limestone rocks, exp. N, 1,500 m, 12. 10. 1979, L. Pokluda, BRNM, ditto, Na jame (1,438 m), half-shaded limestone rock on NW ridge, exp. SW, 1,050–1,170 m, 2. 6. 1980, 23. 6. 1984 SW ridge, 1,460 m, L. Pokluda, BRNM, ditto, unshaded limestone rock on NW ridge, exp. N, 1,400 m, 2. 6. 1980, L. Pokluda, BRNM. Krakova hole Mt., 7. 1958, Z. Pilous, herb. ZP; On N slope of Krakova hole Mt., dolomite substrate, 1,700 m, 15. 6. 1968, Jeslík, BRA, ditto (1,751 m), top dolomite small rocks, exp. NE, 1,740 m, 23. 6. 1974, 13. 10. 1979, 8. 8. 1980, 27. 5. 1972, 19. 9. 1985, L. Pokluda, BRNM. Predajná, on limestone small rocks above Jasenský potok Brook N of village, exp. SE, 480 m, 19. 7. 1966, L. Pokluda, BRNM. Lupča, SW by W, dolomite hill above road, 400 m, 21. 5. 1968, V. Pospíšil, BRNM; Partyzánska Lupča, Lupčanská dolina Valley, small rocks along road, 760 m, 30. 9. 1989, L. Pujmanová, LIT. On NW slope of Kozie Chrbty below Ďumbier Mt., limestone substrate, 1,600 m, 29. 9. 1969, Jeslík, BRA **92**. Liptovský Ján, Stanišovská dolina Valley, shaded limestone rock, 850 m, 28. 6. 1973, L. Pokluda, BRNM, ditto, Pred Bystrou, Javorie Valley, half-shaded limestone rock, 1,150 m, 22. 6. 1974, L. Pokluda, c. sp., BRNM; Pred Bystrou, limestone rock 1.5 km W of gamekeeper's lodge, 1,050 m, 11. 5. 1978, L. Pokluda, BRNM. Unidentified localities

Síp, Orava, J. Klika, PR ad *D. f.* vergens. Poprad, 7. 1937, J. Jedlička, BRNM.

The distribution of *D. flexicaule* and *D. gracile* in the Czech and Slovak Republics is shown in Figs. 8 and 9. Most of the localities of *D. flexicaule* are concentrated in the Slovakian part of the Western Carpathians. There *D. flexicaule* is not found in regions formed by acid volcanic rocks. In mountain ranges also containing limestone or other

