

Assessment of Diastolic LV Function New ASE Guidelines 2016

Harald Becher, MD, PhD

2016 New Guidelines

Recommendations for the Evaluation of Left Ventricular Diastolic Function by Echocardiography: An Update from the American Society of Echocardiography and the European Association of Cardiovascular Imaging

Nagueh SF, Smiseth OA, Appleton CP, Byrd BF 3rd, Dokainish H, Edvardsen T, Flachskampf FA, Gillebert TC, Klein AL, Lancellotti P, Marino P, Oh JK, Popescu BA, Waggoner AD.
J Am Soc Echocardiogr. 2016 Apr;29(4):277-314

Diastolic Function – who cares?

- Patients with dyspnea or history of heart failure but normal systolic function
- Patient with known heart disease and dyspnea
- High left atrial pressure related to dyspnea

LV Filling pressures translate into LA and lung vessels

Early diastole –
Mean PCWP

Late diastole –
LVEDP

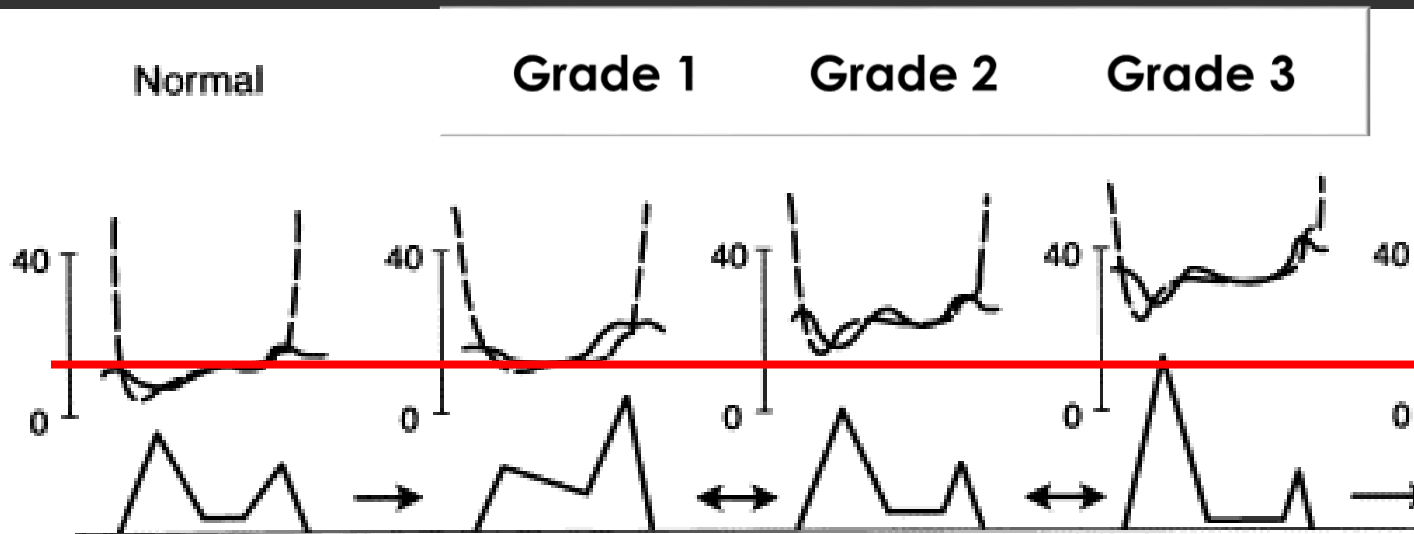

Diast.Dysfunction grade = filling pressure (LAP or PCWP) = V_{maxTR}
Because better correlation for pulmonary pressures

Diastolic dysfunction – old grading

Mean LAP	=	= ↑	↑↑	↑↑↑	↑↑↑
TAU	=	↑	↑	↑↑	↑↑
NYHA		II	II-III	III-IV	IV
Grade diastolic dysfunction		I	II	III	IV

Diastolic dysfunction – new grading

Mean LAP	=	= ↑	↑↑↑	↑↑↑↑
TAU	=	↑	↑	↑↑
NYHA		I-II	II-III	III-IV
Grade diastolic dysfunction		I	II	III

Table 4 LV relaxation, filling pressures and 2D and Doppler findings according to LV diastolic function

