Abstract: This recent checklist of marine arthropods found on the coasts of Turkey represents a total of 1531 species belonging to 7 classes: Malacostraca (766 species), Maxillopoda (437 species), Ostracoda (263 species), Pycnogonida (27 species), Arachnida (26 species), Branchiopoda (7 species), and Insecta (5 species). Seventy-five species were classified as alien species in the region. This paper also includes the first record of the amphipod *Melita valesi* from the Levantine coast of Turkey (Kaş, Gulf of Antalya).

Key words: Arthropoda, Black Sea, Sea of Marmara, Aegean Sea, Levantine Sea, Turkey

1. Introduction

The arthropods, containing approximately 1.2 million described species and constituting almost 80% of all described living animal species, constitute the largest and most successful of the animal phyla. The phylum Arthropoda is commonly divided into 4 subphyla of extant forms: Chelicerata, Crustacea, Hexapoda, and Myriapoda (Pisani, 2009). Although Chelicerata and Hexapoda contain mostly terrestrial species, crustaceans are primarily adapted to aquatic life.

The first taxonomic studies on arthropod species along the Turkish coasts began in the 18th century. Hasselquist (1757) visited some parts of Asia Minor (Anatolia), Egypt, Cyprus, and Palestine and died in İzmir (Smyrna) on his return home. His large collection, notes, and letters to Linnaeus were published in 1757. In one of these letters, *Astacus minimus* (as a *Cancri* species) was mentioned by him in a *Pinna* species in İzmir Bay. According to Holthuis (1961), this species refers to *Pontonia pinnophylax* (Otto, 1821), which is the first known record of a crustacean from the Turkish coasts. The other investigation was made by Forskål (1775), who was appointed with Linnaeus's approval by King Frederick V of Denmark to an expedition to Arabia with his friend Carsten Niebuhr. He collected and reported some crustacean species [*Melicertus kerathurus* (as *Cancer kerathurus*), *Eriphia verrucosa* (as *Cancer verrucosus*), *Liocarcinus corrugatus* (as *Cancer pellitus*), and *Nepinnotheres pinnotheres* (as *Cancer pinnotheres*)] from

İzmir Bay (Smirnæ) and the Bosphorus (Constantinopoli). Forskål died of malaria in July 1763 and Carsten Niebuhr edited and published the work of his friend in 1775. In the 19th century, Ostroumoff (1896) participated in the Selanik expedition on the invitation of the Ottoman Sultan Abdul Hamid II, who showed interest in the scientific investigations in the Sea of Marmara. He reported over 50 crustacean species in the area. The other studies performed on marine arthropods in the Sea of Marmara were made by Heller (1863), Colombo (1885), Sowinsky (1897), and Marion (1898) in the 19th century. During the first half of the 20th century, researchers who made main contributions to the understanding of the diversity of marine arthropods were Thompson (1912), Colosi (1922), Ninni (1923), Stephensen (1923), Gruvel (1928), Monod (1930, 1931), and Neu (1939). In the second half of the 20th century, there has been a significant increase in the number of scientific studies on arthropods along the coasts of Turkey. The first and most comprehensive study was performed by Demir (1952) in the Sea of Marmara, who recorded a total of 113 arthropod species (107 crustaceans and 6 pycnognoids). Afterwards, numerous studies were carried out by native and foreign researchers, such as Tortonese (1959), Caspers (1968), Geldiay and Kocataş (1972a, 1972b), Pınar (1974), Kocataş (1976a, 1976b, 1976c); Kocataş and Katağan (1978); Kocataş (1981a, 1981b), Balkış and Albayrak (1994), Krapp-Schickel (1994), Öztürk (1998), Sezgin et al. (2001), Balkış et al. (2002), Uysal A et al. (2002), Uysal Z et al. (2002),

Sezgin (2003), Yurdabak (2004), Çınar et al. (2006), Ateş et al. (2010), Aslan-Cihangir and Pancucci-Papadopoulou (2011a, 2011b), Bakır (2012), Bakır and Çevirgen (2012), Çınar et al. (2012a, 2012b), Pešić et al. (2014), Bakır and Katağan (2014), and Gönülal et al. (2014). In addition to these studies, Kocataş et al. (2000) compiled all reported arthropod species along the coasts of Turkey and recorded 901 species in the region.