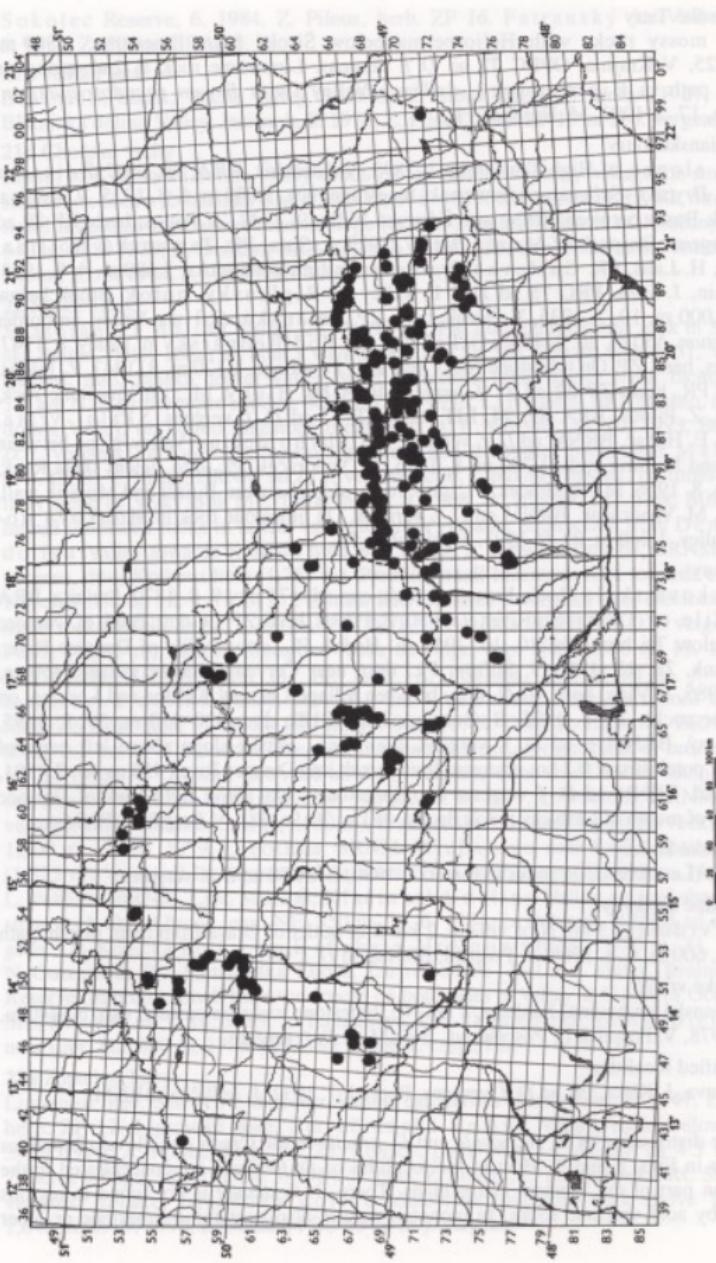

Figure 8. Distribution of *Ditrichum flexicaule* (Schwaeg.) Hampe.

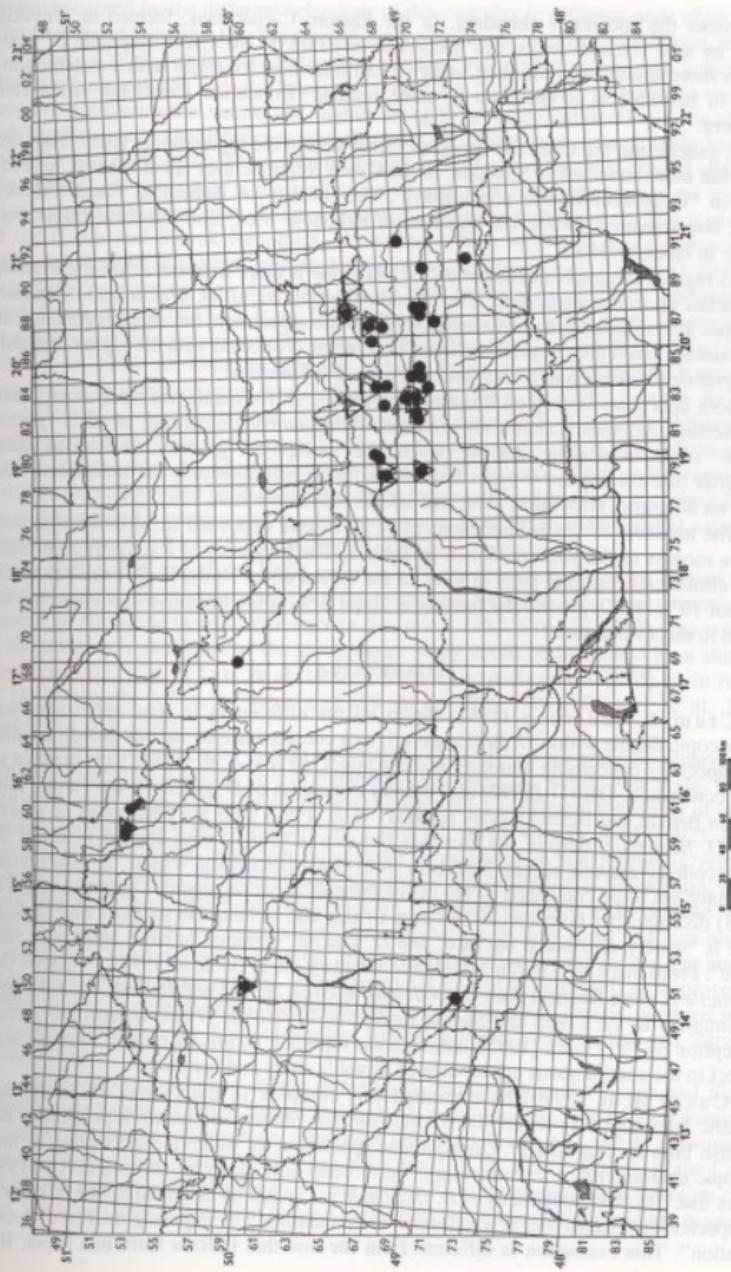

Figure 9. Distribution of *Ditrichium gracile* (Mitt.) Kunze – full dots, transitive samples – triangles.

basic rocks the species is abundant. In the Eastern Carpathians, formed in Slovakia mostly by acid volcanic rocks, this species is very rare. In the Czech Republic *D. flexicaule* is more abundant in Moravia, where it can find more localities with a suitable substrate. In Bohemia it is abundant in some regions (Bohemian Karst) but rather rare elsewhere.