	Normal	Grade I	Grade II	Grade III
LV relaxation	Normal	Impaired	Impaired	Impaired
LAP	Normal	Low or normal	Elevated	Elevated
Mitral E/A ratio	≥ 0.8	≤ 0.8	>0.8 to <2	>2
Average E/e' ratio	<10	<10	10–14	>14
Peak TR velocity (m/sec)	<2.8	<2.8	>2.8	>2.8
LA volume index	Normal	Normal or increased	Increased	Increased

- Conclusions on LV diastolic function should be included routinely in reports when feasible, particularly in patients referred with symptoms of dyspnea or diagnosis of heart failure.
- The report should comment on LV filling pressures and the grade of LV diastolic dysfunction.
- If available, comparison with previous studies is encouraged to detect and comment on changes in diastolic function grade over time.

2016 Guidelines

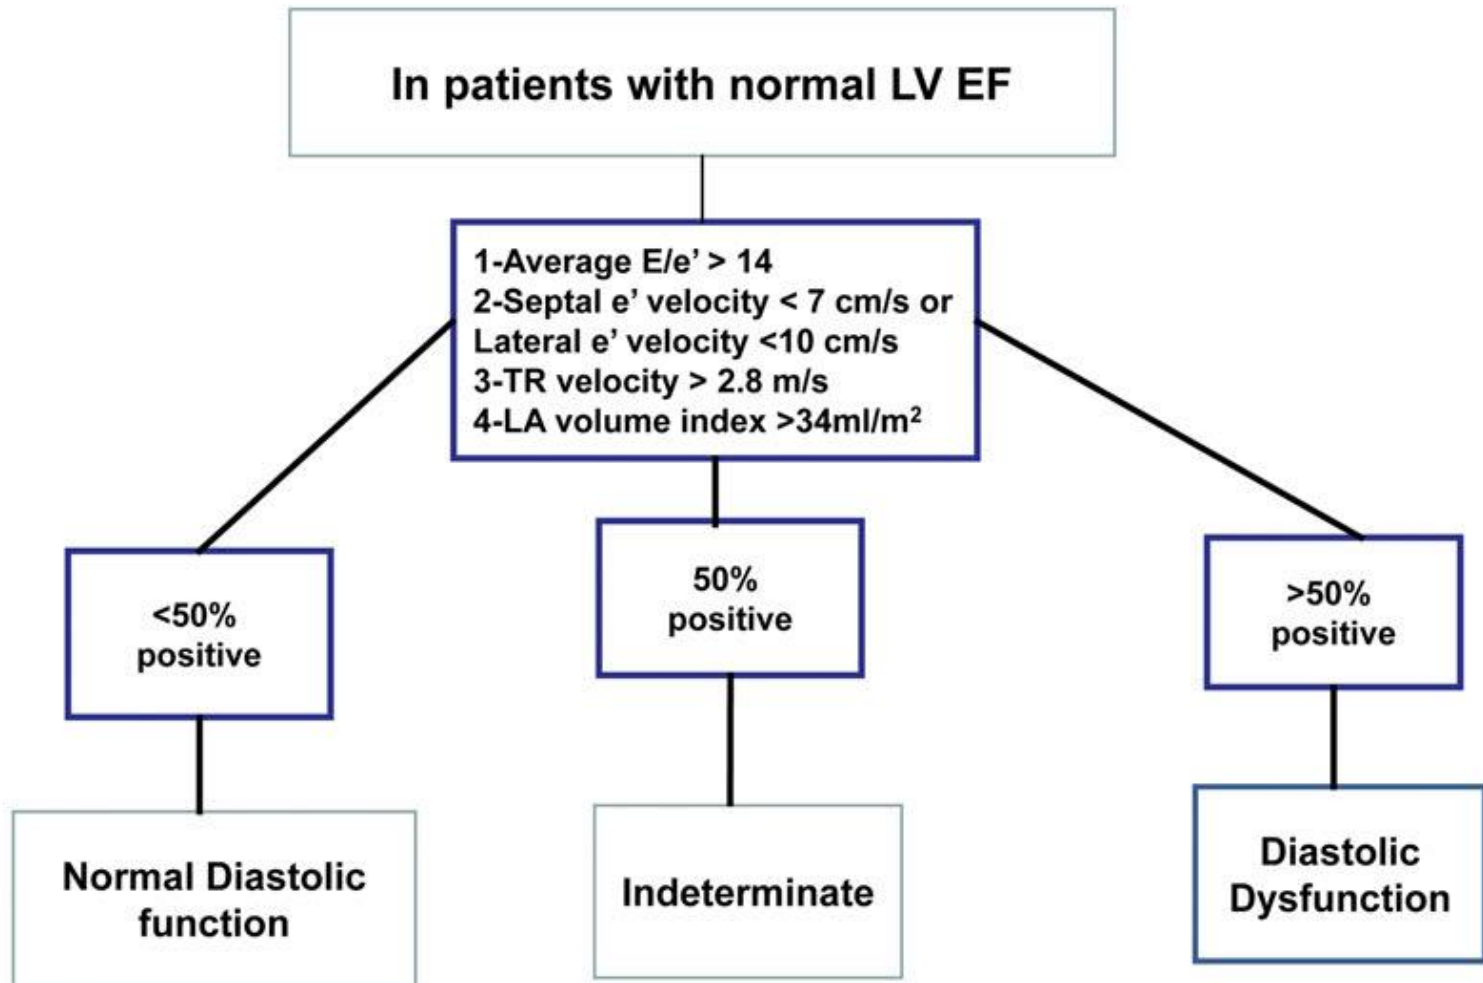

- Do not rely on only one measurement
- Consistency between at least 2 measurements for assessing Diastolic Function
- Algorithm for both screening and classification of diastolic dysfunction.
- CW Doppler of Tricuspid Regurgitation for assessment of LVEDP

Key parameters

- ▣ Mitral inflow – PW Doppler
- ▣ Mitral ring tissue Doppler
- ▣ LA volume index
- ▣ Tricuspid regurgitation

First Questions when assessing diastolic function

- Is LV ejection fraction abnormal?
- Does the patients have known myocardial disease with normal EF?
 - CAD, regional wall motion abnormalities
 - LVH
 - Abnormal GLS

In patients with normal LV EF

- 1-Average E/e' > 14
- 2-Septal e' velocity < 7 cm/s or Lateral e' velocity < 10 cm/s