So far, over 300 papers regarding marine arthropods have been published from the region, which constitutes important knowledge. However, the high number of publications also makes it difficult to access this information. To overcome this problem, all reported marine arthropod species of Turkey were combined herein in a single checklist while reducing the misidentifications and synonyms as much as possible.

2. Materials and methods

In this study, previously published papers and some unpublished data on arthropod species from the Turkish coasts have been taken into account. The checklist contains the valid names of the native and alien species with their first records in the Turkish seas as well as their depth ranges and habitat preferences in the region (Table 1). Species with uncertain records or validity have not been included in the main list, but they are listed with the reasons for rejection in Table 2. The references marked with "+" are subsequent records of that species. The timeline of the first records according to years and the species distribution in the Turkish seas are given. The Turkish coasts have been divided into squares (15×15 km) in ArcGIS 9.3 software. The natural-breaks method was used to point out the areas with the highest number of species.

Table 1. Checklist of marine arthropods of Turkey *: Alien species; +: key reference; BS: Black Sea; SM: Sea of Marmara; AS: Aegean Sea; LS: Levantine Sea; DR: depth range (I: 0–10 m; II: 11–50 m; III: 51–100 m; IV: 101–200 m; V: 201–400 m; VI: 401–600 m; VII: >600 m); H: habitat (Hs: hard substratum including algae, sponge, mussels, etc.; Ss: soft substratum including all phanerogames; P: pelagic; Pz: parasite; CT: commensal on sea turtles, CM: commensal on *Maja* spp., W: inhabiting submerged wood); PS: present study.

Table 2. Questionable and misidentified marine arthropod species along the coasts of Turkey.