D. gracile and the transitive types are rather rare in the region under study. They are somewhat more abundant in Slovakia. In the Czech Republic they occur scantily (one locality in "Českokrumlovské předšumaví"; one locality in Bohemian Karst ("Český kras"), also transitive forms; six localities in Krkonoše Mts., also transitive forms; one locality in Jeseníky Mts.)

As regards orographic distribution, *D. flexicaule* is more frequent at lower elevation, but reaches up to the alpine belt. The altitudinal amplitude of *D. gracile* and the transitive types also reaches from low elevations up to the alpine belt, but they predominate in the mountain and higher vegetation belts. This fact is connected with the higher demands of *D. gracile* for shade and greater and more durable humidity.

Both taxa grow largely on limestone substrates. *D. flexicaule* has rarely been found on travertine, dolomite, calciferous sandstone, Permian conglomerates, phyllite, "granosyenite" rocks, serpentine, diabase, teschenite, melaphyre, granite and Silurian slate; *D. gracile* and the transitive types have been found predominantly on limestones, also rarely on dolomite, serpentine, slate and calciferous mica schist.

The numbers of fertile specimens of *D. flexicaule* deposited in herbariums in successive months of the year are shown in Table 3. The frequency of fructification is highest in climatically optimal parts of year. In the region under study, *D. flexicaule* is fertile at about 10 %. In *D. gracile* the fertility is about 3 %, if the transitive specimens are included in this evaluation.

Discussion

Crum & Anderson (1981) report all the differences in size, appearance and microscopic details within *D. flexicaule* s. l. as a consequence of various growth conditions, especially concerning humidity and shading. Corley & al. (1981) have drawn a similar conclusion. Duell (1992) also prefers evaluation of *D. gracile* at the variety level only. In Britain and Ireland Corley (in Hill & al. 1992) does not distinguish *D. gracile* from *D. flexicaule*, despite the fact that Frisvoll (1985), who studied in detail the whole collective taxon, reports both taxa from Great Britain and writes: "British bryologists have yet to be convinced of the distinctness of these segregates". However, Smith (1993) distinguishes both species in Great Britain and Ireland. He suggests that *D. flexicaule* is "widely distributed but rare" and *D. gracile* "common in basic areas, rare elsewhere". From maps by Smith (1993) and Corley (in Hill & al. 1992), it follows that *D. gracile* is more frequent than *D. flexicaule* in Great Britain and Ireland. It is the opposite situation in the Czech and Slovak Republics. Nyholm (1986) accepts the species conception by Frisvoll (1985), although she reports it *D. gracile* only in a remark with respect to the simultaneous appearance of Frivoll's study and her own.

Casas & al. (1990) have studied this complex in the Iberian Peninsula and Balearic Isles, and they write: "Direct macroscopic observation makes it possible to distinguish both species easily". Questionable specimens, in which a confirmation of microscopic characteristics was necessary, were found only rarely by them. Smith (1993) writes that "95 % of specimens of *D. flexicaule* s. l. could be allocated to one or other of the species with naked eye or a $\times 10$ lens, the remaining 5 % requiring microscopic examination". This evaluation is different from the one that follows from this paper. It is

probably caused by the different behaviour of this complex in different parts of its range. The barrier between the two taxa could have a different intensity in different regions.

Casas & al. (1990) also dealt with chorology and ecology in the area under study (Iberian Peninsula and Balearic Isles) and found that *D. flexicaule* possessed a more expressive Mediterranean nature and higher drought tolerance, while *D. gracile* showed sub-Mediterranean characteristics and demands for higher and more durable humidity (also Casas & al. 1992). *D. gracile* forms tall and extensive stands in shaded and moist places, while *D. flexicaule* is more common in rock crevices. Both species are confined to calcareous substrates from 300 m a. s. l. to the alpine (subalpine) belt. This is also true of the Czech and Slovak Republics. Nyholm (1986) reports *D. gracile* growing on basic, moist rocks in shaded habitats, beside streams, in ravines etc., while *D. flexicaule* is reported as growing on calcareous soil, in rock crevices, in rich fens, sometimes in sand dunes. Tuomikoski & al. (1973) report *D. gracile* to be more common than *D. flexicaule* in Newfoundland. The same follows from Smith (1993) and Corley (in Hill & al. 1992) for Great Britain and Ireland. In the Iberian Peninsula *D. gracile* is also somewhat more common than *D. flexicaule* (Casas & al. 1990). Frahm (in Frey & al. 1994) writes: "Selten mit Sporogonen. In dichten dunkelgrünen Polstern auf Kalkböden durch ganz Europa, in Trockenrasen oder auf trockeneren Felsen relativ niedrig, an feuchten Standorten in großen lockeren Polstern. Sehr große Formen in feuchten Schluchten und an Wasserfällen sind als var. *sterilis* De Not. (var. *longifolium* Zett.) beschrieben worden und werden von einigen Autoren als eigene Art *D. crispatisimum* (C. Müll.) Par. (*D. giganteum* Williams) angesehen."