- 3-TR velocity > 2.8 m/s
- 4-LA volume index > 34ml/m²

<50% positive

Normal Diastolic function

50% positive

Indeterminate

LA size,
GLS
S'

>50% positive

Diastolic Dysfunction

=myocardial disease

Continue like in Pts with reduced EF

TR max PG = 12.9 mmHg
TR max vel = 179.4 cm/sec

Diastolic Function in patients with reduced EF

- The main reason to assess diastolic function in patients with reduced EF is to estimate LV filling pressure or left atrial pressure

Diastolic Function in patients with reduced EF

- The main reason to assess diastolic function in patients with reduced EF is to estimate LV filling pressure or left atrial pressure
- Assessment of mitral inflow + three other key parameters (not necessary in all patients)

Assessing Diastolic LV Function in Patients with reduced EF: **Mitral Inflow first!**

□ $E/A \leq 0.8$ and $E \leq 50 \text{ cm/s}$

□ $E/A > 2$

□ Every other E/A and $E > 50 \text{ cm/s}$

Assessing Diastolic LV Function in Patients with reduced EF: **Mitral Inflow first!**

□ $E/A \leq 0.8$ and $E \leq 50 \text{ cm/s}$

□ $E/A > 2$

□ Every other E/A and $E > 50 \text{ cm/s}$

If $E/A > 2$ no further measurements needed
 In particular no deceleration time

Assessing Diastolic LV Function in Patients with reduced EF: **Mitral Inflow first!**

▣ $E/A \leq 0.8$ and $E \leq 50$ cm/s

Normal LAP, Grade 1 Diast.Dysfunction

▣ $E/A > 2$

▣ Every other E/A and $E > 50$ cm/s

Assessing Diastolic LV Function in Patients with reduced EF: **Mitral Inflow first!**