Species	Synonym	Situation	References
PYCGONOGONIDA			
<i>Tanystylum conirostre</i> (Dohrn, 1881)	<i>Clotenia conirostris</i> D.	Suspicious, confirmation needed	Ostroumoff, 1894
SESSILIA			
<i>Megabalanus tintinnabulum</i> (Linnaeus, 1758)	<i>Balanus tintinnabulum</i>	Suspicious, misidentification (?)	Geldiay and Kocataş, 1972a
<i>Verruca stroemia</i> (O.F. Müller, 1776)		Suspicious, misidentification (?)	Demir, 1952
CALANOIDA			
<i>Acartia hasanii</i> Unal, Shmeleva & Kideys, 2002		Suspicious, inadequate identification	Ünal et al., 2002
<i>Acartia ioannae</i> Unal, Shmeleva & Kideys, 2002		Suspicious, inadequate identification	Ünal et al., 2002
<i>Acartia janetae</i> Unal, Shmeleva & Kideys, 2002		Suspicious, inadequate identification	Ünal et al., 2002
TANAIDACEA			
<i>Leptognathia propontiaca</i> (Ostroumoff, 1896)		Suspicious, unclear as to what species was referred to	Ostroumoff, 1896
CUMACEA			
<i>Cumella armatura</i> Mutlu, 1990		Suspicious, unclear as to what species was referred to	Öztürk, 1998
ISOPODA			
<i>Armadilloniscus littoralis</i> Budde-Lund, 1885		A terrestrial species that can be found in the supralittoral	Geldiay and Kocataş, 1972b; Kirkim et al., 2005; Kirkim et al., 2006; Sezgin and Aydemir Çil, 2010
<i>Asellus aquaticus</i> (Linnaeus, 1758)		Considered as freshwater species	Bat et al., 2000; Kirkim et al., 2005; Kirkim et al., 2006
<i>Cymothoa oestrum</i> (Linnaeus, 1758)		Suspicious, no record from Mediterranean Sea, confirmation needed	Demir, 1952
<i>Halophiloscia couchii</i> (Kinahan, 1858)		A terrestrial species that can be found in the supralittoral	Kirkim et al., 2006; Sezgin and Aydemir Çil, 2010
<i>Sphaeroma granulata</i> Milne Edwards, 1840		Suspicious, unclear as to what species was referred to	Ostroumoff, 1894
<i>Tylos europaeus</i> Arcangeli, 1938		A terrestrial species that can be found in supralittoral	Geldiay and Kocataş, 1972a; Bakır and Çevirgen, 2010
<i>Tylos latreillei</i> Audouin, 1826		A terrestrial species that can be found in the supralittoral	Geldiay and Kocataş, 1972b; Geldiay et al., 1977; Kocataş and Katağan, 1983; Kirkim et al., 2005; Kirkim et al., 2006
AMPHIPODA			
<i>Amphilochoides longimanus</i> (Chevreux, 1888)		Suspicious, no record from Mediterranean Sea, confirmation needed	Kocataş and Katağan, 1978
<i>Byblis gaimardii</i> (Krøyer, 1846)		Suspicious, no record from Mediterranean Sea, confirmation needed	Ostroumoff, 1894
<i>Caprella linearis</i> Linnaeus, 1767		Suspicious, no record from Mediterranean Sea, confirmation needed	Kocataş, 1976b
<i>Crassicornophium bonellii</i> (Milne Edwards, 1830)		There are records from Black Sea but suspicious, confirmation needed	Ostroumoff, 1894; Kocataş and Katağan, 1980; Kocataş and Katağan, 1980; Öztürk, 1998; Sezgin and Katağan, 2007
<i>Crassicornophium crassicornis</i> Bruzelius, 1859		There are records from Black Sea but suspicious, confirmation needed	Sowinsky, 1897
<i>Cryptorchestia cavimana</i> (Heller, 1865)		Suspicious, the specimens may belong to <i>Cryptorchestia garbinii</i>	Sezgin et al., 2001; Bakır, 2012
<i>Elasmopus gracilis</i> Schellenberg, 1938		Suspicious, no record from Mediterranean Sea, confirmation needed	Kocataş and Katağan, 1978

Table 2. (Continued).