Ochyra & Kuta 1990(1992) report n = 13 for *D. gracile*, which is a usual chromosome number for various species of the genus *Ditrichum*, and the basic chromosome number of the whole family *Ditrichaceae* (Fritsch 1982, Steere 1972). The solution of the taxonomic problems of the group under study could be facilitated by a study of isoenzymes (cf. e. g. Wyatt & al. 1992, 1993, Shaw & Srodon 1995) or, in future, of DNA directly (cf. e. g. Marienfeld & al. 1989, 1991, Reski & al. 1994, Gazdová & al. 1995).

In different regions the two taxa under study (*D. f.*, *D. g.*) are mutually separated by differently intensive barriers. This is apparently true even on a world-wide scale. Due to their different ecological requirements, the two taxa show a different frequency of occurrence in different parts of their range (e. g. Smith 1993, Casas & al. 1992). In the region under study the transitive types have been found in the following regions: Bohemian Karst, Krkonoše Mts. (Czech Republic); Krivánská Fatra, Veľká Fatra, Nízké Tatry, Západné Tatry, Belanské Tatry, Pieniny, Západné Beskydy Mts., Spišské vrchy Hills (Slovakia). These are mostly territories in which both taxa occur and may also be fertile (largely mountain regions). Thus, occasional hybridisation and its vestiges may be assumed to occur in these regions. This hypothesis has yet to be proved or disproved by further studies. Merely the transitive types, and not the typical *D. gracile*, occurred in the phytogeographical units Spišské kotliny basins (Spišské vrchy Hills) and Západné Beskydy Mts.

As concerns comparison of the distribution frequencies in the Czech and Slovak Republics with those of Great Britain and Ireland, is the opposite ratio of their frequency similar to the species *Pleuridium subulatum* (Hedw.) Rabenh. and *P. acuminatum* Lindb. (Novotný 1992 (1993), Finch (in Hill & al. 1992). That is, in the Czech and Slovak Republics *Ditrichum flexicaule* and/or *Pleuridium subulatum* are more common, while in Great Britain and Ireland *Ditrichum gracile* and/or *Pleuridium acuminatum*.

I found *D. gracile* in herbarium collections labelled *D. flexicaule*, without indication of a corresponding variety, or as *D. flexicaule* var. *longifolium* Zett. Several times *D. flexicaule* var. *densum* (B.S.G.) Braithw. has been reported in the literature from Slovakia (e. g. Šmarda (1948), Pilous 1988 (1991), but *D. gracile* has been only mentioned from the territory under study by Duell (1984); his Czechoslovak data originated from Z. Pilous. Pilous & Duda (1960) reports on *D. flexicaule*: "Besides long-leaved forms a form occurs in our country with short, straight leaves, its mats are dense, low."

Conclusion

One may state on the basis of the results of the present study that transitive types exist between the two taxa. *D. flexicaule* is a more homogeneous taxon than *D. gracile*. The intensity of the barrier between the two taxa, and thus also the abundance of the transitive types, may differ in different parts of the range, depending on the conditions in a given region. On the basis of the present study it is not recommended to carry out any taxonomical changes. However, the results (cf. the principal co-ordinate analysis [Figs. 4-6]) also suggest that the two taxa could be evaluated on the subspecific level. It is necessary, however, to consider the vast range of the taxa under study, and to carry out detailed investigations in other representatively selected regions in order to assess the variability in dependence on its geographical distribution. Furthermore, it is necessary to analyse the morphology of sporophytes in a sufficiently numerous and representative series.

The use of multivariate analytical methods cannot be considered to provide more objective results, only significant help in the study of these taxa. It may be useful to evaluate questionable populations separately on the basis of more numerous material. Additional information on this group can be obtained from further studies based on quite independent analyses, e. g., of isozymes or DNA directly.

