This annex to the U.S. West Coast chapter in “The State of Deep-Sea Coral and Sponge Ecosystems of the United States” provides a list of deep-sea coral taxa in the Phylum Cnidaria, Classes Anthozoa and Hydrozoa, known to occur in U.S. waters off Washington, Oregon, and California (Figure 1). Deep-sea corals are defined as azooxanthellate, heterotrophic coral species occurring in waters 50 meters deep or more. Details are provided on the vertical and geographic extent of each species (Table 1). This list is an update of the peer-reviewed 2017 list by Whitmire et al. (2017) and includes taxa recognized through 2019. Taxonomic names are generally those currently accepted in the World Register of Marine Species ([WoRMS](#)), and are arranged by order, and alphabetically within order by family, genus, and species. Data sources (references) listed are those principally used to establish geographic and depth distribution.

Regional geographic distribution within U.S. waters is divided into two biogeographic provinces: the Oregon Province (OR), which extends from around the Northern tip of Vancouver Island, Canada, to around Point Arguello/Point Conception, USA; and the California Province (CA), which extends south from there to around Magdalena Bay, Mexico.

In summary, we have confirmed the presence of 138 unique coral taxa in U.S. waters off Washington, Oregon, and California. Octocorals were the most speciose (102 taxa total), followed by scleractinians (20 taxa), antipatharians (10 taxa), and stlyasterid corals (6 species), some of these taxa unidentified to species. Four new species have been described from the region since the 2017 West Coast deep-sea coral taxa list. Two species (*Muricea californica* and *Muricea fruticosa*) that were included in the 2017 list have been removed, as it appears that they are restricted to depths shallower than 50 meters (Horvath 2019).

Figure 1. U.S. West Coast region, delimiting geographic boundaries considered in this work, divided into the Oregon Province (OR) and the California Province (CA).

Table 1. List of known deep-sea coral species in the Phylum Cnidaria, Class Anthozoa and Class Hydrozoa, and their reported distributions in U.S. waters off Washington, Oregon, and California. Blue shaded fields indicate newly described species since 2017. Bold text indicates these new descriptions as well as other changes to the list found in Whitmire et al. (2017), including additions or range extensions, with new species denoted with an asterisk (*), and changes in taxonomy since 2017, denoted with a cross (†) (e.g., species that were listed in 2017, but have since been given a new name or alternative spelling). “NR” indicates a lack of reported distribution or depth information. References are numbered to correspond with citations following the table, along with notes (in superscript letters) pertaining to individual taxa. Distribution: OR = records from the Oregon Province; CA = records from the California Province.

Notes

- a. Two specimens in the National Museum of Natural History – identified as: *Heteropathes cf. pacifica* USNM 1234550, and *Heteropathes* sp. USNM 1234539. Also an image of *Heteropathes* sp. not *H. pacifica*: *Heteropathes* (Opresko DM, 2011). The Deep-Sea Guide (DSG). Monterey Bay Aquarium Research Institute (MBARI). Consulted on: 2019-07-03.
- b. Black corals identified as belonging to the genera *Bathypathes*, *Lillipathes*, *Parantipathes*, and *Umbellapathes* have also been observed off S. California (CA province), but have not been identified to species. L. Lundsten (pers. com.).
- c. Transfer of *Lophelia pertusa* to the genus *Desmophyllum* has been proposed recently based on genetic similarity of mitochondrial genomes and microsatellites (Addamo et al. 2016), and this change has been accepted by WoRMS. However, we have retained given *Lophelia pertusa* given the broad recognition of, and extensive literature on, this species under the traditional name.
- d. A specimen collected in Olympic Coast National Marine Sanctuary was initially identified as *Calcigorgia beringi* (included in Whitmire et al. 2017), this was subsequently identified as *C. japonica* by Matsumoto et al. 2019, with *C. beringi* restricted to the Aleutian Islands.
- e. Colonies of unidentified coralliids have been observed in both the Californian and Oregonian provinces. In the previous list these were designated as *Corallium* sp., however, with the resurrection of two additional genera in this family, the family name appears to be more appropriate at this time. Horvath (2019, Part 1) identified one specimen from the Santa Barbara Museum of Natural History (SBMNH) collected in the Channel Islands as likely to be *Hemicorallium ducale* (Bayer, 1955). *Hemicorallium imperiale* (Bayer, 1955) and *H. ducale* have both been collected from Fiberling Guyot, west of the Channel Islands, but outside the U.S. EEZ, and so are likely to also occur within U.S. waters.
- f. Gorgoniidae: In addition to the species listed here, two additional gorgoniid species, *Leptogorgia diffusa* (Verrill, 1868) and *Leptogorgia flexilis* (Verrill, 1868), are found in the Southern California Bight, but appear to be limited to depths shallower than 50 m (Horvath 2019, Part II).
- g. Breedy and Guzman have suggested that the genus *Adelogorgia* be placed in the Family Plexauridae, rather than Gorgoniidae. This revision has not been incorporated in WoRMS.