<i>Elasmopus steinitzi</i> Ruffo, 1959		Suspicious, no record for existence, confirmation needed	Kocataş and Katağan, 1978
<i>Elasmopus crassimana</i> (Miers, 1884)		Suspicious, no record from Mediterranean Sea, confirmation needed	Geldiay and Kocataş, 1972a
<i>Gammarellus homari</i> (Fabricius 1779)		Suspicious, no record from Mediterranean Sea, confirmation needed	Demir, 1952
<i>Gammarus locusta</i> (Linnaeus, 1758)		Suspicious, no record from Mediterranean Sea, confirmation needed	Sowinsky, 1897; Ostroumoff, 1894
<i>Gammarus marinus</i> Leach, 1815		Suspicious, no record from Mediterranean Sea, confirmation needed	Sowinsky, 1897
<i>Iphimedia jugoslavica</i> G. Karaman, 1975		Suspicious, no record from Mediterranean Sea, confirmation needed	Kocataş and Katağan, 1978
<i>Laetmatophilus tuberculatus</i> Bruzelius, 1859		Suspicious, no record from Mediterranean Sea, confirmation needed	Sowinsky, 1897
<i>Leucothoe crassimana</i> Kossmann, 1880		Suspicious, no record from Mediterranean Sea, confirmation needed	Sowinsky, 1897
<i>Medicorophium affine</i> (Bruzelius, 1859)		Suspicious, no record from Mediterranean Sea, confirmation needed	Sowinsky, 1897; Mutlu and Ergev, 2008
<i>Megaluropus agilis</i> Hoeck, 1889		Suspicious, no record from Mediterranean Sea, confirmation needed	Mutlu and Ergev, 2013
<i>Microdeutopus longimanus</i>		Suspicious, specimens may belong to <i>Microprotopus longimanus</i> Chevreux, 1997	Kocataş and Katağan, 1978
<i>Microdeutopus damnoniensis</i> (Bate, 1856)		Suspicious, confirmation needed	Kocataş, 1978
<i>Monocorophium cylindricum</i> (Say, 1818)		Suspicious, no record from Mediterranean Sea, confirmation needed	Caspers, 1968
<i>Gammaropsis nitida</i> (Stimpson, 1853)		Suspicious, no record from Mediterranean Sea, confirmation needed	Sowinsky, 1897
<i>Parhyale explorator</i> Arresti, 1989		Misidentification, specimens belong to <i>Ptilohyale plumicornis</i> (Heller, 1866)	Bakır et al., 2008
<i>Pontocrates arcticus</i> G.O. Sars, 1895	<i>Pontocrates arenarius</i> (Bate, 1858)	Misidentification, specimens may belong to <i>Pontocrates arenarius</i> (Bate, 1858)	Kocataş and Katağan, 1978
<i>Proboloides gregaria</i> (G.O. Sars, 1882)		Suspicious, no record from Mediterranean Sea, confirmation needed	Kocataş and Katağan, 1978
<i>Socarnes erythrophthalmus</i> Robertson, 1892		Suspicious, no record from Mediterranean Sea, confirmation needed	Kocataş and Katağan, 1978; Mutlu and Ergev, 2013
<i>Stenogammarus deminutus</i> (Stebbing, 1906)		Suspicious, confirmation needed	Öztürk, 1998
<i>Tryphosella dilatata</i> (Chevreux, 1903)		Suspicious, confirmation needed	Doğan et al., 2005
<i>Tryphosella simillima</i> Ruffo, 1985		Suspicious, confirmation needed	Sezgin, 2003
DECAPODA			
<i>Alpheus edwardsii</i> (Audouin, 1826)	<i>Alpheus audouini</i> (Coutière, 1905)	Suspicious, misidentification (?), confirmation needed	Galil et al., 2002; Özcan et al., 2008
<i>Alpheus lobidens</i> De Haan, 1849	<i>Alpheus crassimanus</i> Heller, 1865	Misidentification, specimens may belong to <i>Alpheus inopinatus</i> Holthuis and Göttlieb, 1958	Geldiay 1969; Geldiay and Kocataş, 1973; Kocataş, 1981a; Kocataş and Katağan, 1994
<i>Anapagurus hyndmanni</i> (Bell, 1845)		Suspicious, no record from Mediterranean Sea, confirmation needed	Mutlu and Ergev, 2008
<i>Cancer pagurus</i> Linnaeus, 1758		Suspicious, confirmation needed, specimens may belong to <i>Atergatis roseus</i> (Rüppell, 1830), <i>Eriphia verrucosa</i> (Forskål, 1775), or <i>Xantho</i> spp.	Devedjian, 1926; Eryılmaz, 1997; Gökalp, 2011; Keskin and Atar, 2013

Table 2. (Continued).

