

MOUNT SHELDON RAGWORT

Senecio sheldonensis

Aster Family (Asteraceae)

Habitat: Turfy places in subalpine meadows. Wet to moist meadows and forest openings in montane to alpine zones

DISTRIBUTION

Yukon: South and central Yukon

North America: Yukon, Northwest Territories, British Columbia

World: Endemic to mountains in NW Canada.

CONSERVATION RANK

Global rank: Vulnerable (G3)

Canadian rank: Vulnerable (N3)

Yukon rank: Imperilled to Vulnerable (S2S3)

Distinguishing features: It is separated from *S. triangularis* by its smaller stature (30-60cm tall), broadly lanceolate leaves (not triangular-hastate) and margins that are shallowly sinuate or wavy denticulate (not denticulate). Lacks basal leaves.