Acknowledgements

I thank the curators of the herbariums cited above for permission to study their collections. I am indebted to Mr. L. Mucina (Institute of Botany, University of Vienna) for permission to use the SYN TAX 5.0 package. Special thanks are extended to Mr. K. Marhold and Mr. M. Chytrý for many useful comments on the use of multivariate methods. I am also most grateful to Mr. Vlastimil Šebesta for help in preparing Fig. 5. Appreciation for help in drawing pictures is given to Mrs. L. Pichová and Miss V. Novoměstská.

SOUHRN

Ditrichum flexicaule s. l. se vyznačuje výjimečnou variabilitou. V České a Slovenské republice se vyskytuje dva nápadné taxony. Je to *Ditrichum flexicaule* (Schwae gr.) Hampe a *D. gracile* (Mitt.) Kunze [= *D. crispissimum* (C. Müll.) Par.]. Byla provedena morfometrická analýza, při níž bylo na 95 náhodně zvolených vzorcích hodnoceno 7 znaků. Jednalo se o následující znaky: počet hyalínich buněk na okraji báze listu (hyacel), křivost stěn buněk na bázi listu blíže žebru (curvat), délka listu (leafle), šídlivost listu (awlnes), poměr délky buněk na žebre a na okraji listu v jeho šídlivitě části (shorte), zubatost špičky (toothne), šířka špičky ve vzdálenosti 35 µm od vrcholu (tipbre). Oba taxony a hodnocené znaky jsou znázorněny na obr. 1 a 2. Jejich rozlišovací znaky jsou uvedeny v tab. 1. Znaky byly hodnoceny na ordinální nebo metrické škále. Pro vyhodnocení tohoto souboru byly použity dvě metody multivariační analýzy. Nejdříve byla použita analýza hlavních komponent (PCA). Použití této metody není v případě daného souboru zcela korektní, protože tato metoda předpokládá, že většina znaků je hodnocena na metrické škále. Pro tento soubor, který obsahuje data

hodnocená na různých typech škál (smíšená data), je zcela korektní vyhodnocení pomocí analýzy hlavních koordinát (PCA). Byl použit program PRINCOOR z balíku SYNTAX 5.0.

Výsledky multivariačních analýz jsou znázorněny na obrázcích 3–6. Výsledky obou metod ukazují, že taxon *D. flexicaule* s. l. je možno rozdělit na dvě skupiny odpovídající taxonům *D. flexicaule* s. a *D. gracile*. Tyto skupiny přecházejí prostřednictvím přechodných typů, které jsou méně početná a vykazují větší variabilitu ve srovnání s oběma taxonomy (obr. 5). Tyto přechodné vzorky vytvářejí skupinu, která má díky tzv. arch (horseshoe) efektu podkovovitý tvar. Výsledky PCA ukazují též důležitosť jednotlivých hodnocených znaků. Jako nejméně spolehlivý znak se ukázala zubatost (tootne) a šifka (tipbre) špičky. Je možno vyslovit hypotézu, že oba taxony jsou oddeleny v různých oblastech různé intenzitní bariérou v závislosti na ekologických podmínkách. To lze předpokládat též v rámci celého areálu, který v případě *D. flexicaule* s. l. představuje téměř celý svět.

Na obrázku 7 jsou znázorněny axilární chlupy, které pro rozlišení obou taxonů nejsou vhodné. Na obrázcích 8 a 9 je pomocí bodových map znázorněno rozšíření obou taxonů v České a Slovenské republice. Druh *D. flexicaule* je velmi hojný ve slovenské části západních Karpat, především v oblastech s hojnějším výskytem vápenců nebo jiných bazických hornin. V České republice je hojnější na Moravě, kde nachází více stanovišť s vhodným substrátem. V Čechách je hojný pouze v některých oblastech (Český kras), ale jinak je zde poměrně vzácný. Taxon *D. gracile* je celkově dosti vzácný. Poněkud hojnější je na Slovensku. V České republice se vyskytuje jen ve čtyřech oblastech (Českokrumlovské předsumaví – 1 lokalita; Český kras – 1 lokalita, též přechodný typ; Krkonoše – 6 lokalit, též přechodný typ; Hrubý Jeseník – 1 lokalita).

Oba taxony nacházíme především na vápencích, ale též na dalších bazických horninách. Z hlediska výškového rozšíření je výskyt *D. flexicaule* soustředen především v nižších polohách, ale nalezneme ho též až v alpinských oblastech. *D. gracile* má výškovou amplitudu rovněž od nízkých až do vysokých nadmořských výšek, ale převažuje v horském a výšších vegetačních stupních. *D. flexicaule* je plodné zhruba z 10 % (tab. 3). *D. gracile* je plodné zcela výjimečně v 3 % případu.