<i>Carcinus maenas</i> (Linnaeus, 1758)		Misidentification, specimens may belong to <i>Carcinus aestuarii</i> Nardo, 1847	Ostroumoff, 1894; Ostroumoff, 1896; Devedjian, 1926; Mater and Kocataş, 1967; Doğan et al., 2008
<i>Geryon trispinosus</i> (Herbst, 1803)	<i>Geryon tridens</i> Krøyer, 1837	Suspicious, confirmation needed	Ostroumoff, 1896; Müller, 1986
<i>Liocarcinus holsatus</i> (Fabricius, 1798)	<i>Portunus lividus</i> Leach, 1814	Suspicious, confirmation needed	Ostroumoff, 1896; Ostroumoff, 1894; Müller, 1986; Bilgin and Çelik, 2004
<i>Liocarcinus navigator rondeletii</i> (Risso, 1816)	<i>Liocarcinus rondeletii</i> (Risso, 1816)	Suspicious, confirmation needed	Bilgin and Çelik, 2004
<i>Mithrax verrucosus</i> H. Milne Edwards, 1832		Misidentification, specimens may belong to <i>Eriphia verrucosa</i> (Forskål, 1775)	Ostroumoff, 1896
<i>Myra fugax</i> (Fabricius, 1798)		Misidentification, specimens may belong to <i>Myra subgranulata</i> Kossmann, 1877	Kocataş, 1981a; Enzenross and Enzenross, 1987; Enzenross et al., 1990; Kocataş and Katağan, 1994
<i>Necora puber</i> (Linnaeus, 1767)		Suspicious, misidentification (?), confirmation needed	Devedjian, 1926; Keskin and Atar, 2013
<i>Paractaea monodi</i> Guinot, 1969		Misidentification, specimens may belong to <i>Paractaea rufopunctata</i> (H. Milne Edwards, 1834)	Holthuis and Gottlieb, 1956
<i>Pilumnus aestuarii</i> Nardo, 1869		Misidentification, specimens may belong to <i>Carcinus aestuarii</i> Nardo, 1847	Kocataş, 1981a
<i>Pilumnus inermis</i> A. Milne-Edwards and Bouvier, 1894		Misidentification, specimens belong to <i>Pilumnus hirtellus</i> (Linnaeus, 1761)	Bakır and Katağan, 2005
<i>Pisa corallina</i> (Risso, 1816)		Accepted name is <i>Pisa hirticornis</i> (Herbst, 1804)	Ostroumoff, 1896; Balkış, 2003; Kocataş, 1981a
<i>Processa robusta</i> Nouvel and Holthuis, 1957		Suspicious, misidentification (?), confirmation needed	Mutlu and Ergev, 2013
<i>Sergestes arachnipodus</i> (Cocco, 1832)		Misidentification, specimens belong to <i>Eusergestes arcticus</i> (Krøyer, 1855)	Ostroumoff, 1896
<i>Sirpus ponticus</i> Verestchaka, 1989		Misspelled, specimens belong to <i>Sirpus</i> <i>zariquieyi</i> Gordon, 1953	Gönlüğür-Demirci, 2006
<i>Thalamita sima</i> H. Milne Edwards, 1834		Suspicious, misidentification (?), confirmation needed	Ostroumoff, 1896
<i>Urocaridella antonbruunii</i> (Bruce, 1967)		Misidentification, specimens belong to <i>Urocaridella pulchella</i> Yokeş and Galil, 2006	Yokeş and Galil, 2004; Gökçalp, 2011
<i>Xantho floridus</i> (Montagu, 1808)		Suspicious, confirmation needed	Ninni, 1923; Demir, 1952; Balkış, 1992

3. Results and discussion

3.1. New record

Melita valesi Karaman, 1955 (Figures 1A and 1B)

Material. – 7 ind., 2.5–3.0 mm, Levantine coast, Kaş, 36°11'52"N, 29°38'19"E, 23 m, muddy sand, S: 39.23‰, T: 27.83 °C, DO: 6.64 mg/L, Van Veen grab, 07.09.2011 – 4 ind., 2.8 mm, Levantine coast, Gulf of Antalya, 36°25'36"N, 32°08'36"E, 21 m, gravel and sand, S: 39.24‰, T: 28.41 °C, DO: 6.24 mg/L, Van Veen grab, 09.09.2011.

Diagnosis. Eyes weakly developed. Antenna 1 peduncle with 3 articles. First and second segments of antenna 1 are equal, third is shorter. Flagellum with 9 articles. Accessory

flagellum present with 2 articles. Urosome segments without dorsal teeth. Fewer uropod 3 marginal spines than in the other species in the genus (Figure 1B).

Distribution. Western Mediterranean (Karaman, 1978), Adriatic Sea (Karaman, 1955) Aegean Sea (Stefanidou, 1996), Levantine coast of Turkey (present study).

3.2. Geographical distribution of the species

The present work revealed the presence of 1531 marine arthropod species along the Turkish coasts (Table 1; Figure 2). The majority of the species belonged to the classes of Malacostraca (766 species), Maxillopoda (437 species), and Ostracoda (263 species). Other classes (Arachnida,

Figure 1. *Melita valesi*: A) side view of body, B) uropod 3.