□ $E/A \leq 0.8$ and $E \leq 50$ cm/s

Normal LAP, Grade 1 Diast.Dysfunction

□ $E/A > 2$

High LAP, Grade 3 Diast.Dysfunction

□ Every other E/A and $E > 50$ cm/s

Patients with reduced EF

$E/A \leq 0.8 + E > 50 \text{ cm/s}$
or
 $E/A > 0.8 - < 2$

3 criteria to be evaluated*

- 1-Average $E/e' > 14$
- 2-TR velocity $> 2.8 \text{ m/s}$
- 3-LA Vol. index $> 34 \text{ ml/m}^2$

Patients with reduced EF

$E/A \leq 0.8 + E > 50 \text{ cm/s}$
or
 $E/A > 0.8 - < 2$

3 criteria to be evaluated*

- 1. Average $E/e' > 14$**
- 2. TR $> 2.8 \text{ m/s}$**
- 3. LA Vol $> 34 \text{ ml/m}^2$**

2 of 3 or 3 of 3
Negative

2 of 3 or 3 of 3
Positive

When only 2 criteria are available

2 negative	1 positive and 1 negative	2 positive

Patients with reduced EF or myocard. disease with normal EF

When you cannot use the flowcharts

- ▣ Atrial fibrillation – use different rules
- ▣ More than moderate mitral regurgitation
- ▣ Severe mitral ring calcification
- ▣ Mitral valve repair or prosthesis
- ▣ LBBB, paced ventricular rhythm
- ▣ LV assist devices

Change in Reporting Diastolic Function

- Normal diastolic function and filling pressure
- Grade 1 (impaired relaxation with low to normal filling pressure)
- Grade 2 (moderate increase in filling pressure)
- Grade 3 (marked elevation in filling pressure)

2016 ASE Recommendations for Assessment of Diastolic Function

- Simplified screening in patients with normal EF or unknown heart disease – *do not use E/A!*
- In patients with reduced EF assessing mitral inflow is the first step followed by using 3 key parameters

2016 ASE Recommendations for Assessment of Diastolic Function

- Simplified screening in patients with normal EF or unknown heart disease – *do not E/A*
4 key parameters
- In patients with reduced EF assessing mitral inflow is the first step followed by using 3 key parameters **4 key parameters**

Warning

- ▣ The guidelines are not necessarily applicable in children or in the perioperative setting

Table 6 Assessment of LV filling pressures in special populations

Disease	Echocardiographic measurements and cutoff values
AF ^{43,94-99}	Peak acceleration rate of mitral E velocity ($\geq 1,900$ cm/sec ²) IVRT (≤ 65 msec) DT of pulmonary venous diastolic velocity (≤ 220 msec) E/Vp ratio (≥ 1.4) Septal E/e' ratio (≥ 11)
Sinus tachycardia ^{41,44}	Mitral inflow pattern with predominant early LV filling in patients with EFs <50% IVRT ≤ 70 msec is specific (79%) Pulmonary vein systolic filling fraction $\leq 40\%$ is specific (88%) Average E/e' >14 (this cutoff has highest specificity but low sensitivity) When E and A velocities are partially or completely fused, the presence of a compensatory period after premature beats often leads to separation of E and A velocities which can be used for assessment of diastolic function
HCM ¹⁰⁰⁻¹⁰⁶	Average E/e' (>14) Ar-A (≥ 30 msec) TR peak velocity (>2.8 m/sec) LA volume (>34 mL/m ²).
Restrictive cardiomyopathy ^{13,107-109}	DT (<140 msec) Mitral E/A (>2.5) IVRT (<50 msec has high specificity) Average E/e' (>14)
Noncardiac pulmonary hypertension ³²	Lateral E/e' can be applied to determine whether a cardiac etiology is the underlying reason for the increased pulmonary artery pressures When cardiac etiology is present, lateral E/e' is >13, whereas in patients with pulmonary hypertension due to a noncardiac etiology, lateral E/e' is <8
Mitral stenosis ¹¹⁰	IVRT (<60 msec has high specificity) IVRT/T _{E-e'} (<4.2) Mitral A velocity (>1.5 m/sec)
MR ¹¹⁰⁻¹¹²	Ar-A (≥ 30 msec) IVRT (<60 msec has high specificity) IVRT/T _{E-e'} (<5.6) may be applied for the prediction of LV filling pressures in patients with MR and normal EFs Average E/e' (>14) may be considered only in patients with depressed EFs