- h. Isididae: Specimens identified as *Keratoisis* sp. were also observed and collected from Southern California (CA province; NMNH Invertebrate Zoology Collections; SBMNH Invertebrate Zoology Online Collections), but not identified to species.
- i. *Gersemia rubiformis* (Ehrenberg, 1834) was identified by Williams (2013) as belonging in the family Alcyoniidae, genus *Alcyonium*. This change has not yet been reflected in WoRMS, and here we have retained *G. rubiformis*. Ref: Williams GC (2013) New taxa and revisionary systematics of alcyonacean octocorals from the Pacific coast of North America (Cnidaria, Anthozoa). ZooKeys: 15-42. Recent genetic studies (Everett, in prep.) including both molecular barcoding and genotyping by sequencing suggest that individuals identified as *G. rubiformis* in the Northeast Pacific may represent as many as three separate species from both *Gersemia* and *Alcyonium*.
- j. Plexauridae: There remains significant uncertainty over the species listed currently listed under the genera *Swiftia* and *Thesea* (reviewed by Horvath 2019, Part III). In addition to the species listed here, two plexaurid species from the Southern California Bight appear to be limited to depths shallower than 50 m. These include *Muricea californica* Aurivillius, 1931, *Muricea fruticosa* Verrill, 1868.
- k. Plexaurid gen. et. sp. indet. is based on a single specimen at California Academy of Sciences, originally identified as *Echinogorgia* sp. More recently, Gary Williams (CAS) described the specimen as “significantly different than other members of *Echinogorgia*, which is an Indo-Pacific genus” (G. Williams, pers. comm.).
- l. *Swiftia kofoidi* (Nutting, 1909) and *Swiftia pacifica* (Nutting, 1912) are related species that exhibit geographic transitional morphology around Pt. Conception, CA, with most specimens identified as *S. kofoidi* collected from the southern end of the region (especially the CA province), while *S. pacifica* appears most often to the north with a distribution that extends to Alaska (Horvath 2019, Part III).
- m. Type material for *Swiftia pusilla* is limited and in poor condition. Its status as a separate species and placement in the genus *Swiftia* may be problematic. See discussion in Horvath (2019, Part III).
- n. Additional work is needed to determine if *Thesea* sp. A and *Thesea* sp. B represent different species (Horvath 2019, Part III).
- o. One specimen of *Primnoa pacifica* (USNM 57557) listed as collected off La Jolla, CA in 1904.
- p. *Stylatula elongata* is primarily a shallow-water species, with almost all records < 50 m. The depth record of 820 m appears to be based on a single specimen (CAS-IZ 131632) and may be in error.
- q. The MBARI deep-sea guide identifies *Kophobelemnon biflorum* Pasternak, 1960 as a synonym for *Kophobelemnon macrospinosum* Thomson, 1927.
- r. WoRMS identifies *Distichoptilum rigidum* (Nutting, 1912) as a nomen dubium.
- s. The 2017 list included records of an unidentified *Protoptilum* sp. in several collections. This may or may not be the same as the newly described species.
- t. The 2017 list synonymized *Umbellula lindahli* Kölliker, 1875 and the Southern Ocean *Umbellula carpenteri* Kölliker, 1880 based on Broch (1958). Subsequent examination and genetic analysis by Dolan 2008 suggests that these are separate species. A single record of *U. carpenter* was reported from Monterey Canyon, but its identity has not been subsequently confirmed.
- u. Williams and Matsumoto (2015) reviewed the genus *Stylatula*. They indicated that *Stylatula elongata* and *S. gracilis* may represent the same species, or, if valid, *S. gracilis* may only occur from the southern tip of Baja California to Panama.

Acknowledgements

This list represents an update of Whitmire et al. (2017), which in turn built upon an initial list by Whitmire & Clarke (2007). We would like to thank Drs. Marcelo Kitahara, Alberto Lindner, Dennis Opresko and Gary Williams, who provided thoughtful reviews. Dr. Heather Coleman assisted greatly with the references and design.