Pycnogonida, Branchiopoda, and Insecta) included 65 species in total (Figure 2). The Aegean coast has the highest number of species (1056 species) as it has different physicochemical characteristics and the longest coastline (Figure 2) and is relatively the most studied region. Most of the studies on the Aegean coast were begun by Turkish researchers around 1960 (Figure 3). The Levantine coast is the second important area in the ranking of species number. This region is under great influence by Lessepsian migration. However, species records were not updated until 1960 (Figure 3). The new species records in the Sea of Marmara began to increase due to the contributions of 4 major studies (Colombo, 1885; Ostroumoff, 1894; Ostroumoff, 1896; Sowinsky, 1897) at the end of the 19th century and showed another increase after 1940 (Figure 3). The lowest number of species was determined for the Black Sea coast, and the main reasons for this may be the chemical features of the sea (low salinity and high H₂S) and the limited number of studies performed in the area (Figure 4).

3.3. Evaluation of species

There is much misidentification and uncertainty about the presence of the marine arthropod species along the Turkish coasts. Some important ones are indicated below and others are given in Table 2.

The taxonomic position of *Artemia* species occurring in Turkish waters is uncertain. The specimens identified as *Artemia salina* or *A. parthenogenetica* from Çamaltı (İzmir) and Ayvalık (Balıkesir) salterns (Uçal and Ergen, 1994; Başbuğ, 1995; Koray, 1998) have been proven to have only parthenogenetic populations (Abatzopoulos et al., 2002). Therefore, specimens from the region should be cited as “parthenogenetic *Artemia* populations” or *Artemia* sp., and DNA analysis is required to clear the identity of the *Artemia* species in Turkey.

The most comprehensive study on marine Arachnida species was conducted by Bartsch (2004) in the Sea of Marmara, who described 7 new species and provided a checklist of the species reported from the area.

Nebalia bipes (Fabricius, 1780) was reported by many researchers from the Aegean coast of Turkey (Geldiay and Kocataş, 1972a; Koçak et al., 1999; Bakır and Katağan, 2005; Aydin et al., 2007; Doğan et al., 2008). On the other hand, the distribution of *Nebalia bipes* was restricted by Dahl (1985) to Arctic latitudes. Moreira et al. (2012) indicated that most of specimens of Leptostraca in older studies in the Mediterranean Sea were ascribed to *Nebalia bipes*. Another indication for this is that the specimens of *Nebalia bipes* from Cyprus identified by Kocataş et al. (2001) were actually *Nebalia strausi* (Koçak et al., 2007). According to the information above, the presence of *Nebalia bipes* on the Turkish coasts is suspicious and reexamination is required.

Many amphipod species reported from the Turkish coasts in previous studies were questionable, because their distribution ranges were known to be outside the Mediterranean Sea. For example, the specimens identified as *Parhyale explorator* Arresti, 1989 by Bakır et al. (2008) from the Levantine coast were reexamined by Bakır et al. (2013), who realized that they in fact belonged to *Ptilohyale plumicornis* (Heller, 1866). Another questionable species is *Cryptorchestia cavimana* (Heller, 1865), which was originally described from the mountains of Cyprus at 1250 m (see Ruffo et al., 2014). Specimens that were identified as *C. cavimana* from the supralittoral zone of the Mediterranean Sea, Central Europe, and England were proven to actually belong to a new species, *Cryptorchestia garbinii* (Ruffo et al., 2014).

Newman and Ross (1976) stated that the records of *Balanus crenatus* in the Mediterranean are questionable. Among the *Verruca* species, only *Verruca spengleri* exists in the Mediterranean (Young et al., 2003), and therefore the report of *V. stroemia* from the Sea of Marmara by Demir (1952) was considered as *V. spengleri* (Beşir and Çınar, 2012).

Figure 2. The number of marine arthropod species along the Turkish coasts (ARA: Arachnida, PYC: Pycnogonida, BRA: Branchiopoda, MAX: Maxillopoda, OST: Ostracoda, MAL: Malacostraca, INS: Insecta).

Figure 3. Timeline of the species records along the Turkish coasts.

Figure 4. The number of arthropod species in quadrates (15×15 km) along the Turkish coasts.

According to Gubanova et al. (2014), the descriptions and drawings of 3 *Acartia* species (*Acartia hasanii* Ünal, Shmeleva & Kideys, 2002; *Acartia ioannae* Ünal, Shmeleva & Kideys, 2002; *Acartia janetae* Ünal, Shmeleva & Kideys, 2002) described from the northeast Levantine Sea (Turkey) by Ünal et al. (2002) are also questionable, as they drew only the fifth pair of legs, which could belong to any member of the family Acartiidae that is in the copepodid stage. These species are therefore not included in the list.

Wittmann and Ariani (2012) indicated that *Diamysis bahirensis* (G.O. Sars, 1877) (marked with question mark in the list) reported by Katağan (1983, 1985) from İzmir Bay might be in fact *Diamysis cymodoceae*. Although *D. bahirensis* occurs in the SW Mediterranean, Canal of Sicily, and Ionian coast of Sicily, *D. cymodoceae* is the most common *Diamysis* species in the shallow coastal waters of the eastern Mediterranean.

There is confusion about the existence of some *Xantho* species on the Turkish coasts. *Xantho granulicarpus* was erroneously reported as *X. floridus* from an İstanbul fish market by Ninni (1923). Demir (1952) also determined this species as *X. floridus* on rocky substrata in the Sea of Marmara. Müller (1986) revealed that the specimens identified as *X. floridus* by Ninni (1923) and Demir (1952) in fact belonged to *X. granulicarpus*. Afterwards, Kocataş (1971, 1981a) reported *X. granulicarpus* from the Aegean and Mediterranean coasts. Reuschel and Schubart (2006) revised the *Xantho* species in the Mediterranean and

concluded that only *X. hydrophilus* (Herbst, 1790), *X. poressa*, and *X. pilipes* occurred in the Mediterranean Sea. They also indicated that *X. incisus* Leach, 1814 is a junior synonym of *X. hydrophilus* and that the taxonomic status of *X. hydrophilus granulicarpus*, which was described by Forest (in Drach and Forest 1953), is doubtful.

Cancer pagurus Linnaeus, 1758 and *Carcinus maenas* (Linnaeus, 1758), which are economically and ecologically important species, appear to have been misidentified from the Turkish coasts. *Cancer pagurus* has high economic value throughout the northeast Atlantic from Norway in the north to northern Africa in the south (Sunnanå, 2008). There are several, but mostly old, records of this species from the north coast of the Mediterranean (Pesta, 1918; Zariquey-Alvarez, 1968). Devedjian (1926) mentioned this species in Turkey and its catching methods and some ecological features, but did not provide any information about where it was caught. Erylmaz (1997) and Keskin and Atar (2013) also reported this species from the Sea of Marmara and Black Sea, respectively. However, no specimen was deposited in collections by the authors, which would have allowed these records to be confirmed. The photograph of *Cancer pagurus* from Bodrum (Aegean Sea) provided by Gökalp (2011) in fact was *Atergatis roseus*. Thus, the presence of this species on the coasts of Turkey is doubtful.

Carcinus maenas is native to the northeast Atlantic Ocean and is one of the most common crabs in the region. It is very similar to *Carcinus aestuarii*, which is a common

species in the Mediterranean Sea, Sea of Marmara, and Black Sea (Yamada and Hauck, 2001). This species was previously reported from the Aegean and Mediterranean coasts of Turkey by Ostroumoff (1896), Devedjian (1926), Mater and Kocataş (1967), and Doğan et al. (2008). However, there is no preserved specimen of this species in the museum's collections in Turkey to confirm its presence in the region. According to Ragionieri and Schubart (2013), the distribution of *C. maenas* is restricted to the northeastern Atlantic coast and the Sea of Alboran, whereas *C. aestuarii* occurs throughout the Mediterranean Sea. Therefore, all reports of *Carcinus* on the Turkish coasts might belong to *Carcinus aestuarii*.

The Lessepsian immigrant *Portunus segnis* (Forskål, 1775) was reported from the Aegean (Yokeş et al., 2007) and Levantine (Gruvel, 1928) coasts of Turkey. Altuğ et al. (2011) reported this species from the Sea of Marmara. However, there was no statement regarding this important record of *P. segnis* except the species list. The presence of *P. segnis* in Sea of Marmara is suspicious and needs confirmation.

Kocataş et al. (2000) mentioned that a total of 901 arthropod species (only Crustacea and Pycnogonida) were reported from the Turkish coasts. It was outlined that the Aegean Sea coast had the highest number of crustacean species (465 species), followed by the Levantine coast (226 species), the Turkish Strait System (174 species), and the Black Sea coast (75 species). In the present study, the number of crustacean species has increased several times higher compared to the study by Kocataş et al. (2000). Besides crustaceans, there were only 10 pycnogonid species reported by Kocataş et al. (2000) from the Aegean and Levantine coasts. In the present study, the number of Pycnogonida species increased to 27. In addition, the present study lists 26 arachnid species reported from the Turkish marine waters.

Most of the arthropod species (57%) in Table 1 were reported to live on soft substrata including phanerogams. The number of species that prefer hard substrata is almost equal to the number of pelagic species (19.4% and 18.6%, respectively). The parasitic species are lowest in number (3.5%). In addition to these, there are some species living on special habitats, such as *Chelura terebrans* and *Limnoria* spp., which bore tunnels in submerged woods. *Podocerus chelonophilus* lives on the shell, under the tail, or at the base of the legs of sea turtles. *Isaea montagui* lives as a commensal of *Maja* spp. on the carapace and in their branchial chambers. Specimens of *Isaea montagui* (see Table 1) have been found on *Maja goltziana* d'Oliveira, 1888 (Figure 5).

Figure 5. Distribution of the number of species according to habitats (Hs: hard substratum including algae, sponges, mussels, etc.; Ss: soft substratum including all phanerogams; P: pelagic; Pz: parasite; CT: commensal on sea turtles, CM: commensal on *Maja* spp., W: inhabiting submerged wood).

A total of 1061 arthropod species were found in the shallow-water benthic and pelagic environments (0–10 m). However, only the ostracods *Bathycythere vanstraateni* and *Macrocypris ligustica*, the leptostracan *Nebalia abyssicola*, and the decapods *Dorhynchus thomsoni*, *Gennadas elegans*, *Geryon longipes*, *Gnathophyllum elegans*, *Monodaeus guinotae*, *Munida tenuimana*, *Plesionika acanthonotus*, *P. martia*, and *Richardina fredericii* were encountered at depths of deeper than 600 m (Figure 6).

A total of 75 alien species have been reported from the coasts of Turkey, of which 65 species were found on the Levantine coast of Turkey, especially in İskenderun Bay, due to its proximity to the Suez Canal. A total of 6 areas in the bays of İskenderun, Mersin, and Antalya were represented by the highest number of alien species (13–18 species per grid). Two Lessepsian immigrants, *Penaeus semisulcatus* and *Erugosquilla massavensis*, have expanded their distributional ranges to the Sea of Marmara. The alien species reported on the Black Sea coast of Turkey were *Acartia (Acanthacartia) tonsa* and *Callinectes sapidus* (Figure 7).

Figure 6. Distribution of the number of species according to depth.

Figure 7. The number of alien species in quadrates (15×15 km) along the Turkish coasts.

In conclusion, many faunistic studies have been conducted along the coasts of Turkey. However, some habitats (i.e. coralligenous) and depths (deep water) remain largely unexplored. Understanding of the diversity of marine arthropods will undoubtedly increase if more scientific efforts are performed in less studied areas and habitats.
